Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Protect containers against physical damage. Storage preferred in an outdoor or detached building. If storage is indoor, use a standard flammable liquid storage room. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Benzene requires a shipping label of "FLAMMABLE LIQUID." Benzene falls in Hazard Class 3 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep benzene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is highly flammable. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Dilution with alcohol or acetone to minimize smoke is recommended.[22] Bacterial degradation is also possible.

Benzenearsonic acid B:0320

Molecular Formula: $C_6H_7AsO_3$

Common Formula: $C_6H_5AsO(OH)_2$

Synonyms: Acido fenilarsonico (Spanish); Phenyl arsenic acid; Phenylarsonic acid

CAS Registry Number: 98-05-5

RTECS® Number: CY3150000

UN/NA & ERG Number: UN3465 (organoarsenic compounds, solid, n.o.s.)/151

EC Number: 202-631-9

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted.

Air Pollutant Standard Set.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); List of high risk pollutants (Section 63.74) as arsenic compounds.

Clean Water Act: Section 307 Toxic Pollutants, 40CFR401.15 (effluent limitations); as arsenic and compounds.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA (Section 313): as an arsenic organic compound. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s. This compound is not specifically cited but falls in these categories since it is an arsenic compound. See entry on "Arsenic."

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzenearsonic acid is a colorless, crystalline powder. Molecular weight = 202.05; Specific gravity (H_2O:1) = 1.76; Freezing/Melting point = 160°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug. This material is used as an analytical reagent for tin.

Permissible Exposure Limits in Air

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA.

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

Protective Action Criteria (PAC)

TEEL-0: 1.35 mg/m^3

PAC-1: 4.05 mg/m^3

PAC-2: 6.74 mg/m^3

PAC-3: 40 mg/m^3

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 3A (2004); BAT: 50 μg[As]/L in urine/end of exposure or end-of-shift; for long-term exposures; after several shifts.

NIOSH IDLH: 5 mg[As]/m^3.

Arab Republic of Egypt: TWA 0.2 mg(As)/m^3, 1993; Australia: TWA 0.05 mg(As)/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg(As)/m^3, 1993; Finland: carcinogen, 1999; France: VME 0.2 mg(As)/m^3, 1993; Hungary STEL 0.5 mg (As)/m^3, carcinogen, 1993; India: TWA 0.2 mg(As)/m^3, 1993; the Philippines: TWA 0.5 mg(As)/m^3, 1993; Poland: MAC (time-weighted average) 0.3 mg(As)/m^3, 1993; Sweden: NGV 0.03 mg(As)/m^3, carcinogen, 1999; Switzerland: MAK-week 0.1 mg(As)/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg(As)/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; United Kingdom: LTEL 0.2 mg(As)/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen.

Determination in Air: Use NIOSH Analytical Method #5022, arsenic, organic compounds.

Permissible Concentration in Water: The EPA[61] has set a limit in drinking water of 0.05 μg/L.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of arsenic poisoning usually appear 30 min to 1 h after ingestion but may be delayed many hours. Symptoms include a sweetish metallic taste and garlicky odor; difficulty in swallowing; abdominal pain; vomiting and painful diarrhea; dehydration, thirst, and cramps; dizziness, stupor, delirium, rapid heartbeat; headache, skin disorders; and coma. Benzenearsonic acid is a deadly poison. The LD_{low} oral (rat) is 50 mg/kg; the oral LD_{50} mouse is 270 μg/kg.

Long Term Exposure: Chronic exposure to arsenic compounds can cause dermatitis and digestive disorders. Renal damage may develop.

Points of Attack: Skin, kidneys.

Medical Surveillance: Kidney function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH; however, where the potential exists for exposure, the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Organoarsenic compounds, solid, n.o.s. and Arsenic compounds, solid, n.o.s., including organic compounds of arsenic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1.

Arsenic compounds, solid, n.o.s. (inorganic, including arsenates, n.o.s.; arsenites, n.o.s.; arsenic sulfides, n.o.s.; and organic compounds of arsenic, n.o.s.) require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material does not burn or burns with difficulty. Extinguish fire using agent suitable for surrounding fire. Use water in flooding quantities as fog. Avoid breathing dusts and fumes; keep upwind; wear self-contained breathing apparatus. Benzenearsonic acid emits poisonous fumes of arsenic when heated to decomposition.

If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Benzene, 1-(chloromethyl)-4-nitro- B:0330

Molecular Formula: $C_7H_6ClNO_2$

Common Formula: $ClCH_2C_6H_4NO_2$

Synonyms: Benzene, 1-(Chloromethyl)-4-nitro-; *p*-(Chloromethyl)nitrobenzene; 1-(Chloromethyl)-4-Nitrobenzene; 4-(Chloromethyl)nitrobenzene; α-Chloro-*p*-Nitrotoluene; *p*-Nitrobenzyl Chloride

CAS Registry Number: 100-14-1

RTECS® Number: XS9093000

UN/NA & ERG Number: UN1578 (Chloronitrobenzenes, *meta-* or *para-*, solid)/152

EC Number: 202-822-7

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (chloronitrobenzenes); Human Inadequate Evidence; Animals Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3.

Listed in the TSCA inventory.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Benzene, 1-(chloromethyl)-4-nitro- is a crystalline solid. Molecular weight = 171.58; Freezing/Melting point = 71°C. Slightly soluble in water; slow reaction.

Potential Exposure: Used in organic synthesis.

Incompatibilities: Can react with sulfuric acid.[52] Keep away from oxidizers, amines, bases: sodium hydroxide, potassium hydroxide; may cause fire and explosions. Corrodes steel.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 28 mg/m^3

PAC-3: 125 mg/m^3

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is a lachrymator.[52] Poisonous if swallowed or dust is inhaled. Can cause headaches, vomiting, cyanosis, difficulty in breathing. May cause skin irritation and sensitization.

Long Term Exposure: Prolonged chronic exposure to nitro compounds of aromatic hydrocarbons may cause liver and kidney damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: Kidney and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a refrigerator or in a cool, dry place and protect from prolonged exposure to moisture.[52]

Shipping: Chloronitrobenzenes, *meta-* or *para-*, solid require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group II.

A plus sign (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small liquid spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Benzenesulfonyl chloride B:0340

Molecular Formula: $C_6H_5ClO_2S$

Common Formula: $C_6H_5SO_2Cl$

Synonyms: Benzene sulfochloride; Benzene sulfonechloride; Benzene sulfone-chloride; Benzenesulfonic (acid) chloride; Benzenesulfonic acid chloride; Benzenesulfonyl chloride; Benzenosulphochloride; BSC-refined D

CAS Registry Number: 98-09-9

RTECS® Number: DB8750000

UN/NA & ERG Number: UN2225/156

EC Number: 202-636-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U020.

RCRA Land Ban Waste Restrictions.

Reportable Quantity (RQ): 100 lb (45.4 kg).

TSCA 40CFR716.120(a).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Benzenesulfonyl chloride is a colorless oily liquid with a pungent odor. Molecular weight = 176.6; Specific gravity = 1.3842 at 15°C; Boiling point = 251−252°C (decomposes); Freezing/Melting point = 15°C; Vapor pressure = 1 mmHg at 20°C; Relative vapor density (air = 1) = 6.12; Flash point = 130°C; Autoignition point = 460°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Moderately soluble in water.

Potential Exposure: It is used as a chemical intermediate for benzenesulfonamides, thiophenol, glybuzole (hypoglycemic agent), *N*-2-chloroethylamides, benzonitrile; for its esters—useful as insecticides and miticides.

Incompatibilities: Violent reaction with strong oxidizers, dimethyl sulfoxide, and methyl formamide. It is very reactive with bases and many organic compounds. Incompatible with ammonia, aliphatic amines. Water contact forms hydrochloric and chlorosulfonic acids. Aqueous solutions of this chemical are strong acids that react violently with bases. Attacks metals in presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 200 mg/m^3

Permissible Concentration in Water: The former USSR-UNEP/PRPTC project[43] set a MAC of 0.5 mg/L in water used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause severe irritation and burns to skin and eyes. Breathing this chemical may cause liver damage. Symptoms may include allergic reactions and severe shock. Benzenesulfonyl chloride is poisonous; may be fatal if inhaled, swallowed, or absorbed through the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Reversible toxic damage to the liver is possible after dermal exposure. LD_{50} = (oral-rat) 1960 mg/kg.[9]

Long Term Exposure: May cause chronic irritation of the air passages and lungs, bronchitis with cough and phlegm. Repeated exposure may cause liver damage. Repeated skin contact may cause dry skin, redness, rash, and sores.

Points of Attack: Liver, lungs.

Medical Surveillance: Lung function tests, liver function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a "CORROSIVE" label.[19] It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not breathe vapors. Wear proper respiratory protection, eye protection, and full protective clothing. Do not touch spilled material; stop leak, use water spray to reduce vapors. *Small spills:* take up with sand or other non-combustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, or foam extinguishers. *Do not use water.* Poisonous gases are produced in fire, including hydrogen chloride and sulfur dioxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Banned or Severely Restricted (many countries) (UN).[13, 35]
Very Toxic Substance (World Bank).[15]
OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR1910.1010).
Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; 40CFR401.15 Section 307 Toxic Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).
US EPA Hazardous Waste Number (RCRA No.): U021.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Reportable Quantity (RQ): 1 lb (0.45 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer (benzidine and its salts) 2/27/87; (benzidine-based dyes) 10/1/92.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Benzidine is a white, grayish-yellow crystalline solid or powder. Turns brownish-red on exposure to air and light; Molecular weight = 184.26; Freezing/Melting point = 128°C. Molecular weight = 184.2; Boiling point = 400°C; Freezing/Melting point = 128°C (anhydrous, rapid heat); 115−120°C (slow heat)[icsc]. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.04% at 12°C.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. Benzidine is used primarily in the manufacture of azo dyestuffs; there are over 250 of these produced. Other uses, including some which may have been discontinued, are in the rubber industry as a hardener; in the manufacture of plastic films; for detection of occult blood in feces, urine, and body fluids; in the detection of H_2O_2 in milk; in the production of security paper; and as a laboratory reagent in determining HCN, sulfate, nicotine, and certain sugars. No substitute has been found for its use in dyes. Free benzidine is present in the benzidine-derived azo dyes. According to industry, quality control specifications require that the level not exceed 20 ppm and in practice the level is usually below 10 ppm. Regulations in the United States concerning this chemical define strict procedures to avoid worker contact: mixture containing 0.1% or more must be maintained in isolated or closed systems; employees must observe special personal hygiene rules, and certain procedures must be followed in case of emergencies. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.
Incompatibilities: Violent reaction with strong oxidizing materials. Contact with red fuming nitric acid may cause fire. Oxidizes in air.
Permissible Exposure Limits in Air
OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.
NIOSH IDLH: Not determined. Potential occupational carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 0.15 mg/m^3
PAC-1: 0.5 mg/m^3
PAC-2: 3.5 mg/m^3
PAC-3: 125 mg/m^3
Note: OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens

and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine (and dyes based on them) may present a cancer risk to workers and should be handled with caution and exposure minimized.

DFG MAK: [skin] Carcinogen Category 1. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Australia: (prohibited) [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Finland: carcinogen, 1999; France: VME 0.001 ppm (0.008 mg/m^3), carcinogen, 1999; Poland: MAC (time-weighted average) 0 mg/m^3; MAC (STEL) 0 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for benzidine in ambient air[60] ranging from zero (New York, North Dakota, South Carolina, Virginia) to 0.014 ng/m^3 (North Carolina) to 0.02 ng/m^3 (Rhode Island) to 30 μg/m^3 (30,000 ng/m^3) (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method #5509, Benzidine, #8306, in urine, OSHA Analytical Method ID-65.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 2500 μg/L on an acute basis; insufficient data to yield a value for saltwater aquatic life. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results from a concentration of 0.0012 μg/L.[6] Kansas has set a guideline in drinking water of 0.0015 μg/L.[61]

Determination in Water: High-performance liquid chromatography (EPA Method 605) or an oxidation/colorimetric method using Chloramine T (available from EPA) or a gas chromatography/mass spectrometric method (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 1.34$.

Routes of Entry: Inhalation, percutaneous absorption, and ingestion of dust.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. Corrosive to the skin and respiratory tract. Easily absorbed thought the skin. Inhalation can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingestion: animal studies suggest 0.01−0.08% in food may cause a decrease in liver, kidney, and body weight; an increase in spleen weight; swelling of the liver, and blood in the urine.

Long Term Exposure: May cause skin allergy. Benzidine is a human carcinogen. Exposure may cause an increase in urination, blood in the urinary tract tumors. Can affect the blood and cause bladder tumors; liver and kidney damage.

Points of Attack: Skin, bladder, kidney, liver.

Medical Surveillance: OSHA mandates the following be investigated: reduced immunologic competence; steroid treatment; pregnancy; cigarette smoking; NIOSH lists the following tests: cystoscopy; pulmonary function tests; urine (chemical/metabolite); urinalysis (routine); urinalysis (routine), cytology every 6 months, hematuria every month; urinalysis (routine) every month. Placement and periodic examinations should include an evaluation of exposure to other carcinogens; use of alcohol, smoking; medications; and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations. Urine cytology. Evaluation by a certified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Use gastric lavage if ingested followed by saline catharsis. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: These are designed to supplement engineering controls (such as a prohibition on open-vessel operation) and to prevent all skin or respiratory contact. Full body protective plastic clothing and butyl rubber gloves should also be used. On exit from a regulated area employees should shower and change into street clothes, leaving their protective clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Store in a dark, cool, well-ventilated area in closed, sealed containers. Keep out of sunlight and away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Benzidine requires a shipping label of "POISONOUS/TOXIC MATERIALS." Benzidine falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with a mixture of 9 parts sand to 1 part soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzidine may burn but does not readily ignite. Use dry chemical, carbon dioxide, or foam extinguishers. Use water spray in flooding quantities as fog. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.[22] Package spill residues and sorbent media in 17H epoxy-lined drums and move to an EPA-approved disposal site. Treatment may include destruction by potassium permanganate oxidation, high-temperature incineration, or microwave plasma methods. Encapsulation by organic polyester resin or silicate fixation. These disposal procedures should be confirmed with responsible environmental engineering and regulatory officials.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzo(b)fluoranthene is a colorless, needle-shaped solid. Molecular weight = 252.32; Boiling point = 480°C; Freezing/Melting point = 168°C; Vapor pressure = 5.0×10^{-7} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = <1 mg/mL at 19°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen. There is no commercial production of this compound. Benzo(b)fluoranthene is a chemical substance formed during the incomplete burning of fossil fuel, garbage, in cigarette smoke, or any organic matter and is found in smoke in general; it is carried into the air, where it condenses onto dust particles and is distributed into water and soil and on crops. B(b)F is a polycyclic aromatic hydrocarbon (PAH) and a component of coal tar pitch used in industry as a binder for electrodes. It is also a component of creosote, which is used to preserve wood. PAHs are also found in limited amounts in bituminous materials and asphalt used for paving, roofing, and insulation. B(b)F has some use as a research chemical. It is available from some specialty chemical firms in low quantities (25−100 mg).

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines “coal tar pitch volatiles” in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: Exposure by all routes should be carefully controlled to levels as low as possible; Suspected Human Carcinogen.

Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 4 mg/m^3
PAC-3: 20 mg/m^3

DFG MAK: Carcinogen Category 2; Germ Cell Mutagen Group 2.

Austria: carcinogen, 1999; France: carcinogen, 1993; Norway: TWA 0.04 mg/m^3, 1999.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: The Environmental Protection Agency (EPA) developed guidelines for permissible levels of carcinogenic PAHs in ambient water based on data from a carcinogenicity study on benzo(a)pyrene. EPA recommended that for the protection of human health from potential carcinogenic effects of exposure to PAHs through the ingestion of contaminated water, fish, and shellfish, the ambient water concentrations of total carcinogenic PAHs may not be possible to achieve because of naturally occurring levels in the environment; EPA consequently estimated ambient water concentrations of total carcinogenic PAHs at 28, 2.8, and 0.28 ng/L of water, corresponding to incremental lifetime cancer risk levels of one additional cancer case for every 100,000, 1 million, and 10 million people exposed, respectively, based on consumption of contaminated water, fish, and shellfish as an aid for developing water quality regulations (1 ng is one-billionth of a gram). Kansas has set a guideline for drinking water of 0.029 μg/L.

Determination in Water: The analytical methods required by EPA for the analysis of B(b)F in water are procedures 610 (HPLC/FS), 625 (GC/MS), and 1625 (GC/MS). These are the required test procedures under the Clean Water Act for municipal and industrial wastewater-discharging sites. GC/MS is also the method recommended by the EPA Contract Laboratory Program for analysis of B(b)F and other PAHs in water and soil. Octanol/water partition coefficient as Octanol−water coefficient: Log $K_{ow} = 6.1$.

Routes of Entry: Inhalation, passing through the skin. B(b)F enters the body primarily through breathing polluted air containing the compound or from inhaling tobacco smoke. Drinking contaminated water or accidentally swallowing soil or dust particles containing B(b)F can also result in B(b)F entering the body. Smoking or charcoal-broiling food can cause B(b)F to be formed. B(b)F can then enter the body through consumption of the contaminated food. Under normal conditions of environmental exposure, B(b)F does not usually enter the body through the skin; however, small amounts could enter the body if contact occurs with soil that contains high levels of B(b)F (e.g., near a hazardous waste site) or if contact occurs with heavy oils containing B(b)F.

Harmful Effects and Symptoms

B(b)F is a toxic chemical that causes cancer in laboratory animals when it is applied to their skin. B(b)F has not been studied adequately, and, consequently, it is not known whether it causes cancer if it is breathed or ingested or if it causes harmful effects other than cancer. Because B(b)F causes skin cancer in animals, it is possible that humans exposed in the same manner or by other routes could develop cancer as well.

Short Term Exposure: The substance can be absorbed into the body by inhalation of its aerosol skin absorption. Skin contact may cause irritation or skin allergy, which is greatly aggravated by sunlight on contaminated skin. Eye contact or "fume" exposure may cause irritation and a reaction greatly aggravated by sunlight during or shortly following exposure. Direct contact or "fumes" can cause irritation of the nose, throat, and bronchial tubes; skin irritation, redness, and possible swelling.

Long Term Exposure: Repeated skin contact may cause thickening, pigment changes, and skin growths, including warts, pimples, and skin cancer. B(b)F is a probable carcinogen in humans. May cause eye allergy. Repeated inhalation of fumes, especially with heating may cause chronic bronchitis with cough and phlegm.

Points of Attack: Skin, eyes.

Medical Surveillance: Periodic skin examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention.

Personal Protective Methods: Sun screen lotion or creams with a high ability to screen out ultraviolet light can help prevent skin allergic reactions. These may need frequent reapplication if the user is sweating. Ultraviolet-screening sunglasses can help with eye allergic reactions. Consult your doctor or pharmacist in selecting these. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: There is no commercial production of this compound. A reference material of certified high purity is available for research. If shipped, it may be categorized as poisonous solids, n.o.s. requiring a "POISONOUS/TOXIC MATERIALS" label.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Residues and sorbent media may be packaged in 17H epoxy-lined drums and disposed of at an EPA-approved site. Destroy by permanganate oxidation, high-temperature incineration with scrubbing equipment, or microwave plasma treatment, if available. Confirm disposal procedures with responsible environmental engineer and regulatory officials.

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 400 mg/m^3

Permissible Concentration in Water: Russia has proposed a MAC of 0.6 mg/L in surface water.[35]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.88.

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to skin, eyes (possibly severe), and mucous membranes. Skin contact may cause irritation, skin rash, or burning feeling on contact. Ingestion causes nausea and GI troubles. For most people, ingestion of 1/10−2/10 oz will have no effect although some sensitive people may experience allergic reactions. Larger amounts may cause stomach upset. Information from animal studies shows that about 6 oz may be lethal to a 150-lb person. LD_{50} (oral, rat) = 1700 mg/kg.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Mutation data reported.

Points of Attack: Skin, eyes, and mucous membranes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Cannister mask recommended.

Storage: Color Code—Green: General storage may be used. Store away from excessive heat. Benzoic acid must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Vapor may explode if ignited in an enclosed area. Solutions should be neutralized with soda ash. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Then flush the area with water. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzoic acid is a combustible solid. Benzoic acid may burn but does not readily ignite. High levels of dust may form an explosive concentration in air. Use dry chemical, CO_2, or water spray extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Benzonitrile B:0380

Molecular Formula: C_7H_5N

Common Formula: C_6H_5CN

Synonyms: Benzene, cyano-; Benzenenitrile; Benzoic acid nitrile; Benzonitrilo (Spanish); Cyanobenzene; Fenylkyanid; Phenyl cyanide

CAS Registry Number: 100-47-0

RTECS® Number: DI2450000

UN/NA & ERG Number: UN2224/152

EC Number: 202-855-7 [*Annex I Index No.:* 608-012-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 5000 lb (2270 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions, or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2; S23 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Benzonitrile is a colorless, oily liquid. It has an almond odor. Molecular weight = 103.13. Boiling point = 191°C; Freezing/Melting point = −13°C; Critical temperature = 426°C; Critical pressure = 611 psia; Specific gravity (H_2O:1) = 1.01 at 25°C; Relative vapor density (air = 1) = 3.6; Electrical conductivity = 2×10^6 pS/m; Ratio of specific heats of vapor (gas) = 1.091; Latent heat of vaporization = 3.67×10^5 J/kg; Heat of combustion = -351×10^5 J/kg. Explosive limits in air: Lower = 1.4%, Upper = 7.2%; Flash point = 71°C; Autoignition temperature = 550°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Poor solubility in water.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Benzonitrile is used as an electroplating agent; in organic synthesis of pharmaceuticals; dyestuffs; rubber chemicals; as a solvent and chemical intermediate.

Incompatibilities: Strong acids which can liberate hydrogen cyanide. Forms explosive mixture with air.

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

Protection Action Criteria (PAC)*

TEEL-0: 1 ppm
PAC-1: 3 ppm
PAC-2: **22** ppm
PAC-3: **56** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Russia[43] set a MAC of 1.0 mg/m^3 in work-place air.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.6$.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Benzonitrile can affect you when breathed in by passing through your skin. Lower exposures can cause you to feel dizzy and lightheaded. Exposure to high levels, by breathing or skin contact, can cause trouble breathing, convulsions, coma, and death. Exposure may impede cellular or tissue respiration causing cyanosis and unconsciousness. Contact can irritate the eyes and skin. Prolonged contact can cause skin burns. The oral LD_{50} for cat and rabbit is 800 mg/kg.

Long Term Exposure: Repeated exposure may damage the liver and nervous system.

Points of Attack: Liver, nervous system.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention. If cyanide poisoning is suspected use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Butyl rubber and polyvinyl alcohol gloves have been tested and found to be resistant to permeation by benzonitrile. Wash thoroughly immediately after exposure to benzonitrile and at the end of the work shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of benzonitrile to potentially exposed workers. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area. Away from strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Benzonitrile requires a shipping label of "POISONOUS/TOXIC MATERIALS." Benzonitrile falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Before entering confined space where benzonitrile may be present, check to make sure that an explosive concentration does not exist. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzonitrile is a combustible liquid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Water may be ineffective in controlling fire. Poisonous gases are produced in fire, including nitrogen oxides and hydrogen cyanide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: (1) Mix with calcium hypochlorite and flush to sewer with water or (2) incinerate.

CAS Registry Number: 119-61-9

RTECS® Number: DI9950000

EC Number: 204-337-6

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: *E. coli* polA without S9 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Benzophenone is a combustible, white, crystalline solid with a rose-like odor. Molecular weight = 182.23; Specific gravity (H_2O:1) = 1.085 at 50°C; Boiling point = 305°C; Freezing/Melting point = 48.5°C; Latent heat of vaporization = 2.93×10^5 J/kg; Heat of combustion = -358×10^5 J/kg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Benzophenone is used in UV curing of inks and coatings; as an intermediate; as an odor fixative in fragrances, flavoring, soaps; in the manufacture of pharmaceuticals and insecticides; in organic syntheses.

Incompatibilities: Oxidizing materials such as dichromates and permanganates.

Permissible Exposure Limits in Air

AIHA WEEL: 0.5 mg/m^3 TWA

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 350 mg/m^3

PAC-3: 500 mg/m^3

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.4$.

Routes of Entry: Inhalation, through the skin, and by ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact can cause irritation. Ingestion can cause nausea, vomiting, and stomach pain. Estimated lethal dose is 8 oz.

Medical Surveillance: See NIOSH Criteria Document: 78-173 *Ketones.*

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention.

Personal Protective Methods: Adequate ventilation; sinks, showers, and eyewash stations should be available. Goggles or face shields and rubber gloves should be worn if contact is likely.

Respirator Selection: Local exhaust or breathing protection.

Storage: Color Code—Green: General storage may be used. Store in a cool, well-ventilated area away from sources of ignition and incompatible materials.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Use dry chemical, alcohol foam, or CO_2.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR1910.1001) as coal tar pitch volatiles.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Water Pollution Standard Set (EPA) (Canada).

Clean Water Act: Section 307 Toxic Pollutants, 40CFR401.15 (effluent limitations); 40CFR413.02, Total Toxic Organics, 40CFR423, Priority Pollutants, as polynuclear aromatic hydrocarbons (PAH).

US EPA Hazardous Waste Number (RCRA No.): U022.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.061; Nonwastewater (mg/kg), 3.4.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8100 (200); 8270 (10).

Safe Drinking Water Act: MCL, 0.0002 mg/L; MCLG, zero.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA (Section 313): as polycyclic aromatic compounds (PAC), Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 7/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as Benzo(*a*)pyrene and coal tar pitch volatiles; Drinking water quality.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R46; R60; R61; R43; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: B(a)P appears as yellowish needles,[2] crystals, or powder. Odorless. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 252.32; Freezing/Melting point = 179°C[2]; Boiling point = 311°C at 10 mmHg[2]; Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Benzo[a]pyrene (B[a]P) is a polycyclic aromatic hydrocarbon (PAH) that has no commercial-scale production. B(a)P is produced in the United States by one chemical company and distributed by several specialty chemical companies in quantities from 100 mg to 5 g for research purposes. Although not manufactured in great quantity, B(a)P is a by-product of combustion. It is estimated that 1.8 million pounds per year are released from stationary sources, with 96% coming from: (1) coal refuse piles, outcrops, and abandoned coal mines; (2) residential external combustion of bituminous coal; (3) coke manufacture; and (4) residential external combustion of anthracite coal. Human exposure to B(a)P can occur from its presence as a by-product of chemical production. The number of persons exposed is not known. Persons working at airports in tarring operations, refuse incinerator operations, power plants, and coke manufacturers may be exposed to higher B(a)P levels than the general population. Scientists involved in cancer research or in sampling toxic materials may also be occupationally exposed. The general population may be exposed to B(a)P from air pollution, cigarette smoke, and food sources. B(a)P has been detected in cigarette smoke at levels ranging from 0.2 to 12.2 μg per 100 cigarettes. B(a)P has been detected at low levels in foods ranging from 0.1 to 50 ppb.

Incompatibilities: Strong oxidizers, nitrogen dioxide, and ozone.

Permissible Exposure Limits in Air

Polynuclear aromatic hydrocarbons (PAH)

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens; See NIOSH Pocket Guide, Appendix C.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen; Suspected Human Carcinogen; BEIp assigned *as Polycyclic Aromatic Compounds (PAHs).*

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 80 mg/m^3

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutagen Group 2.

Australia: carcinogen, 1993; Belgium: carcinogen, 1993; Finland: TWA 0.01 mg/m^3, [skin], carcinogen, 1999; France: carcinogen, 1993; Norway: TWA 0.04 mg/m^3, 1999; Poland: TWA 0.003 mg/m^3, 1999; Russia: STEL 0.00015 mg/m^3, carcinogen, 1993; Sweden: NGV 0.002 mg/m^3, KTV 0.02 mg/m^3, [skin], carcinogen, 1999; Switzerland: MAK-week 0.0002 ppm (0.002 mg/m^3), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Russia[43] set a MAC of 0.001 μg/m^3 in ambient residential air. In addition, several states have set guidelines or standards for benzo[a]pyrene in ambient air[60] ranging from zero (New York and Virginia) to 0.0007 μg/m^3 (Pennsylvania) to 0.10 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: Water quality criteria document for PAH published in final 11/2/80. Total PAH addressed. A concentration of PAH 2.8 ng/L (0.0028 μg/L) is estimated to limit a cancer risk to one in a million (EPA). Canada's MAC for drinking water quality is 0.00001 mg/L. Russia[43] set a MAC of 0.005 μg/L water used for domestic purposes. The WHO[35] has set a maximum limit of 0.2 μg/L in drinking water and a guideline level of 0.01 μg/L. Kansas has set a guideline of 0.03 μg/L in drinking water[60] and New Mexico a standard of 10.0 μg/L.

Determination in water: Octanol−water coefficient: Log $K_{ow} = 6.0$.

Routes of Entry: Inhalation skin absorption.

Harmful Effects and Symptoms

B(a)P has produced tumors in all of the nine species for which data are reported following different administrations including oral, skin, and intratracheal routes. It has both a local and a systemic carcinogenic effect. In subhuman primates, there is convincing evidence of the ability of B(a)P to produce local sarcomas following repeated subcutaneous injections and lung carcinomas following intratracheal instillation. It is also an initiator of skin carcinogenesis in mice, and it is carcinogenic in single-dose experiments and following prenatal exposure. In skin carcinogenesis studies in mice, B(a)P was consistently found to produce more tumors in a shorter period of time than did other polycyclic aromatic hydrocarbons (PAH), with the possible exception of DB(a,h)A. In a dose-response study involving subcutaneous injection in mice, the minimal dose at which carcinogenicity was detected was higher for B(a)P than for DB(a, h)A and for MC. However, the latent periods were shorter for B(a)P than for DB(a, h)A. In studies using intratracheal administration, B(a)P appeared to be less effective than 7H-dibenzo(c,g)carbazole in the hamster.[1] No epidemiological studies on the significance of B(a)P exposure to humans are available, and studies are insufficient to prove that B(a)P is carcinogenic for man. However, coal tar and other materials which are known to be carcinogenic to humans may contain B(a)P. The substance has also been detected in other environmental situations. A 1% solution applied to the skin caused skin irritation, swelling, flaking, coloration of skin, and formation of warts.

Short Term Exposure: B(a)P can cause exposure by inhalation and passing through the unbroken skin. Can cause skin irritation with rash and/or burning sensations. Exposure to sunlight can increase these effects. Eye contact can cause irritations and burns.

Long Term Exposure: B(a)P is a probable carcinogenic in humans. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials and are carcinogenic (Category 1) in animal studies. May damage the developing fetus. May affect male reproductive glands and cause genetic damage. May be transferred to nursing infants through exposed mother's milk. Repeated exposure can cause skin changes, such as thickening, darkening, and pimples. Later skin changes include loss of color, reddish areas, thinning of the skin, and warts. Sunlight may cause rash to develop, and increased risk of skin cancer. Skin cancer is very often easily cured when detected early.

Points of Attack: Skin, respiratory system, bladder, liver, kidneys as PAH.

Medical Surveillance: Complete blood count, chest X-ray, pulmonary function tests, photopatch testing, sputum cytology, urinalysis (routine) [cytology, hematuria], liver, kidney, and bladder function tests recommended for coal tar pitch volatiles.[2]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Avoid exposure of (pregnant) women!* Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing chemicals (such as chlorates, perchlorates, permanganates, and nitrates). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Flammable, but generally found in such low quantities it is not considered a fire hazard. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including Carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a flammable solvent.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzotrichloride is a combustible, colorless to yellow-brown, oily liquid that fumes on contact with air. It has a penetrating odor. Molecular weight = 195.47; Specific gravity (H_2O:1) = 1.38; Boiling point = 220°C; Freezing/Melting point = −4.8°C; Flash point = 127°C (cc); Autoignition temperature = 211°C. Explosive limits in air: LEL 2.1%; UEL 6.5% at 160°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slowly reacts in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Benzotrichloride is used as a chemical and dye intermediate; extensively used in the dye industry for the production of Malachite green, Rosamine, Quinoline red, and Alizarin yellow A. It can also be used to produce ethyl benzoate. Commercial grades may contain hydrochloric acid, benzylidene chloride, or benzyl chloride.

Incompatibilities: Benzotrichloride decomposes on heating, on contact with acids and/or water, producing toxic and corrosive hydrogen chloride and benzoic acid. Reacts violently with strong oxidizers, iron and other metals, alkali and earth alkali metals, bases and organic substances, and may cause fire and explosions. On contact with air it emits toxic and corrosive hydrogen chloride. Attacks many metals in the presence of water. Attacks many plastics.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.1 ppm/0.8 mg/m^3 TWA [skin]; Ceiling; Suspected Human Carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7 mg/m^3

PAC-3: 10 mg/m^3

DFG MAK: [skin] Carcinogen Category 2.

Austria: carcinogen, 1999; Finland: carcinogen, 1999; Russia: STEL 0.2 mg/m^3, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000. Several states have set guidelines or standards for benzotrichloride in ambient air ranging from zero in North Dakota to 0.0007 μg/m^3 in Rhode Island.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Permissible Concentration in Water: No criteria set. (Benzotrichloride decomposes in the presence of water to benzoic acid and hydrogen chloride.)

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.9$.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause irritation and chemical burns to the nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Based on animal study information, permanent injury or death may occur from exposure to 125 ppm for 4 h. Skin contact may cause irritation and chemical burns. Eye contact can cause severe irritation and chemical burns. Ingestion may cause severe irritation and chemical burns to the mouth, throat, and stomach. Additionally, it may be aspirated into the lungs with the risk of chemical pneumonitis. The damage may be permanent. LD_{50} = (oral-rat) 6 mg/kg.

Long Term Exposure: Benzotrichloride may affect the liver, kidneys, thyroid, central nervous system, and hematopoietic system, causing impaired functions and anemia. Probable carcinogen in humans.

Points of Attack: Lungs, liver, kidneys, thyroid glands, blood.

Medical Surveillance: Liver function tests; examination of the nervous system; thyroid function, complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where benzotrichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a dark, cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Benzotrichloride requires a shipping label of "CORROSIVE." This material falls in Hazard Class 8 and Packing Group II.[19, 20]

Spill Handling: Material is extremely hazardous to health but areas may be entered with extreme care. Full protective clothing including self-contained breathing apparatus should be provided. No skin surface should be exposed. Spilled material should not be touched. For *large spills* dike far ahead of spill for later disposal. Water should be used in copious amounts because of reaction with water and formation of toxic by-products. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may react violently with water. Fire may produce irritating and/or poisonous gases. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a

secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with flammable solvent added in incinerator with afterburner and alkaline scrubber.

Carcinogenicity: IARC: Human Limited Evidence; Animals Inadequate Evidence, *probably carcinogenic to humans*, Group 2A, 1999.

US EPA Gene-Tox Program, Inconclusive: *B. subtilis* rec assay.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R20/21/22; R34; R43; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Benzoyl chloride is a colorless to slight brown liquid with a strong, penetrating odor. Molecular weight = 140.57; Boiling point = 197.2°C at 760 mmHg; Freezing/Melting point = −1°C; Flash point = 72°C; Vapor pressure = 0.38 mmHg at 20°C; Autoignition temperature = 197°C. Explosive limits in air: Lower = 2.5%; Upper = 27%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩ (water reactive). Decomposes in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. Benzoyl chloride is used as a chemical intermediate; in organic synthesis; to produce other chemicals, dyes, perfumes, herbicides, and medicines.

Incompatibilities: Forms explosive mixture with air. Contact with heat, hot surfaces, and flames cause decomposition, forming phosgene and hydrogen chloride. Water contact may be violent; forms hydrochloric acid. Reactions with amines, alcohols, alkali metals, dimethyl sulfoxide, strong oxidizers, and metal salts may be violent, causing fire and explosions. Attacks metals in the presence of moisture, forming explosive hydrogen gas. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 ppm/0.8 mg/m^3 Ceiling Concentration; not classified as a human carcinogen.

AIHA WEEL: 5 ppm/7.2 mg/m^3, Ceiling Limit, (skin), Potential for dermal sensitization.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 ppm

PAC-1: **0.3** ppm

PAC-2: **5** ppm

PAC-3: **20** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 3B.

Hungary: TWA 5 mg/m^3, STEL 10 mg/m^3, 1993; Russia: STEL 5 mg/m^3, 1993.

Determination in Air: By photometry.[11]

Permissible Concentration in Water: EPA has suggested a limit of 69 μg/L.[52]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive if ingested. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can cause chronic rash, warts, sore throat, and reduced sense of smell. Can cause bronchitis with cough and phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, and mucous membranes.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Use in a well-ventilated area. Showers, sinks, and eyewash stations should be readily available. Wear an apron, gauntlets, rubber gloves, boots, and any additional protective clothing to prevent skin contact. Wear safety goggles.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—White: (2) Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Store in a cool, dry, well-ventilated area preferably in a detached warehouse. Keep away from sources of ignition. Avoid physical damage to the container.

Shipping: Benzoyl chloride requires a shipping label of "CORROSIVE." The Hazard Class is 8 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water or wet method.* Absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers; or cover any spills with sodium bicarbonate. Remove the resulting mixture to a fiber container or plastic bag for disposal by incineration.[24] Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzoyl Chloride is a combustible liquid. *Do not use water.* Reacts violently with water or steam releasing heat, phosgene and hydrogen chloride fumes. Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour into sodium bicarbonate solution and flush to sewer.

Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3 [skin] 1999; France: VME 5 mg/m^3, 1999; Hungary: TWA 5 mg/m^3; STEL 10 mg/m^3 [skin] 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000. Occupational Exposure Limit; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. In addition, four states have set guidelines or standards for benzoyl peroxide in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5009, Benzoyl peroxide.[18]

Determination in Water: Octanol–water coefficient: Log K_{ow} = 3.4–3.5.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes, skin, and respiratory tract. *Inhalation:* 1.3 mg/m^3 may cause nose and throat irritation. 12 mg/m^3 may cause lung irritation, asthmatic wheezing, decreased pulse rate and temperature, difficult breathing, and stupor. *Skin:* a 5% solution left on the skin for 12 h has caused redness, swelling, and burning. A 5% solution left on the skin for 48 h may cause severe irritation. Solutions greater than 20% left on for more than a few minutes caused severe irritation. *Eyes:* 2.6 mg/m^3 has caused irritation. *Ingestion:* there is little or no information available on human ingestion. However, results from animal studies suggest that the lethal dose for humans is about ¾ pound. LD$_{50}$ = (oral-rat) 7710 mg/kg.[9]

Long Term Exposure: May cause skin sensitization; allergic reaction may develop. May cause lung irritation and bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Skin, respiratory system, and eyes.

Medical Surveillance: Preplacement and periodic medical examinations should be conducted with particular attention to skin conditions. Lung function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Protective clothing and safety glasses with side shields or safety goggles should be worn by employees to reduce the possibility of skin contact and eye irritation. Such protection is especially important where benzoyl peroxide and other powder or granular benzoyl formulations may become airborne or where liquid or paste formulations of benzoyl peroxide might be spattered or spilled. Protective clothing should be fire resistant. Any fabric that generates static electricity is not recommended. To prevent the buildup of static electricity, appropriate conductive footwear should be worn. Gloves made of rubber, leather, or other appropriate material should be worn by employees. Aprons made of rubber or other appropriate material is recommended for added protection when handling benzoyl peroxide and its formulations. Plastic aprons that may generate static electricity should not be used. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily if it may be contaminated. Remove nonimpervious clothing promptly if contaminated.

Respirator Selection: Respiratory protection as follows must be used whenever airborne concentrations of benzoyl peroxide cannot be controlled to the recommended workplace environmental limit by either engineering or administrative controls. NIOSH: *50 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *125 mg/m^3*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1500 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Protect containers against physical damage. Isolate in well-detached, fire-resistive, cool and well-ventilated building with no other materials stored therein; provide explosion venting in a safe direction and prohibit any electrical installation or heating facilities. Dibenzoyl peroxide should be stored in and used from original containers. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Benzoyl peroxide requires an "ORGANIC PEROXIDE" label. Benzoyl peroxide falls in Hazard Class 5.2 and Packing Group II. IATA UN9999 Proper Shipping Name: FORBIDDEN MATERIALS.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Mix spilled material with water-wetted vermiculite, and deposit in sealed containers. Do not use spark-generating materials or materials made of paper or wood for sweeping or handling spilled benzoyl peroxide*. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. At high temperatures it may explode. Poisonous gases are produced in fire. Use water only. Do not use chemical or carbon dioxide extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Clean up and salvage operations after a fire should not be attempted until all of the peroxide has cooled completely.

Disposal Method Suggested: Pretreatment involves decomposition with sodium hydroxide. The final solution of sodium benzoate, which is very biodegradable, may be flushed into the drain. Disposal of large quantities of solution may require pH adjustment before release into the sewer or controlled incineration after mixing with a noncombustible material.

Benzyl bromide B:0440

Molecular Formula: C_7H_7Br

Common Formula: $C_6H_5CH_2Br$

Synonyms: (Bromomethyl)benzene; *p*-(Bromomethyl)nitrobenzene; Bromophenylmethane; α-Bromotoluene; ω-Bromotoluene; Bromuro de bencilo (Spanish); Toluene, α-bromo-

CAS Registry Number: 100-39-0

RTECS® Number: XS7965000

UN/NA & ERG Number: UN1737/156

EC Number: 202-847-3 [*Annex I Index No.:* 602-057-00-2]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S2; S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Benzyl bromide is a combustible, colorless to yellow liquid with a pleasant odor. Molecular weight = 171.05; Specific gravity (H_2O:1) = 1.438; Boiling point = 198°C; Freezing/Melting point = −4.0°C; Flash point = 79°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Insoluble in water (slowly decomposes).

Potential Exposure: Compound Description: Mutagen. It is used as a chemical intermediate; in organic syntheses; as a foaming and frothing agent.

Incompatibilities: Forms explosive mixture with air. Contact with water forms hydrogen bromide and benzyl alcohol. Incompatible with strong oxidizers, bases, magnesium. Attacks metals, except nickel and lead, in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 60 mg/m^3

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.9.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory system. Eye contact can cause severe irritation and burns. Skin contact can cause severe irritation, redness, swelling, and sores. High levels can cause dizziness because it attacks the nervous system.

Long Term Exposure: Mutation data reported. Repeated skin contact can cause chronic irritation with dry skin, redness, rash, and sores. Similar very irritating substances can cause lung damage.

Points of Attack: Skin, lungs.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Store in tightly closed containers in a cool, well-ventilated area away from water and other incompatible materials listed above.

Shipping: Benzyl Bromide requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." Benzyl bromide falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid on vermiculite, dry sand, earth, or similar noncombustible material. Collect material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including bromine gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour into vermiculite, sodium bicarbonate, or a sand-soda ash mixture and transfer to paper boxes, then to an open incinerator. Alternatively, mix with flammable solvent and spray into incinerator equipped with afterburner and alkali scrubber.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Benzyl chloride is a colorless to slight yellow liquid with a strong, unpleasant, irritating odor. The odor threshold is 0.05 ppm.[41] Molecular weight = 126.6; Specific gravity (H_2O:1) = 1.10; Boiling point = 179.4°C; Freezing/Melting point = − 43°C; Vapor pressure = 1 mmHg at 20°C; Flash point = 67°C (cc); Autoignition temperature = 585°C. Flammable Limits in Air: LEL = 1.1%; UEL = 14.0%.[52] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Practically insoluble in water; solubility = 0.05%.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Used as an intermediate and as an irritant gas in chemical warfare. In contrast to phenyl halides, benzyl halides are very reactive. Benzyl chloride is used in the production of benzal chloride, benzyl alcohol, and benzaldehyde. Industrial usage includes the manufacture of plastics, dyes, synthetic tannins, perfumes, and resins. It is used in the manufacture of many pharmaceuticals. Suggested uses of benzyl chloride include the vulcanization of fluororubbers and the benzylation of phenol and its derivatives for the production of possible disinfectants.

Incompatibilities: Forms explosive mixture with air. Contact with water forms hydrogen chloride fumes. Strong oxidizers may cause fire and explosions. Unstabilized benzyl chloride undergoes polymerization with copper, aluminum, iron, zinc, magnesium, tin, and other common metals, except lead and nickel, with the liberation of heat and hydrogen chloride gas. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks some plastics and rubber. Decomposition and polymerization reactions are inhibited, to a limited extent, by addition of triethylamine, propylene oxide, or sodium carbonate.[17]

Permissible Exposure Limits in Air

OSHA PEL: 1 ppm/5 mg/m^3 TWA.

NIOSH REL: 1 ppm/5 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/5.2 mg/m^3 TWA; Confirmed Carcinogen with unknown relevance to humans.

NIOSH IDLH: 10 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 1 ppm

PAC-2: 10 ppm

PAC-3: 50 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 1 ppm (5 mg/m^3), 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (5.2 mg/m^3), 1993; Denmark: TWA 1 ppm (5 mg/m^3), 1999; Finland: TWA 1 ppm (5 mg/m^3); STEL 3 ppm (15 mg/m^3), 1999; France: VME 1 ppm (5 mg/m^3), VLE 2 ppm (11 mg/m^3); STEL 3 ppm (15 mg/m^3), carcinogen, 1993; Hungary: STEL 0.5 mg/m^3 [skin] 1993; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Philippines: TWA 1 ppm (5 mg/m^3), 1993; Poland: 3 mg/m^3, ceiling 5 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, 1993; Sweden: NGV 1 ppm (5 mg/m^3), KTV 2 ppm (11 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 1 ppm (5 mg/m^3), carcinogen, 1999; Turkey: TWA 1 ppm (5 mg/m^3), 1993; United Kingdom: TWA 0.5 ppm (2.6 mg/m^3); STEL 1.5 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several States have set guidelines or standards for benzyl chloride in ambient air[60] ranging from 0.01 μg/m^3 (Rhode Island) to 0.7 μg/m^3 (Massachusetts) to 16.7 μg/m^3 (New York) to 20.0 μg/m^3 (Rhode Island) to 25 μg/m^3 (South Carolina) to 50 μg/m^3 (North Dakota) to 85 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada) to 500 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Methods 1003, Hydrocarbons, halogenated.[18]

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of 69 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.3$.

Routes of Entry: Inhalation of vapor, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation exposure may result in severe irritation of upper respiratory tract with coughing, burning of the throat, headache, dizziness, and weakness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Eye contact may result in immediate and severe eye irritation and prolonged exposure may cause permanent eye damage. Ingestion may cause severe burns of the mouth, throat, and gastrointestinal tract resulting in nausea, vomiting, cramps, and diarrhea. It is intensely irritating to skin, eyes, and mucous membranes. Highly toxic; may cause death or permanent injury after very short exposure to small quantities. Large doses cause central nervous system depression, with possible unconsciousness.

Long Term Exposure: Causes thyroid cancer in animals. Has been listed as a direct-acting or primary carcinogen. May damage the developing fetus. May cause liver damage and affect the nervous system.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: NIOSH recommends pulmonary function tests; chest X-ray; Expired air test. Preplacement and periodic examinations should include the skin, eyes, and an evaluation of the liver, kidney, respiratory tract, blood, and nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$)*:* 4H™ and Silver Shield™ gloves, CPF3® suits; Responder™ suits; Trychem 1000™ suits; **4 h:** (At least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 ppm:* CcrOvAg* (APF = 10) [any chemical cartridge respirator with organic vapor and acid gas cartridge(s)] or GmFOvAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor or acid gas canister] or PaprOvAg* (APF = 25) [any powered, air-purifying respirator with organic vapor and acid gas cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOvAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor or acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. This material should be stored in tightly closed containers in a cool, well-ventilated area away from sunlight, heat, moisture, active metals, oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Benzyl chloride requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." The Hazard Class is 6.1 and the packing Group is II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. If leak or spill has not ignited, use water spray to disperse vapors and to provide protection for persons attempting to stop leak. Use water spray to flush spills away from exposures. Take up small spills with sand or other noncombustible absorbent material and place into containers for later disposal. For larges spills, dike for later disposal. Always wear positive pressure breathing apparatus and special protective clothing. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Benzyl chloride is a combustible liquid. Use dry chemical, carbon dioxide, or foam extinguishers. *Do not use water.* Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration at 816°C for 0.5 s minimum for primary combustion and 1204°C for 12.0 s for secondary combustion. Elemental chlorine formation may be alleviated by injection of steam or methane into the combustion process.[24]

EC Number: 205-410-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Benzyl cyanide is a colorless, oily liquid with an aromatic odor. Molecular weight = 117.2; Boiling point = 233.5°C; Freezing/Melting point = −24; Vapor pressure = low < 0.40 at 20°C; Flash point = 113°C (oc),[17] also cited as 101°C.[52] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description (as CN): Organometallic, Mutagen; Reproductive Effector; Human Data. Benzyl cyanide is used in organic synthesis, especially of penicillin precursors. It is used as a chemical intermediate for amphetamines, phenobarbital; the stimulant, methyl phenidylacetate; esters as perfumes and flavors.

Incompatibilities: Violent reaction with strong oxidizers, sodium hypochlorite, lithium aluminum hydride.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

NIOSH IDLH: 25 mg[CN]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 4.3 mg/m^3

PAC-3: 30 mg/m^3

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

Australia: TWA 5 mg/m^3, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling

Concentration 5 mg/m^3 [skin]. Russia[43] set a MAC of 0.8 mg/m^3 in work-place air.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.58.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous. May be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. LD_{50} = (oral-rat) 270 mg/kg.[9]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. For cyanide poisoning, use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: NIOSH/OSHA (as cyanides): *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials listed above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Phenylacetonitrile requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. When heated to decomposition, it emits very toxic fumes of cyanide and nitrogen oxides. Container may explode in heat of fire. Runoff from fire control water may give off poisonous gases. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Water polluting (*Beryllium nitrate*).

Description: Beryllium is a gray shiny metal or powder, or fine granules which resemble powdered aluminum. Beryllium is slightly soluble in water. All beryllium compounds are soluble to some degree in water. Beryl ore is the primary source of beryllium, although there are numerous other sources. Molecular weight = 9.0; Boiling point = 2970°C; Freezing/Melting point = 1278°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Beryllium is used extensively in manufacturing electrical components, chemicals, ceramics, nuclear reactors; in the aerospace industry; and X-ray tubes. A number of alloys are produced in which beryllium is added to yield greater tensile strength, electrical conductivity, and resistance to corrosion and fatigue. The metal is used as a neutron reflector in high-flux test reactors. Human exposure occurs mainly through inhalation of beryllium dust or fumes by beryllium ore miners, beryllium alloy makers, and fabricators; phosphor manufacturers; ceramic workers; missile technicians; nuclear reactor workers; electric and electronic equipment workers; and jewelers. The major source of beryllium exposure of the general population is thought to be the burning of coal. Approximately 250,000 pounds of beryllium is released from coal and oil-fired burners. EPA estimates the total release of beryllium to the atmosphere from point sources is approximately 5500 pounds per year. The principal emissions are from beryllium-copper alloy production. Approximately 721,000 persons living within 12.5 miles (20 km) of point sources are exposed to small amounts of beryllium (median concentration 0.005 $\mu g/m^3$). Levels of beryllium have been reported in drinking water supplies and in small amounts in food.

Incompatibilities: Beryllium metal reacts with strong acids, alkalis (forming combustible hydrogen gas), oxidizable materials. Forms shock-sensitive mixtures with some chlorinated solvents, such as carbon tetrachloride and trichloroethylene. Incompatible with caustics, chlorinated hydrocarbons, oxidizers, molten lithium.[NIOSH]

Permissible Exposure Limits in Air

OSHA PEL: 0.002 mg[Be]/m^3 TWA; 0.005 mg[Be]/m^3 Ceiling Concentration; 0.025 mg[Be]/m^3/30 min maximum peak-per 8 h shift.

NIOSH REL: 0.0005 mg[Be]/m^3 STEL (do not exceed); Limit exposure to lowest feasible concentration.

ACGIH TLV®[1]: 0.00005 mg[Be]/m^3 TWA, inhalable fraction; Confirmed Human Carcinogen.

NIOSH IDLH: 4 mg[Be]/m^3.

DFG MAK: Danger of sensitization of the airways; Carcinogen Category 1, proven carcinogens in humans.

Arab Republic of Egypt: TWA 0.002 mg/m^3, 1993; Australia: TWA 0.002 mg/m^3, carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.002 mg/m^3, Carcinogen 1993; Denmark: TWA 0.001 mg/m^3, 1999; Finland: TWA 0.002 mg/m^3; STEL 0.006 mg/m^3, carcinogen, 1999; France: VME 0.002 mg/m^3, continuous carcinogen, 1999; Hungary: STEL 0.001 mg/m^3, carcinogen, 1993; India: TWA 0.002 mg/m^3, carcinogen, 1993; Japan: TWA 0.002 mg/m^3, 2A carcinogen, 1999; Norway: TWA 0.001 mg/m^3, 1999; the Philippines: TWA 0.002 mg/m^3, 1993; Poland: MAC (TWA) 0.001 mg/m^3, MAC STEL 0.003 mg/m^3, 1999; Russia: STEL 0.001 mg/m^3, carcinogen, 1993; Sweden: NGV 0.002 mg/m^3, carcinogen, 1999; Switzerland: MAK-W 0.002 mg/m^3, carcinogen, 1999; Thailand: TWA 0.002 mg/m^3; STEL 0.005 mg/m^3, 1993; Turkey: TWA 0.002 mg/m^3, 1993; United Kingdom: TWA 0.002 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for beryllium in ambient air[60] ranging from zero (North Dakota) to 0.0042 μg/m^3 (Massachusetts) to 0.01 μg/m^3 (Connecticut, Pennsylvania, South Carolina) to 0.02 μg/m^3 (South Dakota and Virginia) to 0.1 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #7704.[18] Beryllium in Air by Field-Portable Fluorometry (4/6/2007); 9110[18] Beryllium in Surface Wipes by Field-Portable Fluorometry (4/6/2007). (See also the ATSDR profile cited below).

Permissible Concentration in Water: In 1980 the EPA set the following criteria: *To protect freshwater aquatic life:* 130 μg/L on an acute basis: 5.3 μg/L on a chronic basis. *To protect saltwater aquatic life:* insufficient data to set criteria. *To protect human health:* preferable zero. An additional lifetime cancer risk of 1 in 100,000 results from a concentration of 0.037 μg/L.[6] Russia[43] set a MAC of 0.0002 mg/L (0.2 μg/L) in water bodies used for domestic purposes. Kansas and Rhode Island have set guidelines for beryllium in drinking water[61]: 0.13 μg/L in Kansas and 131 μg/L in Rhode Island.

Determination in Water: Total beryllium may be determined according to EPA, by digestion followed by atomic absorption by a colorimetric method, or by inductively coupled plasma (ZCP) optical emission spectrometry. Dissolved beryllium can be determined by 0.45 micron filtration prior to the above method for total beryllium. See also the ATSDR Profile cited below.

Routes of Entry: Inhalation of fume or dust.

Harmful Effects and Symptoms

Local: The soluble beryllium salts are cutaneous sensitizers as well as primary irritants. Contact dermatitis of exposed parts of the body is caused by acid salts as well as primary irritants. Contact dermatitis of exposed parts of the body is caused by acid salts of beryllium. Onset is generally delayed about 2 weeks from the time of first exposure. Complete recovery occurs following cessation of exposure. Eye irritation and conjunctivitis can occur. Accidental implantation of beryllium metal or crystals of soluble beryllium compound in areas of broken or abraded skin may cause granulomatous lesions. These are hard lesions with a central nonhealing area. Surgical excision of the lesion is necessary. Exposure to soluble beryllium compounds may cause nasopharyngitis, a condition characterized by swollen and edematous mucous membranes; bleeding points, and ulceration. These symptoms are reversible when exposure is terminated. *Systemic:* Beryllium and its compounds are highly toxic substances. Entrance to the body is almost entirely by inhalation. The acute systemic effects of exposure to beryllium primarily involve the respiratory tract and are manifested by a nonproductive cough, substernal pain, moderate shortness of breath, and some weight loss. The character and speed of onset of these symptoms, as well as their severity, are dependent on the type and extent of exposure. An intense exposure, although brief, may result in severe chemical pneumonitis with pulmonary edema. Chronic beryllium disease can be classified by its clinical variants according to the disability the disease process produces. (1) Asymptomatic nondisabling disease is usually diagnosed only by routine chest X-ray changes and supported by urinary or tissue assay. (2) In its mildly disabling form, the disease results in some nonproductive cough and dyspnea following unusual levels of exertion. Joint pain and weakness are common complaints. Diagnosis is by X-ray changes. Renal calculi containing beryllium may be a complication. Usually, the patient remains stable for years, but eventually shows evidence of pulmonary or myocardial failure. (3) In its moderately severe disabling form, the disease produces symptoms of distressing cough and shortness of breath, with marked X-ray changes. The liver and spleen are frequently affected, and spontaneous pneumothorax may occur. There is generally weight loss, bone and joint pain, oxygen desaturation, increase in hematocrit, disturbed liver function, hypercalciuria, and spontaneous skin lesions similar to those of Boeck's sarcoid. Lung function studies show measurable decreases in diffusing capacity. Many people in this group survive for years with proper therapy. Bouts of chills and fever carry a bad prognosis. (4) The severely disabling disease will show all of the above-mentioned signs and symptoms in addition to severe physical wasting and negative nitrogen balance. Right heart failure may appear, causing a severe nonproductive cough which leads to vomiting after meals. Severe lack of oxygen is the predominant problem, and spontaneous pneumothorax can be a serious complication. Death is usually due to pulmonary insufficiency or right heart failure.

Short Term Exposure: Eye or skin contact can cause irritation, itching, and burning. Sometimes an allergic eye problem develops, breaking out with future exposure. Inhalation overexposure can severely irritate the airways and lungs, causing nasal discharge, tightness of the chest, cough, shortness of breath, and/or fever. Death can occur in severe cases. Seek prompt medical attention. Future exposures can cause further attacks. Symptoms may be delayed for days following exposure. Some persons later develop lung scarring after such exposures.

Long Term Exposure: Be is a probable cancer causing agent in humans. There is some evidence that it causes lung and bone cancer in humans and animals. High or repeated exposure can permanently scar the lungs or other body organs. If Be particles get under cuts in the skin, ulcers or lumps can develop; these must be surgically removed. Allergic skin rashes can occur. High or repeated exposure can cause kidney stones to develop.

Points of Attack: Skin, eyes, respiratory system, lungs, liver, spleen, heart.

Medical Surveillance: Preemployment history and physical examinations for worker applicants should include chest X-rays, baseline pulmonary function tests (FVC and FEV_1), and measurement of body weight. Beryllium workers should receive a periodic health evaluation that includes spirometry (FVC and FEV_1), medical history questionnaire directed toward respiratory symptoms and a chest X-ray, blood/urine trace metals. General health, liver and kidney functions, and possible effects of the skin should be evaluated. See NIOSH Criteria Document 72-10268.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Work areas should be monitored to limit and control levels of exposure. Personnel samplers are recommended. Good housekeeping, proper maintenance, and engineering control of processing equipment and technology are essential. The importance of safe work practices and personal hygiene should be stressed. When beryllium levels exceed the accepted standards, the workers should be provided with respiratory protective devices of the appropriate class, as determined on the basis of the actual or projected atmospheric concentration of airborne beryllium at the worksite. Protective clothing should be provided to all workers who are subject to exposure in excess of the standard. This should include shoes or protective shoe covers as well as other clothing. The clothing should be reissued clean on a daily basis. Workers should shower following each shift prior to changing to street clothes.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red (powder): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Beryllium must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates); and strong acids (such as hydrochloric, sulfuric, and nitric); since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Use only nonsparking tools and equipment, especially when opening and closing containers of beryllium. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Beryllium powder requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE SOLID." (powder) It falls in Hazard Class 6.1 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Be is a combustible solid. Smother fire with dry sand, dry clay, dry ground limestone, or use approved Class "D" extinguishers (NFPA). *Do not use carbon dioxide or halogenated extinguishing agents. Do not use water.* Poisonous gases, including beryllium oxide fume, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For beryllium (powder), waste should be converted into chemically inert oxides using incineration and particulate collection techniques. These oxides should be returned to suppliers if possible. Recovery and recycling is an alternative to disposal for beryllium scrap and pickle liquors containing beryllium.[22]

New Jersey Department of Health and Senior Services. (July 1998). *Hazardous Substances Fact Sheet: Beryllium (dust and powder)*. Trenton, NJ

Note: Beryllium Chloride (July 2004), Fluoride (July 2004), Nitrate (June 2005) and Oxide (July 2004) are the

subject of fact sheets from the state of New Jersey, quite similar to one another. Also, the chloride, fluoride, nitrate and oxide are the topics of articles cited above. To avoid duplication, separate entries for those four compounds are therefore not included here.

Binapacryl B:0475

Molecular Formula: $C_{15}H_{18}N_2O_6$
Synonyms: Acricid®; Ambox®; BP 855®; BP 736®; 2-*sec*-Butyl-4,6-dinitrophenyl-3,3-dimethylacrylate; 2-*sec*-Butyl-4,6-dinitrophenyl-3-methyl-2-butenoate; 2-*sec*-Butyl-4,6-dinitrophenyl-3-methylcrotonate; 2-*sec*-Butyl-4,5-dinitrophenyl senecioate; Dapacryl®; 3,3-Dimethyl-acrylate de 2,4-dinitro-6-(1-methylpropyle) phenyle (French); 3,3-Dimethylacrylic acid 2-*sec*-butyl-4,5-dinitrophenyl ester; Dinapacryl®; 4,6-Dinitro-2-*sec*-butylphenyl β,β-dimethylacrylate; 2,4-Dinitro-6-*sec*-butylphenyl-2-methylcrotonate; 4,6-Dinitrophenyl-2-*sec*-butyl-3-methyl-2-butenonate; Dinoseb methacrylate; Endosan®; ENT 25,793; FMC 9044®; HOE 2784®; 3-Methylcrotonic acid 2-*sec*-butyl-4,6-dinitrophenyl ester; (6-(1-Methyl-propyl)-2,4-dinitro-phenyl)-3,3-dimethyl acrylat (German); 2-(1-Methylpropyl)-4,6-dinitrophenyl-β,β-dimethacrylate; 2-(1-Methylpropyl)-4,6-dinitrophenyl ester 3-methyl-2-butenoic acid; Morocide®; Morrocid®; Niagara® 9044 (FMC)
CAS Registry Number: 485-31-4
RTECS® Number: GQ5600000
UN/NA & ERG Number: UN2780/(Substituted nitrophenol pesticide, liquid, flammable, poisonous)/131; UN2779 (substituted nitrophenol pesticides, solid, toxic)/153
EC Number: 207-612-9; 609-024-00-1
Regulatory Authority and Advisory Bodies
EPA: Group C, possible carcinogen as dinoseb, the parent chemical.
California Prop. 65: Developmental toxin and male reproductive toxin, as dinoseb, the parent chemical.
Clean Water Act: Section 311 Hazardous Substances/RQ (same as CERCLA); Section 307 Toxic Pollutants as nitrophenols.
US EPA Hazardous Waste Number (RCRA No.): P020.
Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06, Vol. 71, No. 158] Reportable Quantity (RQ) = 1000 lb (454 kg).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant.
Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as dinoseb and its salts and esters).
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R61; R21/22; R50/53; Safety phrases: S53; S26; S45; S60; S61; S45; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned. However, its parent chemical, dinoseb is 2—Hazard to waters.
Description: Binapacryl is a nitrophenol pesticide and the dimethyl acrylic ester of dinoseb. Binapacryl is a colorless, crystalline solid or powder. Crystals may turn pale-yellow to brownish on contact with air. The solid may be dissolved in a flammable liquid carrier. Mild, ammonia odor. Molecular weight = 322.31; Density = 1.238 g/cm^3 at 20°C. Melting/Freezing = 66°C; Boiling Point = 437°C at 760 mmHg; Vapor pressure = 4.2×10^{-7} mmHg at 20°C; Flash point = 172°C; but may be dissolved in a flammable liquid carrier. Practically insoluble in water.
Potential Exposure: Mutagen; cholinesterase inhibitor. Used as an acaricide, fungicide, and miticide. Not registered in the United States.
Incompatibilities: Slight hydrolysis on long contact with water. Keep away from caustics and concentrated acids that can cause decomposition. Slowly decomposed by ultraviolet light. When heated to decomposition it emits fumes of nitrogen oxides. Contact with metals may evolve flammable hydrogen gas. A nitrophenol may be an oxidizer (of unknown strength); incompatible with reducing agents including alkali metals, hydrides, nitrides, and sulfides, which might cause a violent reaction or detonation. Nitrophenols may explode when heated. Nitrophenols may react as a weak organic acid. Do not mix with Nitric or Sulfuric acid as explosive shock- and impact-sensitive salts may be formed.
Permissible Exposure Limits in Air:
No standards or TEEL available.
Determination in Air: No methods available.
Permissible Concentration in Water: No criteria set. Runoff from spills or fire control may cause water pollution. To protect freshwater aquatic life—230 μg/L on an acute toxicity basis for nitrophenols as a class. To protect saltwater aquatic life—4,850 μg/L on an acute toxicity basis for nitrophenols as a class. To protect human health—70.0 μg/L(6). Octanol–water partition: Log $K_{ow} = 4.72$. Values above 3.0 are likely to bioaccumulate in marine organisms.
Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II(5) Method #S166(18). Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604, or gas chromatography plus mass spectrometry EPA Method 625.
Routes of Entry: Inhalation, skin contact, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Severely irritates eyes, skin, and respiratory tract, with burning sensation, pain, redness, and swelling. Metabolic stimulant. If inhaled, causes coughing, dilated pupils, headache, profuse perspiration, intense thirst, extreme fatigue, rapid pulse, high fever, clammy, flushed skin, rapid breathing, nausea, vomiting, yellowish

tint to skin and lips, anxiety and confusion, convulsions, risk of lung edema. The effects may be delayed. Medical observation is recommended. If swallowed, face and lips turn bluish. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Severe exposure can cause death from heart failure.

LD_{50} = (oral-rat) 58 mg/kg.

Long Term Exposure: May damage the liver, kidneys, and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss, and cataracts in the eyes.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: Examination of eyes for cataracts. Examination of skin and nails for staining. Blood tests for dinitro-*o*-cresol. Persons with blood levels over 10 ppm (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: Liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions) if breathing has stopped, and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not induce vomiting when formulations containing petroleum solvents are ingested.* Otherwise, give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. If working with liquid wear splash-proof chemical goggles, if working dry material wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). Wear a positive pressure self-contained breathing apparatus (SCBA) when fighting fires involving binapacryl.

Storage: Color Code—Red (*dissolved material in a flammable liquid carrier*): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code (*dry, solid material*)—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinoseb you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store at temperatures from 0 to 6°C.

Shipping: Binapacryl, solid: label "SUBSTITUTED NITROPHENOL PESTICIDES, SOLID, TOXIC." It falls into DOT/UN Hazard Class 6.1(b) and Packing Group III. The DOT-required shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." The Hazard Class is 3 and the Packing Group is I.[19, 20]

Spill Handling: Remove all ignition sources. Evacuate personnel not wearing protective equipment from spill or leak until cleanup is complete. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water. *Dry material*: Keep dry spilled material wet. Do not attempt to sweep up dry material. Use HEPA vacuum or wet method to reduce dust during clean up. *Do not dry sweep*. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep material out of water sources and sewers. It will be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep material out of water sources and sewers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Binapacryl is a combustible material; it may burn but does not ignite readily. In heat of fire it emits fumes of nitrogen oxides. When heated, vapors may form explosive mixtures with air. Extinguish fire using agent suitable for type of surrounding fire. Use water in flooding quantities as fog. Use "alcohol" foam, dry chemical, or carbon dioxide. Cool all affected containers with flooding quantities of water. If fire becomes uncontrollable, evacuate for a radius of 1 mile. Nitrophenol pesticides may be dangerously explosive. Containers may explode when heated. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Runoff will pollute waterways. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Avoid release to the environment. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Conduct at 1000°C for 2.0 s minimum with scrubber for nitrogen oxides removal is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Biphenyl is a combustible, white flakes or crystalline solid with a pleasant, characteristic odor. Molecular weight = 154.2; Specific gravity (H_2O:1) = 1.04; Boiling point = 256°C; Freezing/Melting point = 69–70°C; Vapor pressure = 0.005 mmHg at 20°C; Flash point = 113°C; Autoignition temperature = 540°C. Explosive limits in air: LEL = 0.6% at 111°C, UEL = 5.8% at 166°C.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary

Irritant. Biphenyl is a fungicide (pesticide). It is also used as a heat transfer agent, dye carrier, and as an intermediate in organic synthesis.

Incompatibilities: Mist forms explosive mixture with air. Strong oxidizers may cause fire and explosions.

NIOSH IDLH: 100 mg/m^3.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.31 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.2 ppm/1 mg/m^3 TWA.

NIOSH REL: 0.2 ppm/1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.2 ppm/1.3 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: 1.25 ppm

PAC-2: **9.6** ppm

PAC-3: 15.9 ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 3B.

Arab Republic of Egypt: TWA 0.2 ppm (1 mg/m^3), 1993; Australia: TWA 0.2 ppm (1.5 mg/m^3), 1999; Austria: MAK 0.2 ppm (1 mg/m^3), 1993; Belgium: TWA 0.2 ppm (1.3 mg/m^3), 1993; Denmark: TWA 0.2 ppm (1 mg/m^3), 1999; Finland: TWA 0.2 ppm (1 mg/m^3); STEL 0.6 ppm (3 mg/m^3) [skin] 1993; France: VME 0.2 ppm (1.5 mg/m^3), 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; India: TWA 0.2 ppm (1.5 mg/m^3), 1993; Norway: TWA 0.2 ppm (1 mg/m^3), 1999; Poland: TWA 1 mg/m^3; STEL 2 mg/m^3, 1999; Sweden: NGV 0.2 ppm (1.3 mg/m^3), KTV 0.4 ppm (2.5 mg/m^3), 1999; Switzerland: MAK-W 0.2 ppm (1.3 mg/m^3), 1999; Thailand: TWA 0.2 ppm (1 mg/m^3), 1993; United Kingdom: TWA 0.2 ppm (1.3 mg/m^3); STEL 0.6 ppm (3.8 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV TWA 0.2 ppm. Several states have set guidelines or standards for biphenyl in ambient air[60] ranging from 0.086 μg/m^3 (Massachusetts) to 0.4 μg/m^3 (Rhode Island) to 5.0 μg/m^3 (New York) to 15.0 μg/m^3 (Florida and North Dakota) to 20.0 μg/m^3 (Connecticut) to 25 μg/m^3 (Virginia) to 36 μg/m^3 (Nevada) to 40 μg/m^3 (North Dakota).

Determination in Air: Tenax Gas chromatography; CCl4; Gas chromatography/Flame ionization detection; NIOSH (IV) Method #2530.

Permissible Concentration in Water: No criteria set but EPA has suggested an ambient limit of 13.8 μg/L based on health effects.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 3.2−4.1.

Routes of Entry: Inhalation of vapor or dust; percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact contributes significantly to overall exposure. Repeated exposure to dust may result in irritation of skin and respiratory tract. The vapor may cause moderate eye irritation. Repeated skin contact may produce sensitization dermatitis. In acute exposure, biphenyl exerts a toxic action on the central nervous system, on the peripheral nervous system, and on the liver. Symptoms of poisoning are headache, diffuse, gastrointestinal pain, nausea, indigestion, numbness and aching of limbs, and general fatigue. LD_{50} = (oral-rat) 3280 mg/kg.[9]

Long Term Exposure: Chronic exposure is characterized mostly by central nervous system symptoms, fatigue, headache, tremor, insomnia, sensory impairment, and mood changes. However, such symptoms may be rare. May cause lung irritation and bronchitis. Liver and kidney damage. May cause skin allergy with itching and rash.

Points of Attack: Liver, skin, central nervous system, upper respiratory system, eyes.

Medical Surveillance: Consider skin, eye, liver function, and respiratory tract irritation in any preplacement or periodic examination. Examination by a qualified allergist. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Because of its low vapor pressure and low order of toxicity, it does not usually present a major problem in industry. Protective creams, gloves, and masks with organic vapor canisters for use in areas of elevated vapor concentrations should suffice. Elevated temperature may increase the requirement for protective methods or ventilation. Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any possibility of eye contact with molten biphenyl. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily as it may be contaminated. Remove nonimpervious clothing immediately if wet or contaminated.

Respirator Selection: *Up to 10 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 50 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) Any supplied-air respirator with a full face-piece. *Up to 100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD,PP (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Before entering confined space where biphenyl may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish ventilation to keep levels below explosive limit. Spill material should be dampened with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak following cleanup. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide and acrid smoke. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bis(2-chloroethoxy)methane is a colorless liquid. Molecular weight = 173.1; Boiling point = 218°C; Freezing/Melting point = −33°C; Flash point = 110°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slight solubility in water; solubility = 0.8%.

Potential Exposure: The chloroalkyl ethers have a wide variety of industrial uses in organic synthesis, treatment of textiles, the manufacture of polymers, polysulfide rubbers, and insecticides, as degreasing agents and solvents, and in the preparation of ion exchange resins.

Incompatibilities: Oxidizing materials. Contact with mineral acids causes decomposition.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 ppm

PAC-1: 2 ppm

PAC-2: 6 ppm

PAC-3: 6 ppm

Permissible Concentration in Water: No criteria set because of inadequate data according to EPA.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <1$.

Harmful Effects and Symptoms

Specific data on BCEXM are very sparse. The reader is referred to the sections on other chloroalkyl ethers: Chloromethyl methyl ether, CMME: Bis(chloromethyl) ether, BCME: Bis(2-chloroethyl) ether, BCEE—Bis (2-chlorosiopropyl) ether, BCIE LD_{50} = (oral-rat) 65 mg/kg.[9] This material is toxic by inhalation and ingestion and is a strong irritant.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to

clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Destroy by high-temperature incineration with HCl scrubber.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichloroisopropyl ether is a colorless liquid. Molecular weight = 171.1. Specific gravity (H_2O:1) = 1.11 at 25°C; Boiling point = 187−189°C; Freezing/Melting point = − 101°C; Flash point = 85°C (oc).[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. BCIE was previously used as a solvent and as an extractant. It may be formed as a by-product of propylene oxide production. It has been found in industrial waste water and natural water.

Incompatibilities: Strong oxidizers, strong acids, and oxygen. It may form dangerous peroxides upon standing; may explode when heated.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.3 ppm

PAC-1: 0.75 ppm

PAC-2: 6 ppm

PAC-3: 40 ppm

Russia: MAC: 5 mg/m^3.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 238,000 μg/L on an acute basis for chloroalkyl ether in general. No criteria developed for saltwater aquatic life due to lack of data. For protection of human health, the ambient water criterion is 34.7 μg/L.[6] Kansas has set a guideline for this compound in drinking water of 34.7 μg/L.[61]

Determination in Water: Gas chromatography (EPA Method 611) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 2.5.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

There is no empirical evidence that BCIE is carcinogenic; however, some chronic toxic effects of the compound have been noted.

Short Term Exposure: Can cause irritation and burns on contact with eyes, nose, and skin. Very high levels of BCIE may cause loss of appetite, fatigue, irritability, and even death. LD_{50} = (oral-rat) 240 mg/kg (moderately toxic).[9]

Long Term Exposure: There is limited evidence that this chemical may cause cancer in animals; lung adenomas. Many similar solvents can cause brain or disturbed sleep; this chemical has not been fully evaluated for these effects. May cause liver and kidney damage.

Medical Surveillance: Kidney and liver function tests. Evaluate for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Ethers tend to form unstable peroxides. Before entering confined space where BCIE may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Dichloroisopropyl ether requires a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use special incinerator due to high HCl content, such as seagoing incinerator ships.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Bis(chloromethyl) ether is a colorless, volatile liquid with a suffocating odor. Molecular weight = 115.0. Specific gravity (H_2O:1) = 1.32 at 25°C; Boiling point = 106.1°C; Freezing/Melting point = −42°C; Vapor pressure = 30 mmHg at 25°C; Flash point = ≤18.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1₩. Insoluble in water (decomposes, creating hydrogen chloride).

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. Exposure to bis(chloromethyl) ether may occur in industry and in the laboratory. This substance can form spontaneously in warm moist air by the combination of formaldehyde and hydrogen chloride. This compound is used as an alkylating agent in the manufacture of polymers; as a solvent for polymerization reactions; in the preparation of ion exchange resins; and as an intermediate for organic synthesis. Haloethers, primarily α-chloromethyl ethers, represent a category of alkylating agents of increasing concern due to the establishment of a causal relationship between occupational exposure to two agents of this class and lung cancer in the United States and abroad. The cancers are mainly oat cell carcinomas. Potential sources of human exposure to BCME appear to exist primarily in areas including: (a) its use in chloromethylating (crosslinking) reaction mixtures in anion-exchange resin production; (b) segments of the textile industry using formaldehyde-containing reactants and resins in the finishing of fabric and as adhesive in the laminating and flocking of fabrics; and (c) the nonwoven industry which uses as binders, thermosetting acrylic emulsion polymers comprising methylol acrylamide, since a finite amount of formaldehyde is liberated on the drying and curing of these bonding agents. NIOSH has confirmed the spontaneous formation of BCME from the reaction of formaldehyde and hydrochloric acid in some textile plants and is now investigating the extent of possible worker exposure to the carcinogen. However, this finding has been disputed by industrial tests in which BCME was not formed in air by the reaction of textile systems employing hydrochloric acid and formaldehyde.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids. Decomposes on contact with water, moist air, and heat, forming corrosive hydrochloric acid, hydrogen chloride, and formaldehyde vapors. May form shock-sensitive compounds on contact with oxidizers, peroxides, and sunlight. Attacks many plastics.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements. See Appendix B of the *NIOSH Pocket Guide*.

NIOSH REL: Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.001 ppm/0.0047 mg/m^3 TWA, Confirmed Human Carcinogen.

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Protective Action Criteria (PAC)*
TEEL-0: 0.001 ppm
PAC-1: 0.006 ppm
PAC-2: **0.044** ppm
PAC-3: **0.18** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 1.

Australia: TWA 0.001 ppm (0.006 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.001 ppm (0.0047 mg/m^3), carcinogen, 1993; Denmark: TWA 0.001 ppm (0.005 mg/m^3), 1999; Finland: TWA 0.001 ppm (0.004 mg/m^3); STEL 0.003 ppm, carcinogen, 1999; France: VME 0.001 ppm (0.006 mg/m^3), carcinogen, 1999; India: TWA 0.001 ppm (0.005 mg/m^3), carcinogen, 1993; Norway: TWA 0.001 ppm (0.005 mg/m^3), 1999; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.001 ppm (0.005 mg/m^3), carcinogen, 1999; United Kingdom: TWA 0.001 ppm (0.005 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. The Czech Republic[35] has set a TWA of 0.00025 mg/m^3 and a ceiling value of 0.005 mg/m^3.

Determination in Air: Collection by charcoal tube, analysis by gas liquid chromatography.

Permissible Concentration in Water: For maximum protection of human health from potential carcinogenic effects of exposure to BCME through ingestion of water and contaminated aquatic organisms, the ambient water concentration is zero. Concentrations of BCME estimated to result in additional lifetime cancer risks of 1 in 100,000 are presented by a concentration of 0.038 ng/L (3.8×10^{-5} μg/L).[6] Kansas has set a guideline for drinking water also.[61]

Determination in Water: Gas chromatography (EPA Method 611) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 1.1$.

Routes of Entry: Inhalation of vapor, and percutaneous absorption.

Harmful Effects and Symptoms

Bis(chloromethyl) ether has an extremely suffocating odor even in minimal concentration so that experience with acute poisoning is not available. It is not considered a respiratory irritant at concentrations of 10 ppm. Bis(chloromethyl) ether is a known human carcinogen. Animal experiments have shown increases in lung adenoma incidence; olfactory esthesioneuroepitheliomas which invaded the sinuses, cranial vault, and brain; skin papillomas and carcinomas; and subcutaneous fibrosarcomas. There have been several reports of increased incidence of human lung carcinomas (primarily small cell undifferentiated) among ether workers exposed to bis(chloromethyl) ether as an impurity. The latency period is relatively short—10−15 years. Smokers as well as nonsmokers may be affected.

Short Term Exposure: This chemical is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Affects the nervous system. Symptoms can be loss of appetite, nausea, and fatigue; higher exposures can cause irritability, anxiety, and weakness.

Long Term Exposure: Can cause liver and kidney damage. Lungs may be affected by repeated or prolonged exposure. This substance is carcinogenic to humans and has caused lung cancer in humans. May cause genetic damage in humans.

Points of Attack: Skin, respiratory tract, eyes, lungs.

Medical Surveillance: Preplacement and periodic medical examinations should include an examination of the skin and respiratory tract, including chest X-ray. Sputum cytology has been suggested as helpful in detecting early malignant changes; and in this connection, a smoking history is of importance. Possible effects on the fetus should be considered. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: These are designed to supplement engineering controls and should be appropriate for protection of all skin or respiratory contact. Full body protective clothing and gloves should be used on entering areas of potential exposure. Those employed in handling operations should be provided with full face, supplied-air respirators of continuous-flow or pressure-demand type. Wash thoroughly *immediately* following exposure to this chemical. On exit from a regulated area, employees should remove and leave protective clothing and equipment at the point of exit, to be placed in impervious containers at the end of the work shift for decontamination or disposal. Showers should be taken before dressing in street clothes.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in airtight containers in a cool, dry, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dichlorodimethyl ether, symmetrical, has a DOT label requirement of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group I.[19, 20]

Spill Handling: Evacuate area. Seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line). Full body protective clothing and gloves should be used on entering areas of potential exposure. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. *Spill or leak:* do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible material and place into containers for later disposal. *Large spills:* dike far ahead of spills for later disposal. Do NOT let this chemical enter the environment (extra personal protection: complete protective clothing including self-contained breathing apparatus). Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Bis(chloromethyl)ketone B:0520

Molecular Formula: $C_3H_4Cl_2O$

Common Formula: $ClCH_2COCH_2Cl$

Synonyms: Bis(chloromethyl) ketone; *sym*-Dichloroacetone; α,α'-Dichloroacetone; α,γ'-Dichloroacetone; 1,3-Dichloroacetone; 1,3-Dichloro-2-propanone

CAS Registry Number: 534-07-6

RTECS® Number: UC1430000

UN/NA & ERG Number: UN2649/153

EC Number: 208-585-6

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): EHS = 10 lb (4.54 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bis(chloromethyl)ketone is a crystalline solid. Molecular weight = 127.02; Freezing/Melting point = 45°C; Boiling point = 173°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Formerly extensively used in textiles (especially polyester fabrics) and still employed in polyurethane foams, textile backcoating, and adhesives.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.125 mg/m^3

PAC-1: 0.4 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 2 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: It causes tearing and blistering. It may be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes.

Long Term Exposure: Due to the availability of insufficient data on short-term effects, caution should be exercised.

Medical Surveillance: See NIOSH Criteria Document: *78-173 Ketones*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Keep away from sources of ignition. Store in a refrigerator, in a tightly closed container. Store below 4°C. Keep away from oxidizers, heat, flame, and sparks.

Shipping: The DOT label requirement[19] for 1,3-Dichloroacetone is "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation; wear respiratory protection, eye protection, and protective clothing. In case of contact, immediately flush skin or eyes with water. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. For small spills, absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *For large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Bismuth and compounds B:0530

Molecular Formula: Bi

Synonyms: Bismuth-209; Bismuto (Spanish)

CAS Registry Number: 7440-69-9

Bismuth compounds:

Bismuth acetate 22306-37-2; Bismuth germanate 12233-73-7; Bismuth hydroxide 10361-43-0; Bismuth hydroxide nitrate oxide 1304-85-4; Bismuth iodide 7787-64-6; Bismuth nitrate 10361-44-1; Bismuth oxide 1304-76-3; Bismuth oxychloride (Bismuth chloride oxide) 7787-59-9; Bismuth(III) nitrate, pentahydrate 10035-06-0; Potassium bismuthate 12589-75-2; Sodium bismuthate 12232-99-4

RTECS® Number: EB2600000

EC Number: 231-177-4

Regulatory Authority and Advisory Bodies

7440-69-9

Listed on the TSCA inventory.

CERCLA/SARA Section 302, Extremely Hazardous Substances: TPQ = 10 lb/10,000 lb (4.54/4540 kg).

Banned or Severely Restricted (In medicine) (UN).[13]

Mexico, wastewater as heavy metals.

On Canada's DSL List.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Bismuth is a pinkish-silver, hard, brittle metal. It is found as the free metal in ores, such as bismutite and bismuthinite and in lead ores. Molecular weight = 209.0; Boiling point = 1420−1560°C; Freezing/Melting point = 271°C. Hazard Identification (based on NFPA-704 M Rating System): (bismuth) Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Bismuth is used as a constituent of tempering baths for steel alloys; in low Freezing/Melting point alloys which expand on cooling; in aluminum and steel alloys to increase machinability; and in printing type metal. Bismuth compounds are found primarily in pharmaceuticals as antiseptics, antacids, antiluetics, and as a medicament in the treatment of acute angina. They are also used as a contrast medium in roentgenoscopy and in cosmetics. For the general population the total intake from food is 5−20 μg with much smaller amounts contributed by air and water.

Incompatibilities: Reacts with strong acids and strong oxidants, chlorine, fused ammonium nitrates, iodine pentafluoride, and nitrosyl fluoride.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Bismuth; bismuth germanate

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 200 mg/m^3

There is no Federal standard for bismuth metal. ACGIH has set TWA values only for bismuth telluride (see B:0540).

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of 3.5 μg/L based on health effects. Russia[43] set a MAC of 0.5 mg/L of trivalent bismuth and 0.1 mg/L of pentavalent bismuth.

Determination in Water: Atomic absorption spectrophotometry may be used.[1] Spark source mass spectrometry may also be used.

Routes of Entry: Ingestion of powder or inhalation of dust.

Harmful Effects and Symptoms

Most accounts of bismuth poisoning are from the soluble compounds used previously in therapeutics. Bismuth compounds have been withdrawn from pharmaceuticals because of reports of encephalopathy.[13] Fatalities and near fatalities have been reported chiefly as a result of intravenous or intramuscular injection of soluble salts.

Short Term Exposure: Bismuth and bismuth compounds have slight effect on intact skin and mucous membrane. Absorption occurs only minimally through broken skin.

Long Term Exposure: All bismuth compounds do not have equal toxicity. Although considered less hazardous than most heavy metals, can cause kidney and possible liver damage. Chronic intoxication from repeated oral or parenteral doses causes "bismuth line." This is a gum condition with black spots of buccal and colonic mucosa, superficial stomatitis, foul breath, and salivation.

Points of Attack: Kidneys, liver.

Medical Surveillance: No special considerations are necessary other than following good general health practices. Liver and kidney function should be followed if large amounts of soluble salts are ingested.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: Dimercaptol (BAL) brings good results in the treatment of bismuth poisoning if given early. Other measures include atropine and meperidine to relieve gastrointestinal discomfort.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of bismuth poisoning it may have *some* value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Personal hygiene should be stressed, and eating should not be permitted in work areas. Dust masks should be worn in dusty areas to prevent inadvertent ingestion of the soluble bismuth compounds.

Storage: Color Code—Green: General storage may be used.

Shipping: Bismuth is not cited by DOT[19] in its Performance-Oriented Packaging Standards as regards label requirements or maximum permitted shipping quantities.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a minimum amount of concentrated HCl. Dilute with water until precipitate is formed. Redissolve in HCl. Then saturate with H_2S. Filter, wash, dry, and return to supplier.

Bismuth telluride B:0540

Molecular Formula: Bi_2Te_3

Synonyms: Bismuth sesquitelluride; Dibismuth telluride

doped: Doped bismuth sesquitelluride; Doped bismuth telluride; Doped tellurobismuthite; Doped bismuth tritelluride; (*Note*: Doped with selenium sulfide. Commercial mix may contain 80% Bi_2Te_3, 20% stannous telluride, plus some tellurium.)[NIOSH]

undoped: Bismuth sesquitelluride, Bismuth telluride, Bismuth tritelluride, Tellurobismuthite

CAS Registry Number: 1304-82-1; 37293-14-4 (doped and undoped)

RTECS® Number: EB3110000 (undoped)

UN3284 (tellurium compound, n.o.s.)/151

EC Number: 215-135-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (1304-82-1).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bismuth telluride is a gray crystalline solid. Molecular weight = 800.83; Specific gravity (H_2O:1) = 7.7; Freezing/Melting point = 573°C; Vapor pressure = 0 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2.

Note: Commercial mix of doped bismuth tritelluride may contain 80% Bi_2Te_3, 20% stannous telluride, plus some tellurium. Insoluble in water. Doped and undoped have similar physical properties.

Potential Exposure: Bismuth telluride is used in thermoelectric cooling, power generation; and in semiconductor manufacture. Exposure involves those working in "Silicon Valley" and similar locations around the world.

Incompatibilities: Reacts with acids. A violent reaction with strong oxidizers. Toxic gas may evolve from contact with moisture.

Permissible Exposure Limits in Air

Undoped

OSHA PEL: 15 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction (undoped); None (doped with Se).
NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction; 5 mg/m^3 TWA (doped with Se).
ACGIH TLV®[1]: 10 mg/m^3 (undoped) TWA; 5 mg/m^3 TWA (doped with Se); not classifiable as a human carcinogen.
No TEEL available.
Australia: TWA 10 mg/m^3, 1993; Australia: TWA 5 mg/m^3, 1993; Austria: MAK 0.1 mg(Te)/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 10 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; France: VME 5 mg/m^3, 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Norway: TWA 10 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.5 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for bismuth telluride in ambient air[60] ranging from 0.05 mg/m^3 (North Dakota) to 0.08 mg/m^3 (Virginia) to 0.2 mg/m^3 (Connecticut) to 0.238 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #0500, #0600, or OSHA Analytical Method ID-121 Metal & Metalloid Particulates in work-place Atmospheres (Atomic Absorption).

Routes of Entry: Inhalation/ingestion of dust, eye/skin contact.

Harmful Effects and Symptoms

Bismuth telluride can affect you when breathed in. Exposure may irritate the eyes, nose, and throat. Lung changes may occur. It is not known at this time whether these are permanent.

Short Term Exposure: Harmful if inhaled; may cause respiratory tract irritation. Harmful if absorbed through skin. Causes skin irritation. Eye contact causes irritation and redness. Harmful if swallowed. May cause nausea, headache, and vomiting.

Long Term Exposure: Can affect the kidneys and possibly the liver; bismuth nephropathy (with proteinuria) may occur. Bismuth may affect the amniotic fluid and fetus. In animals: pulmonary lesions (nonfibrotic).[NIOSH]

Points of Attack: Kidneys, liver.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of bismuth poisoning it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: *Clothing:* Avoid skin contact with Bismuth Telluride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Bismuth telluride must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluoride), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture.

Shipping: Tellurium compound, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I to III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid containing Bismuth telluride in vermiculite, dry sand, earth, or similar material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires, use dry chemical, carbon dioxide, water spray, or foam. Extinguish fire using an agent suitable for the type of surrounding fire; Bismuth telluride itself does not burn. Poisonous gases are produced in fire, including bismuth oxides and tellurium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
TSCA 40CFR716.120(a).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).
European/International Regulations: Hazard Symbol: Xn; Risk phrases: R37; R41; R43; R62; R52; Safety phrases: S2; S26; S36/37; S39; S46; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Bisphenol A is a white or tan crystals or flakes with a mild phenolic odor. Molecular weight = 228.29; Specific gravity (H_2O:1): 1.2; Boiling point = 220°C at 4 mmHg; Freezing/Melting point = 153°C; Flash point = 207°C (oc); Autoignition temperature = 600°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 120 mg/L.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Workers engaged in the manufacture of epoxy, polysulfone, polycarbonate, and certain polyester resins. It is also used in flame retardants, rubber chemicals, and as a fungicide. Bisphenol A (BPA), an environmental estrogen, is found in a wide variety of products, including polycarbonate bottles food and drink containers. According to 2008 research conducted at University of Cincinnati, when it comes to BPA, it is not whether polycarbonate bottles are new or old but the liquid's temperature that has the greatest impact on how much BPA is released. When exposed to boiling hot water, BPA was released 55 times more rapidly than exposure to cold water.

Incompatibilities: Strong oxidizers, strong bases, acid chlorides, and acid anhydrides.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: 5 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(1); photosensitization; Pregnancy Risk Group C.
Russia: STEL 5 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3 (respirable dust); 10 mg/m^3 (total dust), 2003. It should be recognized that bisphenol-A can be absorbed through the skin, thereby increasing exposure.

Determination in Air: Collection by charcoal tube, analysis by gas liquid chromatography.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.32$. Fish Tox (benzamide) LC_{50} (fathead minnow, 96 h) = 4.6 mg/L.

Routes of Entry: Passes through the unbroken skin; inhalation; ingestion.

Harmful Effects and Symptoms

Bisphenol-A and its resins produce a typical contact dermatitis; redness and edema with weeping, followed by crusting and scaling, usually confined to the area of contact. Since the face is frequently affected, this may indicate that vapors are the cause, although contact with contaminated clothing can also be a factor. Areas other than the face and neck, back of hands, and forearms are seldom involved. LD_{50} = (oral-rat) 3250 mg/kg[9] which is slightly toxic. Dusts may cause irritation to mouth, nose, or throat and can cause eye irritation. As regards ingestion, comparison with phenol suggests probable symptoms would include nausea, burning of mouth, throat, and stomach; severe stomach pain; stomach ulcers; vision disturbances; irregular breathing and pulse, dizziness, fainting, coma, and possible death. Animal studies suggest that death may occur from ingestion of about 1/3 pound (6 oz) for a 150-lb person. On long-term exposure, susceptible individuals may become sensitized after repeated or prolonged contact and thereafter exhibit an allergic response. Allergy may include reaction to many epoxy resins containing bisphenol A.

Short Term Exposure: Eye and skin contact can cause irritation and burns. May irritate the respiratory tract.

Long Term Exposure: May cause skin sensitization and allergy. There is limited evidence that this chemical may damage the developing fetus.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Dust mask should be worn to protect against inhaled dust. Fire fighters should wear self-contained breathing apparatus to protect against noxious fumes.

Storage: Color Code—Green: General storage may be used. Store away from heat and strong oxidizers and the incompatible materials listed above.

Shipping: Bisphenol A is not cited in the DOT Performance-Oriented Packaging Standards as regards label requirements or maximum shipping; however, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Vacuum cleaning is preferable to sweeping to keep dust levels down. Use special HEPA vacuum, not a shop vacuum. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Bisphenol A is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Bithionol B:0560

Molecular Formula: $C_{12}H_6Cl_4O_2S$

Synonyms: Actamer; Bidiphenbis(2-hydroxy-3,5-dichlorophenyl) sulfide; Bithinol sulfide; Bitin; CP3438; 2,2′-Dihydroxy-3,3′,5,5′-tetrachlorodiphenyl sulfide; 2-Hydroxy-3,5-dichlorophenyl sulphide; Lorothidol; NCI-C60628; Neopellis; TBP; 2,2′-Thiobis(4,6-dichlorophenol); Vancide BL; XL 7

CAS Registry Number: 97-18-7

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

RTECS® Number: SN0525000

EC Number: 202-565-0

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (USA, Japan) (UN).[13]

TSCA 40CFR716.120(a).

Clean Water Act: Toxic Pollutant (Section 401.15) as chlorinated phenols.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%, as chlorophenols.

MARINE POLLUTANT (49CFR, Subchapter 172.101, Appendix B) as chlorophenols.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bithionol is a white or grayish powder with a slight phenolic odor. Molecular weight = 365.03; Freezing/Melting point = 188°C; vapor pressure = very low. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: It is used as a surfactant-formulated antimicrobial against bacteria, molds, and yeast. It is proposed as an agricultural fungicide. Other uses include deodorant, germicide, fungistat, and in the manufacture of pharmaceuticals. It is no longer allowed to be used in cosmetics. A food additive in feed and drinking water of animals. Also a food additive permitted in food for human consumption.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: Danger of photosensitization.

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Probable oral lethal dose for humans is 5−15 g/kg for a 70-kg (150 lb) person. The toxicity of this compound is similar to that of phenol. Major hazard of phenol poisoning stems from its systemic effects which include central nervous system depression with coma, hypothermia, loss of vasoconstrictor tone, cardiac depression, and respiratory arrest. Symptoms of exposure include burning pain in mouth and throat; white necrotic lesions in mouth, esophagus, and stomach; abdominal pain; vomiting, bloody diarrhea; paleness; sweating; weakness; headache; dizziness; tinnitus; scanty, dark-colored urine; weak irregular pulse; and shallow respiration.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a refrigerator or a cool dry place.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust. Stay upwind. Do not touch spilled material. Use water spray to reduce vapors. Absorb spills with noncombustible absorbent material. For *large spills* dike far ahead for later disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Bitoscanate B:0570

Molecular Formula: $C_8H_4N_2S_2$

Synonyms: Biscomate; 1,4-Diisothiocyanatobenzene; Isothiocyanic acid *p*-phenylene ester; Jonit; 1,4-Phenylene diisosthiocyanic acid; Phenylene 1,4-diisothiocyanate; Phenylene thiocyanate

CAS Registry Number: 4044-65-9

RTECS® Number: NX9150000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 223-741-3

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%, as cyanide compounds.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions, or cyanides, inorganic, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bitoscanate is a colorless to beige, odorless, crystalline compound. Molecular weight = 192.3; Freezing/Melting point = 132°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0.

Potential Exposure: Those engaged in the manufacture, formulation, and application of this anthelmintic compound.

Incompatibilities: In general, keep away from strong oxidizers, moisture, strong acids, strong bases. This is a thiocyanate compound. Violent reactions may occur upon contact with chlorates (potassium chlorate, sodium chlorate), nitrates, nitric acid, organic peroxides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

This material is highly toxic if ingested. It is a central nervous system and gastrointestinal toxin in humans. LD_{50} = (oral-rat) 2 mg/kg (highly toxic).[9]

Short Term Exposure: Harmful if inhaled; may cause respiratory tract irritation. Harmful if absorbed through skin. Causes skin irritation. Eye contact causes irritation and redness. Harmful if swallowed. May cause nausea, headache, and vomiting.

Long Term Exposure: Inhalation may result in respiratory tract sensitization.

Medical Surveillance: Blood cyanide level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. For cyanide poisoning, use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as cyanides): *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area. Store under inert gas; moisture sensitive.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including cyanide, nitrogen oxides, sulfur oxides, and carbon oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Blister agents/Vesicants

Blister agents or vesicants are chemicals which have severely irritating properties and can produce irritated and reddened skin with progression to blisters, swelling and inflammation of tissues surrounding the eyes with progression to light sensitivity and lacrimation. They can damage the skin, eyes, and airways. They have the ability to form widespread vesicular lesions, causing blistering and peeling of the skin. High concentrations of vapor or direct liquid exposures to the eye can cause damage to the eye surface. Warm, moist tissues are most susceptible to damage and the tissues of the upper respiratory tract can also be affected. Symptoms of exposure may be delayed until hours or days after exposure depending on the magnitude of the absorbed dose. The major chemical warfare agents in this category are listed below along with their record number for quick access.

Sulfur Mustard, agents H and HD see M:1460
Sulfur Mustard, agent T or HT see M:1460
Nitrogen Mustard, agent HN-1 see E:0400
Nitrogen Mustard, agent HN-2 see M:0300
Nitrogen Mustard, agent HN-3 see T: 0960
Lewisite, agents L-1 and L-2 see HL L: 0250
Mustard-Lewisite, agent HL see L: 0250
Phosgene oxime, agent CX see P:0555

Blood agents

Blood agents, among the most lethal chemical weapon agents, disrupt the normal biochemical processes required by your cells to use oxygen. The major chemical warfare agents in this category are listed below along with their record number for quick access.

Arsine, agent SA see A:1580
Cyanogen chloride, agent CK see C:1620
Hydrogen cyanide, agent AC 74-90-8 see H:0440
Potassium cyanide (KCN) see P:0910
Sodium cyanide (NaCN) S:0450
Sodium monofluoroacetate see S:0480

Borax B:0573

Molecular Formula: $B_4H_2Na_2O_8$ (borax)

Common Formula: $Na_2B_4O_7 \cdot H_2O$ (borax); $Na_2B_4O_7 \cdot 5H_2O$ (borax pentahydrate)

Synonyms: *Borax:* Borato sodico (Spanish); Borato sodico, anhidro (Spanish); Disodium tetraborate; Sodium borate; Sodium borate decahydrate; Sodium tetraborate

Borax pentahydrate: Borate pentahydrate sodium; Tetraborate pentahydrate

CAS Registry Number: 1303-96-4 (borax); *(alt.) borax*: *(alt.)* 1344-90-7; *(alt.)* 12447-40-4; *(alt.)* 61028-24-8; 1330-43-4 (disodium tetraborate, anhydrous); 12179-04-3 (borax pentahydrate)

RTECS® Number: VZ2275000 (borax)

UN/NA & ERG Number: UN3077/171

EC Number: 215-540-4 [*Annex I Index No.:* 005-011-01-1] (*disodium tetraborate, anhydrous*)

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act, 55FR1470 Priority List.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% [sodium tetraborate (borax)].

Canada Drinking Water Quality: 5.0 mg/L IMAC.

Mexico Drinking Water Criteria: 1.0 mg/L.

European/International Regulations: (*disodium tetraborate, anhydrous*) Hazard Symbol: T; Risk phrases: R60; R61; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Nonwater polluting agent (*borax, decahydrate*).

Description: Borax is a noncombustible (an inherent fire retardant), bluish-gray or green, odorless crystalline powder or granules. Molecular weight = 301.37; Boiling point = 320°C; Freezing/Melting point = 75°C (rapid heating). Borax is soluble in water; solubility = 6% at 20°C. Borax pentahydrate is a white crystalline solid or free-flowing powder. Odorless. Molecular weight = 291.4; Specific gravity (H_2O:1) = 1.82; Melting Point: 200°C; Density: 1.82 g/cm^3. Soluble in water; solubility = 3%.

Potential Exposure: (*Borax*): Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Borax is used as a soldering flux, preservative against wood fungus, and as an antiseptic. Used in ant poisons, for fly control around refuse and manure piles, as a larvicide. It is used in the manufacture of enamels and glazes, fiberglass insulation; sodium perborate bleach; in tanning, cleaning compounds; for fireproofing fabrics and wood; and in artificial aging of wood.

Incompatibilities: Dissolves in water with some violence forming a basic solution.

Permissible Exposure Limits in Air

Borate compounds, inorganic (including borax)

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®: 2 mg/m^3 TWA (inhalable fraction); 6 mg/m^3 (inhalable fraction) not classifiable as a human carcinogen.

For particulates not otherwise classified (PNOC)

OSHA: 15 mg/m^3 TWA (Total dust); 5 mg/m^3 TWA (Respirable fraction).

DFG MAK: 4 mg/m^3 TWA (Inhalable fraction); 1.5 mg/m^3 TWA (Respirable fraction).

Protective Action Criteria (PAC)

Borax

TEEL-0: 17.6 mg/m^3

PAC-1: 52.9 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

Borax decahydrate (1330-43-4)

TEEL-0: 17.6 mg/m^3

PAC-1: 52.9 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

Borax pentahydrate [12179-04-3]

OSHA PEL: None.

NIOSH REL: 1 mg/m^3 TWA.

ACGIH TLV®: 2 mg/m^3 TWA inhalable fraction; 6 mg/m^3 TWA inhalable fraction; not classifiable as a human carcinogen (2004).

Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).

Determination in Water: Fish Tox: LC_{50} (goldfish, 72 h) = 178 mg/L; EC_{50} [*Daphnia magna* (water flea), 48 h] = 1.085−1.402 mg/L.

Permissible Concentration in Water: EPA in July 1976 established a criterion for boron of 750 μg/L for long-term irrigation on sensitive crops. More recently,[32] EPA has suggested an ambient water limit of 43 μg/L based on health effects.

Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion.

Harmful Effects and Symptoms

These effects vary greatly with the type of borax compound. Acute poisoning in humans from boric acid or borax is usually the result of application of dressings, powders, or ointment to large areas of burned or abraded skin, or accidental ingestion. The signs are nausea, abdominal pain, diarrhea and violent vomiting, sometimes bloody, which may be accompanied by headache and weakness. There is a characteristic erythematous rash followed by peeling. In severe cases, shock with fall in arterial pressure, tachycardia, and cyanosis occur. Marked CNS irritation, oliguria, and anuria may be present. The oral lethal dose in adults is over 30 g. Little information is available on chronic oral poisoning, although it is reported to be characterized by mild GI irritation, loss of appetite, disturbed digestion, nausea, possibly vomiting, and erythematous rash. The rash may be "hard" with a tendency to become purpuric. Dryness of skin and mucous membranes, reddening of tongue, cracking of lips, loss of hair, conjunctivitis, palpebral edema, gastrointestinal disturbances, and kidney injury have also been observed.

Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes, weakness, joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system, enzyme activity, carbohydrate metabolism, hormone function, and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys.

Short Term Exposure: Borax may affect the nervous system. Serious overexposure to borates can cause seizures, unconsciousness, and death.

Long Term Exposure: May cause brain, kidney, and liver damage. Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. Animal tests show that this substance possibly causes toxic effects upon human reproduction (WHO).

Medical Surveillance: No specific considerations are needed for boric acid or borates except for general health and liver and kidney function. In the case of boron trifluoride, the skin, eyes, and respiratory tract should receive special attention. In the case of the boranes, central nervous system and lung function will also be of special concern.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Workers involved with the manufacture of boric acid should be provided with masks to prevent inhalation of dust and fumes.

Storage: Color Code—Green: General storage may be used; Store in a cool, dry place away from incompatible materials listed above.

Shipping: Boric acid and Borax may be classified[52] as ENVIRONMENTALLY HAZARDOUS SUBSTANCES, SOLID, N.O.S. These chemicals would require a shipping label of "CLASS 9." They fall in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water, or foam extinguishers. Irritating and toxic fumes are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Borax, dehydrated: The material is diluted to the recommended provisional limit (0.10 mg/L) in water. The pH is adjusted to between 6.5 and 9.1 and then the material can be discharged into sewers or natural streams.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.

Listed in TSCA inventory.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act, 55FR1470 Priority List.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; Category D-2A.

European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Nonwater polluting agent.

Description: Boric acid is a white, amorphous powder or colorless, crystalline solid. Molecular weight = 61.84; Boiling point = 300°C (decomposes: loses 1/2 its H_2O); Freezing/Melting point = 170.9°C (decomposes above 100°C). Saturated solutions: at 0°C, 2.6% acid; at 100°C, 28% acid. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Boric acid is soluble in water; solubility = 4.7 g/100 mL at 20°C.

Potential Exposure: Compound Description (*Boric acid*): Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Boric acid is a fireproofing agent for wood, a preservative, and an antiseptic. It is used in the manufacture of glass, pottery, enamels, glazes, cosmetics, cements, porcelain, borates, leather, carpets, hats, soaps, artificial gems, in tanning leather, printing, dyeing, painting, and photography.

Incompatibilities: Boric acid decomposes in heat above 100°C, forming boric anhydride and water. Boric acid is hygroscopic; it will absorb moisture from the air. Boric acid aqueous solution is a weak acid; incompatible with strong reducing agents including alkali metals and metal hydrides (may generate explosive hydrogen gas), acetic anhydride, alkali carbonates, and hydroxides. Violent reaction with powdered potassium metal, especially if impacted. Attacks iron in the presence of moisture.

Permissible Exposure Limits in Air

Borate compounds, inorganic (including boric acid)

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®: 2 mg/m^3 TWA (inhalable fraction); 6 mg/m^3 (inhalable fraction) not classifiable as a human carcinogen.

For particulates not otherwise classified (PNOC)

Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).

Determination in Water: Fish Tox: LC_{50} (goldfish, 72 h) = 178 mg/L; EC_{50} [*Daphnia magna* (water flea), 48 h] = 1.085−1.402 mg/L.

Permissible Concentration in Water: EPA in July 1976 established a criterion for boron of 750 μg/L for long-term irrigation on sensitive crops. More recently,[32] EPA has suggested an ambient water limit of 43 μg/L based on health effects.

Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion.

Harmful Effects and Symptoms

Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes, weakness, joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system, enzyme activity, carbohydrate metabolism, hormone function, and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys. Based on animal studies, may be fetotoxic, affect reproductive material and fertility; teratogenic effects.

Short Term Exposure: Boric acid dust or aqueous solutions cause irritation of the eyes, skin, and the respiratory tract. Boric acid dust is absorbed through mucous membranes but not through the unbroken skin. Solutions and dust can be absorbed in harmful amounts through abraded skin, burns, and open wounds. Prolonged skin contact may cause dermatitis. If absorbed through the broken skin, boron may affect behavior, metabolism, sense organs, the gastrointestinal tract, and respiratory tract (respiratory depression). Ingestion can cause digestive/gastrointestinal tract irritation with symptoms of nausea, vomiting, and diarrhea. Prolonged or high levels of exposure may cause effects on the gastrointestinal tract, liver, and kidneys. Prolonged exposure to boric acid may affect the nervous system. Serious overexposure can cause seizures, unconsciousness, and death. Ingestion of 5 g or more may irritate gastrointestinal tract and affect central nervous system; may be fatal to some adults. LD_{50} = (rat-oral) 2660 mg/kg; 3450 (mouse-oral) mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. May affect behavior, cause damage to the brain, kidneys, liver, cardiovascular system, central nervous system (CNS), peripheral nervous system (PNS), cardiovascular system, blood, liver, urinary system (kidney, ureter, bladder), and endocrine system. Animal tests show that this substance possibly causes toxic effects upon human reproduction.[WHO]

Medical Surveillance: Check for eye and skin disorder problems. Tests for liver, kidney, or respiratory function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Workers involved with the manufacture of boric acid should be provided with masks to prevent inhalation of dust and fumes. Wear impervious gloves: recommended gloves include Butyl rubber, Neoprene, Viton™.

Respirator Selection: A respiratory protection program that meets OSHA's Respiratory Protection Standard 29 CFR 1910.134 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use. Oxygen levels below 19.5% are considered IDLH by NIOSH/OSHA and require use of a full-facepiece pressure/demand SCBA; or, a full facepiece, supplied-air respirator with auxiliary self-contained air supply is required under 1910.134-1998.

Storage: Color Code—Green: General storage may be used. Store in a cool, dry place away from incompatible materials listed above.

Shipping: Boric acid may be classified[52] as ENVIRONMENTALLY HAZARDOUS SUBSTANCES, SOLID, N.O.S. This chemical would require a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water, or foam extinguishers. Irritating and toxic fumes are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Boric acids may be recovered from organic process wastes as an alternative to disposal.

Boron and compounds B:0580

Molecular Formula: B

Synonyms: There are no common synonyms for boron.

CAS Registry Number: 7440-42-8

RTECS® Number: ED7350000

UN/NA & ERG Number: UN3178 (Flammable solid, inorganic, n.o.s.)/133

EC Number: 231-151-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse; EPA: Available data are inadequate for an assessment of human carcinogenic potential.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act, 55FR1470 Priority List.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% [boric acid, sodium tetraborate (borax)].

Canada Drinking Water Quality: 5.0 mg/L IMAC.

Mexico Drinking Water Criteria: 1.0 mg/L.

WGK (German Aquatic Hazard Class): 1—Nonwater polluting agent (*boron, borax*).

Description: Boron is a yellow or brownish-black powder and may be either crystalline or amorphous. It does not occur free in nature and is found in the minerals borax, colemanite, boronatrocalcite, and boracite. Molecular weight = 10.81; Freezing/Melting point = 2190°C; 2079°C (highly purified). Boiling point = 3660°C; 2550°C (highly purified); Autoignition temperature = 580°C. Hazard Identification (based on NFPA-704 M Rating System) (*boron, 1000 μg/mL*) Health 1, Flammability 1, Reactivity 0; (*Boron, 10,000 μg/mL)*: Health 2, Flammability 1, Reactivity 2. Practically insoluble in water.

Potential Exposure: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Boron is used in metallurgy as a degasifying agent and is alloyed with aluminum, iron, and steel to increase hardness. It is also a neutron absorber in nuclear reactors. Boron is frequently encountered in a variety of chemical formulations including boric acid, various borate salts, borax, and boron soil supplements.

Incompatibilities: Boron dust forms explosive mixture in air. Contact with strong oxidizers may cause explosions. Violent reaction (possible explosion) with concentrated nitric acid, hydrogen iodide, silver fluoride. Boron is incompatible with ammonia, bromine tetrafluoride, cesium carbide, chlorine, fluorine, interhalogens, iodic acid, lead dioxide, nitric acid, nitrosyl fluoride, nitrous oxide, potassium nitrite, rubidium carbide. Reacts exothermically with metals at high temperature above 900°C.

Permissible Exposure Limits in Air

For particulates not otherwise classified (PNOC)

OSHA: 15 mg/m^3 TWA (Total dust); 5 mg/m^3 TWA (Respirable fraction).

DFG MAK: 4 mg/m^3 TWA (Inhalable fraction); 1.5 mg/m^3 TWA (Respirable fraction).

Borate compounds, inorganic (including 1330-43-4; 1303-96-4; 10043-35-3; 12179-04-3)

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®: 2 mg/m^3 TWA (inhalable fraction); 6 mg/m^3 (inhalable fraction) not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

Boron (elemental)

TEEL-0: 1.5 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 250 mg/m^3

1303-96-4 (sodium borate decahydrate)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

1330-43-4 (sodium borate; disodium tetraborate; borates, tetrasodium salts)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 500 mg/m^3

16940-66-2 (sodium borohydride)

TEEL-0: 0.015 mg/m^3

PAC-1: 0.05 mg/m^3

PAC-2: 0.35 mg/m^3

PAC-3: 4 mg/m^3

Determination in Air: Use NIOSH Analytical Method #0500 or OSHA Analytical Method ID-125G, Metal and Metalloid Particulates in work-place Atmospheres (ICP analysis).

Determination in Water: Fish Tox: LC$_{50}$ (goldfish, 72 h) = 178 mg/L; EC$_{50}$ [*Daphnia magna* (water flea), 48 h] = 1.085−1.402 mg/L.

Permissible Concentration in Water: Regular use of irrigation water with more than 1 ppm boron is harmful to most kinds of plants. In July 1976 the US EPA established a criterion for boron of 750 μg/L for long-term irrigation on sensitive crops. More recently,[32] EPA has suggested an ambient water limit of 43 μg/L based on health effects. There is no mandatory maximum limit in the United States for boron in drinking water, but when last reported in 1996, US EPA was considering adoption of 0.6 ppm as the standard. The World Health Organization (WHO) and several European countries have adopted or recommended drinking water limits for boron of 0.3 ppm.

Routes of Entry: Inhalation of dust, fumes, and aerosols; ingestion; skin absorption.

Harmful Effects and Symptoms

Boron compounds may produce irritation of the nasal mucous membranes, the respiratory tract, and eyes. *Systemic:* These effects vary greatly with the type of compound. Acute poisoning in humans from boric acid or borax is usually the result of application of dressings, powders, or ointment to large areas of burned or abraded skin, or accidental ingestion. The signs are nausea, abdominal pain, diarrhea, and violent vomiting, sometimes bloody, which may be accompanied by headache and weakness. There is a characteristic erythematous rash followed by peeling. In severe cases, shock with fall in arterial pressure, tachycardia, and cyanosis occur. Marked CNS irritation, oliguria, and anuria may be present. The oral lethal dose in adults is over 30 g. Little information is available on chronic oral poisoning, although it is reported to be characterized by mild GI irritation, loss of appetite, disturbed digestion, nausea, possibly vomiting, and erythematous rash. The rash may be "hard" with a tendency to become purpuric. Dryness of skin and mucous membranes, reddening of tongue, cracking of lips, loss of hair, conjunctivitis, palpebral edema, gastrointestinal disturbances, and kidney injury have also been observed. Workers manufacturing boric acid had some atrophic changes in respiratory mucous membranes, weakness, joint pains, and other vague symptoms. The biochemical mechanism of boron toxicity is not clear but seems to involve action on the nervous system, enzyme activity, carbohydrate metabolism, hormone function, and oxidation processes coupled with allergic effects. Borates are excreted principally by the kidneys. No toxic effects have been attributed to elemental boron.

Short Term Exposure: Irritating by skin and eye contact. Can be absorbed through the skin. Harmful by inhalation and ingestion. LD_{50} = (mouse-oral) 560 mg/kg; (oral-rat) 650 mg/kg. High exposure may cause central nervous system (CNS) disturbances.

Long Term Exposure: May cause brain, kidney, and liver damage. Repeated exposure may cause boric acid to accumulate in the brain, bone, and other body parts. Repeated skin contact may cause dermatitis, borism (boron poisoning), dry skin, skin eruptions, and gastric disturbances. Animal tests show that this substance possibly causes toxic effects upon human reproduction (WHO). Repeated exposure may cause central nervous system (CNS) effects.

Medical Surveillance: No specific considerations are needed for boric acid or borates except for general health and liver and kidney function. In the case of boron trifluoride, the skin, eyes, and respiratory tract should receive special attention. In the case of boranes, central nervous system and lung function will also be of special concern.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Exposed workers should be educated in the proper use of protective equipment and there should be strict adherence to ventilating provisions in work areas. Safety glasses, respirator, adequate ventilation.

Respirator Selection: A respiratory protection program that meets OSHA's 29 CFR 1910.134 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use. In many cases, a dust respirator meeting these standards may suffice.

Storage: Dust is a flammable solid. Store in a cool, dry place away from incompatible material, sources of heat and ignition. Boron powder may decompose on exposure to air and may have to be stored under a nitrogen blanket.

Shipping: These materials are not specifically cited in the DOT performance-oriented packaging regulations.[19] However, boron requires a shipping label of "FLAMMABLE SOLID." Based on this description, it would fall in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. The material may be dampened with water to avoid dust and then transferred to a sealed container for disposal. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water, or foam extinguishers. Irritating and toxic fumes are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 215-125-8 [*Annex I Index No.:* 005-008-00-8]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as boric anhydride.

European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Boron oxide is a noncombustible, colorless, semitransparent lumps or hard, white, odorless crystals, with slightly bitter taste. Molecular weight = 69.64; Boiling point = about 1860°C; Freezing/Melting point = about 450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Moderately soluble in water; solubility = (moderate) 3%; slow reaction.

Potential Exposure: Compound Description: Primary Irritant. Boron oxide is used in glass manufacture and the production of other boron compounds. It is used in fluxes, enamels, drying agents, and as a catalyst.

Incompatibilities: Bromine pentafluoride, calcium oxide. Reacts slowly with water, forming boric acid.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA (total dust).

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 10 mg/m^3 TWA.

NIOSH IDLH: 2000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 300 mg/m^3

PAC-3: 500 mg/m^3

Austria: MAK 15 mg/m^3, 1993; Denmark: TWA 10 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 10 mg/m^3, 1999; the Philippines: TWA 15 mg/m^3, 1993; Poland: MAC (TWA) 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3. Several states have set guidelines or standards for boron oxide in ambient air[60] ranging from 10 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Collection on a filter and gravimetric analysis. Use NIOSH Analytical Method #0500 Particulates NOR, total dust.[18]

Determination in Water: Fish Tox: LC50 (goldfish, 72 h) = 570 mg/L; EC$_{50}$ [*Daphnia magna* (water flea), 48 h] = 370−490 mg/L.

Permissible Concentration in Water: No criteria set but EPA has suggested[32] an ambient water limit of 138 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May irritate the skin, causing a rash or burning feeling on contact. May cause nasal irritation, conjunctivitis, erythema. Ingestion causes abdominal pain, diarrhea, nausea, vomiting. Low toxicity. The oral LD$_{50}$ mouse is 3163 mg/kg.[9]

Long Term Exposure: Unknown at this time.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *100 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *250 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *500 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *2000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a dry, well-ventilated area away from incompatible materials listed above and water.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical may require a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Moisten dry material to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Boron oxide is a noncombustible solid. Extinguish fire using an agent suitable for type of surrounding fire. Boron oxide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Australia: TWA 1 ppm (10 mg/m^3), 1993; Austria: MAK 1 ppm (10 mg/m^3), 1999; Belgium: STEL 1 ppm (10 mg/m^3), 1993; Denmark: TWA 1 ppm (10 mg/m^3), 1999; Finland: TWA 1 ppm (10 mg/m^3); STEL 3 ppm (30 mg/m^3), 1999; Norway: TWA 1 ppm (10 mg/m^3), 1999; Switzerland: MAK-W 1 ppm (10 mg/m^3), 1999; the Netherlands: MAC 10 mg/m^3 (total dust), 2003; Argentina, Bulgaria, Columbia, Israel, Jordan, South Korea, New Zealand, Singapore, Vietnam: use ACGIH TLV Ceiling Concentration 1 ppm. Several states have set guidelines or standards for boron tribromide in ambient air[60] ranging from 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Water: No method established. Reaction.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Eyes, skin, respiratory system.

Harmful Effects and Symptoms

Short Term Exposure: Boron tribromide is highly toxic and can affect you when inhaled, on skin contact and by eye contact. Boron tribromide is a corrosive liquid and exposure can cause severe burns of the eyes, nose, throat, lungs, and skin. Boron tribromide may cause cough, headache, nose bleeds, and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause a brownish color of the tongue and/or runny nose. May cause irritation of the lungs and bronchitis to develop. May cause kidney damage and affect the nervous system.

Points of Attack: Kidneys, nervous system, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests, kidney function tests, examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Gloves made of chlorinated polyethylene are considered fair to good protection for boron tribromide. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over* 1 ppm, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with an acid gas canister. Increased protection is obtained from full face-piece-powered air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Before entering confined space where boron tribromide may be present, check to make sure that an explosive concentration does not exist. Store in airtight, unbreakable containers in a cool well-ventilated area away from water, steam, potassium, sodium, alcohol, and other incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Boron tribromide requires a "CORROSIVE, POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 8 and Packing Group I. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stop discharge if possible. Avoid contact with liquid or vapor.[41] Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Ventilate area of leak or spill after cleanup is complete. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)

when spilled in water

Day 0.3/0.5
Night 0.6/1.4
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.9/3.1

Fire Extinguishing: This chemical decomposes in heat and may explode. Use dry chemical or carbon dioxide. Do not use foam. Do not use water on material itself. Water can be used to cool intact containers and to absorb vapors. Poisonous gases are produced in fire, including hydrogen bromide and boron oxides. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (≥1.00% concentration). *Theft hazard* 45 (≥84.70% concentration).

Listed on the TSCA inventory.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 5000 lb (2270 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T+; Risk phrases: R14; R26/28; R34; Safety phrases: S1/2; S9; S26; S28; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Boron trichloride is a colorless liquid or liquefied gas with a pungent, irritating odor. Molecular weight = 117.2; Specific gravity (H_2O:1) = 1.35 at 11°C; Boiling point = 12.5°C; Freezing/Melting point = − 107°C;

Vapor pressure = 985 mmHg at 20°C; Relative vapor density (air = 1) = 4.02. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Insoluble in water (reaction).

Potential Exposure: Used in refining of aluminum, magnesium, copper alloys, and in polymerization of styrene. Manufacture and purification of boron; catalyst in organic reactions; semiconductors; bonding of iron or steel; purification of metal alloys to remove oxides, nitrides, and carbides; chemical intermediate for boron filaments; soldering flux; electrical resistors; and extinguishing magnesium fires in heat treating furnaces.

Incompatibilities: Incompatible with lead, graphite-impregnated asbestos, potassium, sodium. Vigorously attacks elastomers, packing materials, natural and synthetic rubber; viton, tygon, saran, silastic elastomers. Avoid aniline, hexafluorisopropylidene amino lithium, nitrogen dioxide, phosphine, grease, organic matter, and oxygen, nitrogen, peroxide, and phosphine. Fat or grease reacts vigorously with boron trichloride. It reacts with water or steam to produce heat, boric acid, and corrosive hydrochloric acid fumes. Oxygen and boron trichloride react vigorously on sparking. Attacks most metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.3 ppm
PAC-2: 2.09 ppm
PAC-3: 2.5 ppm

Boron trichloride is a poisonous, corrosive gas. Other than TEELs shown above, no other numerical standards have been established. Since the hydrolysis product, HCl, tends to govern the effect in moist air, reference should be made to the limit for hydrogen chloride as follows:

OSHA PEL: 5 ppm/7 mg/m^3 Ceiling Concentration.
NIOSH REL: 5 ppm/7 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: 5 ppm/7.5 mg/m^3 Ceiling Concentration; not classifiable as a human carcinogen.
NIOSH IDLH: 50.
DFG MAK: 5 ppm/7.6 mg/m^3, Pregnancy Risk Group C.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Extremely corrosive to the eyes, skin, and respiratory tract. Contact with eyes produces severe pain, swelling, corneal erosions, and blindness. Viscid white or blood-stained foamy mucus and threads of tissue may appear in mouth. Inhalation can cause low blood oxygen, difficulty in breathing; chest pain and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms of overexposure include depression of circulation, persistent vomiting and diarrhea, profound shock and coma. Temperature becomes subnormal and rash may cover entire body. Boron affects the central nervous system causing depression of circulation as well as shock and coma. May result in marked fluid and electrolyte loss and shock.

Long Term Exposure: Can cause liver, kidney, and brain damage.

Medical Surveillance: Consider X-ray following acute overexposure. Liver, kidney, and lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention immediately. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Before entering confined space where boron trichloride may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated, fireproof place. Metal containers involving the transfer of this chemical should be grounded and bonded. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: This chemical requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3 (poison) hazard Zone B, with no Packing Group cited.[19, 20]

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Seek expert help. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid breathing vapors. Keep upwind. Remove all ignition sources. Ventilate area of leak or spill. Isolate area until gas has dispersed. Stop leak if you can do so without risk. Keep material out of water sources and sewers. Use water spray to knock down vapors. Do not use water on material itself. Neutralize spilled material with crushed limestone, soda ash, or lime. Collect neutralized material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled on land

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day	0.4/0.6
Night	1.0/1.5

when spilled in water

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day	0.8/1.2
Night	2.4/3.8

Fire Extinguishing: Boron trichloride is not combustible but decomposes in heat forming chlorine. Reacts with water forming boric acid and hydrochloric acid fumes. Use dry chemical, carbon dioxide, or dry sand to extinguish. If large quantities of combustibles are involved, use water in flooding quantities as spray and fog. Use water spray to absorb vapors. For large fires use water spray, fog, or foam. *Do not get water on material itself.* Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed, undamaged containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

European/International Regulations: Hazard Symbol: T+, C; Risk phrases: R14; R26; R35; Safety phrases: S1/2; S9; S26; S28; S36/37/39; S45; European/International Regulations (*dihydrate*): not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Boron trifluoride is a nonflammable, colorless gas with a pungent, suffocating odor. Forms dense white fumes in moist air. Shipped as a nonliquefied compressed gas. Molecular weight = 67.8; Relative vapor density (air = 1) = 2.38; Boiling point = −100°C; Freezing/Melting point = −127°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1₩. Reacts with water; solubility in cold water = 106%.

Potential Exposure: Boron trifluoride is a highly reactive chemical used primarily as a catalyst in chemical synthesis. It is stored and transported as a gas, but can be reacted with a variety of materials to form both liquid and solid compounds. The magnesium industry utilizes the fire-retardant and antioxidant properties of boron trifluoride in casing and heat treating. Nuclear applications of boron trifluoride include neutron detector instruments; boron-10 enrichment; and the production of neutroabsorbing salts for molten-salt breeder reactors.

Incompatibilities: Boron trifluoride reacts with polymerized unsaturated compounds. Decomposes on contact with water, moist air, and other forms of moisture, forming toxic and corrosive hydrogen fluoride, fluoroboric acid, and boric acid. Reacts violently with alkali and alkaline earth metals (except magnesium); metals, such as sodium, potassium, and calcium oxide, and with alkyl nitrates. Attacks many metals in presence of water.

Permissible Exposure Limits in Air

OSHA PEL: 1 ppm/3 mg/m^3 Ceiling Concentration.

NIOSH REL: 1 ppm/3 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/2.8 mg/m^3 Ceiling Concentration.

Several states have set guidelines or standards for boron trifluoride in ambient air[60] ranging from 0 μg/m^3 (Connecticut) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (North Dakota) to 71 μg/m^3 (Nevada).

Determination in Air: Collection by an impinger preceded by a filter followed by colorimetric analysis.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Boron trifluoride gas, upon contact with air, immediately reacts with water vapor to form a mist; which, if at a high enough concentration, provides a visible warning of its presence. The gas or mist is severely irritating and corrosive to the skin, eyes, and respiratory system. Inhalation causes coughing and breathing difficulties. Boron trifluoride is highly toxic; may cause death, by inflammation, lung congestion, or pulmonary edema, a medical emergency that can be delayed for several hours. Death or permanent injury can result from very short exposure to small quantities (an estimated 40−60 ppm for 30−60 min.). Contact with the skin and eyes can cause redness, pain, and serious burns. May cause depression of the central nervous system. Rapid evaporation of the liquid may cause frostbite.

The toxic action of the halogenated borons (boron trifluoride and trichloride) is considerably influenced by their halogenated decomposition products. They are primary irritants of the nasal passages, respiratory tract, and eyes in man. Animal experiments showed a fall in inorganic phosphorus level in blood and on autopsy, pneumonia, and degenerative changes in renal tubules.

Long Term Exposure: May cause liver and kidney damage. Long-term exposure leads to irrigation of the respiratory tract, dysproteinemia, reduction in cholinesterase activity, increased nervous system liability.

Points of Attack: Respiratory system, kidneys, eyes, skin.

Medical Surveillance: In the absence of a suitable monitoring method, NIOSH recommends that medical surveillance, including comprehensive preplacement and annual periodic examinations be made available to all workers employed in areas where boron trifluoride is manufactured, used, handled, or is evolved as a result of chemical processes.

First Aid: If contact with liquid, treat for frostbite. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Engineering controls should be used to maintain boron trifluoride concentrations at the lowest feasible level. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots; Responder™ suits. Wear corrosive-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* SA* (any supplied-air respirator). *25 ppm*: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Poison gas. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Protect cylinders against extreme temperature changes; dropping, falling, or physical damage. Store outdoors or in a cool, well-ventilated, dry area in a noncombustible structure away from incompatible materials listed above. Cylinders must not be exposed to temperatures below −28.9°C or above 54.4°C.

Shipping: This chemical requires a shipping label of "POISON GAS." The Hazard Class is 2.3 (poison) Hazard Zone B, with no Packing Group cited.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse gas. Stop leak if you can do it without risk. Use water spray to reduce vapor but do not put water on leak or spill area. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Do not get water inside container. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

Liquid

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.2/1.9
Night 3.0/4.8

Compressed

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.2/1.9
Night 3.0/4.8

Fire Extinguishing: Do not use water. For small fire use dry chemical or carbon dioxide. On larger fires use any agent suitable for surrounding fire. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chemical reaction with water to form boric acid and fluoroboric acid. The fluoroboric acid is reacted with limestone, forming boric acid and calcium fluoride. The boric acid may be discharged into a sanitary sewer system while the calcium fluoride may be recovered or landfilled. Protect cylinder and labels from physical damage. The owner of the compressed gas cylinder is the only entity allowed by federal law (49CFR) to transport and refill them.

Boron trifluoride etherates B:0630

Molecular Formula: $C_2H_6BF_3O$ (*with methyl ether*); $C_4H_{10}BF_3O$ (*with ethyl ether*)

Common Formula: $CH_3OCH_3 \cdot BF_3$ (*with methyl ether*); $C_2H_5OC_2H_5 \cdot BF_3$ (*with ethyl ether*)

Synonyms: Boron trifluoride diethyl etherate; Boron trifluoride dimethyl ether; Boron trifluoride dimethyl etherate; Boron trifluoride etherate; Fluorid bority dimethyl ether

CAS Registry Number: 353-42-4 (*compounded with methyl ether*); 109-63-7 (*compounded with ethyl ether*); 373-57-9 (*methanol complex in excess methanol*)

RTECS® Number: ED8400000 (*with methyl ether*); KX7375000 (*with ethyl ether*)

UN/NA & ERG Number: UN2965 (dimethyl etherate)/139; UN2604 (diethyl etherate)/132

EC Number: 206-532-1 (*with dimethyl ether*); 203-689-8 (*with diethyl ether*)

Regulatory Authority and Advisory Bodies

The following is for 353-42-4 (with methyl ether), except as noted.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 15,000 ($\geq$1.00% concentration) [Boron trifluoride compound with methyl ether (1:1)].

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

Safe Drinking Water Act as boron: Priority List (55FR1470).

Reportable Quantity (RQ): 1000 lb (454 kg) (with methyl ether).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg) (with methyl ether).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% [109-63-7 (*boron trifluoride diethyletherate*)].

WGK (German Aquatic Hazard Class): No value assigned.

Description: Boron trifluoride etherates:

(*compounded with methyl ether*) is moisture-sensitive, corrosive, flammable liquid. Molecular weight = 113.9; Boiling point = 126−127°C; Freezing/Melting point = −14°C. Hazard Identification (based on NFPA-704 M Rating System): (*dimethyl etherate/UN 2965*) Health 4, Flammability 4, Reactivity 1₩.

(*compounded with ethyl ether*) is a moisture-sensitive, corrosive, flammable liquid. Molecular weight = 141.9; Boiling point = 126°C; Freezing/Melting point = −58°C; Flash point = 64°C (oc). Hazard Identification (based on NFPA-704 M Rating System) (*methyl ether*): Health 3, Flammability 3, Reactivity 1₩. Decomposes in water.

(*methanol complex in excess methanol*) Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 1.

Potential Exposure: Used as a catalyst.

Incompatibilities: Reacts with air forming corrosive hydrogen fluoride vapors. Incompatible with oxidizers (may cause fire and explosion), water, steam or heat, forming corrosive and flammable vapors. Peroxide containing etherate reacts explosively with aluminum lithium hydride, magnesium tetrahydroaluminate. Mixtures with phenol react explosively with 1,3-butadiene. Presumed to form explosive peroxides.

Permissible Exposure Limits in Air

There are no airborne exposure limits for the etherates. Exposure limits for boron trifluoride may be applicable in most cases as follows:

OSHA PEL: 1 ppm/3 mg/m^3 Ceiling Concentration.

NIOSH REL: 1 ppm/3 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/2.8 mg/m^3 Ceiling Concentration.

NIOSH IDLH: 25 ppm.

Protective Action Criteria (PAC)*

With methyl ether

TEEL-0: 0.75 mg/m^3

PAC-1: **2.5** mg/m^3

PAC-2: **37** mg/m^3

PAC-3: **110** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

With ethyl ether

TEEL-0: 9.34 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

Arab Republic of Egypt: TWA 1 ppm (3 mg/m^3), 1993; Australia: TWA 1 ppm (3 mg/m^3), 1993; Austria: MAK 1 ppm (3 mg/m^3), 1999; Belgium: STEL 1 ppm (2.8 mg/m^3), 1993; Denmark: TWA 1 ppm (3 mg/m^3), 1999; Finland: TWA 1 ppm (3 mg/m^3); STEL 3 ppm (8.3 mg/m^3), 1999; France: VLE 1 ppm (3 mg/m^3), 1999; the Netherlands: MAC 3 mg/m^3, 2003; Japan: 0.3 ppm (0.83 mg/m^3), 1999; Norway: TWA 1 ppm (3 mg/m^3), 1999; the Philippines: STEL 1 ppm (3 mg/m^3), 1993; Russia: TWA 0.3 ppm; STEL 1 mg/m^3, 1993; Switzerland: MAK-W 1 ppm (3 mg/m^3), KZG-W 2 ppm (6 mg/m^3), 1999; Thailand: TWA 1 ppm (3 mg/m^3), 1993; Turkey: TWA 1 ppm (3 mg/m^3), 1993; United Kingdom: STEL 1 ppm (2.8 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 1 ppm. Several states have set guidelines or standards for boron trifluoride in ambient air[60] ranging from 0 μg/m^3 (Connecticut) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (North Dakota) to 71 μg/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: These compounds are corrosive. Contact may cause severe burns to skin and eyes. The boron fluoride etherates are highly toxic by inhalation. Inhalation may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can cause kidney damage.

Points of Attack: Kidneys.

Medical Surveillance: Consider chest x-ray following acute overexposure. Kidney and lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: (as boron trifluoride) *10 ppm:* SA* (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Before entering confined space where these chemicals may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The DOT-required label for the dimethyl etherate [UN2965] is "DANGEROUS WHEN WET, CORROSIVE, FLAMMABLE LIQUID." The Hazard Class in 4.3 and the Packing Group is I.[19, 20]

The diethyl etherate [UN2604] requires a "CORROSIVE FLAMMABLE LIQUID" label. It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spill material. Use water spray to reduce vapors, but do not get water inside containers. For *small spills*, absorb with sand or other noncombustible absorbent material and place into containers. For *large spills*, dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires use dry chemical, carbon dioxide, water spray, or foam extinguishers. For large fires, use water spray, fog, or foam. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Bromacil B:0640

Molecular Formula: $C_9H_{13}BrN_2O_2$

Synonyms: Borea; Borocil extra; Bromacil 1.5; alpha-Bromacil 80 WP; Bromax; Bromazil; 5-Bromo-3-*sec*-butyl-6-methyluracil; 5-Bromo-6-methyl-3-(1-methylpropyl)-2,4-(1H,3H)-pyrimidinedione; 5-Bromo-6-methyl-3-(1-methylpropyl)-2,4(1H,3H)-pyrimidinedione; 3-*sec*-Butyl-5-bromo-6-methyluracil (German); Croptex onyx; Cynogan; Dupont herbicide 976; Eerex; Eerex granular weed killer; Eerex water soluble granular weed killer; Fenocil; Herbicide 976; Hydon; Hyvar; Hyvarex; Hyvar-EX; Hyvar X; Hyvar X-7; Hyvar X Bromacil; Hyvar X weed killer; Hyvar X-WS; Krovar II; Nalkil; 2,4(1H,3H)-Pyrimidinedione, 5-bromo-6-methyl-3-(1-methylpropyl)-; Uracil, 5-Bromo-3-*sec*-butyl-6-methyl; Uragan; Uragon; Urox; Urox B; Urox B water soluble concentrate weed killer; Urox-HX; Urox HX granular weed killer

CAS Registry Number: 314-40-9; *(alt.)* 154670-12-9

RTECS® Number: YQ9100000

UN/NA & ERG Number: NA1993 [For Domestic Bulk Shipments: Proper shipping name: Combustible liquid, n.o.s. (Ethanol, Methanol)]/128

EC Number: 206-245-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act: Priority List (55FR1470).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bromacil is a noncombustible colorless, crystalline solid, that may be dissolved in a flammable liquid. Molecular weight = 261.2; Specific gravity (H_2O:1) = 1.55 at 25°C; Boiling point = (sublimes); Freezing/Melting point = 158.3°C (sublimes); Vapor pressure = 0.0008 mmHg at 25°C (NIOSH); 3.1×10^{-7} mmHg (EPA); Flash point (*in ethanol or methanol*) = 44°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0; (*in ethanol or methanol*): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water; 0.08% at 77°F/25°C. Commercial formulations use carrier solvents that may alter the physical properties shown.

Potential Exposure: Compound Description: Agricultural Chemical, Mutagen, Reproductive Effector. Used for general weed or brush control in noncrop areas and primarily for the control of annual and perennial grasses and broadleaf weeds, both nonselectively on noncrop lands and selectively for weed control in a few crops (citrus and pineapple). A limit of 0.1 mg/kg of agricultural products is set in several countries.[35] Those exposed will be those involved in manufacture, formulation, and application.

Incompatibilities: Incompatible with strong acids, oxidizers, heat. Decomposes slowly in strong acids.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.68 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/10 mg/m^3 TWA.

ACGIH 10 mg/m^3 TWA, confirmed animal carcinogen with unknown relevance to humans.

No TEEL available.

Australia: TWA 1 ppm (10 mg/m^3), 1993; Belgium: TWA 1 ppm (11 mg/m^3), 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 1 ppm (10 mg/m^3); STEL 3 ppm (30 mg/m^3), 1999; France: VME 1 ppm (10 mg/m^3), 1999; Switzerland: MAK-W 1 ppm (10 mg/m^3), 1999; United Kingdom: TWA 1 ppm (11 mg/m^3), STE; 2 ppm (22 mg/m^3), 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Some states have set guidelines or standards for bromacil in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: A no-adverse-effects-level in drinking water has been calculated by NAS/NRC as 0.086 mg/L.[46] Some states have set guidelines for Bromacil in drinking water,[61] including Maine at 25 μg/L and Kansas at 87.5 μg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.1. Fish Tox: 6485.34001000 ppb MATC (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, upper respiratory system, lungs. Inhalation can cause irritation, coughing, and wheezing.

Long Term Exposure: Has caused thyroid affects in animals. Human Tox: 90.00000 ppb Health Advisory (LOW).

Points of Attack: Eyes, skin, respiratory system, thyroid.

Medical Surveillance: Before beginning work and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. Thyroid function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles (depending on physical state of material) and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where potential exists for exposures *over 1 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where potential for high exposures exists*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a

NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—Green: General storage may be used. Prior to working with bromacil you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, oxidizers, heat, and open flame.

Shipping: UN 1993 IMO/IATA: Proper Shipping Name: Flammable liquid, n.o.s. (Ethanol, Methanol) Hazard Class 3. Special Information: Flash point 44°C (for ocean transport only). Packing Group: III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid containing bromacil in vermiculite, dry sand, earth, or similar material. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index $K_{oc} = 32$.

Fire Extinguishing: Bromacil may burn, but does not readily ignite. Bromacil may be ignited by heat or open flame. Dust may cause an explosion. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including bromine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Bromacil should be incinerated in a unit operating at 850°C equipped with gas scrubbing equipment.[22]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 (45.4).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bromadiolone is white to off-white (yellowish) powder. Molecular weight = 527.41; Freezing/Melting point = 200−210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Potential Exposure: Bromadiolone is used as an anticoagulant rodenticide. It is bait for rodent control used against house mice, roof rats, warfarin-resistant Norway rats. It is also authorized by USDA for use in official establishments operating under the federal meat, poultry, shell egg grading, and egg products inspection program.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

Routes of Entry: Ingestion, inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

The compound is toxic by oral exposure, the oral LD_{50} rabbit is 1.0 mg/kg and LD_{50} = (oral-rat) 1.125 mg/kg (Extremely toxic).[9]

Short Term Exposure: Very toxic if ingested by skin and eye contact. May cause eye irritation. Bromadiolone has an acute oral toxicity $LD_{50} = 1-3$ mg/kg, rodents/nonrodents (HIGH). Dermal toxicity $LD_{50} = 9.4$ mg/kg, rabbits (HIGH).

Long Term Exposure: Studies of mutagenicity and teratogenicity have not shown any mutagenic, embryotoxic, or teratogenic effects. Coumarin and its derivatives may be carcinogenic to humans.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with bromadiolone you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Coumarin derivatives, solid, toxic, n.o.s., have a DOT label requirement of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is I, II.[19, 20]

Toxic solids, organic, n.o.s., requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal.

Fire Extinguishing: This material may burn but does not ignite readily. *Small fires:* dry chemicals, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Bromine is a fuming red to dark reddish-brown, nonflammable, volatile liquid with a suffocating odor. Soluble in water and alcohol. Molecular weight = 159.8; Specific gravity = (H_2O:1) = 3.12; Boiling point = 58.8°C; Freezing/Melting point = −7.2°C; Relative density of the vapor/air-mixture at 20°C (air = 1) = 2.12; Vapor pressure = 172 mmHg at 20°C. The Odor threshold is 3.5 ppm.[41] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2.

Potential Exposure: Compound Description: Human Data. Bromine is primarily used in the manufacture of gasoline antiknock compounds (1,2-dibromoethane). Other uses are for gold extraction; in brominating hydrocarbons; in bleaching fibers and silk; in the manufacture of military gas, dyestuffs; and as an oxidizing agent. It is used in the manufacture of many pharmaceuticals and pesticides.

Incompatibilities: A powerful oxidizer. May cause fire and explosions in contact with organic or other readily oxidizable materials. Contact with aqueous ammonia, acetaldehyde, acetylene, acrylonitrile, or with metals, may cause violent reactions. Anhydrous Br_2 reacts with aluminum, titanium, mercury, potassium; wet Br_2 with other metals. Also incompatible with alcohols, antimony, alkali hydroxides, arsenites, boron, calcium nitrite, cesium monoxide, carbonyls, dimethyl formamide, ethyl phosphine, fluorine, ferrous and mercurous salts, germanium, hypophosphites, iron carbide, isobutyronphenone, magnesium phosphide, methanol, nickel carbonyl, olefins, ozone, sodium, and many other substances. Attacks some coatings and some forms of plastic and rubber. Corrodes iron, steel, stainless steel, and copper.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.54 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.7 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.7 mg/m^3 TWA; 0.3 ppm/ 0.8 mg/m^3 STEL.

ACGIH TLV®[1]: 0.1 ppm/0.66 mg/m^3 TWA; 0.1 ppm TWA; 0.2 ppm STEL.

NIOSH IDLH: 3 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.033 ppm

PAC-1: **0.033** ppm

PAC-2: **0.24** ppm

PAC-3: **8.5** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

DFG MAK: No numerical value established. Data may be available.

Europe OEL: 0.1 ppm/0.7 mg/m^3 TWA

Arab Republic of Egypt: TWA 0.1 ppm (0.7 mg/m^3), 1993; Australia: TWA 0.1 ppm (0.7 mg/m^3); STEL 0.3 ppm (2 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.7 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.66 mg/m^3); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (0.7 mg/m^3), 1999; Finland: STEL 0.1 ppm (0.7 mg/m^3) [skin] 1999; France: VLE 0.1 ppm (0.7 mg/m^3), 1999; the Netherlands: MAC-TGG 0.7 mg/m^3, 2003; India: TWA 0.1 ppm (0.7 mg/m^3); STEL 0.3 ppm (2 mg/m^3), 1993; Japan: 0.1 ppm (0.65 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.7 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.7 mg/m^3), 1999; Poland: MAC (TWA) 0.7 mg/m^3, MAC (STEL) 2 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 0.5 mg/m^3, 1993; Sweden: NGV 0.1 ppm (0.7 mg/m^3), KTV 0.3 ppm (2 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.7 mg/m^3), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.7 mg/m^3), 1993; United Kingdom: TWA 0.1 ppm (0.66 mg/m^3); STEL 0.3 ppm (2.0 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm; STEL 0.2 ppm. Several States have set guidelines or standards for bromine in ambient air[60] ranging from 2.33 μg/m^3 (New York) to 7.0 μg/m^3 (Florida and North Dakota) to 11.0 μg/m^3 (Connecticut) to 17 μg/m^3 (Nevada) to 200 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #6011, OSHA Analytical Method ID-108.

Permissible Concentration in Water: Russia has set a MAC value of 0.2 mg/L in water bodies used for domestic purposes. Maine has set a guideline[61] for drinking water of 660 μg/L.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

The majority of exposures to bromine occur by inhalation and typically lead to symptoms of ocular, nasal, and respiratory irritation. A corrosive liquid, bromine can cause severe eye and skin irritation and burns that may cause permanent damage and scarring. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Short Term Exposure

Symptoms of exposure can include dizziness, headache, lacrimation (discharge of tears), epistaxis (nosebleed); cough, feeling of oppression; abdominal pain; diarrhea. Signs and symptoms of poisoning include eye redness and lacrimation, nose and throat irritation, cough, and dyspnea. Ingestion of liquid bromine can cause abdominal pain and hemorrhagic gastroenteritis with secondary shock. Signs and symptoms might also include brown discoloration of mucous membranes and the tongue.

Inhalation: Small amount will cause coughing, nosebleed, dizziness, and headache followed by abdominal pain and diarrhea and sometimes measles-like eruption on trunk and extremities. *Skin contact:* causes pustules and painful nodules in exposed areas of skin; if not removed will cause deep, painful ulcers. *Ingestion (of liquid):* causes burning pain in mouth and esophagus, lips and mucous membranes stained brown; severe gastroenteritis evidenced by abdominal pain and diarrhea; cyanosis, and shock. Regular exposure to concentrations approaching the permissible exposure level causes irritability, loss of appetite, joint pains, and dyspepsia. Other symptoms include loss of cornea reflexes, inflammation of the throat, thyroid dysfunction, cardiovascular disorders, disorders of digestive tract. Inhalation exposure to 11−23 mg/m^3 produces severe choking. 30−60 mg/m^3 is extremely dangerous. 200 mg/m^3 is fatal in a short time. Vapors can cause acute as well as chronic poisoning. It has cumulative properties. It is irritating to the eyes and respiratory tract. Poisoning is due to the corrosive action on the gastrointestinal tract. Nervous, circulatory, and renal disturbances occur after ingestion. Ingestion of liquid can cause death due to circulatory collapse and asphyxiation from swelling of the respiratory tract. The lowest oral lethal dose reported for humans is 14 mg/kg. The lowest lethal inhalation concentration reported for humans is 1000 ppm.

Long Term Exposure: May cause acne-like eruptions on the skin. Repeated exposure may cause headache, chest pain; joint pain, and indigestion. Bronchitis or pneumonia may develop with cough, shortness of breath, and phlegm.

Points of Attack: Respiratory system, eyes, lungs, central nervous system.

Medical Surveillance: The skin, eyes, and respiratory tract should be given special emphasis during preplacement and periodic examinations. Chest x-rays as well as general health, lung, blood, liver, and kidney function should be considered. Exposure to other irritants or bromine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **4 h:** (At least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *2.5 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS*† (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *3 ppm:* CcrFS† (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s); or GmFS† (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprTS† (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS† (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE [any appropriate escape-type, self-contained breathing apparatus(es)].

*Substance causes eye irritation or damage; eye protection needed.

†Only *nonoxidizable sorbents* are allowed (not charcoal).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Store in a cool, dry room with ventilation along the floor. Keep sealed or glass stoppered. Protect against physical damage. Keep out of direct sunlight. Separate from combustibles, organics, or other readily oxidizable materials. Store above −7°C/20°F to prevent freezing but avoid heating above room temperature to prevent pressure increase which could rupture containers.

Shipping: Bromine requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." The Hazard Class is 8 and the Packing Group is I.[19, 20] A plus sign (+) symbol indicates that the designated proper shipping name (bromine or bromine solutions) and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wear eye protection. Wear positive pressure breathing apparatus and special protective clothing. Ventilate area of spill or leak. Collect for reclamation by absorbing it in vermiculite, dry sand, earth, or a similar material and deposit it in sealed containers in secured sanitary landfill. Potassium carbonate, sodium carbonate, sodium bicarbonate, lime, and sodium hydroxide solutions are neutralizing agents for liquid bromine spills. Do not touch material, stop leak if possible without risk. Use water spray to reduce vapors. *Do not* absorb in saw-dust or other combustible absorbents; avoid contact with metal implements. *Small spills:* absorb with sand or other noncombustible absorbent material and place in container. *Large spills:* dike spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

Bromine

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6.3
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.9/3.1
Night 4.1/6.6

Bromine solution and Bromine, solution (Inhalation Hazard Zone A)

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.1/1.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.9/3.1
Night 4.1/6.6

Small spills (From a small package or a small leak from a large package)

Bromine, solution (Inhalation Hazard Zone B)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.7/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.2/1.9
Night 2.1/3.3

Fire Extinguishing: Bromine is not combustible but enhances combustion of other substances. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Large volumes of concentrated solutions of reducing agents (bisulfites or ferrous salts) may be added.[24] The mixture is neutralized with soda ash or dilute HCl and flushed to the sewer with large volumes of water.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 45 (≥ 6007% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bromine pentafluoride is colorless to pale yellow liquid, with pungent odor. At temperatures above boiling point this chemical is a colorless gas. Molecular weight = 174.92; Specific gravity (H_2O:1) = 2.48; Relative vapor density (air = 1) = 6.1; Boiling point = 40.5°C; Freezing/Melting point = − 61°C; Vapor pressure = 328 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3₩. Reacts explosively with water.

Potential Exposure: Bromine pentafluoride is used as an oxidizer in liquid rocket propellant combinations; it may be used in chemical synthesis.

Incompatibilities: A powerful oxidizer. Bromine pentafluoride reacts with every known element except inert gases, nitrogen, and oxygen. It reacts violently with water, acids, acid fumes (releasing highly toxic fumes of bromine and fluorine). Incompatible with halogens, arsenic, selenium, alkaline halides, sulfur, iodine, glass, metallic halides, metal oxides, and metals (except copper, stainless steel, nickel and Monel®). Fire may result from contact with combustibles or organic matter at room temperature, and contact of this substance with water produces an explosion. Even under mild conditions this substance attacks organic compounds vigorously, often causing explosion. Decomposes in heat above 460°C.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 ppm/0.7 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 ppm/0.72 mg/m^3 TWA.

OSHA PEL: (Shipyards) 0.1 ppm/0.7 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 ppm

PAC-1: 0.15 ppm

PAC-2: **1.0** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Australia: TWA 0.1 ppm (0.7 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.7 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.72 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.7 mg/m^3), 1999; Finland: STEL 0.1 ppm (0.7 mg/m^3) [skin] 1999; France: VME 0.1 ppm (0.7 mg/m^3), 1999; Norway: TWA 0.6 mg[F]/m^3, 1999; the Netherlands: MAC-TGG 0.7 mg/m^3, 2003; Sweden: TWA 2 mg[F]/m^3, 1999; Switzerland: MAK-W 0.1 ppm (0.7 mg/m^3), 1999; United Kingdom: TWA 0.1 ppm (0.73 mg/m^3); STEL 0.3 ppm (2.2 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH Threshold Limit Value: TWA 0.1 ppm. Several states have set guidelines or standards for bromine pentafluoride in ambient air[60] ranging from 7.0 μg/m^3 (North Dakota) to 11.0 μg/m^3 (Virginia) to 14.0 μg/m^3 (Connecticut) to 17.0 μg/m^3 (Nevada).

Determination in Air: Sample collection by impinger or fritted bubbler, analysis by ion-specific electrode.

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Respiratory irritation is noted. See also "Fluorine" and "Chlorine trifluoride."

Short Term Exposure: Can cause severe irritation and burns of the eyes and skin. Inhalation can irritate the nose and throat; higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can cause kidney, liver, and lung damage.

Points of Attack: Eyes, skin, and mucous membranes.

Medical Surveillance: Kidney, liver, and lung function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use of self-contained breathing apparatus is recommended.[24] Where there is potential exists for exposures over 0.1 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with bromine pentafluoride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, acids, acid fumes, and combustibles. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Bromine pentafluoride requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 5.1 and Packing Group I. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Gas:* Ventilate area of spill or leak to disperse gas. If this is a gas leak, stop flow of gas. If the leak from a cylinder cannot be stopped, remove the container to a safe place in the open air, and repair leak, or allow cylinder to empty. *Liquid:* Cover spill with dry lime, sand, or soda ash and deposit in closed and sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.6/1.4

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.9/1.5
Night 2.0/3.2

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 2.6/4.1

Fire Extinguishing: Not combustible but enhances combustion of other substances. May spontaneously ignite combustible and organic materials. *Do not* use water or water-based extinguishers to fight fire; reacts explosively with steam or water. An exception is when large amounts of combustible material are involved and firefighters can protect themselves by distance or barrier from the violent reaction with water. Use carbon dioxide or dry chemical on small fires.[17] Poisonous gases are produced in fire, including bromine and fluorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Allow gas to flow into mixed caustic soda and slaked lime solution.[24] Return unwanted cylinders to supplier if possible.

RTECS® Number: ED2275000

UN/NA & ERG Number: UN1746/144

EC Number: 232-132-1

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade); *Theft hazard* 45 (≥6.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 15,000 lb (6810 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bromine trifluoride is a noncombustible, colorless to gray-yellow fuming liquid with an extremely irritating odor. Molecular weight = 136.9. Specific gravity (H_2O:1) = 2.8 at 20°C; Boiling point = 135°C; Freezing/Melting point = 8.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3₩. Reacts with water, forming corrosive gas.

Potential Exposure: Bromine trifluoride is used as a fluorinating agent and an electrolytic solvent.

Incompatibilities: A powerful oxidizer, highly reactive and a dangerous explosion hazard. Contact with water or other hydrogen containing materials forms hydrogen fluoride gas. Reacts with almost all elements except for inert gases. Violent reaction with reducing agents; organic materials; strong acids; strong bases; halogens, salts (antimony salts), metal oxides; and many other materials. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

NIOSH IDLH: 250 mg[F]/m^3.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Bromine trifluoride can affect you when breathed in and passing through your skin. This substance is a corrosive chemical and contact can severely irritate and burn the skin and eyes (causing possible blindness). Exposure can severely irritate the nose, throat, and lungs. Higher exposures can cause a buildup of fluid in the lungs which can cause death.

Long Term Exposure: Repeated exposure can cause skin rash, lung irritation, and bronchitis; and may cause a buildup of bromine and fluorine in the body.

Points of Attack: Lungs, skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest x-ray after acute overexposure. Blood fluorine and bromine levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min without stopping, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: *Clothing:* Avoid skin contact with bromine trifluoride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Bromine trifluoride must be stored to avoid contact with water (which releases hydrogen fluoride gas), ammonium halides, antimony trioxide, antimony chloride, and solvents (such as ether, acetone, acetic acid, toluene, and so on), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from organic and/or combustible materials (such as wood, cotton, and straw), chloride and bromide salts, and many metals. Whenever bromine trifluoride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Bromine trifluoride requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 5.1 and Packing Group I. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 0.3/0.5

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 2.4/3.8

Fire Extinguishing: Bromine trifluoride does not burn but may ignite combustible materials. Do not use water or foam. Use dry chemical or CO_2 extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act, 55FR1470 Priority List; 40CFR 141.40(e), re: community and noncommunity water systems.

TSCA 40CFR766.38 precursor chemical substances reporting.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R38; R51/53; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Bromobenzene is a flammable, clear, colorless mobile liquid with a pleasant odor. Molecular weight = 157.02. Specific gravity (H_2O:1) = 1.48; Boiling point = 156°C; Freezing/Melting point = −31°C; Flash point = 51°C; Autoignition temperature = 565°C. Explosive limits in air: LEL = 6%; UEL = 36.5%[icsc]. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Very slightly soluble in water; solubility = 0.04% at 25°C.

Potential Exposure: Compound Description: Mutagen. Bromobenzene is used as an intermediate in organic synthesis, and as an additive in motor oil and fuels. During chlorination water treatment, bromobenzene can be formed in small quantities.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, alkaline earth metals (barium, calcium, magnesium, strontium, etc.), metallic salts; with risk of violent reactions. May accumulate static electrical charges; may cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.25 ppm
PAC-1: 4 ppm
PAC-2: 25 ppm
PAC-3: 350 ppm

Hungary: TWA 3 mg/m^3; STEL 6 mg/m^3 [skin] 1993; Russia: STEL 3 mg/m^3, 1993.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.1$.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Observations in humans: Bromobenzene irritates the skin and is a central nervous system depressant in humans. In view of the relative paucity of data on the carcinogenicity, teratogenicity, and long-term oral toxicity of bromobenzene, estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence. It is recommended that studies to produce such information be conducted before limits in drinking water can be established. Since bromobenzene was negative on the *Salmonella*/microsome mutagenicity test, there should be less concern than with those substances that are positive. LD_{50} = (oral-rat) 2699 mg/kg (slightly toxic).[9]

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Exposure can cause dizziness, lightheadedness, and unconsciousness.

Long Term Exposure: May cause liver and kidney damage.

Points of Attack: Skin, liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. ACGIH recommends polyvinyl alcohol or Viton as protective materials. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with bromobenzene you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerated area away from incompatible materials listed above. Protect from light.[52] Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Bromobenzene requires a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Follow by washing spill area with alcohol then with soap and water. Do not flush spilled material into sewer. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and hydrogen bromide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[24]

Description: Bromodichloromethane is a liquid. Molecular weight = 163.8; Specific gravity (H_2O:1) = 1.98; Boiling point = 90°C. Odor threshold = about 1675 mg/m^3. Soluble in water.

Potential Exposure: This compound may find application in organic synthesis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 150 mg/m^3

DFG MAK: [skin]; Carcinogen Category 3B

Permissible Concentration in Water: The Maximum Contaminant Level (MCL) for total trihalomethanes (including bromodichloromethane) in drinking water has been set by the US EPA at 0.10 mg/L (44 RF 68624). Illinois and Vermont have set guidelines for Bromodichloromethane in drinking water.[61] Illinois at 1.0 μg/L and Vermont at 100 μg/L.

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = <2.0.

Harmful Effects and Symptoms

Bromodichloromethane is acutely toxic to mice. It was mutagenic in the *Salmonella typhimurium* TA 100 bacterial test system and carcinogenic in mice with the same qualification for result significance as for dichloromethane noted. Positive correlations between cancer mortality rates and levels of brominated trihalomethanes in drinking water in epidemiological studies have been reported. LD_{50} = (oral-rat) 916 mg/kg (slightly toxic).[9]

Short Term Exposure: This material irritates the eyes, nose, and mucous membranes.[52]

Long Term Exposure: May cause cancer in humans.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerated space in a tightly closed container. Protect from light.[52] A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic, liquids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Contain and isolate spill to limit spread. Construct clay-bentonite dams to isolate the spill. Treatment alternatives for contaminated waste include activated charcoal treatment. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not combustible. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Package in epoxy-lined drums. Destroy by high-temperature incinerator equipped with an HCl scrubber.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Bromoform is a colorless (turns yellow on exposure to air) with a sweet-smelling, chloroform-like odor. Odor threshold = 0.447 ppm. Molecular weight = 252.8; Specific gravity (H_2O:1) = 2.9; Boiling point = 149.5°C; Freezing/Melting point = 8.3°C (to hexagonal crystals); Vapor pressure = 5 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 0.1% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Bromoform is used in pharmaceutical manufacturing; as an ingredient in fire-resistant chemicals and gauge fluids; and as a solvent for waxes, greases, and oils.

Incompatibilities: Heat causes bromoform to decompose forming toxic and corrosive hydrogen bromide and bromine. Bromoform is a weak acid. Reacts violently with oxidants, bases in powdered form. Reacts with chemically active metals (alkaline metals), powdered aluminum, potassium, sodium, zinc, and magnesium and acetone under basic conditions, causing fire and explosion hazard. Attacks some forms of plastic, rubber, and coating. Corrosive to most metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.34 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.5 ppm/5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 ppm/5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 ppm/5.2 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.5 ppm

PAC-1: 25 ppm

PAC-2: 200 ppm

PAC-3: 850 ppm

DFG MAK: Carcinogen Category 3B.

NIOSH IDLH: 850 ppm.

Australia: TWA 0.5 ppm (5 mg/m^3) [skin] 1993; Austria: MAK 0.5 ppm (5 mg/m^3), 1999; Belgium: TWA 0.5 ppm (5.2 mg/m^3) [skin] 1993; Denmark: TWA 0.5 ppm (5 mg/m^3) [skin] 1999; Finland: TWA 0.5 ppm (5 mg/m^3); STEL 1.5 ppm (15 mg/m^3) [skin] 1999; France: VME 0.5 ppm (5 mg/m^3) [skin] 1999; the Netherlands: MAC-TGG 5 mg/m^3 [skin] 2003; the Philippines: TWA 0.5 ppm (5 mg/m^3) [skin] 1993; Poland: TWA 5 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (5600 mg/m^3), 1999; United Kingdom: TWA 0.5 ppm (5.3 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for bromoform in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 110 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated, or[18] OSHA Analytical Method #7, Organic Vapors.

Permissible Concentration in Water: See Regulatory Authority and Advisory Bodies above. Mexico's drinking water criteria is 0.002 mg/L. This substance is highly persistent; bioaccumulation or risk of cancer, reduce exposure by humans to minimum. Two states have set guidelines for bromoform in drinking water: 1.0 μg/L in Illinois and 40 μg/L in Maryland.[61]

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = 2.4.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Can cause irritation to the nose and throat, tearing, reddening of the face, dizziness, and death. Exposure of dogs to 7000 ppm for 8 min causes death. *Skin:* Can be absorbed. Large quantities can lead to symptoms listed under ingestion. *Eyes:* Can cause irritation and tearing. *Ingestion:* Causes burning of mouth and throat. Can cause headache, dizziness, disorientation, slurred speech; troubled breathing; tremors and unconsciousness. The estimated lethal dose is 1/3 ounce for a 150-pound adult. However, LD_{50} = (oral-rat) 1147 mg/kg (slightly toxic).[9]

Long Term Exposure: Bromoform can cause liver damage. May have an effect on the nervous system. Repeated exposure can cause skin rash. Has caused cancer in laboratory animals; whether it does so in humans is unknown. Very irritating substances, such as bromoform may affect the lungs.

Points of Attack: Skin, liver, kidneys, respiratory system, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$)*:* polyvinyl alcohol gloves; Viton™ gloves, suits. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: OSHA: *12.5 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *850 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode. *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Bromoform must be stored to avoid contact with incompatible materials listed above. Store in tightly closed containers in a cool well-ventilated area away from heat and light.

Shipping: Bromoform requires a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Bromoform itself does not burn. Poisonous gases are produced in fire, including bromine and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound

increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Purify by distillation and return to suppliers.[22] Alternatively, incinerate with excess fuel.

CAS Registry Number: 101-55-3

UN/NA & ERG Number: UN3082/171

EC Number: 202-952-4

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): U030.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.055; Nonwastewater (mg/kg), 15.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4-Bromophenyl phenyl ether is a brominated diphenylether and a liquid at common ambient temperatures. Molecular weight = 249.10; Boiling point = 310.14°C; Specific gravity (H_2O:1) = 1.449 (1.4208 at 20°C); Freezing/Melting point = 18.72°C; Vapor pressure = 0.0015 mmHg at 20°C; Flash point = >110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Poor solubility in water; solubility = 4.8 mg/L at 25°C.

Potential Exposure: Very little information on 4-bromophenyl phenyl ether exists. It is prepared by brominating diphenyl ether with Br_2 at 95−100°C in carbon tetrachloride.[US EPA, 1986] 4-Bromophenyl phenyl ether has been identified in raw water, in drinking water, and in river water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 200 mg/m^3

Permissible Concentration in Water: *Freshwater Aquatic Life:* For 4-bromophenyl phenyl ether the criterion to protect freshwater aquatic life as derived using the guidelines is 6.2 μg/L as a 24-h average and the concentration should not exceed 14 μg/L at any time. *Saltwater Aquatic Life:* For saltwater aquatic life, no criterion for 4-bromophenyl phenyl ether can be derived using the guidelines, and there is insufficient data to estimate a criterion using other procedures. *Human Health:* Because of a lack of adequate toxicological data on nonhuman mammals and humans, protective criteria cannot be derived at this time for this compound.

Determination in Water: *p*-Monobromodiphenyl ether (MBDE) can be determined by the standard US EPA Method 611-Haloethers. Chromatographic conditions are described in US EPA (1986). The limit of determination in municipal and industrial waste waters is 2.3 μg/L. Octanol−water coefficient: Log K_{ow} = 4.28 (4.08−4.94) [US EPA (1984, 1986)]. According to US EPA (1986), there are monitoring data for *p*-monobromodiphenyl ether in water in the USA. The mean concentration was 0.2 mg/L (range 0−202.7 mg/L, 2193 listings) in water.

Harmful Effects and Symptoms

4-Bromophenyl phenyl ether has been tested in the pulmonary adenoma assay, a short-termed carcinogenicity assay. Although the results were negative, several known carcinogens also gave negative results. No other health effects were available. Skin contact can cause tissue defatting and dehydration leading to dermatitis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color Code—Green: General storage may be used. Store away from heat, flames, or oxidizing materials; ethers tend to peroxidize when exposed to air forming unstable peroxides that may detonate with extreme violence.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire including hydrogen bromide gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with alkaline flue gas scrubbing.

Regulatory Authority and Advisory Bodies

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin (male, female) (1-bromopropane) 12/7/04; (female, male) (2-bromopropane) 5/31/05.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (*n*-propyl bromide).

European/International Regulations:

(*1-bromopropane*) Hazard Symbol: F+, T; Risk phrases: R60; R11; R36/37/38; R48/20; R63; R67; Safety phrases: S53; S45; (*2-bromopropane*) Hazard Symbol: F + , T; Risk phrases: R60; R11; R48/20; R66; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class) (*2-bromopropane*): 2—Water polluting (1-bromopropane); 1.

Description: Bromopropane is a toxic and highly flammable, colorless liquid; Flash point ≤22°C. Molecular weight = 123.0 (1-bromopropane); 123.0 (2-bromopropane); Boiling point = 71°C (1-bromopropane); 59.4°C (2-bromopropane); Freezing/Melting point = − 110°C (1-bromopropane); − 89°C (2-bromopropane); Specific gravity (H_2O:1): 1.35 (1-bromopropane); Flash point = − 10°C (cc) (1-bromopropane); Autoignition temperature = 490°C (1-bromopropane). Explosive Limits in air: LEL = 4.6%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): (as *n*-propyl bromide): Health 2, Flammability 3, Reactivity 0; (2-bromopropane) Health 2, Flammability 3, Reactivity 3. Soluble in water; solubility = 0.25% at 20°C (1-bromopropane).

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector. Used for making other chemicals.

Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosion.

Permissible Exposure Limits in Air

1-Bromopropane

ACGIH TLV®[1]: 10 ppm/50 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 30 ppm

PAC-2: 2500 ppm

PAC-3: 2500 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.12.

Routes of Entry: Inhalation, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Exposure can cause dizziness, lightheadedness, and unconsciousness. Very high exposures can cause death.

Long Term Exposure: Repeated or high exposures may cause liver and lung damage. May be a developmental toxicant.

Points of Attack: Liver, lungs.

Medical Surveillance: Lung and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Outside or detached storage is preferred. Prior to working with Bromopropane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: 2-Bromopropane requires a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3, Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid in vermiculite, dry sand, earth or similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen bromide, are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling

streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Brucine B:0740

Molecular Formula: $C_{23}H_{26}O_4 \cdot 4H_2O$

Common Formula: $C_{23}H_{26}O_4 \cdot 4H_2O$

Synonyms: Brucina (Spanish); (−)Brucine; (−)Brucine dihydrate; Brucine hydrate; 2,3-Dimethoxystrichnidin-10-one; 10,11-Dimethoxystrychnine; 2,3-Dimethoxystrychnine; Dimethoxystrychnine; 10,11-Dimethylstrychnine; Strychnidin-10-one, 2,3-Dimethoxy-; Strychnine, 2,3-dimethoxy-

CAS Registry Number: 357-57-3 (anhydrous); 5892-11-5 (hydrate)

RTECS® Number: EH8925000

UN/NA & ERG Number: UN1570/152

EC Number: 206-614-7 [*Annex I Index No.:* 614-006-00-1] (*anhydrous*)

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P018.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: (*anhydrous*) Hazard Symbol: T+, N; Risk phrases: R26/28; R52/53; Safety phrases: S1/2; S13; S45; S61; European/International Regulations (*hydrate*): Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Brucine is a colorless to white, odorless, crystalline solid with a very bitter taste. Molecular weight = 394.46; Boiling point = 470°C; Freezing/Melting point = 178°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Poor solubility in water; solubility = 1 gm/1320 mL.

Potential Exposure: Compound Description: Drug, Natural Product. Brucine is used as denaturant for Ethanol, also resolving agent for isomer separation; in the manufacture of other chemicals, in perfumes, as a medication for animals, and as a poison for rodents. It is an alkaloid, produced from strychnos seeds.

Incompatibilities: Reacts with strong oxidizers. Finely dispersed material in air can cause dust explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Anhydrous

TEEL-0: 0.3 mg/m^3

PAC-1: 0.75 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 40 mg/m^3

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <1.0$ (0.9).

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Exposure can cause headache, nausea, vomiting, ringing in the ears; disturbed vision; restlessness, excitement, twitching and convulsions, seizures; breathing difficulties. Severe poisoning can cause paralysis, unconsciousness, and death. The probable fatal dose in adult is estimated at 1 g.[Gosselin, 1984]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Protect against physical damage. Outside or detached storage is preferred. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with brucine you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers.

Shipping: Label: "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Brucine may burn but does not readily ignite. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 200-250-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1998; NTP (K) NTP: Known to be a human carcinogen.

California Proposition 65 Chemical: Cancer 2/27/87.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Busulfan is a white crystalline powder. Molecular weight = 246.3; Freezing/Melting point = 114−118°C. Decomposes in water.

Potential Exposure: Those involved in the manufacture, formulation, or use of this compound which finds application as an insect sterilant, and as a chemotherapeutic agent taken orally to treat some kinds of leukemia.

Incompatibilities: Oxidizers, moist air, and water.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin causing rash. Exposure can cause nausea, vomiting, diarrhea, and seizures.

Long Term Exposure: A carcinogen in humans causes leukemia, kidney, and uterine cancer. A probable teratogen in humans. May damage the developing fetus. May cause testes damage in males (decrease sperm count, cause impotence), and decrease fertility in females. Long-term exposure may result in cataracts, lung irritation, permanent lung scarring, bone marrow damage, liver damage. Symptoms of exposure include bleeding tendencies, decreased leukocyte count, or depressed bone marrow activity.[52]

Points of Attack: See above.

Medical Surveillance: Completed blood count, chest x-ray, lung function tests, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately with water or normal saline for 20−30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a refrigerator and protect from exposure to oxidizers or moisture.[52] A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The label requirement for medicine, solid, toxic, n.o.s. is "POISONOUS/TOXIC MATERIALS." Medicine, solid, toxic, n.o.s., fall in Hazard Class 6.1 and busulfan falls in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

1,3-Butadiene B:0760

Molecular Formula: C_4H_6

Common Formula: $H_2C{=}CH{-}CH{=}CH_2$

Synonyms: Biethylene; Bivinyl; Buta-1,3-dien (German); α-γ-Butadiene; Buta-1,3-diene; Butadiene; 1,3-Butadieno (Spanish); Divinyl; Erythrene; NCI-C50602; Pyrrolylene; Vinylethylene

CAS Registry Number: 106-99-0

RTECS® Number: EI9275000

UN/NA & ERG Number: UN1010 (stabilized)/116P

EC Number: 203-450-8 [*Annex I Index No.:* 601-013-00-X]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 ($\geq$1.00% concentration).

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse; NTP: 11th Report on Carcinogens, 2004: Known human carcinogen; IARC: Human Sufficient Evidence; Animal Limited Evidence, *carcinogenic to humans*, Group 1; NTP (K) NTP: Known to be a human carcinogen; EPA: (when inhaled) Carcinogenic to humans; strong evidence of human carcinogenicity; combinations of evidence.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical; Carcinogen 4/1/88; Developmental, female, male 4/16/04.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: F+, T; Risk phrases: R45; R46; R12; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 1,3-Butadiene is a toxic and extremely flammable, colorless, liquefied gas with a gasoline-like odor. Molecular weight = 54.1; Specific gravity (H_2O:1) = 0.6; Boiling point = −4°C; Freezing/Melting point = −109°C; Vapor pressure = 2.4 mmHg at 20°C; Flash point = −76°C (liquid); Autoignition temperature = 420°C. The explosive limits are: LEL = 2.0%; UEL = 11.5%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. The Odor threshold is 0.45 ppm. Floats and boils on water; practically insoluble; solubility = 0.1%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. 1,3-Butadiene is used chiefly as the principal monomer in the manufacture of many types of synthetic rubber and other chemicals. Butadiene is finding increasing usage in the formation of rocket fuels, plastics, and resins.

Incompatibilities: Self-reactive. May form explosive peroxides on exposure to air. High heat can cause a violent chemical reaction that will cause container rupture. Fires, explosions, or hazardous polymerization may result from contact with air, strong oxidizers, strong acids, ozone, rust, nitrogen dioxide, phenol, chlorine dioxide, crotonaldehyde, or a free radical polymerization initiator, such as hydroquinone. Unsafe in contact with acetylide-forming materials, such as monel, copper, and copper alloys (piping material for this gas must not contain more than 63% copper). Add inhibitor (such as tributylcatechol) to prevent self-polymerization and monitor to insure effective levels are maintained at all times. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.21 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/2.21 mg/m^3 TWA; 5 ppm/11.05 mg/m^3 STEL (see CFR291910.1061 & CFR291910.19).

NIOSH REL: Potential occupational carcinogen. Reduce exposures to the lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 2 ppm/4.4 mg/m^3 TWA; Suspected Human Carcinogen.

NIOSH IDLH: 2000 ppm [LEL].

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **670** ppm

PAC-2: **5300** ppm

PAC-3: **2200** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group 2

Australia: TWA 10 ppm (22 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (22 mg/m^3), carcinogen, 1993; Denmark: TWA 10 ppm (22 mg/m^3), 1999; Finland: TWA 50 ppm (73 mg/m^3), carcinogen, 1999; France: VME 10 ppm (36 mg/m^3), 1993; Hungary: STEL 10 mg/m^3, carcinogen, 1993; the Netherlands: MAC-TGG 46.2 mg/m^3, 2003; Norway: TWA 1 ppm (2.2 mg/m^3), 1999; the Philippines: TWA 1000 ppm (2200 mg/m^3), 1993; Poland: MAC (TWA) 10 mg/m^3; STEL 40 mg/m^3, 1999; Russia: STEL 100 mg/m^3, 1993; Sweden: NGV 10 ppm (20 mg/m^3), KTV 20 ppm (40 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 5 ppm (11 mg/m^3), carcinogen, 1999; Turkey: TWA 1000 ppm (2200 mg/m^3), 1993: United Kingdom: TWA 10 ppm (22 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. The Czech Republic[35] has set a very stringent TWA of 20 mg/m^3 with a ceiling value of 40 mg/m^3. Several states have set guidelines or standards for butadiene in ambient air[60] ranging from 0 μg/m^3 (North Dakota) to 0.003 μg/m^3 (Michigan) to 0.035 μg/m^3 (Massachusetts and North Carolina) to 220 μg/m^3 (Virginia) to 22,000 μg/m^3 (Connecticut) to 52,400 μg/m^3 (Nevada).

Determination in Air: Adsorption by charcoal tube[2]; workup with CH_2C_{12}; analysis by gas chromatography/flame ionization detection. Use NIOSH Analytical Method #1024[18] or OSHA Analytical Method ID-56.

Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/^{3} in water bodies used for domestic purposes.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <2.0.

Routes of Entry: Inhalation of gas or vapor, eye, and/or skin contact.

Harmful Effects and Symptoms

Initial signs and symptoms of exposure include blurred vision, nausea, prickling and dryness of the mouth, throat, and nose, followed by fatigue, headache, vertigo, decreased blood pressure and pulse rate, unconsciousness, and respiratory paralysis. Concentrations above 8000 ppm may cause narcotic effects, dizziness, headache, drowsiness, and loss of consciousness. Death can result 23 min after inhaling air containing 25% butadiene. It is a central nervous system depressant in high concentrations. It may be irritating and cause burns to skin, mucous membranes, and eyes. Contact with the liquid may cause frostbite. It can asphyxiate by the displacement of air.

Short Term Exposure: 1,3 Butadiene irritates the eyes, skin, and respiratory tract. Rapid evaporation of the liquid may cause frostbite. Inhalation of the vapors may cause effects on the central nervous system, sleepiness, and loss of consciousness. Very high exposures may cause death.

Long Term Exposure: This chemical is a probable carcinogen in humans; it may have effects on the bone marrow and liver. There is limited evidence that this chemical is a teratogen in animals, and that it may also damage the testes and ovaries. It may cause heritable genetic damage in humans. Animal tests show that this substance may cause toxic effects upon human reproduction. See also NIOSH Profile (Alkenes), SRI, 2/77. NIOSH Current Intelligence Bulletin 41, 1984.

Points of Attack: Eyes, respiratory system, central nervous system, reproductive system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Viton™ gloves, suits, Saranex™, Barricade™ coated suits; CPF3® suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h:** (At least 4 h but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

From [1910.1051] $\leq$ *5 ppm:* Air-purifying half-mask or full-face-piece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 4 h. $\leq$ *10 ppm:* Air-purifying half-mask or full-face-piece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 3 h. $\leq$ *25 ppm:* (1) Air-purifying half-mask or full-face-piece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 2 h; (2) Any powered air-purifying respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 1 h; or (3) Continuous-flow supplied-air respirator equipped with a hood or helmet. $\leq$ *50 ppm:* (1) Air-purifying full-face-piece respirator equipped with approved butadiene or organic vapor cartridges or canisters. Cartridges or canisters shall be replaced every 1 h; or (2) Powered air-purifying respirator (PAPR) equipped with a tight-fitting face-piece and approved butadiene or organic vapor cartridges. PAPR cartridges shall be replaced every 1 h. $\leq$ *1000 ppm:* Supplied-air respirator equipped with a half-mask or full face-piece and operated in a pressure-demand or other positive-pressure mode. *>1000 ppm, unknown concentration, or firefighting*: (1) Self-contained breathing apparatus equipped with a full face-piece and operated in a pressure-demand or other positive-pressure mode; or (2) Any supplied-air respirator equipped with a full face-piece and operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode. *Escape from IDLH conditions (IDLH = 2000 ppm):* (1) Any positive-pressure self-contained breathing apparatus with an appropriate service life; or (2) Any air-purifying full-face-piece respirator equipped with a front- or back-mounted butadiene or organic vapor canister.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Outdoor or detached storage is preferred. Store cylinders upright. Prior to working with 1,3-butadiene, you should be trained on its proper handling and storage. Do not store uninhibited 1,3-butadiene. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, heat and sunlight. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Butadiene, inhibited, requires a shipping label of "FLAMMABLE GAS." This material falls in Hazard Class 2.1 and does not have an assigned Packing Group.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse gas. Attempt to stop leak if without hazard. Use water spray to knock down vapors. Avoid breathing vapors. Keep upwind. Do not handle broken packages without protective equipment. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: See respirator selection for *>1000 ppm, unknown concentration, or firefighting*. This chemical is an extremely flammable liquid. Let tank car, tank truck, or storage tank burn unless leak can be stopped; with smaller tanks or cylinders, extinguish/isolate from other flammables. Stop flow of gas before extinguishing fire. *Small fires:* dry chemical or carbon dioxide. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Stay away from ends of tanks. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Cool container with water using unmanned device until well after fire is out. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Butadiene vapors are uninhibited and may form polymers in vents or flame arresters of storage tanks, resulting in stoppage of vents. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥ 1.00% concentration).
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations (*n- & isobutane*): Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16.
Iso-isomer: Clean Air Act: Accidental Release Prevention/Flammable Substances [Section 112(r), Table 3], TQ = 10,000 lb (4540 kg).
European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16 (see Appendix 4).
WGK (German Aquatic Hazard Class): Nonwater polluting agent.
Butane containing ≥ 0.1% butadiene: European/International Regulations: Hazard Symbol: F+, T; Risk phrases: R45; R46; R12; Safety phrases: S53; S45.
Description: Butane is a colorless, extremely flammable, liquefied, compressed gas. A liquid below 30°F/−1.1°C. Natural gas-like odor. Odor threshold: 204 ppm. Molecular weight = 58.12; Specific gravity (H_2O:1) = 0.6; Relative vapor density (air = 1) = 2.11; Boiling point = −0.5°C; Freezing/Melting point = −138°C; Vapor pressure = 2.05 atm at 19°C. The explosive limits are: LEL = 1.9%; UEL = 8.4%; Flash point = −60°C (flammable gas); Autoignition temperature = 287°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Practically insoluble in water; solubility = 6×10^{-3} at 20°C.
Isobutane is a colorless, extremely flammable, liquefied, compressed gas. A liquid below 11°F/−11°C. Gasoline-like odor. Molecular weight = 58.1; Specific gravity (H_2O:1) = 0.6 (liquid); Boiling point = −12°C; Freezing/Melting point = −159°C; Vapor pressure = 3.1 mmHg at 20°C; Relative vapor density (air = 1) = 2.06. The explosive limits are: LEL = 1.8%; UEL = 8.4%; Flash point = flammable gas; Autoignition temperature = 460°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.
Potential Exposure: Compound Description: Human Data. It is used as a raw material for butadiene, as a fuel for household or industrial purposes (alone or in admixture with propane). It is also used as an extractant, solvent, and aerosol propellant. It is used in plastic foam production as a replacement for fluorocarbons.
Incompatibilities: Strong bases, strong oxidizers (e.g., nitrates & perchlorates), chlorine, fluorine, (nickel carbonyl + oxygen).
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.38 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 800 ppm/1900 mg/m^3 TWA.
ACGIH TLV®[1]: 800 ppm TWA.
Protective Action Criteria (PAC)*
TEEL-0: 1000 ppm
PAC-1: **5500** ppm
PAC-2: **17,000** ppm
PAC-3: **53,000** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.
Iso-isomer
TEEL-0: 800 ppm
PAC-1: 2400 ppm
PAC-2: 4000 ppm
PAC-3: 15,000 ppm
DFG MAK: 1000 ppm (2400 mg/m^3) (both isomers).
Australia: TWA 800 ppm (1900 mg/m^3), 1993; Austria: MAK 800 ppm (1900 mg/m^3) (all isomers), 1999; Belgium: TWA 800 ppm (1900 mg/m^3), 1993; Denmark: TWA 500 ppm (1200 mg/m^3), 1999; Finland: TWA 800 ppm (1900 mg/m^3); STEL 1000 ppm (2350 mg/m^3), 1999; France: VME 800 ppm (1900 mg/m^3), 1999; Hungary: TWA 300 mg/m^3; STEL 900 mg/m^3, 1993; the Netherlands: MAC-TGG 1430 mg/m^3, 2003; Japan: 500 ppm (1200 mg/m^3), 1999; Norway: TWA 250 ppm (600 mg/m^3), 1999; Poland: TWA 1900 mg/m^3; STEL 3000 mg/m^3, 1999; Russia: TWA 500 ppm; STEL 300 mg/m^3, 1993; Switzerland: MAK-week 800 ppm (1900 mg/m^3), 1999; United Kingdom: TWA 600 ppm (1450 mg/m^3); STEL 750 ppm (1810 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New

Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 800. Several states have set forth guidelines or standards for butane in ambient air[60] ranging from 19 mg/m^3 (North Dakota) to 32 mg/m^3 (Virginia) to 38 mg/m^3 (Connecticut) to 45.2 mg/m^3 (Nevada).

Determination in Air: OSHA Analytical Method 56.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested an ambient limit of 19,000 μg/L based on health effects.

Determination in water: Octanol−water coefficient: Log $K_{ow} = 2.9$.

Routes of Entry: Inhalation, skin, and/or eye contact (liquid).

Harmful Effects and Symptoms

Butane is not characterized by its toxicity but rather by its narcosis-producing potential at high exposure levels.

Short Term Exposure: Can cause headache, lightheadedness, drowsiness, and unconsciousness from lack of oxygen. Contact with the liquid can cause frostbite.

First Aid: Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. Clothing frozen to the skin should be thawed before being removed. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. NIOSH recommends: **8 h** (At least 4 h but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Butyl, Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; CPF3® suits; Trychem 1000™ suits; **4 h:** (At least 4 h but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Large amounts of butane (800 ppm and above) will replace the amount of available oxygen and lead to suffocation. Oxygen content should never be below 19%. Use NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode; or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with butane you should be trained on its proper handling and storage. All appropriate sections of the OSHA Standard 1910.111, Storage, Handling, of Liquefied Petroleum Gases must be followed. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above and heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Butane requires a shipping label of "FLAMMABLE GAS." Butane falls in Hazard Class 2.1 with no Packing Group specified.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep the gas concentration below the explosive limit range by forced ventilation.[24] Stop the flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air. Repair leak or allow cylinder to dissipate to the atmosphere. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butane is a flammable gas. In case of fire, stop the flow of gas if it can be done safely. Use dry chemical, carbon dioxide; or halon extinguishers. Use water to keep fire-exposed containers cool and to protect personnel doing the shut off. If a leak or spill has caught fire, use water spray to disperse gas and to protect personnel shutting off leak. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration.

Butanedione B:0780

Molecular Formula: $C_4H_6O_2$
Common Formula: $CH_3COCOCH_3$
Synonyms: Biacetyl; Butadione; 2,3-Butanedione; Butanodiona (Spanish); Diacetyl; 2,3-Diketobutane; Dimethyl diketone; Dimethylglyoxal; Glyoxal dimethyl; Glyoxal, dimethyl-
CAS Registry Number: 431-03-8
RTECS® Number: EK2625000
UN/NA & ERG Number: UN2346/127
EC Number: 207-069-8
Regulatory Authority and Advisory Bodies
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Butanedione is a yellow-green, mobile liquid with a chlorine-like odor. Molecular weight = 86.1. Boiling point = 88°C; Freezing/Melting point = − 2.4°C; Flash point = 27°C; Autoignition temperature = 365°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Highly soluble in water.
Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen, Primary Irritant. Butanedione is used as an aroma carrier food additive in butter, vinegar, coffee, and other foods.
Incompatibilities: Contact with oxidizers may cause fire and explosions. High heat may cause violent combustion or explosion.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 20 mg/m^3
PAC-1: 60 mg/m^3
PAC-2: 400 mg/m^3
PAC-3: 400 mg/m^3
Determination in water: Octanol−water coefficient: Log $K_{ow} = -1.32$.
Routes of Entry: Inhalation, skin contact, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Butanedione can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Contact can irritate the skin. May have a narcotic effect on the nervous system.
Long Term Exposure: Repeated exposure may affect the blood count and nervous system. Repeated or prolonged contact may cause skin sensitization.
Points of Attack: Skin, eyes, respiratory system, blood, nervous system.
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: complete blood count. Consider nerve conductions studies. Examination by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: *Clothing:* Avoid skin contact with Butanedione. Wear solvent-resistant gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn.
Respirator Selection: Where there is potential for exposures to butanedione exists, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butanedione is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of butanedione should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butanedione. Wherever butanedione is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Shipping: Butanedione must be labeled "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep Butanedione out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butanedione is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

TSCA 40CFR716.120(a).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20/21/22; R36/38; Safety phrases: S2; S36/37; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

As glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol R—$(OCH_2CH_2)_n$—OR′ where $n = 12$, or 3; R = alkyl or aryl groups; R′ = R, H, or groups which when removed yield glycol ethers with the structure: R—$(OCH_2CH)_n$—OH. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. R—$(OCH_2CH_2)_n$—OR′; where $n = 12$ or 3; R = alkyl C_7 or less; or R = phenyl or alkyl-substituted phenyl; R′ + H, or alkyl C_7 or less; or OR′ consisting of carboxylic ester, sulfate, phosphate, nitrate, or sulfonate. Form R *de minimis* concentration reporting level: 1.0%.

Description: 2-Butoxy ethanol is a colorless liquid with a mild, ether-like odor. Molecular weight = 118.20; Boiling point = 171°C; Freezing/Melting point = −75°C; Specific gravity (H_2O:1) = 0.90; Vapor pressure = 0.8 mmHg at 20°C; Relative vapor density (air = 1) = 4.1; Flash point = 61°C (cc); Autoignition temperature = 238°C. Explosive limits = LEL 1.1% at 93°C; UEL 12.7% at 135°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. This material is used as a solvent for resins in protective coatings, lacquers, varnishes, and enamels. It is also used in varnish removers and in dry cleaning compounds.

Incompatibilities: Forms explosive mixture with air. Can form unstable and explosive peroxides; check for peroxides prior to distillation; render harmless if positive. Decomposes, producing toxic fumes. Violent reaction with strong caustics and strong oxidizers. Attacks some coatings, plastics, and rubber. Attacks metallic aluminum at high temperatures.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.83 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/240 mg/m^3 TWA [skin].

NIOSH REL: 5 ppm/24 mg/m^3 TWA [skin].

Determination in Air: Use NIOSH Analytical Method #1403,[18] OSHA Analytical Method 83.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.830$. EC_{50} [*Daphnia magna* (water flea), 24 h] = 1.815 mg/L.

Routes of Entry: Inhalation, skin absorption, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Irritation of eyes, nose, and throat, hemolysis, hemoglobinuria. LD_{50} = (oral-rat) 1480 mg/kg (slightly toxic).

Short Term Exposure: This chemical irritates the eyes, skin, and respiratory tract. High exposure caused dizziness, lightheadedness, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure could cause central nervous system depression and liver and kidney damage.

Long Term Exposure: The liquid defats the skin. This chemical can break down red blood cells and cause anemia, effects the hematopoietic system, resulting in blood disorders. It can also damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, hematopoietic system, blood, kidneys, liver, lymphoid system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests, urinalysis, and kidney function tests. Complete blood count (CBC) with reticulocyte count. Liver function tests. Consider chest x-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Butyl, Viton™ gloves, suits, Saranex™. **4 h:** (At least 4 h but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)]; or Sa* (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area. Keep in dark due to possible formation of explosive peroxides. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic, liquids, organic, n.o.s., or Ethylene glycol monobutyl ether require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Enter spill area from upwind side. Establish forced ventilation to keep levels below explosive limit. Use absorbent material to permit spill removal to vapor-tight plastic bags for eventual disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Butoxyl B:0800

Molecular Formula: $C_7H_{14}O_3$

Common Formula: $CH_3COOCH_2CH_2CH(OCH_3)CH_3$

Synonyms: Acetic acid 3-methoxybutyl ester; 3-Methoxybutyl acetate; Methyl-1,3-butylene glycol acetate

CAS Registry Number: 4435-53-4

RTECS® Number: EL4725000

UN/NA & ERG Number: UN2708/127

EC Number: 224-644-9

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butoxyl is a colorless liquid with a sharp odor. Molecular weight = 146.19; Specific gravity (H_2O:1) = 0.96; Boiling point = 169−173°C; Melting/Freezing point = < -80°C; Flash point = 62°C (cc); 77°C.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 1. Slightly soluble in water; solubility = 30 g/L.

Potential Exposure: Those involved in the use of this material as a cleaning solvent and as a component in varnishes and casting molds.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No TEEL available.

Routes of Entry: Inhalation, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Butoxyl can be an eye irritant. High vapor levels can cause dizziness. LD_{50} = (oral-rat) 4210 mg/kg (slightly toxic).[9]

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. If local exhaust ventilation or enclosure is not used, respirators should be worn. Wear protective work clothing. Wash thoroughly immediately after exposure to Butoxyl and at the end of the work shift. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of Butoxyl to potentially exposed workers.

Respirator Selection: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Butoxyl must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butoxyl is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butoxyl requires a shipping label of "FLAMMABLE LIQUID." The Hazard Class is 3 and the Packing Group is III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*n-, iso-, tert-*)
Description: Butyl acetates are colorless or yellowish liquids with pleasant, fruity odors. There are 4 isomers. Molecular weight = 116.16 (all isomers).
n-isomer
Specific gravity (H_2O:1) = 0.87; Boiling point = 126−127°C; Freezing/Melting point = −77°C; Vapor pressure = 6 mmHg at 20°C; Flash point = 22°C; Autoignition temperature = 370°C. Flammable Limits in Air: LEL = 1.7%, UEL = 7.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water; solubility in water = 0.9% at 20°C.
sec-isomer
Specific gravity (H_2O:1) = 0.87; Boiling point = 112°C; Freezing/Melting point = −99.4°C; Vapor pressure = 10 mmHg at 20°C; Relative vapor density (air = 1) = 4.0; Flash point = 19°C (cc); Flammable Limits in Air: LEL = 1.7%, UEL = 9.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility in water = 0.8% at 20°C.
iso-isomer
Specific gravity (H_2O:1) = 0.87; Boiling point = 117°C; Freezing/Melting point = −99°C; Vapor pressure = 13 mmHg at 20°C; Flash point = 18°C (cc); Autoignition temperature = 421°C; Flammable Limits in Air: LEL = 1.3%, UEL = 10.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 0.6% at 20°C.
tert-isomer
Specific gravity (H_2O:1) = 0.87; Boiling point = 97−98°C. Flammable Limits in Air: LEL = 1.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.
Potential Exposure: Compound Description (*n*-): Reproductive Effector; Human Data; Primary Irritant; (*tert*- and *iso*-) Primary Irritant. *n*-Butyl acetate is an important solvent in the production of lacquers, leather, and airplane dopes, and perfumes. It is used as a solvent and gasoline additive. *sec*-Butyl acetate is used as a widely used solvent for nitrocellulose, nail enamels, and many different purposes. *tert*-Butyl acetate is common industrial solvent used in the making of lacquers, artificial

leather, airplane dope, perfume, and as a food additive. Isobutyl acetate is used as a solvent and in perfumes and artificial flavoring materials.

Incompatibilities: All butyl acetates are incompatible with nitrates, strong oxidizers, strong alkalies, strong acids. Butyl acetates form explosive mixtures with air, reacts with water—on standing—to form acetic acid and *n*-butyl alcohol. Violent reaction with strong oxidizers and potassium-*tert*-butoxide. Dissolves rubber, many plastics, resins, and some coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.03 mg/m^3 (*n*-isomer); 1 ppm = 4.75 mg/m^3 (all other at 25°C & 1 atm isomers).

Several states have set guidelines or standards for butyl acetates in ambient air[60] as follows (all values in mg/m^3):

State	***n-***	***sec-***	***tert-***	***iso-***
Connecticut	14.2	19.0	19.0	14.0
Florida	14.2	–	–	14.0
Massachusetts	–	–	–	0.97
Nevada	16.9	22.6	22.6	16.67
New York	14.2	–	–	14.0
South Dakota	14.2	–	–	–

Determination in Air: Adsorption of charcoal, workup with CS_2, analysis by gas chromatography. Use NIOSH Analytical Method #1450 (Esters I), #1405, #2549 Volatile Organic Compounds[18] (screening), and OSHA Analytical Method 7 Organic Vapors.

Permissible Concentration in Water: Russia[43] cites a MAC of 0.1 mg/L (for any isomer) in water used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.60 (*n*-); 1.5 (*sec*-).

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact. Passes through the unbroken skin.

Harmful Effects and Symptoms

Headaches, drowsiness, eye irritation, irritation of skin and upper respiratory system. Humans and animals that inhale comparatively low doses of *n*-butyl acetate experience irritation of the nasal and respiratory passages and of the eyes. At higher concentrations narcosis takes place, and repeated exposures have resulted in renal and blood changes in experimental animals.

Short Term Exposure: The substance irritates the eyes, skin, and respiratory tract. High exposures, above the occupational exposure levels, can cause weakness, headache, and drowsiness, and may cause unconsciousness.

Long Term Exposure: *n*-Butyl acetate may cause skin allergy. *n*-Butyl acetate has been shown to damage the developing fetus in animals. Prolonged and repeated exposure to butyl acetates can cause defatting, drying, and cracking of the skin. Although many solvents and petroleum-based products cause lung, brain and disturbed sleep, butyl acetates have not been adequately evaluated to determine these effects. See also NIOSH Profiles: Acetates, SRI, 2/77; *n*-Butyl acetate, SRC, 12/79; Paint and allied products manufacturing, FIRL, 4/78 and SRI, 2/7; Spray painting, FIRL, 4/78.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider initial effects on skin and respiratory tract in any preplacement or periodical examinations, as well as liver, lung, and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of saltwater and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** (At least 4 h but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. **4 h:** (At least 4 h but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n-isomer:* OSHA: *1500 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or Sa* (APF = 10) (any supplied-air respirator). *1700 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

sec-isomer: 1700 ppm: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

tert-isomer: 1500 ppm: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

iso-isomer: 1300 ppm: Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrOv (APF = 10) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl acetates you should be trained on its proper handling and storage. Before entering confined space where these chemicals may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl acetates require shipping label of "FLAMMABLE LIQUID." They fall in Hazard Group 3 and Packing Group II and III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Vapor buildup may cause suffocation. For small quantities absorb on paper towels. Evaporate in a safe place (such as a fume hood). Allow sufficient time for the evaporated vapors to completely clear the hood duct work. Burn the paper in a suitable location away from combustible materials. Or, absorb liquids in activated carbon, vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are flammable liquids. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be used as a fog to control heat and to dilute vapors and wash them from the air. Use water fog in conjunction with alcohol foam, dry chemical, or carbon dioxide as extinguishing agents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Container may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. See also "Spill Handling" section above.

Butyl acid phosphate B:0820

Molecular Formula: $C_8H_{21}O_4P$

Common Formula: $(C_4H_9O)_2PH(OH)_2$

Synonyms: Acid butyl phosphate; *n*-Butyl acid phosphate; Butyl phosphoric acid; Phosphoric acid, dibutyl ester

CAS Registry Number: 12788-93-1

RTECS® Number: TB8490000

UN/NA & ERG Number: UN1718/153

EC Number: 235-826-2

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Butyl acid phosphate is a clear white liquid. Molecular weight = 153.08; Flash point = 110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: It is used in industrial chemicals manufacture.

Incompatibilities: Strong oxidizers, strong acids.

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Butyl acid phosphate can affect you when breathed in. Contact can severely irritate the eyes, skin, and respiratory tract. Can cause permanent eye damage. Inhalation can irritate the nose, throat, and lungs, causing difficult breathing and shortness of breath.

Long Term Exposure: Repeated or prolonged contact can cause skin rash. Very irritating substances, such as butyl acid phosphate, may affect the lungs.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. If pulmonary edema develops from high exposure, medical observation is recommended for 24–48 h.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Butyl acid phosphate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Store in tightly closed containers is a cool, well-ventilated area away from potentially high-heat sources.

Shipping: Butyl acid phosphate requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

n-Butyl acrylate B:0830

Molecular Formula: $C_7H_{12}O_2$

Common Formula: $CH_2{=}CHCOOC_4H_9$

Synonyms: Acrilato de *n*-butilo (Spanish); Acrylic acid *n*-butyl ester; Acrylic acid, butyl ester; *n*-Butyl acrylate; *normal* Butyl acrylate; Butylacrylate, inhibited; Butyl 2-propenoate; 2-Propenoic acid, butyl ester

CAS Registry Number: 141-32-2

RTECS® Number: UD3150000

UN/NA & ERG Number: UN2348/129P

EC Number: 205-480-7 [*Annex I Index No.:* 607-062-00-3]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R36/37/38; R43; Safety phrases: S2; S9 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyl acrylate is a colorless liquid. Molecular weight = 128.2; Specific gravity (H_2O:1) = 0.89; Boiling point = 146−148°C; Freezing/Melting point = − 64°C; Vapor pressure = 4 mmHg at 20°C; Relative vapor density (air = 1) = 4.4; Flash point = 29°C; Autoignition temperature = 292°C. Explosive limits in air: LEL = 1.3%; UEL = 9.9%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2. Slightly soluble in water; solubility in water = 0.14%.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Primary Irritant. This material is used as a monomer in the production of polymers, copolymers, and resins; solvent for coatings; adhesives, paints and binders.

Incompatibilities: Forms explosive mixture with air. Heat, sparks, open flame, light, reducing agents, or peroxides may cause explosive polymerization. Incompatible with strong acids, amines, halogens, hydrogen compounds, oxidizers, sunlight, or other catalysts.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.24 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 10 ppm/55 mg/m^3 TWA.

ACGIH TLV®[1]: 2 ppm; 11 mg/m^3 TWA [sensitizer]; not classified as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **8.3** ppm

PAC-2: **130** ppm

PAC-3: **480** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/11 mg/m^3 TWA; Peak Limitation Category I(2) *as acrylic acid*, *n-butyl ester*.

Australia: TWA 10 ppm (55 mg/m^3), 1993; Austria: MAK 10 ppm (55 mg/m^3), 1999; Belgium: TWA 10 ppm (52 mg/m^3), 1993; Denmark: TWA 10 ppm (55 mg/m^3), 1999; Finland: TWA 10 ppm (55 mg/m^3); STEL 20 ppm (110 mg/m^3) [skin] 1999; France: VME 10 ppm (55 mg/m^3), 1999; Hungary: TWA 20 mg/m^3; STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 11 mg/m^3, 2003; Norway: TWA 10 ppm (55 mg/m^3), 1999; Poland: TWA 20 mg/m^3; STEL 70 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Sweden: NGV 10 ppm (50 mg/m^3), KTV 15 ppm (80 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (55 mg/m^3), KZG-W 20 ppm (110 mg/m^3), 1999; United Kingdom: TWA 10 ppm (53 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Some states have set guidelines or standards for Butyl acrylate in ambient air[60] ranging from 900 μg/m^3 (Virginia) to 1100 μg/m^3 (Connecticut) to 1310 μg/m^3 (Nevada).

Determination in Air: See OSHA Analytical Method PV2011, butyl acrylate.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.4.

Routes of Entry: Ingestion, skin and eye contact.

Harmful Effects and Symptoms

n-Butyl acrylate was found to be but moderately irritating to the skin. As an eye irritant it produced corneal necrosis in an unwashed rabbit eye, similar to that produced by ethyl alcohol. Exposure of rats at 1000 ppm for 4 h proved lethal to 5 of 6 rats exposed; however, rats survived a 30-min exposure to 7000 ppm. There is a close similarity in toxic response by inhalation, skin and eye to methyl acrylate. LD_{50} = (oral-rat) 900 mg/kg (slightly toxic).

Short Term Exposure: This chemical can pass through the skin. The substance severely irritates the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposure may cause liver damage.

Long Term Exposure: May cause liver and lung damage. May cause skin sensitization and allergy. Similar solvents and petroleum-based chemicals have been shown to cause brain and nerve damage.

Points of Attack: Skin, eyes.

Medical Surveillance: Liver and lung function tests. Examination by a qualified allergist. Interview for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves, Responder™ suits; Trychem 1000™ suits; **4 h:** (At least 4 but <8 h of resistance to breakthrough

>0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the *NIOSH/NPPTL Certified Equipment List*, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Butyl acrylate you should be trained on its proper handling and storage. Do not store unless stabilized. Before entering confined space where Butyl acrylate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated, fireproof area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl acrylate, inhibited, requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover liquids with dry lime or soda ash; or absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible and highly reactive liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: There are four isomers. *n*- and *sec*-Butyl alcohols, are colorless liquids with strong, sweet, alcoholic odor. *tert*-Butyl alcohol is a colorless crystalline powder or liquid (above 26°C) with a camphor-like odor. It is often used in aqueous solution. Isobutyl alcohol is a colorless liquid with a mild, sweet, and musty odor. Molecular weight (all isomers) = 74.12.

n-isomer

Boiling point = 117°C; Freezing/Melting point = −90°C; Specific gravity (H_2O:1) = 0.81; Vapor pressure = 6 mmHg at 20°C; Relative vapor density (air = 1) = 2.6; Relative density of vapor/air mixture at 20°C (air = 1) = 1.01; Flash point = 35°C (cc); Autoignition temperature = 345°C. Explosive limits in air: LEL = 1.4%; UEL = 11.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water; solubility in water = 9% at 20°C.

sec-isomer

Boiling point = 100°C; Freezing/Melting point = −115°C; Specific gravity (H_2O:1) = 0.81; Vapor pressure = 12 mmHg at 20°C; Relative vapor density (air = 1) = 2.55; Relative density of vapor/air mixture at 20°C (air = 1) = 1.03; Flash point = 24°C (cc); Autoignition temperature = 406°C. Explosive limits in air: LEL = 1.7%; UEL = 9.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Solubility in water = 16% at 20°C.

tert-isomer

Boiling point = 83°C; Freezing/Melting point = 25°C; Specific gravity (H_2O:1) = 0.79 (solid); Vapor pressure = 42 mmHg at 25°C; Relative vapor density (air = 1) = 2.6; Relative density of vapor/air mixture at 20°C (air = 1) = 1.06; Flash point = 11°C (cc); Autoignition temperature = 470°C. Explosive limits in air: LEL = 2.4%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Good solubility in water; solubility in water = ∞.

iso-isomer

Boiling point = 108°C; Freezing/Melting point = −108°C; Specific gravity (H_2O:1) = 0.80; Vapor pressure = 9 mmHg at 20°C; Relative vapor density (air = 1) = 2.55; Relative density of vapor/air mixture at 20°C (air = 1) = 1.02; Flash point = 28°C (cc); Autoignition temperature = 415°C; Explosive limits in air: LEL = 1.7%; UEL = 10.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Solubility in water = 9% at 20°C.

Potential Exposure: Compound Description (*n*-isomer): Mutagen; Reproductive Effector; Human Data; Primary Irritant; (*sec*-isomer): Reproductive Effector; (*tert*-isomer): Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant; (*iso*-isomer): Tumorigen, Mutagen; Human Data. Butyl alcohols are used as solvents for paints, lacquers, varnishes, natural and synthetic resins, gums, vegetable oils, dyes, camphor, and alkaloids. They are also used as an intermediate in the manufacture of pharmaceuticals and chemicals; in the manufacture of artificial leather, safety glass; rubber and plastic cements, shellac, raincoats, photographic films, perfumes; and in plastic fabrication.

Incompatibilities: Butyl alcohols form explosive mixtures with air. In all cases they are incompatible with strong oxidizers and attack some plastics, rubber, and coatings. *n*-Butanol is incompatible with strong acids; halogens, caustics, alkali metals; aliphatic amines; isocyanates. *sec*-Butanol forms an explosive peroxide in air. Ignites with chromium trioxide. Incompatible with strong oxidizers, strong acids, aliphatic amines, isocyanates, organic peroxides. *tert*-Butanol is incompatible with strong acids (including mineral acid), strong oxidizers or caustics, aliphatic amines, isocyanates, alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium). *iso*-Butanol is incompatible with strong acids, strong oxidizers, caustics, aliphatic amines, isocyanates, alkali metals, and alkali earth. May react with aluminum at high temperatures.

Russia set a MAC of 0.1 mg/m^3 on either a momentary or a daily average basis for ambient air in residential areas.[43]

Several states have set guidelines or standards for butyl alcohols in ambient air[60] as follows (all values in mg/m^3):

State	***n-***	***sec-***	***tert-***	***iso-***
Connecticut	6.0	6.1	–	–
Massachusetts	0.021	–	–	0.021
Nevada	3.57	7.26	–	–
New York	3.0	–	–	–
South Dakota	3.0	–	–	–
Virginia	1.25	3.05	–	2.5

Determination in Air:

NIOSH 1405, 1450; OSHA 7 (*n*-, *sec*-, and *iso*-isomers); NIOSH 1450; OSHA 7 (tert-isomer).[18]

Permissible Concentration in Water: No criteria set, but EPA has suggested[32] ambient limits as follows based on health effects: *n*-isomer 2070 μg/L; *sec*- 6200 μg/L; *iso*- 2070 μg/L; *tert*- 4140 μg/L. Russia[43] set a MAC of 1.0 mg/mL for butyl alcohol in water bodies used for domestic purposes and 0.03 mg/L in water bodies used for fishery purposes.[35]

Determination in Water: Octanol–water coefficient: Log K_{ow} = All isomers are <1.0 as follows: 0.9 (*n*-isomer); 0.6 (*sec*-isomer); 0.4 (*tert*-isomer); 0.8 (*iso*-isomer).

Routes of Entry: Ingestion, inhalation, skin and/or eye contact. Passes through the unbroken skin (*n*-, *iso*-isomer).

Harmful Effects and Symptoms

Short Term Exposure: The vapors of butyl alcohols irritates the eyes and respiratory tract. They can irritate the skin and cause rash or burning feeling on contact. May affect the central nervous system. Exposure to high concentrations could cause headache, nausea, vomiting, and dizziness. Exposure to high levels of the *n*-isomer may cause unconsciousness and may lead to irregular heartbeat. The oral LD_{50} value for rats for the various isomers are as follows: (*n*-isomer) 790 mg/kg; (*sec*-isomer) 6480 mg/kg; (*iso*-isomer) 2460 mg/kg; (*tert*-isomer) 3500 mg/kg.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis, drying, and cracking of the skin. Exposure to the *n*-isomer can damage the liver, heart, and kidneys; cause hearing loss; and affect sense of balance.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: *n-isomer*: whole blood (chemical/metabolite). Expired air, liver and kidney function tests, hearing test (audiogram) and test for balance, EKG test. *tert-isomer:* Liver and kidney function tests. *iso-isomer:* Evaluate for brain effects and possible neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact.

n-isomer: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Butyl, Teflon™ gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; CPF3® suits; Responder™ suits. **4 h:** (At least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Neoprene™ rubber gloves, suits, boots. *sec-isomer*: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): 4H™ and Silver Shield™ gloves. **4 h:** (At least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Butyl, Nitrile.

iso-isomer: Prevent skin contact. **8 h:** butyl rubber gloves, suits, boots; Neoprene™ rubber gloves, suits, boots; Viton™ gloves, suits; Responder™ suits. **4 h:** nitrile rubber gloves, suits, boots; 4H™; and Silver Shield™ gloves.

tert-isomer: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Butyl; 4H™ and Silver Shield™ gloves, Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n-isomer: 1250 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)]. *1400 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv* [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

sec-isomer: NIOSH: *1000 ppm:* CcrOv* [any chemical cartridge respirator with organic vapor cartridge(s)] or SA* (any supplied-air respirator). *2000 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp

(APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

iso-isomer: 500 ppm: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *1250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *1600 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

tert-isomer: 1600 ppm: Sa:Cf* (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Green: General storage may be used. Prior to working with butyl alcohols you should be trained on its proper handling and storage. Before entering confined space where these may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butanols require "FLAMMABLE LIQUID" labels. They fall in Hazard Class 3 and Packing Group II and III. Isobutanol falls in Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in activated charcoal, vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. The *tert*-isomer may be in powdered form; collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butyl alcohols are flammable liquids (*tert*-isomer may also be a flammable solid). Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers (recommended). Water may be ineffective because of low flash point. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration or bury absorbed waste in an approved landfill.[22]

WGK (German Aquatic Hazard Class): (*sec*-) 2—Hazard to waters.

tert- & iso-isomer

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Tributylamine

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Butylamines are highly flammable, colorless liquids (*n*- turns yellow on standing) with ammoniacal or fishlike odors. Odor threshold (*n*-) = 0.24−13.9 ppm.

n-isomer
Molecular weight = 73.14; Boiling point = 78°C; Specific gravity (H_2O:1) = 0.76; Freezing/Melting point = − 43.9°C; Relative vapor density (air = 1) = 2.5; Vapor pressure = 82 mmHg at 20°C; Relative density of vapor/air mixture at 20°C (air = 1) = 1.2; Flash point = − 12°C (cc); Autoignition temperature = 312°C. Explosive limits in air: LEL = 1.7%; UEL = 9.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

sec-isomer
Molecular weight = 73.14; Boiling point = 63°C; Specific gravity (H_2O:1) = 0.72; Relative vapor density (air = 1) = 2.5; Flash point = − 9°C (cc); Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

tert-isomer
Molecular weight = 73.14; Boiling point = 46°C; Specific gravity (H_2O:1) = 0.73; Freezing/Melting point = −67.3°C; Relative vapor density (air = 1) = 2.5; Vapor pressure = 292 mmHg at 20°C; Relative density of vapor/air mixture at 20°C (air = 1) = 1.6; Flash point = − 9°C (cc); Autoignition temperature = 380°C. Explosive limits in air: LEL = 1.7% at 100°C; UEL = 8.9% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Soluble in water.

iso-isomer
Molecular weight = 73.14; Boiling point = 66°C; Specific gravity (H_2O:1) = 0.72; Relative vapor density (air = 1) = 2.5; Flash point = − 9°C (cc); Autoignition temperature = 377.8°C. Explosive limits in air: LEL = 3.4%; UEL = 9.0% Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description (*n*-isomer): Tumorigen, Mutagen; Reproductive Effector; Primary Irritant; (*sec*-isomer): Agricultural Chemical; Drug. *n*-Butylamine is used in pharmaceuticals; dyestuffs, rubber, chemicals, emulsifying agents; photography, desizing agents for textiles; pesticides, and synthetic agents. *sec*-Butylamine is used as a fungistat. *tert*-Butylamine is used as a chemical intermediate in the production of *tert*-Butylaminoethyl methacrylate (a lube oil additive), as an intermediate in the production of rubber, and in rust preventatives and emulsion deterrents in petroleum products. It is used in the manufacture of several drugs.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. *n*-Butylamine is a weak base; reacts with strong oxidizers and acids, causing fire and explosion hazard. Incompatible with organic anhydrides; isocyanates, vinyl acetate; acrylates, substituted allyls; alkylene oxides; epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks some metals in presence of moisture.

Permissible Exposure Limits in Air

Determination in Air: Adsorption on H_2SO_4-treated silica gel, desorption with 50% methanol, analysis by gas chromatography/flame ionization detection, see NIOSH (IV) #2012.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested ambient water limits for butylamines (*n*-, *iso*-, or *tert*-isomer) as 207 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} (*n*-isomer) = 0.9; (*tert*-isomer) = 0.4.

Routes of Entry: Inhalation and percutaneous absorption, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with butylamine can irritate and burn the eyes with possible permanent damage. Skin contact can cause irritation, burns, and blisters. Inhalation can cause nose and throat irritation, "flushed" feeling, headache, dizziness, coughing, shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The LD_{50} rat value ranges from 78 mg/kg (*tert*-) to 366 mg/kg (*n*-butyl) and all 4 are designated moderately toxic.

Long Term Exposure: Repeated exposure may cause itching and skin rash. May cause bronchitis to develop with phlegm and/or shortness of breath. Exposure to high levels of isobutylamine can affect the heart.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Rinse out mouth and *do not* induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. *n-isomer:* **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Responder™ suits; Trychem 1000™ suits; **4 h:** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Trellchem HPS™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *n*-isomer: *50 ppm:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa* (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS* (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *250 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *300 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Store in a refrigerator. Keep under an inert atmosphere for long-term storage.[52]

Shipping: *n*-Butylamine and isobutylamine[19] require "FLAMMABLE LIQUID, CORROSIVE" labels. They fall in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Incineration*: incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.[22]

RTECS® Number: EZ7525000

UN/NA & ERG Number: UN3082/171 (environmentally hazardous substances, liquid, n.o.s.)/171

EC Number: 217-916-3

Regulatory Authority and Advisory Bodies

Water Pollution Standard Proposed (EPA) (See "References" below).

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.003; Nonwastewater (mg/kg), 1.4.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Butylate is a clear liquid with an aromatic odor. Molecular weight = 217.4; Specific gravity = 0.94; Boiling point = 130°C at 10 mmHg at 20°C; Vapor pressure = 1×10^{-3} mmHg. Low solubility in water; solubility = 44 mg/L.

Potential Exposure: Those involved in the manufacture, formulation or application of this carbamate herbicide which is used to control weed seeds in the soil prior to sowing a crop.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: A no-adverse-effects-level (NOAEL) in the range of 24−40 mg/kg body weight/day has been determined by US EPA. This leads to derivation of a 10-day health advisory for Butylate of 2.4 mg/L and a lifetime health advisory of 0.05 mg/L for a 70-kg man. Wisconsin has set a guideline for Butylate in drinking water of 200 μg/L.[61]

Determination in Water: Analysis of Butylate is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen- and phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen−phosphorus detector. The method detection limit has not been determined for Butylate, but it is estimated that the detection limits for analytes included in this method are in the range of 0.1−2 μg/L. Fish Tox: 22.61732000 ppb MATC (INTERMEDIATE).

Harmful Effects and Symptoms

LD_{50} (rat) = 4000 mg/kg (slightly toxic). Applying the criteria described in EPA's guidelines for assessment of carcinogenic risk, butylate may be placed in Group C: a possible human carcinogen. This category is for substances that show limited evidence of carcinogenicity in animals and inadequate evidence in humans.

Long Term Exposure: Human Tox = 400.00000 ppb. Health Advisory (VERY LOW).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus). All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 400.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R61; R62; R50/53; R50; Safety phrases: S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Butyl benzyl phthalate is a clear, oily liquid with a slight odor. Molecular weight = 312.39; Specific gravity (H_2O:1): 1.1; Boiling point = 370°; Freezing/Melting point = −34.7°C; Relative vapor density (air = 1): 10.8; Vapor pressure = very low; Flash point = 199°C; Autoignition temperature = 422°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Butyl benzyl phthalate is used as a plasticizer for polyvinyl and cellulosic resins. It is also used as an organic intermediate.

Incompatibilities: Incompatible with strong acids, nitrates, oxidizers. Destructive to rubber and paint.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 100 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

Denmark: TWA 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: NGV 3 mg/m^3, KTV 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000. Two states have set guidelines or standards for butyl benzyl phthalate in ambient air[60]: New York and Florida: 100 $\mu g/m^3$.

Permissible Concentration in Water: No criteria set. Butyl phthalate esters in general are classified as priority toxic pollutants by EPA.[6] Listed by Mexico for wastewater as phthalate esters.

Determination in Water: No criteria set. Octanol–water coefficient: Log $K_{ow} = 4.77$.

Routes of Entry: Inhalation; can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and the respiratory tract. Skin contact may cause a burning sensation. High levels of this chemical may cause dizziness and lightheadedness. LD_{50} = (oral-rat) 2330 mg/kg (slightly toxic).

Long Term Exposure: May affect liver and kidney function. Repeated exposure may damage the nervous system; causing weakness, “pins and needles,” and poor coordination in arms and legs. May affect the endocrine system.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system, including nerve conduction tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for 20–30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where there is potential for exposure, the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any MSHA/NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place, or refrigerator away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, or foam extinguishers. Water may cause frothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Atomize into an incinerator together with a flammable solvent.[22]

N-Butyl bromide B:0880

Molecular Formula: $C_4H_{12}Br$

Common Formula: $CH_6(CH_2)_3Br$

Synonyms: 1-Bromobutane; Bromuro de *n*-butilo (Spanish); Butane, 1-bromo-; Butyl bromide; Methyl ethyl bromomethane

CAS Registry Number: 109-65-9. Much of the same information in this record may apply to *sec*-Butyl Bromide [2-Bromobutane (78-76-2)]

RTECS® Number: EJ6225000

UN/NA & ERG Number: UN1126 (*n*-isomer)/130; UN2339 (*sec*-isomer)/130

EC Number: 203-691-9 (109-65-9); 201-140-7 (78-76-2)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Butyl bromide is a highly flammable, colorless liquid with a pleasant odor. Molecular weight = 137.04. Boiling point = 101.6°C; Specific gravity (H_2O:1) = 1.276 at 20°C; Freezing/Melting point = − 112.4; Vapor density (air = 1) = 4.68; Flash point = 18°C (21°C for *sec*-isomer). Autoigniton temperature = 265°C. Explosive limits: LEL = 2.6% at 100°C; UEL = 6.6% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Butyl bromide is used to make other chemicals and in making pharmaceuticals.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion. Forms explosive mixture with air. Incompatible with strong acids. May accumulate static electrical charges and cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 15 ppm
PAC-1: 50 ppm
PAC-2: 350 ppm
PAC-3: 1500 ppm

The former-USSR/UNEP Joint Project[43] has set limits in the ambient air of residential areas. The momentary MAC is 0.7 mg/m^3. The average daily MAC is 0.03 mg/m^3.

Routes of Entry: Inhalation, ingestion (*sec*-butyl bromide passes through the skin).

Harmful Effects and Symptoms

Short Term Exposure: Causes eye, skin, and respiratory tract irritation. Inhalation can cause coughing, wheezing, and/or shortness of breath. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels can cause death.

Long Term Exposure: Repeated exposure may cause liver and kidney damage. There is limited evidence that Butyl bromide may damage the developing fetus.

Points of Attack: Liver, kidney.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: liver function tests; kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Butyl bromide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA approve self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Butyl bromide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butyl bromide is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of Butyl bromide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butyl bromide.

Shipping: 1- and 2-Bromobutane must be labeled "FLAMMABLE LIQUID." Both 1- and 2-Bromobutane fall in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including bromine, are produced in fire.

Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC-1: 25 ppm
PAC-2: 150 ppm
PAC-3: 750 ppm

(sec-)

TEEL-0: 0.4 ppm
PAC-1: 1.25 ppm
PAC-2: 7.5 ppm
PAC-3: 3500 ppm

Norway: TWA 0.5 ppm (1.5 mg/m^3), 1999; Russia: STEL 0.5 mg/m^3, [skin], 1993.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.62.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Butyl chloride can affect you when breathed in. High levels can cause you to feel dizzy, lightheaded, and pass out. Very high levels can affect the nervous system and cause death. *sec*-Butyl chloride and *tert*-butyl chloride may have similar effects.

Long Term Exposure: Unknown at this time. May affect the nervous system.

Points of Attack: Eyes, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Butyl chloride, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Butyl chloride is incompatible with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates). Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Butyl chloride is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of Butyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butyl chloride.

Shipping: Chlorobutanes require a shipping label of "FLAMMABLE LIQUID." They fall in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

tert-Butyl chromate B:0900

Molecular Formula: $C_8H_{18}CrO_4$

Common Formula: $[(CH_3)_3CO]_2CrO_2$

Synonyms: Bis(*tert*-butyl) chromate; Chromato *terc*-butilico (Spanish); Chromic acid, di-*tert*-butyl ester of chromic acid; *tert*-Butyl chromate(VI)

CAS Registry Number: 1189-85-1

RTECS® Number: GB2900000

UN/NA & ERG Number: UN3082/171

This is an organometallic, flammable material

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, *carcinogenic to humans*, Group 1, 1990

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

As chromium compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants, as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: Chromium(VI) compounds: 0.1%.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List.

European/International Regulations: Hazard Symbol: E, T+, N; Risk phrases: R45; R46; R60; R61; R2; R8; R21; R25; R26; R34; R42/43; R48/23; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: *tert*-Butyl chromate is a highly flammable, clear, colorless, hygroscopic, corrosive, flammable liquid or red crystals from petroleum ether. Solution in carbon tetrachloride is highly flammable. Molecular weight = 230.3; Freezing/Melting point = −5 to 0°C; −2.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1, (Oxidizer).[NJDHSS] Soluble in water (hydrolyzed).

Potential Exposure: Butyl chromate is used in specialty reactions as an organic source of chromium, in making catalysts, and as a curing agent for urethane foams.

Incompatibilities: *tert*-Butyl Chromate is a strong oxidizer; reacts violently with reducing agents (such as lithium, sodium, aluminum and their hydrides and hydrazine); combustible materials. Water solutions of *tert*-butyl chromate react violently with strong bases. Incompatible with strong acids (i.e., hydrochloric, sulfuric, and nitric), alcohols, and easily oxidized materials, such as paper, wood, sulfur, aluminum, and plastics.

Permissible Exposure Limits in Air

OSHA PEL: 0.005 mg[CrO_3]/m^3 [skin] see 29CFR1910.1026.

NIOSH REL: 0.001 mg[CrO_3]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See NIOSH Pocket Guide, Application A & C.

ACGIH TLV®[1]: 0.01 mg[CrO_3]/m^3 Ceiling concentration [skin], Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3

No TEEL available.

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Denmark: TWA 0.5 mg[Cr]/m^3, 1999; France: VLE 0.1 mg/m^3, [skin], 1999; Japan: 0.5 mg[Cr]/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, [skin], 1993; Switzerland: TWA 0.05 mg/m^3, [skin], 1993; Thailand: TWA 0.1 mg/m^3, 1993; United Kingdom: TWA 0.5 mg[Cr]/m^3, carcinogen, 2000; the Netherlands: MAC 0.1 mg/m^3, [skin], 2003: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.1 mg/m^3 [skin]. Several states have set guidelines or standards for *t*-butyl chromate in ambient air[60] ranging from 0.5 μg/m^3 (Virginia) to 1.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause severe eye and skin irritation and acid-like burns with possible permanent damage to the eyes. Inhalation can cause irritation of the respiratory tract with coughing and wheezing. Exposure can cause headache, nausea, vomiting, diarrhea, and wheezing. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Hexavalent chromium compounds have been determined to be human carcinogens. May cause lung cancer. Breathing this chemical can cause a hole in the "bone" dividing the inner nose (septum), sometime with discharge, bleeding, and/or formation of a crust. *tert*-butyl chromate can cause allergies to the skin and lung. Prolonged skin contact can cause, burns, blisters, and deep necrotic ulcers. Can cause liver and kidney damage.

Points of Attack: Respiratory system, lungs, skin, eyes, central nervous system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Consider the points of attack in preplacement and periodic physical examinations: Examination of the skin and nose. Evaluation by a qualified allergist. Lung function tests. Liver and kidney function tests. Urine test for chromates (chemical metabolite). This test is most accurate shortly after exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to Physician: In case of fume inhalation, treat pulmonary edema. Consider administering prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Personal Protective Methods: Wear appropriate clothing to prevent any possibility of skin contact. Gloves: Silver Shield®/ 4H®; Coveralls: DuPont Tychem® CSM, Responder®, and TK (for *known carcinogens*). Prevent skin contact (as chromic acid and chromates). **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated and daily at the end of each work shift. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, Chromium (VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow Stripe: Reactivity Hazard (strong oxidizer); Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with *tert*-butyl chromate you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in an explosion-proof refrigerator away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: *tert*-Butyl chromate is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, sand, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

1,2-Butylene oxide B:0910

Molecular Formula: C_4H_8O

Synonyms: 1,2-Butene oxide; α-Butylene oxide; 1,2-Epoxybutane; 2-Ethyloxirane; Oxirane, ethyl-; Propyl oxirane

CAS Registry Number: 106-88-7; much of the same information in this record may apply to 2,3-Butylene oxide: 3266-23-7

RTECS® Number: EK3675000

UN/NA & ERG Number: UN3022/127P

EC Number: 203-438-2 [*Annex I Index No.*: 603-102-00-9]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (*106-88-7*): Human No Adequate Data, Animal Limited Data, *possibly carcinogenic to humans*, Group 2B; NCI: Carcinogenesis Studies (inhalation); clear evidence: rat; no evidence: mouse.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

TSCA 40CFR712.30(d); 40CFR716.120 (a).

Canada, National Pollutant Release Inventory (NPRI).

European/International Regulations: (106-88-7) Hazard Symbol: F, Xn, N; Risk phrases: R11; R20/21/22; R36/37/38; R40; R52/53; Safety phrases: S2; S9; S16; S29; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Butylene oxide is a watery white liquid with an etherial odor. Molecular weight = 72.1 (1,2- and 2,3-isomers); Specific gravity (H_2O:1) = 0.83; Boiling point = 63.3°C; Freezing/Melting point = −130°C; Vapor pressure = 142 mmHg at 20°C; 176 mmHg at 25°C; Relative vapor density (air = 1) = 2.2; Relative density of the vapor/air mixture at 20°C (air = 1) = 1.3; Flash point = −22°C; Autoignition temperature = 439°C. Explosive limits in air: LEL: 1.7%; UEL: 19%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Soluble in water; solubility = 9.5% at 25°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. It is used as a stabilizer in chlorinated solvents, and to make other chemicals, such as gasoline additives.

Incompatibilities: Forms explosive mixture with air. Unless inhibited, it can form unstable and explosive peroxides. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Polymerization will occur in the presence of acids, strong bases, and chlorides of tin, iron, and aluminum. Storage tanks and other equipment should be absolutely dry and free from air, ammonia, acetylene, hydrogen sulfide, rust, and other contaminants. Reacts with strong oxidizers. Attacks some plastics. May accumulate static electric charges that can result in ignition of its vapors. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

106-88-7

TEEL-0: 2 ppm

PAC-1: **72** ppm

PAC-2: **140** ppm

PAC-3: **330** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

Austria: [skin], carcinogen, 1999.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.42.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Butylene oxide can cause severe irritation of the eyes, skin, and respiratory tract, with coughing, and/or shortness of breath. High exposures can cause dizziness, lightheadedness, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: 1,2-Butylene oxide is possibly carcinogenic to humans. It may cause mutations and damage to the developing fetus. Prolonged or repeated skin contact may cause blisters or other disorders. 2,2-Butylene oxide may affect the nervous system.

Points of Attack: Skin, lungs, central nervous system, reproductive system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or

authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical acid you should be trained on its proper handling and storage. Protect against physical damage. Store only if inhibited. Outside or detached storage is preferred. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: 1,2-Butylene oxide requires a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3, Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Butyl ether B:0920

Molecular Formula: $C_8H_{18}O$

Common Formula: $C_4H_9OC_4H_9$

Synonyms: 1-Butoxybutane; Di-*n*-butyl ether; Dibutyl ether; Dibutyl oxide; Ether butylique (French); 1,1′-Oxybis (butane); 1,1-Oxybis-butane

CAS Registry Number: 142-96-1

RTECS® Number: EK5425000

UN/NA & ERG Number: UN1149/128

EC Number: 205-575-3 [*Annex I Index No.*: 603-054-00-9]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R36/37/38; R52/53; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Butyl Ether is a flammable, colorless liquid with a mild, ethereal odor. Molecular weight = 130.2. Boiling point = 142°C; Specific gravity (H_2O:1) = 0.8; Freezing/Melting point = − 95°C; Relative vapor density (air = 1) = 4.48; Flash point = 25°C; Autoignition temperature = 194°C. Explosive limits: LEL = 1.5%; UEL = 7.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. It is used as a solvent for hydrocarbons, fatty materials, as an extracting agent in metal separation; in solvent purification, and for making other chemicals.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with strong acids and oxidizers. Contact with air or light may form unstable and explosive peroxides, especially anhydrous form.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 3 ppm

PAC-2: 20 ppm

PAC-3: 400 ppm

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.08 (calc).

Routes of Entry: Inhalation of vapor, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May be poisonous if inhaled or absorbed through skin. Inhalation of vapors may cause dizziness or suffocation. Skin or eye contact may cause irritation. Repeated or prolonged skin contact may cause rash. The vapor irritates the nose, throat, and bronchial tubes and may cause nose bleeds, hoarseness, cough, phlegm, and/or tightness in the chest. Overexposure can also cause headache and make you feel dizzy and lightheaded. Higher levels can cause unconsciousness and even death.

Points of Attack: Skin, eyes, respiratory system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to butyl ether, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl ether you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Butyl ether must be stored in a cool, dark place, separated from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where Butyl ether is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of butyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Butyl ether.

Shipping: Dibutyl ethers require a "FLAMMABLE LIQUID" label. They fall in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

New Jersey Department of Health and Senior Services. (October 2000). *Hazardous Substances Fact Sheet: Butyl Ether*. Trenton, NJ

n-Butyl glycidyl ether B:0930

Molecular Formula: $C_7H_{14}O_2$

Common Formula: $C_4H_9OCH_2CH{-}CH_2$

Synonyms: *n*-BGE; BGE; 1-Butoxy-2,3-epoxypropane; (Butoxymethyl) oxiraine; 1,2-Epoxy-3-butoxy propane; 2,3-Epoxypropyl butyl ether; Gylcidy butyl ether

CAS Registry Number: 2426-08-6

RTECS® Number: TX4200000

UN/NA & ERG Number: UN1993/128

EC Number: 219-376-4 [*Annex I Index No.*: 603-039-00-7]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Carcinogenicity: DFG (suspected).

TSCA: 716.120(c); 40CFR712.30(d).

California Proposition 65 Chemical: Developmental/ Reproductive toxin (male) 8/7/09.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R20/22; R37; R40; R43; R52/53; R68; Safety phrases: S2; S24/25; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *n*-Butyl glycidyl ether is a colorless liquid with slight irritating odor. Molecular weight = 130.2; Specific gravity (H_2O:1) = 0.91; Boiling point = 164°C; Relative vapor density (air = 1) = 4.5; Vapor pressure = 3 mmHg at 25°C; Flash point = 58°C. Soluble in water; solubility 2% at 20°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Primary Irritant. NIOSH has estimated human exposures at 18,000. Used as reactive diluent for epoxy resins, flooring, laminating, and electrical; and as a stabilizer, viscosity-reducing agent, as acid acceptor for solvents; and as a chemical intermediate.

Incompatibilities: Forms explosive mixture with air. Air and light form unstable and explosive peroxides. Contact with strong oxidizers may cause fire and explosions. Contact with strong caustics may cause polymerization. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.33 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/270 mg/m^3 TWA.

NIOSH REL: 5.6 ppm/30 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 3 ppm/ 16 mg/m^3 [skin, sensitizer].

Protective Action Criteria (PAC)

TEEL-0: 3 ppm

PAC-1: 3 ppm

PAC-2: 5.6 ppm

PAC-3: 250 ppm

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 3B; Germ Cell Mutation Category 2.

NIOSH IDLH: 250 ppm.

Australia: TWA 25 ppm (135 mg/m^3), 1993; Austria: Suspected: carcinogen, 1999; Belgium: TWA 25 ppm (133 mg/m^3), 1993; Denmark: TWA 6 ppm (30 mg/m^3), 1999; Finland: STEL 25 ppm (135 mg/m^3), [skin], 1999; France: VME 25 ppm (135 mg/m^3), 1999; the Netherlands: MAC-TGG 135 mg/m^3, 2003; the Philippines: TWA 50 ppm (270 mg/m^3), 1993; Sweden: NGV 10 ppm (50 mg/m^3), TKV 15 ppm (80 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (135 mg/m^3), KZG-W 50 ppm (270 mg/m^3), [skin], 1999; Turkey: TWA 50 ppm (270 mg/m^3), 1993; United

Kingdom: TWA 25 ppm (135 mg/m^3), 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. Several states have set guidelines or standards for butyl glycidyl ether in ambient air[60] ranging from 1.35 mg/m^3 (Connecticut and North Dakota) to 2.25 mg/m^3 (Virginia) to 3.21 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1616 and OSHA Analytical Method 7, Organic Vapors.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of eyes, skin, and respiratory tract with wheezing and coughing. Exposure can cause headache, lightheadedness, dizziness, lack of coordination, and fainting. High levels can cause unconsciousness and even death. LD_{50} = (oral-rat)2050 mg/kg (slightly toxic).

Long Term Exposure: There is limited evidence that this chemical can cause mutations. *n*-Butyl glycidyl ether may cause skin allergy. DFG lists danger of skin and respiratory sensitization. May cause lung and liver disorders.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Pulmonary function tests, expired air. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *56 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *140 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *250 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where *n*-butyl glycidyl ether may be present, check to make sure that an explosive concentration does not exist. Store in a fireproof refrigerator in tightly closed containers under an inert atmosphere·[52] separated from strong oxidants, strong bases, strong acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Based on its flash point, butyl glycidyl ether requires a “FLAMMABLE LIQUID” label. It falls into Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb spills with paper or other absorbent material. Seal in vapor-tight plastic bags or sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, alcohol, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[24]

Butyl isovalerate B:0940

Molecular Formula: $C_9H_{18}O_2$

Common Formula: $CH_3CH_2CH(CH_3)COOC_4H_9$

Synonyms: Butanoic acid, 3-methyl-, butyl ester; *n*-Butyl isopentanoate; *n*-Butyl isovalerate; Butyl isovalerianate; Butyl 3-methyl-butyrate; Isovaleric acid, butyl ester

CAS Registry Number: 109-19-3

RTECS® Number: NY1502000

UN/NA & ERG Number: UN1993/128

EC Number: 203-654-7 (see Appendix 4)

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Butyl Isovalerate is a clear liquid. Molecular weight = 158.27; Boiling point = 150°C; Flash point = 53°C. Hazard Identification (based on NFPA 704 M Rating System): Health 0, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: May be used as a specialty solvent; food additive.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <3.0$.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Avoid skin and eye contact. Do not inhale mists or vapors. Symptoms include headache; muscle weakness; giddiness, nausea, vomiting, confusion, delirium, coughing, labored and difficult breathing; coma and even death. This ester is a skin irritant and has a high oral toxicity; the oral LD_{50} for rabbit is 8.2 mg/kg. Toxicity information of this chemical is grouped with *n*-butyl acetate. It is classified as moderately toxic. Probable oral lethal dose for humans is 0.5−5 g/kg (between 1 oz and a pint) for a 150-lb person. It is a mild irritant and central nervous depressant. Also, it is less toxic than the parent alcohol.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where butyl isovalerate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Based on its flash point (below 60.5°C), this material requires a "FLAMMABLE LIQUID" label. It falls into Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Butyl lactate B:0950

Molecular Formula: $C_6H_{11}O_3$

Common Formula: $CH_3CHOHCOO(CH_2)_3$

Synonyms: Butyl α-hydroxypropionate; Butyl lactate; 2-Hydroxypropanoic acid, butyl ester; Lactato de *n*-butilo (Spanish); Lactic acid, butyl ester

CAS Registry Number: 138-22-7

RTECS® Number: OD4025000

EC Number: 205-316-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Butyl lactate is a liquid. Molecular weight = 146.19; Boiling point = 170°C at 760 mmHg; Freezing/Melting Point = − 43°C; Flash point = 71°C (oc).[17] Autoignition temperature = 340−382°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Butyl lactate is used in making paints, inks, perfumes, dry cleaning fluids, and as a resin solvent in varnishes and lacquers.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, strong bases.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 ppm/ 25 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/30 mg/m^3 TWA.

Australia: TWA 5 ppm (25 mg/m^3), 1993; Belgium: TWA 5 ppm (30 mg/m^3), 1993; Denmark: TWA 5 ppm (25 mg/m^3), 1999; Finland: TWA 1 ppm (6 mg/m^3); STEL 3 ppm (18 mg/m^3), 1999; France: VME 5 ppm (25 mg/m^3), 1999; Norway: TWA 5 ppm (25 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 20 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation to the eyes, skin, nose, throat, and may cause headaches and cough. Symptoms may also include drowsiness, central nervous system depression, nausea, vomiting. At concentrations of 7 ppm with short peaks of 11 ppm, workers experienced headaches, upper respiratory system irritation, and coughing. Some complained of sleepiness and headache in the evening after work and occasional nausea and vomiting was experienced. When exposures were below 1.4 ppm, however, no symptoms were manifested.

Long Term Exposure: Headaches, feeling sleepy, and nausea may develop in the evening after exposure during the day.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where butyl lactate may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: A number with the prefix "NA" is not recognized for international shipments, except between the United States and Canada. No label required. Combustible liquids are in Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Butyl mercaptan is a flammable, colorless liquid with a strong, skunk-like odor. The Odor Threshold in air is 0.00097 ppm. Molecular weight = 90.19; Specific gravity = (H_2O:1): 0.83; Boiling point = 98°C; Freezing/Melting point = − 116°C; Vapor pressure = 35 mmHg at 20°C; Relative vapor density (air = 1) = 3.1; Flash point = 2°C (cc)[17]; Autoignition temperature ≤ 225°C. Explosive limits: LEL = 1.4%; UEL = 10.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 0.06% at 20°C.

Potential Exposure: Compound Description: Reproductive Effector; Primary Irritant. The major use is in the production of organophosphorus compounds, thiolcarbamates; more specifically insecticides, herbicides, acaricides, and defoliants.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, such as dry bleaches and nitric acid. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

OSHA PEL: 10 ppm/35 mg/m^3 TWA.

NIOSH REL: 0.5 ppm/1.8 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 0.5 ppm/1.8 mg/m^3 TWA.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC) 109-79-5

TEEL-0: 0.5 ppm

PAC-1: 7.5 ppm

PAC-2: 50 ppm

PAC-3: 500 ppm

DFG MAK: 0.5 ppm/1.9 mg/m^3 TWA; Peak limitation II(2).

Austria: MAK 0.5 ppm (1.5 mg/m^3), 1999; Denmark: TWA 0.5 ppm (1.5 mg/m^3), 1999; Finland: TWA 0.5 ppm (1.5 mg/m^3); STEL 1.5 ppm (4.5 mg/m^3), 1999; France: VME 0.5 ppm (1.5 mg/m^3), 1999; India: TWA 0.5 ppm (1.5 mg/m^3), 1993; Poland: TWA 1 mg/m^3; STEL 2 mg/m^3, 1999; the Netherlands: MAC-TGG 1.5 mg/m^3, 2003; Switzerland: MAK-W 0.5 ppm (1.9 mg/m^3), KZG-W 1 ppm (3.8 mg/m^3), 1999; Turkey: TWA 10 ppm (35 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 0.5 ppm TLV. Several states have set guidelines or standards for butyl mercaptan in ambient air[60] ranging from 5 μg/m^3 (New York) to 15 μg/m^3 (North Dakota and South Carolina) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (Connecticut) to 36 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2525 and #2542.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water limit of 21 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

In animals: narcosis, incoordination, weakness; cyanosis, pulmonary irritation, eye irritation, paralysis. LD_{50} = (oral-rat) 1500 mg/kg (slightly toxic).

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can cause a skin rash. The substance may affect the thyroid gland. High concentrations can cause weakness, nausea, dizziness, headache, and confusion. Very high concentrations (above the occupational exposure limit) exposure may affect the central nervous system and cause unconsciousness. In animals: narcosis, loss of coordination, lassitude (weakness, exhaustion), cyanosis, pulmonary irritation, and liver, kidney damage.

Long Term Exposure: Repeated exposure can cause skin rash and affect eyes, skin, respiratory system, central nervous system, liver, and kidneys,

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note:* Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area away from heat, oxidizers, or acids.

Shipping: Butyl mercaptan requires a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stop discharge if possible. Evacuate area in case of large spill. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam (preferred) extinguishers. Water may be ineffective in firefighting. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (1093°C) followed by scrubbing with a caustic solution.

Butyl methacrylate B:0970

Molecular Formula: $C_8H_{14}O_2$

Synonyms: *n*-Butyl methacrylate; Butyl 2-methacrylate; *n*-Butyl α-methylacrylate; Butyl 2-methyl-2-propenoate; Metacrilato de *n*-butilo (Spanish); Methacrylate de butyle (French); Methacrylic acid, butyl ester; Methacrylsaeure butyl ester (German); 2-Methyl butylacrylate; 2-Propenic acid, 2-methyl-, butyl ester

CAS Registry Number: 97-88-1

RTECS® Number: OZ3675000

UN/NA & ERG Number: UN2227/130P

EC Number: 202-615-1 [*Annex I Index No.*: 607-033-00-5]

Regulatory Authority and Advisory Bodies

TSCA 40CFR716.120(a).

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R36/37/38; R43; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyl methacrylate is a flammable, colorless liquid with a mild odor. Molecular weight = 122.4; Boiling point = 163°C; Specific gravity (H_2O:1) = 0.9; Freezing/Melting point = −25°C; Relative vapor density (air = 1) = 4.9; Vapor pressure = 2.3 mmHg at 20; Flash point = 52°C (oc); Autoignition temperature = 294°C. Explosive limits: LEL = 2%; UEL = 8%. Hazard Identification (based on

NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.6% at 20°C.

Potential Exposure: Compound Description: Drug; Reproductive Effector; Primary Irritant. Butyl methacrylate is used in resins, solvents, coatings, adhesives, dental materials, and textile emulsions.

Incompatibilities: Forms an explosive mixture with air. Unless inhibitor is maintained at the proper level, oxidizers, heat, ultraviolet light, contamination, or moisture may cause polymerization. May accumulate static electrical charges and cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: [skin] Danger of skin sensitization.

Denmark: TWA 50 ppm (290 mg/m^3), 1999; Russia: STEL 30 mg/m^3, 1993; Sweden: NGV 50 ppm (300 mg/m^3), KTV 75 ppm (450 mg/m^3), 1999; the Netherlands: MAC-TGG 59 mg/m^3, 2003.

Determination in Air: No criteria set.

Determination in Water: No criteria set. Octanol–water coefficient: Log K_{ow} = 2.26–3.01.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate the respiratory tract with coughing, wheezing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Butyl methacrylate may cause skin allergy. There is limited evidence that this chemical is teratogen in animals.

Points of Attack: Skin, reproductive system.

Medical Surveillance: Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Outside or detached storage is preferred. Prior to working with butyl methacrylate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above and from light and heat. Butyl methacrylate should be kept refrigerated and inhibited with 10-ppm hydroquinone monomethylether. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl methacrylate requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3, Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

UN/NA & ERG Number: UN2930 (Toxic solids, flammable, organic, n.o.s.)/131; UN2929 (Toxic liquids, flammable, organic, n.o.s.)/131

Regulatory Authority and Advisory Bodies

o-sec-isomer: Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled (*p-tert-isomer*).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*o-sec-*; *p-tert-*; *p-*; *o-*; *m-*; *p-tert*-isomers).

WGK (German Aquatic Hazard Class): 2—Water polluting (*o-*, *sec-*, and *o-tert-isomers*).

Description: The butylphenols include several isomers. The two most highly regulated are *o-sec*-butylphenol and *p-tert*-butylphenol. Their properties are as follows:

o-sec-isomer (89-72-5): Colorless liquid or solid (below 16°C). Molecular weight = 150.22; Boiling point = 108°C; Flash point = 108°C. Insoluble in water.

p-tert-isomer (98-54-4): White crystalline solid. Molecular weight = 150.24; Boiling point = 237°C; Freezing/Melting point = 97°C; Flash point = 115°C (oc); Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description (*p-tert*-isomer): Tumorigen, Mutagen, Human Data; Primary Irritant; (*o-sec-* and *o-tert*-isomers): Primary Irritant. Butylphenols may be used as intermediates in manufacturing varnish and lacquer resins; as a germicidal agent in detergent disinfectants; as a pour point depressant, in motor-oil additives; de-emulsifier for oil; soap-antioxidant, plasticizer, fumigant, and insecticide.

Incompatibilities: Incompatible with strong acids, caustics, aliphatic amines, amides, oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.14 mg/m^3 at 25°C & 1 atm.

o-sec-isomer

OSHA PEL: None.

NIOSH REL: 5 ppm/30 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/31 mg/m^3 TWA [skin].

Australia: TWA 5 ppm (30 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (30 mg/m^3), 1999; Belgium: TWA 5 ppm

(31 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (30 mg/m^3), [skin], 1999; France: VME 5 ppm (30 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (30 mg/m^3), [skin], 1999; United Kingdom: TWA 5 ppm (31 mg/m^3), [skin], 2000; the Netherlands: MAC-TGG 30 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam, Israel: TWA 5 ppm [skin].

p-tert-isomer

Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 0.5 mg/m^3
PAC-2: 0.75 mg/m^3
PAC-3: 500 mg/m^3

DFG MAK: 0.080 ppm/0.5 mg/m^3 TWA; Peak Limitation Category II(2); [skin] Danger of skin sensitization; Pregnancy Risk Group D.

Australia: TWA 10 ppm (60 mg/m^3); STEL 20 ppm, 1993; Austria: MAK 0.08 ppm (0.5 mg/m^3), [skin], 1999; Denmark: TWA 0.08 ppm (0.5 mg/m^3), [skin], 1999; Switzerland: MAK-W 0.08 ppm (0.5 mg/m^3), LZG-(week) 0.4 ppm, [skin], 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2000.

Several states have set guidelines or standards for the o-*sec*-isomer in ambient air[60] ranging from 300 μg/m^3 (North Dakota) to 500 μg/m^3 (Virginia) to 600 μg/m^3 (Connecticut) to 714 μg/m^3 (Nevada).

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.4-3.4$ [icsc].

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause irritation to nose, throat, and lungs. Sensitization may occur. Skin contact studies with animals suggest that severe irritation at concentrations above 10% may occur. May cause rash, redness, and irritation, especially when skin is wet. Absorption is significant and contact may lead to allergic reaction. Eye studies with animals suggest that severe irritation may occur. Ingestion studies on animals suggest that 8 oz may be lethal to a 150-lb person.

Long Term Exposure: May cause skin color changes by contact or inhalation of levels between 10 and 100 ppm. Allergy may develop after repeated exposure. Liver damage may also occur. There is limited evidence that butylphenol causes skin cancer in animals. Repeated or prolonged skin contact can cause skin ulcers and lead to permanent loss of skin pigment in affected areas.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *No respirator listed by NIOSH for Butylphenols*. If misting or vapor occur consider using a NIOSH/MSHA- or European Standard EN149-approved organic cartridge respirator or NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with butyl phenol you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Based on flash point, solid butylphenols should have a "POISONOUS/TOXIC MATERIALS, FLAMMABLE SOLID" label. Based on flash point, liquid butylphenols should have a "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID" label. These materials fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Butylphenol is combustible. Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: None; Risk phrases: R10; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyl propionate is a flammable, colorless to straw-yellow liquid with an apple-like odor. Molecular weight = 130.2; Boiling point = 146°C; Specific gravity (H_2O:1) = 0.87; Melting/Freezing point = −90°C; Vapor pressure = 2.9 mmHg at 20°C; Relative density at 20°C of the saturated vapor/air mixture (air = 1) = 1.01; Flash point = 32°C; Autoignition temperature = 426°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. It is used as a solvent or lacquer thinner and in perfumes and flavorings.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, strong acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 100 mg/m^3
PAC-1: 300 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes, skin, and the respiratory tract.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Outside or detached storage is preferred. Prior to working with butyl propionate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl propionate requires a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3, Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquid in vermiculite, dry sand, earth, or similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

p-tert-Butyltoluene B:1000

Molecular Formula: $C_{11}H_{16}$

Common Formula: p-$CH_3C_6H_4C_4H_9$

Synonyms: *p*-Methyl-*tert*-butylbenzene; 1-Methyl-4-*tert*-butylbenzene; TBT

CAS Registry Number: 98-51-1

RTECS$^®$ Number: XS8400000

UN/NA & ERG Number: UN2667/152

EC Number: 202-675-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: *p-tert*-Butyltoluene is a colorless liquid with an aromatic gasoline-like odor. Molecular weight = 148.18; Boiling point = 193−194°C; Boiling point = 193°C; Freezing/Melting point = −52°C; Vapor pressure = 0.68 mmHg at 20°C; Flash point = 68°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. This material is used as a solvent for resins and as an intermediate in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Reacts with strong oxidizers. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.07 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 10 ppm/60 mg/m^3 TWA.
NIOSH REL: 10 ppm/60 mg/m^3 TWA; 20 ppm/120 mg/m^3 STEL.
ACGIH TLV®[1]: 1 ppm/6.1 mg/m^3 TWA.
No TEEL available.
DFG MAK: No numerical value established. Data may be available.
NIOSH IDLH: 100 ppm.

Australia: TWA 10 ppm (61 mg/m^3); STEL 20 ppm, 1993; Austria: MAK 10 ppm (60 mg/m^3), 1993; Denmark: TWA 10 ppm (60 mg/m^3), 1999; Finland: TWA 10 ppm (60 mg/m^3); STEL 20 ppm (120 mg/m^3) [skin] 1999; France: VME 10 ppm (60 mg/m^3), 1999; Norway: TWA 10 ppm (60 mg/m^3), 1999; the Netherlands: MAC-TGG 6.1 mg/m^3, 2003; Switzerland: MAK-W 10 ppm (60 mg/m^3), KZG-W 20 ppm (120 mg/m^3), 1999; Turkey: TWA 10 ppm (60 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm. The state of Virginia has set a limit in ambient air[60] of 1.0 mg/m^3. Several states have set guidelines or standards for this compound in ambient air[60] ranging from 600 to 1200 μg/m^3 (North Dakota) to 1000 μg/m^3 (Virginia) to 1200 μg/m^3 (Connecticut) to 1429 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 1501.
Aromatic hydrocarbons or OSHA Analytical Method 7, Organic Vapors.[18]

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract, causes dry nose and throat, headaches, low blood pressure, tachycardia, abnormal cardiovascular system behavior, central nervous system depression, hematopoietic depression. LD_{50} = (oral-rat) 1500 mg/kg (slightly toxic). This chemical may cause effects on the central nervous system.

Long Term Exposure: The liquid defats the skin and may have effects on the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, central nervous system, bone marrow, liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. CBC (complete blood count), electrocardiogram.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; Viton™ gloves, suits. **4 h:** (At least 4 but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): nitrile; 4H™ and Silver Shield™ gloves. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyltoluenes require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably in admixture with a more flammable solvent.[24]

Butyl trichlorosilane B:1010

Molecular Formula: $C_4H_9Cl_3S$

Common Formula: $CH_3(CH_2)_3SiCl_3$

Synonyms: *n*-Butiltriclorosilano (Spanish); Butylsilicon trichloride; *n*-Butyltrichlorosilane

CAS Registry Number: 7521-80-4

RTECS® Number: VV2080000

UN/NA & ERG Number: UN1747/155

EC Number: 231-381-3

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyl trichlorosilane is a colorless liquid. Molecular weight = 191.57. Boiling point = 149°C; Flash point = 45°C (cc); 54°C (oc).[17] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Insoluble in water; reacts violently.

Potential Exposure: This is a raw material for silicone resin production.

Incompatibilities: Forms explosive mixture with air. Violent reaction with water, forming hydrochloric acid and fumes. Contact with strong oxidizers may cause fire and explosions. Attacks metals in a moist environment.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.60** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, skin, eyes.

Harmful Effects and Symptoms

Short Term Exposure: Butyl trichlorosilane is a corrosive chemical and can cause severe eye burns leading to permanent damage. Contact can cause severe skin burns. Exposure to vapors can irritate the eyes, nose, and throat. Butyl trichlorosilane can affect you when breathed in. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposure can cause a buildup of the fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: Repeated exposure may cause bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Where possible, enclose operations and use local exhaust ventilation at the site of chemical release. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Post hazard and warning information in the work area. In addition, as part of an ongoing education and training effort, communicate all information on the health and safety hazards of butyl trichlorosilane to potentially exposed workers.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard. Store separately in a corrosion-resistant location. (2) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl trichlorosilane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl trichlorosilane requires a "CORROSIVE, FLAMMABLE LIQUID" label. It falls in Hazard Class 8 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen chloride, chlorine, and phosgene, are produced in fire. Use dry chemical or carbon dioxide. Foam extinguishers are not recommended. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Butyl vinyl ether B:1020

Molecular Formula: $C_6H_{12}O$

Common Formula: $CH_2{=}CHOC_4H_9$

Synonyms: Butane, 1-(ethenyloxy)-; Butoxyethene; 1-(Ethenyloxy)butane; Ether, butyl vinyl; Vinyl *n*-butyl ether; Vinyl butyl ether

CAS Registry Number: 111-34-2

RTECS® Number: KN5900000

UN/NA & ERG Number: UN2352/127P

EC Number: 203-860-7

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Butyl vinyl ether is an extremely flammable, colorless liquid with an ether-like odor. Molecular weight = 100.2; Specific gravity (H_2O:1) = 0.8; Boiling point = 94°C; Freezing/Melting point = − 112.8°C; Vapor density (air = 1) = 3.5; Flash point = − 9.4°C (oc)[17]; Autoignition temperature = 255°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: This material may be used in organic synthesis and in copolymer manufacture.

Incompatibilities: Moderately explosive by spontaneous chemical reaction. Contact with oxidizers and strong acids may cause fire and explosions. Able to form unstable peroxides, which can cause polymerization.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May be poisonous if inhaled or absorbed through skin. Vapors may cause dizziness or suffocation. Contact may irritate or burn skin and eyes. LD_{50} = (oral-rat) 15,000 mg/kg (insignificantly toxic).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with butyl vinyl ether you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The DOT label requirement for inhibited butyl vinyl ether is "FLAMMABLE LIQUID."[19] It falls in Hazard Class 3 and Packing Group II.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind. Remove all ignition sources. Stop leak if you can do so without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dangerous, fire risk. For small fires use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. For large fires use water spray, fog, or alcohol foam. Move containers from fire area if you can do so without risk. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration.

EC Number: 204-646-6 [*Annex I Index No.*: 605-006-00-2]

Regulatory Authority and Advisory Bodies

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; Safety phrases: S2; S9; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyraldehyde is a highly flammable, colorless liquid with a pungent odor. Odor threshold = 0.009 ppm. Molecular weight = 72.12; Specific gravity (H_2O:1) = 0.79; Boiling point = 76°C; Freezing/Melting point = −99°C; Flash point = −22°C; Relative vapor density (air = 1) = 2.5; Autoignition temperature = 218°C. Explosive limits in air: LEL = 1.9%; UEL = 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slowly mixes with water; solubility = 7%.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. Used in making synthetic resins, solvents, and plasticizers.

Incompatibilities: Butyraldehyde can presumably form explosive peroxides, and may polymerize due to heat or contact with acids or alkalis. May accumulate static electrical charges, and may cause ignition of its vapors. Forms explosive mixture with air. Possible self-reaction in air; undergoes rapid oxidation to butyric acid in air. Incompatible with strong oxidizers (possible violent reaction), strong acids, caustics, ammonia, aliphatic amines, alkanolamines, aromatic amines. May corrode steel due to corrosive action of butyric acid.

Permissible Exposure Limits in Air
AIHA WEEL: 25 ppm TWA.
Protective Action Criteria (PAC)
TEEL-0: 0.02 ppm
PAC-1: 0.06 ppm
PAC-2: 0.4 ppm
PAC-3: 12.5 ppm
Russia: STEL 5 mg/m^3, [skin].

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.9-1.2$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Butyraldehyde is corrosive. Irritates the eyes, skin, and respiratory tract. Eye or skin contact may cause burns and possible permanent damage. High exposure can cause dizziness and lightheadedness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Prolonged or repeated skin exposure may cause skin disorders. Testing has not been completed to determine the carcinogenicity of butyraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, skin.

Medical Surveillance: Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Protect against physical damage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Outside or detached storage is preferred. Prior to working with Butyraldehyde you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyl propionate requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3, Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand, earth or similar noncombustible absorbent material and deposit in sealed containers. *Do not* use sawdust or other combustible absorbent. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Butyric acid B:1040

Molecular Formula: $C_4H_8O_2$

Common Formula: $CH_3(CH_2)_2COOH$

Synonyms: Acido butirico (Spanish); Butanic acid; *n*-Butanoic acid; Butanoic acid; Buttersaeure (German); *n*-Butyric acid; *normal* Butyric acid; Butyric acid; Ethylacetic acid; 1-Propanecarboxylic acid; Propylformic acid

CAS Registry Number: 107-92-6; Much of the following information may also apply to 79-31-2 (Isobutyric acid)

RTECS® Number: ES5425000

UN/NA & ERG Number: UN2820/153

EC Number: 203-532-3 [*Annex I Index No.:* 607-135-00-X] (107-92-6); 201-195-7 [*Annex I Index No.:* 607-063-00-9] (79-31-2)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: (*butyric acid*; *107-92-6*) Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S26; S36; S45; (*isobutyric acid*; *79-31-2*) Hazard Symbol: Xn; Risk phrases: R21/22; R36/38; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Butyric acid is a combustible, oily liquid with an unpleasant odor. The Odor Threshold is 0.0001 ppm.[41] Molecular weight = 88.12; Specific gravity (H_2O:1): 0.96; Boiling point = 163.5°C; Freezing/Melting point = − 7.87°C; Vapor pressure = 0.44 mmHg at 20°C; Flash point = 72°C; Autoignition temperature = 440°C. Flammable Limits in Air: LEL = 2%; UEL = 10%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Highly soluble in water.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. It is used in the manufacture of butyrate esters, some of which are used in artificial flavoring.

Incompatibilities: Forms explosive mixture with air. Incompatible with sulfuric acid, caustics, ammonia, aliphatic amines, isocyanates, strong oxidizers, alkylene oxides, epichlorohydrin.

Permissible Exposure Limits in Air

Temporary Emergency Exposure Limits (DOE).

TEEL-0: 15 ppm

PAC-1: 40 ppm

PAC-2: 250 ppm

PAC-3: 250 ppm

The former-USSR-UNEP/IRPTC joint project MAC value is 2.5 ppm (10 mg/m^3)[43] for work-place air. They also cite a momentary MAC value of 0.015 mg/m^3 and an allowable average daily MAC of 0.01 mg/m^3 in ambient air of residential areas.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.8.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Butyric acid is a medium strong corrosive acid. Can cause severe eye and skin irritation and burns leading to permanent damage. Inhalation can cause respiratory tract irritation, coughing, wheezing, and/or shortness of breath. LD_{50} = (oral-rat) 2940 mg/kg (slightly toxic).[9]

Long Term Exposure: Can affect the blood. Repeated exposures may cause bronchitis to develop with coughing, phlegm, and/or shortness of breath. May cause kidney damage.

Points of Attack: Skin, eyes, and respiratory system.

Medical Surveillance: Lung function tests. Kidney function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Protect against physical damage. Outside or detached storage is preferred. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with butyric acid you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Butyric acid requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group III.[19, 20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquid in vermiculite, dry sand, earth or similar material and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a

secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

PAC-3: 500 mg/m^3
Arsenic, organic compounds
OSHA PEL: 0.5 mg[As]/m^3 TWA
NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.
ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
Protective Action Criteria (PAC)
As arsenic, organic compounds
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 2.5 mg/m^3
PAC-3: 350 mg/m^3
124-65-2 (sodium salt)
TEEL-0: 1.07 mg/m^3
PAC-1: 1.07 mg/m^3
PAC-2: 4 mg/m^3
PAC-3: 500 mg/m^3
Determination in Air: Use NIOSH Analytical Method (IV) #5022, arsenic, organo-.
Determination in Water: The atomic absorption graphite furnace technique is often used for the measurement of total arsenic in water. It also has been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry. Fish Tox = 2841.14769000 ppb MATC (VERY LOW).
Routes of Entry: Inhalation, ingestion, skin and/or eye contact. This chemical can be absorbed through the skin, thereby increasing exposure.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can also cause burning, itching, thickening, and color changes.
Long Term Exposure: Certain other arsenic compounds have been identified as carcinogens. Although this chemical has not been identified as a carcinogen it should be handled with extreme caution. May cause an ulcer of the “bone” dividing the inner nose. It can cause disturbed sleep; thickening of the skin with patch areas of darkening and loss of pigment, or the development of white lines in the nails. May cause liver and kidney damage. Repeated exposure can lead to a metallic or garlic taste in the mouth, loss of appetite, nausea, vomiting, difficulty in swallowing, stomach pain, diarrhea, and possible death. *In animals*: irritation skin, possible dermatitis, respiratory distress, diarrhea, kidney damage, muscle tremor, convulsions, possible gastrointestinal tract damage, reproductive effects, possible liver damage. Human Tox = 5.61798 ppb; CHCL (Chronic Human Carcinogen Level) (HIGH).

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00003-5

Points of Attack: Skin, respiratory system, kidneys, central nervous system, liver, gastrointestinal tract, reproductive system.

Medical Surveillance: Test for urine arsenic. Levels should not be greater than 100 μg/g creatinine in the urine. Examine the skin for abnormal growths. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cacodylic acid you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents, chemically active metals, strong bases, moisture, fertilizers, seeds, insecticides, and fungicides.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Shipping Group is II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide and arsenic oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations (*cadmium*): Hazard Symbol: T + , N; Risk phrases: R45; R26; R48/23/25; R62; R63; R68; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cadmium is a bluish-white metal. Molecular weight = 112.4; Boiling point = 765°C; Freezing/Melting point = 321°C; Autoignition temperature (*metal dust*) = 250°C. Hazard Identification (based on NFPA-704 M Rating System): (*powder*) Health 3, Flammability 2, Reactivity 0. Insoluble in water. The only cadmium mineral, greenockite (CdS), is rare; however, small amounts of cadmium are found in zinc, copper, and lead ores. It is generally produced as a by-product of these metals, particularly zinc. Cadmium is insoluble in water but is soluble in acids. "Cadmium dust" includes dust of various cadmium compounds, such as $CdCl_2$. "Cadmium fume" has the composition Cd/CdO.

Potential Exposure: Cadmium is highly corrosion resistant and is used as a protective coating for iron, steel, and copper; it is generally applied by electroplating, but hot dipping and spraying are possible. Cadmium may be alloyed with copper, nickel, gold, silver, bismuth, and aluminum to form easily fusible compounds. These alloys may be used as coatings for other materials, welding electrodes, solders, etc. It is also utilized in electrodes of alkaline storage batteries, as a neutron absorber in nuclear reactors, a stabilizer for polyvinyl chloride plastics, a deoxidizer in nickel plating, an amalgam in dentistry, in the manufacture of fluorescent lamps, semiconductors, photocells, and jewelry, in process engraving, in the automobile and aircraft industries, and to charge Jones reductors. Various cadmium compounds find use as fungicides, insecticides, nematocides, polymerization catalysts, pigments, paints, and glass; they are used in the photographic industry and in glazes. Cadmium is also a contaminant of superphosphate fertilizers. Human exposure to cadmium and certain cadmium compounds occurs through inhalation and ingestion. The entire population is exposed to low levels of cadmium in the diet because of the entry of cadmium into the food chain as a result of its natural occurrence. Tobacco smokers are exposed to an estimated 17 mg per cigarette. Cadmium is present in relatively low amounts in the earth's crust; as a component of zinc ores, cadmium may be released into the environment around smelters.

Incompatibilities: Air exposure with cadmium powder may cause self ignition. Moist air slowly oxidizes cadmium forming cadmium oxide. Cadmium dust is incompatible with strong oxidizers, ammonium nitrate, elemental sulfur, hydrazoic acid, selenium, zinc, tellurium. Contact with acids cause a violent reaction, forming flammable hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA [*Note:* The PEL applies to all cadmium compounds (as Cd).]

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level. [*Note:* The REL applies to all cadmium compounds (as Cd).]

ACGIH TLV®[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood.

NIOSH IDLH: 9 mg [Cd]/m^3.

Protective Action Criteria (PAC)*
TEEL-0: 0.005 mg/m^3
PAC-1: **0.10** mg/m^3
PAC-2: **0.76** mg/m^3
PAC-3: **4.7** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Cadmium and inorganic compounds

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) (*fume*) 0.02 mg/m^3, MAC (STEL) (*fume*) 0.05 mg/m^3, 1999; MAC (TWA) (*dust*): 0.04 mg/m^3, MAC (STEL) *(dust):* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen.

Several states have set guidelines or standards for cadmium in ambient air[60] ranging from zero (North Dakota) to 0.0006 mg/m^3 (Rhode Island) to 0.0055 μg/m^3 (North Carolina) to 0.0056 μg/m^3 (Massachusetts) to 0.07 (Montana) to 0.12 μg/m^3 (Pennsylvania) to 0.25 μg/m^3 (South Carolina) to 0.4 μg/m^3 (Connecticut and South Dakota) to 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (Nevada) to 2.0 μg/m^3 (New York).

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *dust* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206; *fume*: NIOSH #7048, #7300, #7301, #7303, #7200 (Welding and Brazing Fume), and OSHA ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods.

Routes of Entry: Inhalation or ingestion of fumes or dust.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Dust may cause irritation of the nose and throat. Nonfatal lung inflammation has been reported from concentrations of 0.5−2.5 mg/m^3. In 4−10 h after exposure severe chest pain with persistent cough and difficult breathing, headache, chills, muscle aches, nausea, vomiting, and diarrhea may occur. Fluid in the lungs (pulmonary edema) and dark-purple coloration of the skin may occur. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death. Breathing becomes more difficult and is accompanied by wheezing or coughing of blood. Other symptoms which may occur 12−36 h after exposure in addition to those above include dizziness, irritability, gastrointestinal disturbances, shortness of breath, fever, profuse sweating, exhaustion, and inflammation of the lungs. Death may result within 7−10 days after exposure. The average concentrations of fume responsible for fatalities have been 40−50 mg/m^3 for 1 h, 9 mg/m^3 for 5 h, or 5 mg/m^3 for 8 h. *Skin:* Absorption is negligible. *Eyes:* Cadmium compound dust may cause irritation. *Ingestion:* A dose of 15−30 mg (1/1000 oz) of metal or soluble compounds may cause increased salivation, choking, vomiting, abdominal pain, anemia, kidney malfunction, diarrhea, and persistent desire to empty the bladder. Symptoms may occur within 15−30 min after ingestion. May cause heart and lung failure.

Long Term Exposure: Continued exposure to low levels of cadmium in air may cause irreversible lung injury, abnormal lung function, and kidney disease. Other consequences of cadmium exposures are inflammation of the nose and throat, open sores in the nose, soreness, bleeding and reduced nose size, loss of sense of smell, damage to the olfactory nerve, yellow cadmium stains on teeth, sleeplessness, nausea, lack of appetite, weight loss, anemia, lung distention with scar formation, and liver damage. May cause bone disease characterized by softening, bending, and reduction in bone size. Difficulty walking, pain in back and extremities, and spontaneous fractures may result. Inhalation of 0.06−0.68 mg/m^3 for 4−8 years may cause throat irritation, cough, chest pain, upset stomach, and fatigue. Exposure to levels of 3.0−15.0 mg/m^3 of fumes or dust over a period of 20 years has caused lung distention, anemia, protein in urine, and kidney dysfunction. Studies indicate that there is an increased incidence of prostatic cancer and possible kidney and respiratory cancer in cadmium workers. Cadmium causes birth defects in rats, mice, and hamsters; whether it does so in humans is not known.

Points of Attack: Respiratory system, lungs, kidneys, prostate, blood.

Medical Surveillance: In preemployment physical examinations emphasis should be given to a history of, or actual presence of: significant kidney disease, smoking history, and respiratory disease. A chest X-ray and baseline pulmonary function study is recommended. Periodic examinations should emphasize the respiratory system, including pulmonary function tests, kidneys, and blood. A low-molecular-weight proteinuria may be the earliest indication of renal toxicity. The trichloroacetic acid test may pick this up, but more specific quantitative studies would be preferable. If renal disease due to cadmium is present, there may also be increased excretion of calcium, amino acids, glucose, and phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Cadmium dust: (metal) Prevent skin contact. Any barrier that will prevent contamination from the dry chemical. Wear protective gloves and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield to prevent any possibility of eye contact, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue (*carcinogen*): Health Hazard: Store in a secure poison location. Prior to working with cadmium you should be trained on its proper handling and storage. Cadmium must be stored to avoid contact with sulfur, selenium, tellurium, ammonium nitrate, and hydrazoic acid since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Sources of ignition, such as smoking and open flames, are prohibited where cadmium is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA standard 1910.1045.

Shipping: Cadmium metal and dust are not specifically cited in DOT's Performance-Oriented Packaging Standards, but cadmium compounds are. These require a "POISONOUS/TOXIC MATERIALS" label.[19] They are in Hazard Class 6.1 and depending on other factors, may be in Packing Group I, II, or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable powder. Use dry chemicals appropriate for metal fires or dry sand. Use no other extinguishing agents. *Do not use water*. Toxic gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: With cadmium compounds in general, precipitation from solution as sulfides, drying, and return of the material to suppliers for recovery are recommended. Cadmium may be recovered from battery scrap as an alternative to disposal.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Cadmium acetate C:0110

Molecular Formula: $C_4H_6CdO_4$
Common Formula: $Cd(C_2H_3O_2)_2$
Synonyms: Acetic acid, cadmium salt; Aceto cadmio (Spanish); Bis(acetoxy)cadmium; Cadmium(II) acetate; Cadmium diacetate; C.I. 77185
CAS Registry Number: 543-90-8
RTECS*® *Number: EU9810000
UN/NA & ERG Number: UN2570/154
EC Number: 208-853-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Air Act: Toxic Pollutant (Section 401.15), Hazardous Air Pollutants (Title I, Part A, Section 112). *Note:* Includes any unique chemical substance that contains cadmium as part of that chemical’s infrastructure.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as cadmium acetate; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cadmium acetate is a colorless crystalline solid; Freezing/Melting point = 130°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Cadmium acetate is used in ceramics, textile dyeing, and printing and electroplating, and to make other acetate compounds.

Incompatibilities: Sulfides, strong acids.

Permissible Exposure Limits in Air

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA.

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood.

NIOSH IDLH: 9 mg [Cd]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0103 mg/m^3
PAC-1: 0. 062 mg/m^3
PAC-2: 0.15 mg/m^3
PAC-3: 18.6 mg/m^3
DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A.
Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) *(fume)* 0.02 mg/m^3, MAC (STEL) *(fume)* 0.05 mg/m^3, 1999; MAC (TWA) *(dust):* 0.04 mg/m^3, MAC (STEL) *(dust)* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. See also this section in the entry on Cadmium. North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3.

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods. See also reference.[49]

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Cadmium acetate can affect you when breathed in. Cadmium acetate is a carcinogen; handle with extreme caution. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Risk is greatest near dust or fume from heating or grinding cadmium acetate.

Long Term Exposure: Repeated lower exposure can cause permanent kidney damage, emphysema, low blood sugar, and/or lowered sense of smell. Serious damage can occur at levels below the PEL. See also entry on "Cadmium."

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: Urine test for Cadmium (levels should be less than 10 μg/L urine). Urine test for "low-molecular-weight proteins" (electrophoresis method best). Urinalysis (UA). Complete blood count (CBC). Lung function test. These should be repeated after suspected overexposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: *Clothing:* Avoid skin contact with Cadmium acetate. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium acetate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials listed above. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Cadmium acetate requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cadmium acetate itself does not burn. Poisonous gases are produced in fire, including cadmium fumes. Extinguish fire using an agent suitable for type of surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitation as sulfide, drying, and return to supplier.[22] Incineration is not recommended.

PAC-3: 21.8 mg/m^3

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) *(fume)* 0.02 mg/m^3, MAC (STEL) *(fume)* 0.05 mg/m^3, 1999; MAC (TWA) *(dust):* 0.04 mg/m^3, MAC (STEL) *(dust)* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3.

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods. See also reference.[49]

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Cadmium bromide can affect you when breathed in. Cadmium bromide is a carcinogen; handle with extreme caution. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Risk is greatest near dust or fume from heating or grinding cadmium acetate.

Long Term Exposure: Repeated exposures can cause anemia, permanent kidney damage, emphysema, low blood count, and/or loss of sense of smell, fatigue, yellow staining of teeth. Cadmium bromide should be handled as a potential teratogenic agent and reproductive hazard since several related cadmium compounds are known teratogens and decreases fertility in males and females. Repeated low exposures (below the OSHA PEL) can cause permanent kidney damage, which can go unnoticed without testing until severe. Kidney stones can also occur. Emphysema and/or lung scarring can occur from a single high exposure or repeated lower exposures. Sax (see "References" below) states that $CdBr_2$ is a recognized carcinogen of the connective tissue, lungs, and liver.

Points of Attack: Respiratory system, kidneys, liver.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: Urine test for cadmium (levels should be less than 10 μg of cadmium per liter of urine). Urine test for low-molecular-weight proteins (electrophoresis method best). Urine analysis (UA). Complete blood count (CBC). Lung function tests. These should be repeated after suspected overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: *Clothing:* Avoid skin contact with cadmium bromide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with cadmium bromide you should be trained on its proper handling and storage. Cadmium bromide must be stored to avoid contact with Potassium, since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Cadmium bromide requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Cadmium bromide itself does not burn. Poisonous gases are produced in fire, including cadmium and bromine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Molecular Formula: $CdCl_2$

Synonyms: Caddy; Cadmium dichloride; Cloruro de cadmio (Spanish); Dichlorocadmium; Kadmiumchlorid (Germany); VI-CAD

CAS Registry Number: 10108-64-2; 7790-78-5 (hemipentahydrate)

RTECS® Number: EV0175000

EC Number: 048-008-00-3

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (In pesticides in UK)[13] (other) (UN).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure.

Clean Water Act: Toxic Pollutant (Section 401.15); Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as cadmium chloride; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cadmium chloride is a colorless, odorless, crystalline solid or powder. Molecular weight = 183.30; Boiling point = 960°C; Freezing/Melting point = 568°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 140 g/100 mL at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical Tumorigen, Mutagen; Reproductive Effector; Human Data. Cadmium chloride is used in dyeing and printing of fabrics, in electronic component manufacture, in photography, used as a pesticide, and in nonpasture turf fungicides.

Incompatibilities: Sulfur, selenium, potassium, and strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA.

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood.

NIOSH IDLH: 9 mg [Cd]/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.00815 mg/m^3
PAC-1: 0.0489 mg/m^3
PAC-2: 0.5 mg/m^3
PAC-3: 14.7 mg/m^3

Hemipentahydrate
TEEL-0: 0.0102 mg/m^3
PAC-1: 0.0609 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 18.3 mg/m^3

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) *(fume)* 0.02 mg/m^3, MAC (STEL) *(fume)* 0.05 mg/m^3, 1999; MAC (TWA) *(dust):* 0.04 mg/m^3, MAC (STEL) *(dust)* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3. Guidelines for cadmium chloride in ambient air have been set[60] ranging from 1.67 μg/m^3 (New York) to 5.0 μg/m^3 (Florida).

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) −8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) −3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota); to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods.[49]

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Cadmium chloride can cause severe irritation of the gastrointestinal tract and the respiratory tract. Inhalation can cause nose, throat, and lung irritation. Fumes can cause flu-like illness with chills, headache, aching muscles, and/or fever. Higher exposures can cause nausea, salivation, vomiting, cramps, diarrhea, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium chloride is highly toxic. As little as 14.5 mg of Cd orally causes nausea and vomiting; 8.9 g has caused death. Cadmium salts cause cramps, nausea, vomiting, and diarrhea. Acute poisoning causes lung damage.

Long Term Exposure: This chemical is a probable carcinogen in humans, with some evidence that it causes prostate and kidney cancer in humans, and it has been shown to cause lung and testes cancer in animals. It may also be a reproductive hazard in humans. Repeated low exposures may cause permanent kidney and liver damage, anemia, and/or loss of the sense of smell. Chronic poisoning damages kidneys, lungs, bones, and causes blood changes (anemia).

Points of Attack: See above on harmful effects and symptoms.

Medical Surveillance: Urine test for cadmium. Urine test for "low-molecular-weight proteins" to detect kidney damage. Urinalysis. Complete blood count (CBC). Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Store in tightly closed containers. Avoid contact with strong acids and oxidizers or moisture.

Shipping: Cadmium chloride requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use agent suitable for surrounding fire. Cadmium chloride itself does not burn. Poisonous gases are produced in fire, including cadmium and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It is preferred to convert the salt to the nitrate, precipitate it with H_2S, filter, wash and dry the precipitate, and return it to the supplier.

Determination in Air: For *(dust):* use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods.[49]

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact causes irritation. Inhalation can cause irritation of the nose and throat and irritation of the lungs with coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium oxide can cause metal fume fever with chills, headache, aching muscles, metallic taste, and/or fever. Exposure can cause nausea, salivation, vomiting, cramps, and diarrhea. Symptoms for cadmium poisoning include metallic taste in the mouth, headache, shortness of breath; chest pain, cough with foamy or bloody sputum, pulmonary rales, weakness, leg pains, and pulmonary edema. The lethal inhalation dose of cadmium oxide in humans is 2500 mg/m^3 for a minute exposure. Lethal exposure has been established at 50 mg (cadmium)/m^3 for 1 h for cadmium oxide dust and 30 min for the fume. These concentrations may be inhaled without sufficient discomfort to warn worker of exposure. Acute exposure by inhalation may cause death by anoxia. The lowest human toxic inhalation concentration is 8630 μg/m^3/5 h for the fume.

Long Term Exposure: Lungs (tracheobronchitis, pneumonitis), kidneys (possible kidney stones), and liver may be affected or damaged by repeated or prolonged exposure. Cadmium oxide is probably carcinogenic to humans; there is some evidence of lung and prostate cancer. There is limited evidence that this chemical is a teratogen in animals. Long-term exposure can cause anemia, brittle and painful bones, loss of sense of smell, fatigue, and/or yellow staining of teeth. Cancer site: prostate and lung.[NIOSH]

Medical Surveillance: Urine test for cadmium. Urine test for "low-molecular-weight proteins" to detect kidney damage. Urinalysis. Complete blood count (CBC). Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to Physician: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Cadmium fume: (CdO) Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots. Persons with respiratory disorders should be excluded from contact with this material. A Class I, Type B, biological safety hood should be used when mixing, handling, or preparing cadmium oxide. Wear protective gloves and clothing to prevent any skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with cadmium oxide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, away from magnesium, oxidizers, combustible materials, heat, moisture, and acids. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and Packing Group I.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind and out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid but may increase fire activity. Use any extinguishing agent. Poisonous gases are produced in fire, including toxic fumes of cadmium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Form nitrate with HNO_3, precipitate with H_2S, filter, package, and return to supplier.[22]

EC Number: 218-743-6

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure.

Clean Water Act: Toxic Pollutant (Section 401.15), as cadmium compounds.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as cadmium stearate; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as cadmium compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cadmium stearate is a crystalline solid. Molecular weight = 698.5. Hazard Identification (based on

NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Used as a lubricant and stabilizer in polyvinyl chloride plastics.

Permissible Exposure Limits in Air

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA.

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood.

NIOSH IDLH: 9 mg [Cd]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0303 mg/m^3

PAC-1: 0.182 mg/m^3

PAC-2: 13 mg/m^3

PAC-3: 54.6 mg/m^3

DFG MAK: Carcinogen Category 1; Germ Cell Mutagen Group: 3A.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) *(fume)* 0.02 mg/m^3, MAC (STEL) *(fume)* 0.05 mg/m^3, 1999; MAC (TWA) *(dust):* 0.04 mg/m^3, MAC (STEL) *(dust)* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3.

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods.[49]

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Acute poisoning produces severe nausea, vomiting, diarrhea, and abdominal and chest pains. Dry mouth, salivation, and metallic taste have been reported. If ingested, may result in exhaustion, collapse, shock, and death within a period of 24 h. Acute toxicity most notably occurs secondary to cadmium ingestion or inhalation of cadmium fumes. Poisoning from inhalation is relatively rare but dangerous, having a mortality rate of about 15%. Toxic inhaled concentrations in humans have been reported at 147 mg/m^3/35 min and at 1800 μg/m^3/2 years. LD$_{50}$ = (oral-rat) 1125 mg/kg; the oral LD$_{50}$ for mouse is 590 mg/kg.

Long Term Exposure: Yellow rings may be seen in teeth when chronically exposed. A probable human carcinogen and teratogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium stearate you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area, away from incompatible materials. Where this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Cadmium stearate falls under "cadmium compounds" in DOT regulations. It falls in Hazard Class 6.1 and Packing Group III.[19,20]

Spill Handling: Do not touch spilled material. Stay upwind, keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3.

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total Cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved Cadmium is determined by 0.45-μ filtration followed by the previously cited methods.[49]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes on contact. Inhalation irritates the nose, throat, and lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium sulfate can cause nausea, salivation, vomiting, cramps and diarrhea, metal fume fever with flu-like symptoms, chills, headache, weakness, and metallic taste in the mouth.

Long Term Exposure: Repeated exposure can cause anemia, brittle and painful bones, diminished or loss of the sense of smell, fatigue, and/or yellow staining of the teeth. May cause lung and prostate cancer, kidney damage with kidney stones, liver damage, lung damage with bronchitis, cough, phlegm, and/or shortness of breath. There is some evidence that cadmium sulfate is a teratogen in humans.

Points of Attack: Lungs, liver, kidneys, blood.

Medical Surveillance: Urine test for Cd (levels should be less than 10 μg/L of urine). Urine test for low-molecular-weight proteins (β-2-microglobulin) to detect kidney damage. Complete blood count (CBC). Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or

authorized paramedic may consider administering a corticosteroid spray.

Note to physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4—12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium sulfate, you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and metals.

Shipping: DOT label requirement of "POISONOUS/ TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid that may ignite combustible materials. Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 215-147-8 [*Annex I Index No.:* 048-010-00-4]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains cadmium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: (inorganic compounds: 0.1%; organic compounds: 1.0%).

California Proposition 65 Chemical: Cancer 10/1/87.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B): Severe pollutant, as cadmium compounds.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; R48/23/25; R620; R63; R68; R53 Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cadmium sulfide is an odorless, crystalline, lemon yellow to orange solid. Molecular weight = 144.48; Specific gravity (H_2O:1) = 4.8; Sublimation point = 978°C. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Used in pigments; as an active ingredient in antidandruff shampoos; making photoconductors, solar cells, and other electronic components.

Incompatibilities: Contact with water or moisture releases poisonous hydrogen sulfide gas. Incompatible with oxidizers, hydrogen azide, zinc, selenium, tellurium, and other metals, iodine monochloride, strong acids.

Permissible Exposure Limits in Air

OSHA PEL: *dust and fume* 0.005 mg[Cd]/m^3 TWA.

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[Cd]/m^3 inhalable dust, Suspected Human Carcinogen; 0.002 mg[Cd]/m^3, respirable dust, Suspected Human Carcinogen; BEI: 5 mg[Cd]/g creatinine, urine; 5 mg[Cd]/L, blood.

NIOSH IDLH: 9 mg [Cd]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.00643 mg/m^3

PAC-1: 0.0386 mg/m^3

PAC-2: 11.6 mg/m^3

PAC-3: 11.6 mg/m^3

DFG MAK: [skin]; Carcinogen Category 1; Germ Cell Mutagen Group: 3A.

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1993; Denmark: TWA 0.01 mg/m^3, 1999; Finland: TWA 0.02 mg/m^3, carcinogen, 1999; France: VME 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.005 mg/m^3, 2003; Japan: 0.05 mg/m^3, Group 1 carcinogen, 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.2 mg/m^3, 1993; Poland: MAC (TWA) *(fume)* 0.02 mg/m^3, MAC (STEL) *(fume)* 0.05 mg/m^3, 1999; MAC (TWA) *(dust):* 0.04 mg/m^3, MAC (STEL) *(dust)* 0.2 mg/m^3, 1999; Russia: TWA 0.01 mg/m^3; STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3 (total *dust*), 1999; TWA 0.01 mg/m^3 (respirable *dust*), 1999; Switzerland: MAK-W 0.05 mg/m^3, carcinogen, 1999; Thailand: TWA 0.2 mg/m^3; STEL 0.5 mg/m^3, 1993; Turkey: TWA 0.2 mg/m^3, 1993; United Kingdom: TWA 0.025 mg[Cd]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. See also this section in the entry on "Cadmium." North Carolina has set a guideline for cadmium acetate in ambient air[60] of 0.0055 μg/m^3.

Determination in Air: Collection of particles on a filter, workup with acid, and measurement by atomic absorption have been specified by NIOSH. For *(dust):* Use NIOSH Analytical Methods #7048 (Cd) and #7300 (Elements), #7303, #9102, or OSHA: ID-121, ID-125G, ID-189, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* [1.05 In (hardness) − 8.53] μg/L as a 24-h average, never to exceed: e[1.05 In (hardness) − 3.73] μg/L at any time. *To protect saltwater aquatic life:* 4.5 μg/L as a 24-h average, never to exceed 59.0 μg/L at any time. EPA[62] and Canada set a limit of 0.005 mg/L in drinking water. Mexico has set a limit of 0.01 mg/L in drinking water. Effluent standards for cadmium in water have been set by Argentina, 0.1 mg/L; Japan, 0.1 mg/L. Drinking water standards have been set[35] by the Czech Republic, 0.010 mg/L; EEC, 5.0 μg/L (0.005 mg/L); Japan, <0.01 mg/L; USSR-UNEP/IRPTC, 0.01 mg/L; WHO, 0.005 mg/L. Further, guidelines for cadmium in drinking water have been set[61] ranging from 5 μg/L (Kansas and Minnesota) to 10 μg/L (Maine).

Determination in Water: Total cadmium may be determined by digestion followed by atomic absorption of colorimetric (Dithizone) analysis or by inductively coupled plasma (ICP) optical emission spectrometry. Dissolved cadmium is determined by 0.45-μ filtration followed by the previously cited methods.[49]

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes on contact. Inhalation irritates the nose, throat, and lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cadmium sulfid can cause nausea, salivation, vomiting, cramps and diarrhea, metal fume fever with flu-like symptoms, chills, headache, weakness, and metallic taste in the mouth.

Long Term Exposure: Repeated exposure can cause anemia, brittle and painful bones, diminished or loss of the sense of smell, fatigue, and/or yellow staining of the teeth. May cause lung cancer; kidney damage with kidney stones; liver damage; lung damage with bronchitis, cough, phlegm, and/or shortness of breath; damage to the testes; and may damage the developing fetus. There is some evidence that cadmium sulfid is a teratogen in humans.

Points of Attack: Lungs, liver, kidneys, blood.

Medical Surveillance: Urine test for Cd (levels should be less than 10 μg/L of urine). Urine test for low-molecular-weight proteins (β-2-microglobulin) to detect kidney damage. Complete blood count (CBC). Lung function tests. Liver function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from cadmium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as Cd compounds): *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with Cadmium sulfide, you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, dark, well-ventilated area away from oxidizers and metals, strong acids, water or moisture, and other incompatible materials listed above.

Shipping: DOT label requirement of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not* use water. Use dry chemical extinguishers appropriate for metal fires. Poisonous gases are produced in fire, including sulfur oxides and hydrogen sulfide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium C:0200

Molecular Formula: Ca
Synonyms: Calcicat; Calcium metal; Calcium metal, crystalline; Elemental calcium
CAS Registry Number: 7440-70-2
RTECS® Number: EV8040000
UN/NA & ERG Number: UN1401/138; UN1855 (Calcium, pyrophoric)/135
EC Number: 231-179-5 [*Annex I Index No.*: 020-001-00-X]
Regulatory Authority and Advisory Bodies
European/International Regulations: Hazard Symbol: F; Risk phrases: R15; Safety phrases: S2; S8; S24/25; S43 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Calcium is a silvery-white metal when freshly cut, which tarnishes to a blue-gray color in air. It can also be found as a powder. Molecular weight = 40.1; Specific gravity (H_2O:1) = 1.54; Boiling point = 1485°C; Freezing/Melting point = 849°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Reacts with water.
Potential Exposure: Calcium is used as a raw material for aluminum, copper, and lead alloys.
Incompatibilities: Forms hydrogen gas on contact with air; dust may ignite spontaneously. A strong reducing agent; reacts violently with water, acids, strong oxidizers (such as chlorine, bromine and fluorine), alkaline carbonates, dinitrogen tetroxide, halogenated hydrocarbons, lead chloride, halogens, alkaline hydroxides, oxygen, silicon, sulfur, chlorine, fluorine, chlorine trifluoride, and many other substances. Reacts with water to produce flammable hydrogen gas.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 10 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3
Determination in Air: Use NIOSH (IV) Analytical Method #7020 (Calcium).
Routes of Entry: Inhalation of dust.
Harmful Effects and Symptoms
Contact with the dust can severely irritate and burn the eyes and skin. Exposure to the dust can irritate the air passages and lungs. Calcium is a reactive chemical and is an explosion hazard.
Short Term Exposure: Eye contact can cause irritation and possible permanent damage. Skin contact can cause irritation and burns. Inhalation can irritate air passages and lungs, causing coughing and difficult breathing.
Points of Attack: Eyes, skin, and respiratory system.
Medical Surveillance: Lung function tests are recommended on a preemployment and regular postemployment basis.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear chemical goggles and face shield when working with Calcium, unless full face-piece respiratory protection is worn.
Respirator Selection: Where there is potential for exposure to calcium, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.
Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Store in tightly closed containers in a cool, well-ventilated area away from water, moisture, oxidizers, and acids. Wherever calcium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Store in kerosene or other neutral oil. Do not store large quantities of calcium in rooms with sprinkler systems. A detached fire-resistant building is recommended for large storage.
Shipping: Calcium or calcium alloys must be labeled (UN1401): "DANGEROUS WHEN WET" or (UN1855) "SPONTANEOUSLY COMBUSTIBLE." They fall in (UN1401) Hazard Class 4.3 and Packing Group II; (UN1855) Hazard Class 4.3 and Packing Group I.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered

material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Calcium dust may ignite spontaneously in air. In contact with water or moisture, Calcium releases Hydrogen gas which can be explosive. Containers may explode in fire. Fire may restart after it has been extinguished. Use dry graphite, soda ash, powdered salt, or appropriate metal fire extinguisher. *Do not use water*, CO_2, or dry chemical extinguishers since they are ineffective. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Calcium metal may be burned in an open furnace.[24] When burning calcium waste in a steel pan, dry steam may be directed to the waste with due care to avoid splashing.

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence*, carcinogenic to humans*, Group 1, 1987.

Banned or Severely Restricted (Thailand) Banned for import, production, having in possession and use as an agricultural pesticide. 12/12/2001.

US EPA, FIFRA, 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Air Act: List of high-risk pollutants (Section 63.74) as arsenic compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15) as arsenic compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), listed by name; also listed as calcium arsenate and calcium arsenite, mixtures, solid.

California Proposition 65 Chemical: Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Calcium arsenate is a white flocculent powder. It is not combustible. Molecular weight = 398.1. Boiling point = (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.01% at 77°C.

Potential Exposure: Compound Description: Agricultural Chemical Tumorigen. Workers engaged in manufacture, formulation, and application of pesticides containing calcium arsenate.

Incompatibilities: None reported, according to NIOSH. When heated produces arsenic fumes.

Permissible Exposure Limits in Air

OSHA PEL: 0.010 mg[As]/m^3 TWA; cancer hazard that can be inhaled.

NIOSH REL: 0.002 mg[As]/m^3 [15 min] Ceiling Concentration. Limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen.

NIOSH IDLH: 5 mg[As]/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.0266 mg/m^3
PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3
PAC-3: 13.3 mg/m^3
DFG TRK: 0.10 mg[As]/m^3; BAT: 1.30 μg[As]/L in urine/end-of-shift; Carcinogen Category 1.

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3, 1993; Turkey: TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on an average daily basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301, #7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: No criteria set for calcium arsenate. See "Arsenic" entry.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Can cause poor appetite, a metallic or garlic taste, nausea, vomiting, stomach pain, diarrhea, abnormal heart rhythm, seizures, pain in extremities and muscles, weakness, flushing of skin, numbness and tingling in extremities, intense thirst, and muscular cramps, delirium, and possible death. Kidney failure may occur. Jaundice may appear within an hour. In severe poisoning, death can occur within an hour, but the usual interval is 24 h. This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. It is an irritant to eyes, respiratory tract, mouth, and stomach.

Long Term Exposure: Calcium arsenate is a carcinogen in humans and may be a reproductive hazard. Damage to kidneys, liver and the nervous system has been reported. Chronic exposure can cause bone marrow damage, often leading to aplastic anemia. Long-term exposure can cause an ulcer in the septum dividing the inner nose. High or repeated exposure may damage the nerves, causing weakness and poor coordination in the limbs. Repeated skin contact can cause thickened skin and/or patch areas of darkening and loss of pigment. Some may develop white lines on the nails. There is epidemiological evidence that chronic ingestion of arsenic compounds causes a predisposition to skin cancers. A rebuttable presumption against pesticide registration was issued on October 18, 1978 by US EPA on the basis of oncogenicity, teratogenicity, and mutagenicity.

Points of Attack: Eyes, respiratory system, liver, skin, lymphatics, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Examination of the nose, eyes, nails, and nervous system. Liver function tests. Tests for urine arsenic. NIOSH recommends urine arsenic should not exceed 100 μg/g creatine in the urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018, *Inorganic Arsenic.* See also NIOSH Criteria Document #75-149, "*Inorganic Arsenic.*"

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Calcium arsenate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The DOT label requirement[19] is "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fires. Poisonous gases are produced in fire, including arsenic. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Long-term storage in large, weatherproof, and sift-proof storage bins or silos; small amounts may be disposed in a chemical waste landfill. Alternatively, dissolve in HCl, precipitate as sulfide, with H_2S, dry, and return to supplier.[23]

Calcium carbide C:0220

Molecular Formula: C_2Ca

Common Formula: CaC_2

Synonyms: Acetylongen; Calcium acetylide; Calcium dicarbide; Carbide, acetylenogen

CAS Registry Number: 75-20-7

RTECS® Number: EV9400000

UN/NA & ERG Number: UN1402/138

EC Number: 200-848-3 [*Annex I Index No.*: 006-004-00-9]

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below)

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: F; Risk phrases: R15; Safety phrases: S2; S8; S43 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium carbide is grayish-black granules, powder, or lumps. Slight garlic odor. Molecular weight = 64.1; Specific gravity (H_2O:1) = 2.23; Boiling point ≥ 447°C; Freezing/Melting point = about 2300°C.

Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩ (water reactive).

Potential Exposure: Those involved in the manufacture and handling of carbide and the generation of acetylene.

Incompatibilities: Water contact or moist air forms calcium hydroxide and explosive acetylene gas with risk of fire and explosion. Keep away from acids, oxidizers, hydrogen chloride, methanol, copper salt solutions, lead fluoride, magnesium, selenium, silver nitrate, iron trichloride, tin dichloride, sodium peroxide, stannous chloride, sulfur.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 10 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3

Routes of Entry: Inhalation and ingestion.

Harmful Effects and Symptoms

Irritation of skin, eyes and respiratory tract. Inhalation of dust may cause lung edema.

Short Term Exposure: Corrosive. Contact with eyes or skin causes severe irritation and burns with possible permanent eye damage and ulcers to the skin. Irritates the lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can irritate the lungs. Exposure may cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, and respiratory tract.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—Green: General storage may be used. Prior to working with calcium carbide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and without sprinkler protection and avoid contact with incompatible materials. Use only nonsparking tools and equipment especially when opening and closing containers of calcium carbide. Metal containers involving the transfer of this chemical should be grounded and bonded. Use explosion-proof electrical equipment in the carbide-handling area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Calcium carbide requires a "DANGEROUS WHEN WET" label. It falls in Hazard Class 4.3 and Packing Groups I or II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Wet calcium carbide produces highly flammable acetylene gas. Dry calcium carbide itself is not flammable. *Do not use water*, foam, carbon dioxide, or halogen extinguishers on fire. Use dry chemical, sand, soda ash, or lime extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mixing with large quantity of water using pilot flame to ignite evolved acetylene. Lime residue sent to landfill.

Calcium carbonate C:0230

Molecular Formula: $CCaO_3$

Common Formula: $CaCO_3$

Synonyms: Agricultural limestone; Agstone; Aragonite; Atomit; Bell mine pulverized limestone; Calcite; Calcium (II)carbonate (1:1); Carbonic acid, calcium salt (1:1); Chalk; Dolomite; Franklin; Limestone; Lithographic stone; Marble; Portland stone; Sohnhofen stone; Vaterite. The monocarbonate is an FDA and foreign over-the-counterdrug with more than 250 registered trade names.

CAS Registry Number: 471-34-1; 1317-65-3 (dolomite; limestone)

RTECS® Number: EV9580000; FF9335000 (monocarbonate)

EC Number: 207-439-9; 215-279-6 (limestone)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Calcium carbonate is a white, odorless powder, or crystalline solid. Molecular weight = 100.09; Specific gravity (H_2O:1) = 2.7−2.95; Freezing/Melting point = 825−1339°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Very slightly soluble in water; solubility = 0.001%. In some of the literature monocarbonate (CAS 471-34-1) is listed: Freezing/Melting point = 825°C (decomposes).

Potential Exposure: Compound Description: Primary Irritant (monocarbonate). Calcium carbonate is used as a source of lime, as a neutralizing agent, in manufacturing of rubber, plastics, paint and coatings, sealants, paper, dentifrices, ceramics, putty, polishes and cleaners, insecticides, inks and cosmetics, whitewash, Portland cement, antacids, in analytical chemistry, and others.

Incompatibilities: Calcium carbonate decomposes in high temperature forming carbon dioxide and corrosive materials. Reacts with acids producing carbon dioxide gas release. Incompatible with acids, ammonium salts, fluorine. NIOSH also lists alum as incompatible but this is questionable.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 (respirable fraction) TWA; 5 mg/m^3 (total dust) TWA.

NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 (respirable dust) TWA.

ACGIH TLV®[1]: Withdrawn.

Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 75 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

Dolomite; limestone
TEEL-0: 15 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 500 mg/m^3

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Poland: MAC (TWA) dust 10 mg/m^3, 1999; Russia: STEL 6 mg/m^3, 1993; Switzerland: MAK-W 6 mg/m^3 (respirable dust), 1999; United Kingdom: TWA 10 mg/m^3, total inhalable dust, 2000; TWA 4 mg/m^3, respirable dust, 2000; the Netherlands: MAC-TGG 10 mg/m^3, for regular and monocarbonate, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3.(E)

Determination in Air: NIOSH Analytical Method #7020 (Calcium), Method #7303, or OSHA Analytical Method ID-121. See also NIOSH Analytical Methods #0500 for nuisance dust, total, and 0600 for nuisance dust, respirable.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause irritation to nose. Eye contact can cause irritation. *Ingestion:* Large amounts can cause irritability, nausea, dehydration, and constipation. Estimated lethal dose is over 2 lb.

Long Term Exposure: Ingestion of more than 8 g (1/3 oz) a day can cause blood and kidney disorders.

Points of Attack: Eyes, respiratory system, digestive system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear safety glasses.

Respirator Selection: Wear dust mask.

Storage: Color Code—Green: General storage may be used. Store to avoid contact with acids.

Shipping: The DOT Performance-Oriented Packaging Standards[19] do not cite calcium carbonate.

Spill Handling: Scoop up and place in suitable container. Discard with regular trash.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding materials.

Disposal Method Suggested: Landfills.

New York State Department of Health. (March 1986). *Chemical Fact Sheet: Calcium Carbonate*. Albany, NY: Bureau of Toxic Substance Assessment

Calcium chlorate C:0240

Molecular Formula: $CaCl_2O_6$

Common Formula: $Ca(ClO_3)_2$

Synonyms: Calcium chlorate aqueous solution; Chlorate de calcium (French); Chloric acid, calcium salt

CAS Registry Number: 10137-74-3

RTECS® Number: FN9800000

UN/NA & ERG Number: UN1452 (solid)/140; UN2429 (solution)/140

EC Number: 233-378-2

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Calcium chlorate forms white to yellow deliquescent crystals. Molecular weight = 243; Specific gravity (H_2O:1) = 2.71; Freezing/Melting point = 340° (loses H_2O of crystallization at >100°). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0; oxidizer. Highly soluble in water.

Potential Exposure: Calcium chlorate is used in making fireworks, herbicides (weed killers), and in photography.

Incompatibilities: A strong oxidizer. Reacts, possibly with risk of fire and explosion, with acids (especially organic acids), reducing agents, aluminum, arsenic, chemically active metals, combustible materials, ammonium compounds, charcoal, copper, cyanides, manganese dioxide, metal sulfides, phosphorus, sulfur.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Calcium chlorate can affect you when breathed in. Contact can irritate the skin and eyes. Inhalation can cause irritation of the respiratory tract. Calcium chlorate may damage the kidneys. Very high exposures can interfere with the ability of the blood to carry oxygen, causing headaches, dizziness, weakness, a bluish skin color, and even death. High exposures can cause death. LD_{50} = (oral-rat) 4500 mg/kg.[41]

Long Term Exposure: Can affect the kidneys, liver, heart, and blood.

Points of Attack: Eyes, skin, respiratory system, blood.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level. EKG. Kidney and liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Avoid skin contact with Calcium chlorate. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to Calcium chlorate, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European

Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric) and chemically active metals (such as potassium, sodium, magnesium and zinc). Calcium chlorate must be stored to avoid contact with organic matter, ammonium compounds, aluminum, copper, cyanides, flammable vapors, and other oxidizable materials since violent reactions occur. Avoid storage on wood floors. Friction, heat, or physical shocks may cause calcium chlorate to ignite and explode. Wherever calcium chlorate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Calcium chlorate requires an "OXIDIZER" label. It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: *For dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

For solution: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid that increases the combustion of other substances. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For barium chlorate, the UN[22] recommends using a vast volume of a reducing agent (bisulfites, ferrous salts or hypo) followed by neutralization and flushing to the sewer with abundant water. This should be applicable here as well.

New Jersey Department of Health and Senior Services. (October 2001). *Hazardous Substances Fact Sheet: Calcium Chlorate.* Trenton, NJ

Calcium chloride C:0250

Molecular Formula: $CaCl_2$

Synonyms: Calcium chloride, anhydrous; Calplus; Caltac

CAS Registry Number: 10043-52-4; 7774-34-7 (hexahydrate); 22691-02-7 (hydrate)

RTECS® Number: EV9800000

EC Number: 233-140-8 [*Annex I Index No.:* 017-013-00-2] (*10043-52-4*)

Regulatory Authority and Advisory Bodies

European/International Regulations (*22691-02-7*): Hazard Symbol: Xi; Risk phrases: R11; R36; Safety phrases: S2; S22; S24 S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium chloride is a colorless to off-white crystalline solid which is deliquescent (absorb water). When heated, crystals lose water at 100°C. Molecular weight = 111; Specific gravity (H_2O:1) = 2.16; Boiling point = 1935°C (decomposes); Freezing/Melting point = 772°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water; solubility = 75% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Hormone. Calcium chloride is used as road salt for melting snow, a drying agent in desiccators, for dehydrating organic liquids and gases, in refrigeration brines and antifreeze, as a dust-proofing agent, food additive, concrete hardening accelerator, and others.

Incompatibilities: The solution in water is a weak base. Reacts with zinc in presence of moisture, forming highly flammable hydrogen gas. Dissolves violently in water with generation of much heat. Incompatible with water, bromine trifluoride; 2-furan, percarboxylic acid. May attack some building materials and metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3
PAC-1: 3.5 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 400 mg/m^3

Hexahydrate

TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 100 mg/m^3
PAC-3: 500 mg/m^3

Hydrate

TEEL-0: 2 mg/m^3
PAC-1: 6 mg/m^3
PAC-2: 40 mg/m^3
PAC-3: 450 mg/m^3

Routes of Entry: Inhalation of dust; ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation of dust may cause burning, irritation of the nose, mouth and throat, nose bleeds, and breakdown of nasal tissue. Contact with dry skin may cause severe irritation. Contact with wet skin or concentrated solutions can cause more severe irritation and burns. Ingestion may cause irritation of the mouth, throat and stomach, nausea, and vomiting. Eye contact may cause irritation, burning, and some damage to the surface of the eye. LD_{50} = (oral-rat) 1000 mg/kg (slightly toxic).

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Prolonged or repeated inhalation may cause ulcerations of the nasal mucous membrane.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear goggles or face shield if eye hazard exists, coveralls and rubber gloves. Natural rubber, Neoprene™, and polyvinyl chloride are among the recommended protective materials.

Respirator Selection: Dust mask or dust respirator may be helpful in preventing inhalation exposures.

Storage: Keep tightly sealed in a cool, dry place away from incompatible materials.

Shipping: There are no label or maximum shipping quantity requirements set by DOT.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material, and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add large volumes of water. Add excess soda ash, then neutralize with HCl. Route to sewage plant or use as landfill sludge.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15).

US EPA Hazardous Waste Number (RCRA No.): U032.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Calcium chromate is a yellow crystalline solid, often used in solution. Odorless. It normally occurs as the dehydrate and loses water at 200°C. Molecular weight = 192.1. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Calcium chromate is used as a pigment, as a corrosion inhibitor, in the manufacture of chromium, in oxidizing reactions, and in battery depolarization.

Incompatibilities: A strong oxidizer. Incompatible with boron (violent reaction), ethanol, combustibles, organic, or other easily oxidized materials.

Permissible Exposure Limits in Air

As chromium(VI), inorganic insoluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.01 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3

Protective Action Criteria (PAC)

TEEL-0: 0.000261 mg/m^3

PAC-1: 0.125 mg/m^3

PAC-2: 0.75 mg/m^3

PAC-3: 45 mg/m^3

DFG MAK: Danger of skin sensitization; Carcinogen Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

The above exposure limits are for air levels only. When skin contact also occurs, you may be overexposed, even though air levels are less than the limits listed above. Two states have set guidelines or standards for calcium chromate in ambient air[60] ranging from zero for North Carolina to 0.0008 μg/m^3 for Massachusetts.

Determination in Air: Use NIOSH Analytical Method (IV) #7024, Chromium.

Permissible Concentration in Water: See entry in "Chromium" for priority toxic pollutant limits in water.

Determination in Water: By atomic absorption (AA) using either direct aspiration into a flame or a furnace technique.[49]

Routes of Entry: Skin contact, inhalation of dust, ingestion. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Exposure to 0.18−1.4 mg/m^3 can cause irritation of nose and throat within 2 weeks, disintegration of nasal tissue, coughing, wheezing, headache, painful breathing, and fever within 8 weeks. Skin contact can cause severe irritation. Contact with damaged skin can cause deep sores known as "chrome holes." Eye contact can cause severe chemical burns and possible loss of vision. Ingestion can cause severe sore throat and irritation of the throat, stomach and intestine, which can develop into tissue damage.

Long Term Exposure: Calcium chromate is a carcinogen in humans and has been shown to cause cancer of lung, liver, bladder, etc. Inhalation can cause breakdown of nasal tissue and a hole in the septum dividing the inner nose. Exposed persons may develop skin allergy, bronchitis, lung allergy, and kidney damage.

Points of Attack: Lungs, kidneys, skin, respiratory system, eyes, gastrointestinal system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following is recommended before beginning work and at regular times after that: Urine test for chromates. This test is most accurate shortly after exposure. Examination of the skin and nose. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing; may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. (as chromic acid and chromates); **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- (if using solution) or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, Chromium(VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue (carcinogen): Health Hazard: Store in a secure poison location. Calcium chromate must be stored to avoid contact with combustible, organic, or other easily oxidized materials (such as paper, wood, sulfur, aluminum, hydrazine and plastics) since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solution: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chromium fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reduce to trivalent chromium and precipitate as chromium(III) hydroxide. Compact the sludge and dispose in single purpose special waste dumps.[22]

Calcium cyanamide C:0270

Molecular Formula: $CCaN_2$

Common Formula: $CaCN_2$

Synonyms: Aero-cyanamid; Aero-cyanamid, Special grade; Alzodef; Calcium carbimide; Calcium cyanamid; CCC; Cianamida calcica (Spanish); Cyanamid; Cyanamide; Cyanamide calcique (French); Cyanamide, calcium salt (1:1); Cyanamid granular; Cyanamid special grade; Cy-L 500; Lime nitrogen; NCI-C02937; Nitrogen lime; Nitrolime; USaF Cy-2

CAS Registry Number: 156-62-7

RTECS® Number: GS6000000

UN/NA & ERG Number: UN1403 (Calcium cyanamide, with more than 0.1% Calcium carbide)/138

EC Number: 205-861-8 [*Annex I Index No.:* 615-017-00-4]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R37; R41; Safety phrases: S2; S22; S26; S36/37/S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Calcium cyanamide is a blackish-gray, shiny crystalline material or powder. Molecular weight = 80.11; Specific gravity (H_2O:1) = 2.29; Freezing/Melting point = 1340°C (sublimes >1500°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Insoluble in water; reaction.

Potential Exposure: Compound Description: Agricultural Chemical Tumorigen, Mutagen; Human Data. Calcium cyanamide is used in agriculture as a fertilizer, herbicide, defoliant for cotton plants, and pesticide. It is also used in the manufacture of dicyandiamide and calcium cyanide as a desulfurizer in the iron and steel industry and in steel hardening.

Incompatibilities: Commercial grades of calcium cyanamide may contain calcium carbide; contact with any form of moisture solutions may cause decomposition, liberating explosive acetylene gas and ammonia. May polymerize in water or alkaline solutions to dicyanamide. Contact with all solvents tested also causes decomposition.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.5 mg/m^3 TWA.

ACGIH TLV®[1]: 0.5 mg/m^3 TWA, not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 75 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK 1 mg/m^3, measured as the inhalable fraction, [skin]; Peak Limitation Category II(2).

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3 [skin] 1999; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, 1999; France: VME 0.5 mg/m^3, 1999; Norway: TWA 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Switzerland: MAK-W 0.5 mg/m^3 [skin] 1999; United Kingdom: LTEL 0.5 mg/m^3; STEL 1 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

The former USSR-UNEP/IRPTC joint project[43] set a MAC of 0.02 mg/m^3 in ambient residential air either on a momentary or on a daily average basis. Several states have set guidelines or standards for calcium cyanamide in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μ/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; IV NIOSH Analytical Method #0500, Particulates NOR, total dust.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project[43] set a MAC of 1.0 mg/L in water for domestic purposes.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Calcium cyanamide can cause nausea, headache, dizziness, and flushing of the skin. It is a primary irritant of the mucous membranes of the respiratory tract, eyes, and skin. Drinking alcohol shortly before or within 1−2 days after exposure can cause a severe reaction. Inhalation may result in rhinitis, pharyngitis, laryngitis, and bronchitis. Conjunctivitis, keratitis, and corneal ulceration may occur. An itchy erythematous dermatitis has been reported and continued skin contact leads to the formation of slowly healing ulcerations on the palms and between the fingers. Sensitization occasionally develops. Chronic rhinitis and perforation on the nasal septum have been reported after long exposures. All local effects appear to be due to the caustic nature of cyanamide.

Long Term Exposure: Calcium cyanamide may damage the developing fetus. This chemical may damage the nervous system causing numbness and weakness in the hands and feet. Prolonged contact can cause skin ulcers. It causes a characteristic vasomotor reaction. There occurs erythema of the upper portions of the body, face, and arms accompanied by nausea, fatigue, headache, dyspnea, vomiting, oppression in the chest, and shivering. Circulatory collapse may follow in the more serious cases. The vasomotor response may be triggered or intensified by alcohol ingestion. Pneumonia or lung edema may develop. Cyanide ion is not released in the body, and the mechanism of toxic action is unknown.

Points of Attack: Eyes, skin, respiratory system, vasomotor system.

Medical Surveillance: Examination of the nervous system. Evaluation by a qualified allergist. Evaluate skin, respiratory tract, and history of alcohol intake in placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. In addition to personal protective equipment, waterproof barrier creams may be used to provide additional face and skin protection.

Respirator Selection: *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with calcium cyanamide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Calcium cyanamide with more than 1% calcium carbide requires a "DANGEROUS WHEN WET" label. It falls in Hazard Class 4.3 and Packing Group III.[19]

Spill Handling: Restrict persons not wearing protective equipment from area of spill until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing calcium cyanamide in vermiculite, dry sand, earth, or similar material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Do not use foam extinguishers or water. Use dry chemical, soda ash, or lime. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Calcium cyanide is a white crystalline solid or powder. Odor of hydrogen cyanide. Molecular weight = 92.12; Specific gravity (H_2O:1) = 1.853 at 20°C; Freezing/Melting point $\geq$ 350°C (dangerous decomposition below MP). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; violent reaction.

Potential Exposure: Calcium cyanide is used as a fumigant, as a rodenticide, in leaching precious metal ores, in the manufacture of stainless steel, and as a stabilizer for cement. Used as raw material for production of nitrogenous compounds and in treatment of alcoholism.

Incompatibilities: Contact with water, acids, acidic salts, moist air, or carbon dioxide, forms highly toxic and flammable hydrogen cyanide. Incompatible with fluorine, magnesium. Reacts violently when heated with nitrites, nitrates, chlorates, and perchlorates. Calcium cyanide decomposes in high heat forming hydrogen cyanide and nitrous oxides fumes.

Permissible Exposure Limits in Air
OSHA PEL: 5 ppm[CN] TWA.
NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 min] Ceiling Concentration.
ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.
Protective Action Criteria (PAC)*
TEEL-0: 3.8 mg/m^3
PAC-1: **3.8** mg/m^3
PAC-2: **13** mg/m^3
PAC-3: **28** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
NIOSH IDLH: 25 mg[CN]/m^3.
DFG MAK: 2 mg[CN]/m^3 inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.
The former USSR-UNEP/IRPTC Project[43] set a MAC of 0.3 mg/m^3.

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides.

Permissible Concentration in Water: A limit of 0.2[CN]$^-$/L has been set by US EPA[6] as part of the priority toxic pollutant program.

Routes of Entry: Can be absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms
Calcium cyanide is highly toxic. The lethal human dose is 18 mg/kg. The hazard is that of hydrogen cyanide. The dust is irritating to the eyes, nose, and throat.[41] Inhalation or ingestion causes headache, nausea, vomiting, and weakness; high concentrations are rapidly fatal.

Short Term Exposure: The substance is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system, blood, heart, and respiratory tract.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May be a reproductive toxin in humans.

Points of Attack: Skin, lungs.

Medical Surveillance: Lung function tests. Examination by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Do not allow water to enter nose or mouth. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Calcium cyanide you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area away from moisture, water, acids, and oxidizers. Protect against physical damage to containers.

Shipping: Calcium cyanide requires a “POISONOUS/TOXIC MATERIALS” label. It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep material out of drains, sewers, streams. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical or dry sand. Do not use foam, water, carbon dioxide. Poisonous gases are produced in fire, including phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add cyanide waste to strong alkaline sodium hypochlorite. Let stand 24 h and then flush to sewage plant.[22]

Calcium fluoride C:0290

Molecular Formula: CaF_2

Synonyms: Calcium difluoride; Fluorite; Fluorspar; Fluospar; Met-Spar

CAS Registry Number: 7789-75-5

RTECS® Number: EW1760000

EC Number: 232-188-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium fluoride is colorless crystalline or white, powdery substance. Molecular weight = 78.08; Specific gravity (H_2O:1) = 3.18 at 20°C; Boiling point = 2495°C; Freezing/Melting point = 1423°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector. Calcium fluoride is used for production of hydrofluoric acid, as a flux in steel manufacture, in smelting, electric arc welding, making glass and ceramics, and to fluoridate drinking water.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

Protective Action Criteria (PAC)

TEEL-0: 5.14 mg/m^3

PAC-1: 15.4 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause difficult breathing, burning of mouth, throat, and nose which may result in bleeding. These may be felt at 7.5 mg/m^3. Nausea, vomiting, profuse sweating, and excess thirst may occur at higher levels. *Skin:* May cause rash, itching, and burning. Solutions of 1% strength may cause sores if not removed promptly. *Eyes:* May cause severe irritation. *Ingestion:* Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. 5−40 mg may cause nausea, diarrhea, and vomiting. More severe symptoms of burning and painful abdomen, sores in mouth, throat and digestive tract, tremors, convulsions, and shock will occur from about 1 g. Death may result by ingestion of 2−5 g (1/6 oz).

Long Term Exposure: Repeated exposure may cause poor appetite, nausea, constipation, or diarrhea. Repeated exposure to fluoride chemicals may cause stiffness in muscles or ligaments and even crippling; this could take years to develop. Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 mg/m^3 or higher. Mottling of the teeth may occur at this level.

Points of Attack: Eyes, skin, respiratory system, bones.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Urine fluoride level (normal is less than 4 mg/L).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. A doctor or authorized paramedic may consider administering aluminum hydroxide gel, if conscious.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) *_if not present as a fume_ (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from acids and chemically active metals (such as potassium, sodium, magnesium, and zinc) because corrosive hydrogen fluoride will be produced.

Shipping: Calcium fluoride is not specifically covered by DOT[19] in its Performance-Oriented Packaging Standards.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium hydride C:0293

Molecular Formula: CaH_2

Synonyms: Calcium Dihydride; Hydrolith

CAS Registry Number: 7789-78-8; 57308-10-8 [calcium hydrogen (-1) ion]

RTECS$^{®}$ Number: EW2440000

UN/NA & ERG Number: UN1404/138

EC Number: 232-189-2

Description: Calcium hydride is a grayish-white crystalline solid. Molecular weight = 60.24; Freezing/Melting point = 816°C (it decomposes at about 600°C). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 3₩ (water reactive).

Potential Exposure: Calcium hydride is used as a drying and reducing agent and a cleaner for blocked up oil wells.

Incompatibilities: Reacts with water, moist air, and steam, releasing flammable hydrogen gas and may self-ignite in air. Incompatible with metal halogenates, silver fluoride, and tetrahydrofuran.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

7789-78-8

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 35 mg/m^3

PAC-3: 150 mg/m^3

Permissible Concentration in Water: No criteria set (calcium hydride reacts with water in any event).

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Calcium hydride can affect you when breathed in. Contact with skin or eyes can cause severe burns. Exposure can irritate the eyes, nose, and throat. Breathing Calcium hydride can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: Although it is unknown whether calcium hydride causes lung damage, similar very irritating substances are capable of causing lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium hydride. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to Calcium hydride use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Calcium hydride must be stored to avoid contact with water or steam since violent reactions occur and flammable hydrogen gas is produced. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Calcium hydride should carry a "DANGEROUS WHEN WET" label. It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not use any hydrous (water, foam, etc.) extinguishing agents.* Fire may restart after it has been extinguished. Use dry chemical, soda ash, or lime extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium hydroxide C:0295

Molecular Formula: CaH_2O_2

Common Formula: $Ca(OH)_2$

Synonyms: Bell mine; Calcium hydrate; Carboxide; Hydrated kemikal; Hydrated lime; Lime water; Slaked lime
CAS Registry Number: 1305-62-0
UN/NA & ERG Number: Not regulated.
RTECS® Number: EW2800000
EC Number: 215-137-3
Regulatory Authority and Advisory Bodies
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium hydroxide is a soft white crystalline, odorless powder with an alkaline, bitter taste. Molecular weight = 74.11; Freezing/Melting point = 580°C (decomposes; dehydrates to calcium oxide). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2. Insoluble in water.
Note: Readily absorbs CO_2 from air to form calcium carbonate.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Primary Irritant. Calcium hydroxide is used in agriculture and in fertilizer manufacture, in the formulation of mortar, plasters and cements, and as a scrubbing and neutralizing agent in the chemical industry. It is also used for making insecticides, acaricides, and products to control arthropods.[ESIS]

Incompatibilities: May react violently with acids, maleic anhydride, nitromethane, nitroethane, nitropropane, nitroparaffins, and phosphorus.

Permissible Exposure Limits in Air
OSHA PEL: 15 mg/m^3 (total dust) TWA; 5 mg/m^3 TWA, respirable fraction.
NIOSH REL: 5 mg/m^3 TWA.
ACGIH TLV®[1]: 5 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 75 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3
Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; Poland: AC (TWA) 2 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3. Several states have set guidelines or standards for calcium hydroxide in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Filter collection followed by atomic absorption analysis. Use NIOSH Analytical Method #7020 for Calcium. See also OSHA Analytical Method ID-121.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms
Short Term Exposure: A corrosive. *Inhalation:* May cause severe irritation to mouth, throat, and lungs if dust is inhaled. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* May cause painful irritation and chemical burns on contact with open cuts or sores or on prolonged contact with intact skin. *Eyes:* Powders and slurries may cause severe chemical burns. Blindness can result. *Ingestion:* Powders, crystals, or slurries may give rise to irritation, soreness, and chemical burns. The estimated lethal dose is about 1 lb.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Lungs may be affected by repeated or prolonged exposure to dust particles.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Prevent skin contact. Gloves, eye protection, and coveralls should be worn if contact with calcium hydroxide is likely. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): natural rubber gloves, Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots.

Respirator Selection: A dust mask or respirator with dust cartridges.

Storage: Color Code—Green: General storage may be used. Keep containers tightly closed. Store away from incompatible materials listed above.

Shipping: Calcium hydroxide is not specifically cited by DOT.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill or admixture with acid industrial wastes prior to lagooning.

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: O, C, N; Risk phrases: R8; R22; R31; R34; R50; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Calcium hypochlorite is a white powder, granule or pellets with a strong chlorine-like odor. Molecular weight = 142.98; Freezing/Melting point = about 100°C [decomposes (possibly explosively)]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2₩. Soluble in water; reacts slowly releasing chlorine gas; solubility = 21% at 25°C.

Potential Exposure: Calcium hypochlorite is used to kill algae and bacteria, in bleach, and in pool chemical products.

Incompatibilities: A strong oxidizer. Decomposes in heat or sunlight; becomes explosive above 100°C/212°F. Incompatible with strong acids, water and other forms of moisture, reducing agents, combustible materials, all other chemicals, especially acetylene, aniline and all other amines, anthracene, carbon tetrachloride, iron oxide, manganese oxide, mercaptans, diethylene glycol monomethyl ether, nitromethane, organic matter, organic sulfides, phenol, 1-propanethiol, propyl mercaptan, sulfur, turpentine, organic sulfur compounds.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 350 mg/m^3

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Calcium hypochlorite can affect you when breathed in. Calcium hypochlorite may cause mutations. Handle with extreme caution. Exposure can severely irritate the eyes, nose, and throat. Contact can severely irritate the skin. Exposure can severely irritate the "voice box" (larynx), bronchial tubes, and lungs. Higher levels can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: Repeated or prolonged contact can irritate the lungs; may cause bronchitis.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Avoid skin contact with Calcium hypochlorite. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene™, and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof goggles and face shield when working with powders or dust unless full-facepiece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to Calcium hypochlorite, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet, in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with Calcium hypochlorite you should be trained on its proper handling and storage. Calcium hypochlorite must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), ammonium compounds (such as ammonia and ammonium hydroxide), and amines (such as aniline) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or moisture and combustibles (such as wood, paper, or oil). When heated above 100°C, Calcium hypochlorite becomes explosive. Protect containers against physical damage. Avoid storage for long periods, particularly at summer temperatures. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Calcium hypochlorite must be labeled "OXIDIZER." They fall in DOT Hazard Class 5.1 and UN1748 and UN2880 are in Packing Group II while UN 2208 is in Packing Group III.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances:

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1748 (calcium hypochlorite, dry) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: This chemical is a strong oxidizer and will increase the intensity of any fire. Use water only. *Do not use chemical or carbon dioxide extinguishers*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve the material in water and add to a large volume of concentrated reducing agent solution, then acidify the mixture with H_2SO_4. When reduction is complete, soda ash is added to make the solution alkaline. The alkaline liquid is decanted from any sludge produced, neutralized, and diluted before discharge to a sewer or stream. The sludge is landfilled.

Calcium nitrate C:0310

Molecular Formula: CaN_2O_6

Common Formula: $Ca(NO_3)_2$

Synonyms: Calcium(II) nitrate (1:2); Lime saltpeter; Nitric acid, calcium salt; Nitrocalcite; Norwegian saltpeter

CAS Registry Number: 10124-37-5; 13477-34-4 (tetrahydrate)

RTECS® Number: EW2985000

UN/NA & ERG Number: UN1454/140

EC Number: 233-332-1

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium nitrate is a colorless, moisture absorbing crystalline material. Molecular weight = 164.1; Specific gravity (H_2O:1) = 2.50 at 18°C; Freezing/Melting point = 561°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3, Oxidizer. Soluble in water.

Potential Exposure: It is used to make explosives, fertilizers, matches, fireworks, and other industrial products.

Incompatibilities: A strong oxidizer. Incompatible with combustible materials, reducing agents, organics and other oxidizable materials, chemically active metals, aluminum nitrate, ammonium nitrate.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 3.5 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 125 mg/m^3

Routes of Entry: Eyes, skin, respiratory system.

Harmful Effects and Symptoms

Short Term Exposure: Calcium nitrate can irritate the skin, eyes, nose, throat, bronchial tubes, and lungs. Overexposure may cause nausea and vomiting, headaches, flushing, weakness, faintness, and collapse. Severe overexposure can cause nausea, vomiting, flushing of the head and neck, headache, weakness, faintness, and collapse; the lips and fingernails may become bluish. There may be shortness of breath. Coma, convulsions, and death are possible.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If overexposure is suspected, also consider: complete blood count (CBC) and test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium nitrate. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to Calcium nitrate, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with Calcium nitrate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from flammables (such as fuel) or combustibles (such as wood, paper, and oil). Calcium nitrate may explode if shocked or heated. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Calcium nitrate must be labeled "OXIDIZER."[19] It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a strong oxidizer that will increase the intensity of any fire. Use dry chemical, carbon dioxide, or water spray extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium oxide C:0320

Molecular Formula: CaO

Synonyms: Burnt lime; Calcia; Calx; Fluxing lime; Lime; Lime, burned; Lime, unslaked; Oxyde de calcium (French); Pebble lime; Quicklime

CAS Registry Number: 1305-78-8

RTECS® Number: EW3100000

UN/NA & ERG Number: UN1910/157

EC Number: 215-138-9

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium oxide, CaO, occurs as white or grayish-white lumps or granular powder. The presence of iron gives it a yellowish or brownish tint. Molecular weight = 56.1; Specific gravity (H_2O:1) = 3.34; Boiling point = 2850°C; Freezing/Melting point = 2572°C; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2. Soluble in water (reactive).

Potential Exposure: Calcium oxide is used as a refractory material, a binding agent in bricks, plaster, mortar, stucco and other building materials. Used as a dehydrating agent, a flux in steel manufacturing, and a laboratory agent to absorb CO_2. Used in the manufacture of aluminum, magnesium, glass, pulp and paper, sodium carbonate, calcium hydroxide, chlorinated lime, calcium salts, and other chemicals. Used in the flotation of nonferrous ores, water and sewage treatment, oil treatment in agriculture, dehairing hides, in the clarification of cane and beet sugar juice, and in fungicides, insecticides, drilling fluids, and lubricants.

Incompatibilities: The water solution is a medium strong base. Reacts with water, forming calcium hydroxide and sufficient heat to ignite nearby combustible materials. Reacts violently with acids, halogens, metals.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 2 mg/m^3 TWA.

ACGIH TLV®[1]: 2 mg/m^3 TWA.

NIOSH IDLH: 25 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3, 1999; France: VME 2 mg/m^3, 1999; India: TWA 2 mg/m^3, 1993; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Norway: TWA 2 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 6 mg/m^3, 1999; Sweden: NGV 2 mg/m^3, KTV 5 mg/m^3, 1999; Switzerland: MAK-W 3 mg/m^3, KZG-W 4 mg/m^3, 1999; Turkey: TWA 5 mg/m^3, 1993; United Kingdom: TWA 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg/m^3; the Czech Republic: 4 mg/m^3.

Several states have set guidelines or standards for calcium oxide in ambient air[60] ranging from 20 μg/m^3 (North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 48 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #7020, Method #7303, or OSHA Analytical Method ID-121.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short Term Exposure: The corrosive action of calcium oxide is due primarily to its alkalinity and exothermic reaction with water. It is irritating and may be caustic to the skin, conjunctiva, cornea, and mucous membranes of the upper respiratory tract; may produce burns or dermatitis with desquamation and vesicular rash, lacrimation, spasmodic blinking, ulceration; and ocular perforation, ulceration and inflammation of the respiratory passages; ulceration of nasal and buccal mucosa and perforation of nasal septum. Bronchitis and pneumonia have been reported from inhalation of dust. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The lower respiratory tract may not be affected because irritation of upper respiratory passages is so severe that workers may be forced to leave the area.

Long Term Exposure: Repeated or prolonged contact with skin may cause brittle nails and thickening and cracking of the skin. Repeated or prolonged exposure to dust particles may cause lung problems. Calcium oxide may cause ulceration and perforation of the cartilage separating the nose (septum).

Points of Attack: Respiratory system, skin, and eyes.

Medical Surveillance: Preemployment physical examinations should be directed to significant problems of the eyes, skin, and the upper respiratory tract. Periodic examinations should evaluate the skin; changes in the eyes, especially the cornea and conjunctiva; mucosal ulcerations of the nose, mouth and nasal septum; and any pulmonary symptoms. Smoking history should be known.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear appropriate clothing to prevent any reasonable probability of skin contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash promptly when skin is contaminated and daily at the end of each work shift. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing if contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator); *20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with calcium oxide you should be trained on its proper handling and storage. Should be stored on dry flooring in a fire-resistant room, well protected from the weather. The area should be cool and adequately ventilated. Store in containers protected from physical damage, acids and oxidizing materials, such as permanganate, dichromate, or chlorine.

Shipping: Calcium oxide must bear a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group III.

The symbol "A" restricts the application of requirements of this subchapter to materials offered or intended for transportation by aircraft, unless the material is a hazardous substance or a hazardous waste.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Contact with water or moisture may generate enough heat to ignite nearby combustible materials. Avoid the use of water. Do not use carbon dioxide, foam, or halogenated fire extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves neutralization with hydrochloric acid to yield calcium chloride. The calcium chloride formed is treated with soda ash to yield the insoluble calcium carbonate. The remaining brine solution may be discharged into sewers and waterways.[22]

Calcium peroxide C:0330

Molecular Formula: CaO_2

Synonyms: Calcium dioxide; Calcium superoxide

CAS Registry Number: 1305-79-9

RTECS® Number: EW3865000

UN/NA & ERG Number: UN1457/140

EC Number: 215-139-4

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Calcium peroxide is a grayish-white or yellowish odorless crystalline solid. Molecular weight = 72.1; Freezing/Melting point = 275°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Insoluble in water.

Potential Exposure: Calcium peroxide is used as a seed disinfectant, an antiseptic, and a rubber stabilizer.

Incompatibilities: A strong alkali and strong oxidizer. Incompatible with reducing agents, combustible materials, polysulfide polymers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Calcium peroxide can affect you when breathed in. Contact can severely irritate and may burn the skin and eyes. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs, causing coughing and/or shortness of breath. Still higher exposures may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: Prolonged exposure can damage the skin. Very irritating substances may cause problems.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium peroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles with face shield when working with powders or dust, unless full face-piece respiratory protection is worn. ***Respirator Selection:*** Where there is potential for exposures to calcium peroxide, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with calcium peroxide you should be trained on its proper handling and storage. Calcium peroxide must be stored to avoid contact with combustible materials (such as wood, paper, oil, fuels, etc.) since violent reactions occur. Store in tightly closed containers. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Calcium peroxide must be labeled "OXIDIZER."[19] It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Calcium peroxide is an oxidizer and will greatly increase the intensity of a fire. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium phosphide C:0340

Molecular Formula: Ca_3P2

Synonyms: Photophor; Tricalcium diphosphide

CAS Registry Number: 1305-99-3

RTECS® Number: EW3860000

UN/NA & ERG Number: UN1360/139

EC Number: 215-142-0 [*Annex I Index No.:* 015-003-00-2]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

European/International Regulations: Hazard Symbol: F, T+, N; Risk phrases: R15/29; R28; R50; Safety phrases: S1/2; S28; S36/37; R43; R45; R61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Calcium phosphide is a gray granular solid or reddish-brown crystalline solid. It has a musty odor, somewhat like acetylene. Molecular weight = 182.2; Specific gravity (H_2O:1) = 2.5 at 20°C; Freezing/Melting point = about 1600°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2₩ (water reactive).

Potential Exposure: Calcium phosphide is used to kill rodents; used in explosives and fireworks.

Incompatibilities: A strong reducing agent. Forms spontaneously combustible phosphine gas in moist air. Contact with water or acids releases phosphine gas and can cause explosions. Incompatible with oxidizers, acids, chlorine, chlorine monoxide, halogens, halogen acids, oxygen, sulfur.

Permissible Exposure Limits in Air

DOE Temporary Emergency Exposure Limits (TEELs)

TEEL-0: 0.05 ppm

PAC-1: 0.15 ppm

PAC-2: 1 ppm

PAC-3: 1.8 ppm

Permissible Concentration in Water: No criteria set. (Reacts violently with water as noted above.)

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short Term Exposure: Calcium phosphide can severely irritate the eyes, skin, and respiratory tract. Phosphine (liberated from calcium phosphide) is an acute local irritant; it may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Phosphine is toxic upon inhalation, causing restlessness, tremors, fatigue, gastric pain, diarrhea, coma, and convulsions. Also, calcium phosphide is a dangerous fire and explosion hazard.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Calcium phosphide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to Calcium phosphide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), oxygen, sulfur, or moisture since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where Calcium phosphide is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of Calcium phosphide. Wherever Calcium phosphide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Do not store large amounts of this material in a room protected by water sprinkler systems. Protect containers against physical damage.

Shipping: Calcium phosphide must carry a "DANGEROUS WHEN WET" label.[19] It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1360 (calcium phosphide) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: *Do not use water* or foam extinguishers. Contact with water forms highly toxic and flammable phosphine gas. Use dry chemical, dry sand, soda ash, or lime extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Calcium sulfate C:0350

Molecular Formula: CaO_4S
Common Formula: $CaSO_4$
Synonyms: *anhydrous:* Anhydrite; Anhydrous calcium sulfate; Anhydrous gypsum; Anhydrous sulfate of lime; Calcium salt of sulfuric acid
Dihydrate: Gypsum
Hemihydrate: Plaster of Paris
CAS Registry Number: 7778-18-9 (anhydrous); *(alt.)* 23296-15-3; 10101-41-4 (dihydrate); 10034-76-1 (hemihydrate); 13397-24-5 (hemihydrate-gypsum)
RTECS® Number: WS6920000 (anhydrous); EW4150000 (dihydrate)
EC Number: 231-900-3 (anhydrous)
Regulatory Authority and Advisory Bodies
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Calcium sulfate forms white to clear crystals. It is commonly encountered in the anhydrous form or as the dihydrate. Molecular weight = 136.08; Freezing/Melting point = 1560°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): (*anhydrous; dihydrate*) Health 2, Flammability 0, Reactivity 1. Practically insoluble in water; solubility = 0.3% at 20°C.
Potential Exposure: Calcium sulfate is used as a pigment, in Portland cement, in tiles and plaster, in polishing powders, a filler in paints and paper coatings, in the drying of gases and liquids, a soil conditioner, in molds and surgical casts, in wallboard and many others.
Incompatibilities: Contact with diazomethane, aluminum, phosphorus, and water may cause explosions. *Note:* Hygroscopic material (i.e., absorbs moisture from the air). Reacts with water forming gypsum and plaster of Paris.
Permissible Exposure Limits in Air
OSHA PEL: [Particulates not otherwise regulated] 15 mg/m^3 TWA total dust; TWA; 5 mg/m^3 TWA, respirable fraction.
NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.
ACGIH TLV®[1]: 10 mg/m^3 TWA inhalable fraction (2005).
Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3
DFG MAK: 1.5 mg/m^3 respirable fraction (previously "fine *dust*"); 4 mg/m^3 inhalable fraction (previously "total *dust*"); Pregnancy Risk Group: C.
Australia: TWA 10 mg/m^3, 1993; Austria: MAK 6 mg/m^3 (*dust*), 1999; Belgium: TWA 10 mg/m^3, 1993; United Kingdom: LTEL 10 mg/m^3 (total *dust*), 5 mg/m^3 (respirable dust), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/$m^{3(E)}$.
Determination in Air: By filter collection and gravimetric means. Particulates NOR: NIOSH #0500, total dust or #0600 (respirable).
Routes of Entry: Inhalation of dust, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: *Inhalation:* May cause irritation of mouth, throat, nose, and lungs. Senses of smell and taste may be lessened. Nose irritation may lead to bleeding. *Skin:* May cause irritation in open sores. The harsh washing and abrasive action necessary to remove this material may also lead to irritation. *Eyes:* Dust may irritate eyes. *Ingestion:* May cause blockage of digestive system if material hardens.
Long Term Exposure: May cause nose irritation accompanied by sneezing, tear formation, and excessive fluid secretion. Animal studies suggest that pneumonia and other more serious lung disorders may occur.
Points of Attack: Eyes, skin, respiratory system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear loose-fitting clothing of dust-tight material and safety goggles.
Respirator Selection: A dust mask should be worn if irritation effects become apparent.
Storage: Color Code—Green: General storage may be used. The hemihydrate and anhydrous forms should be stored in tightly sealed containers.
Shipping: Calcium sulfate is a "NONREGULATED MATERIAL."[19]
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Clean up using methods that do not raise dust, such as vacuum and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a

hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguisher suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

This chemical is a combustible liquid. Poisonous gases, including sulfuroxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Nonflammable, so it imposes no particular extinguisher requirements.

Disposal Method Suggested: Landfilling.

Camphene C:0360

Molecular Formula: $C_{10}H_{10}$

Synonyms: Bicyclo-(2.2.1)heptane; 3,3-Dimethylenenorcamphene; 2,2-Dimethyl-3-methylene-; 2-2-Dimethyl-3-methylene norborane; 3,3-Dimethyl-2-methylene norcamphone

CAS Registry Number: 79-92-5

RTECS® Number: EX1055000

UN/NA & ERG Number: UN2319 [terpene hydrocarbons, n.o.s. (Camphene)]/128

EC Number: 201-234-8

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Camphene is a colorless to white crystalline solid with camphor-like odor. It may be shipped as a liquid. Freezing/Melting point = 50°C. Molecular weight = 136.24; Boiling point = 159°C; Melting point = 37°C; Flash point = 42°C (oc); 33°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Camphene is used for mothproofing and in the cosmetics, perfume, and food-flavoring industries.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. Emulsions in xylene may violently decompose on contact with iron or aluminum above 70°C. Contact with reducing agents may cause exothermic reaction, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.1$.

Routes of Entry: Inhalation of vapors, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Camphene can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. Exposure can irritate the eyes, nose, and throat. Higher levels can cause you to feel dizzy, excited, sweaty, and have a headache. At very high levels, confusion, nausea, drowsiness, coma, and kidney damage can occur. LD_{50} = (oral-rat) >5000 mg/kg (slightly toxic).

Long Term Exposure: Similar chemicals also can cause skin allergy. It is not known if camphene can cause the same problem.

Points of Attack: Eyes, skin, respiratory system, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with camphene. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: Where there is potential for exposure to camphene, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with camphene you should be trained on its proper handling and storage. Camphene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Camphene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of camphene.

Shipping: Terpene hydrocarbons, n.o.s. require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II. If shipped as a solid, based on a flash point [less than 60.5°C/141°F] it may be described as "FLAMMABLE SOLIDS, ORGANIC, N.O.S." It requires a shipping label of "FLAMMABLE SOLID." Based on this description, it would fall in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner, using nonsparking tools, and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. The crystals do not easily ignite, but they release flammable vapor at room temperature. Heating greatly increases the release of these flammable vapors. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Camphor C:0370

Molecular Formula: $C_{10}H_{16}O$

Synonyms: Bicyclo-(2.2.1.)-heptanone; Bicyclo 2.2.1 heptan-2-one,1,7,7-trimethyl-; Bornane, 2-oxo-; 2-Bornanone; 2-Camphanone; Camphor, natural; 2-Camphorone; DL-Camphor; Formosa camphor; Gum camphor; Huile de camphre (French); Japan camphor; Kampfer (German); 2-Keto-1,7,7-trimethylnorcamphane; Laurel camphor; Matricaria camphor; Norcamphor, synthetic camphor; 1,7,7-Trimethyl-; 1,7,7-Trimethylbicyclo(2.2.1)-2-heptanone; 1,7,7-Trimethylnorcamphor

CAS Registry Number: 76-22-2; 8008-51-3 (camphor oil)
RTECS® Number: EX1225000
UN/NA & ERG Number: UN2717/133
EC Number: 200-945-0

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in juvenile drugs) (UN).[13]
FDA—over-the-counter drug.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Camphor is a colorless glassy solid with a penetrating, characteristic odor. Odor threshold = 0.079 mg/m^3. Molecular weight = 152.24; Freezing/Melting point = 180°C (natural); 165°C (synthetic); Flash point = 66°C (solid); 47°C (oil); Autoignition temperature = 460°C. Explosive limits: LEL = 0.6%, UEL = 3.5%. Hazard Identification (based on NFPA-704 M Rating System) (*solid*): Health 3, Flammability 2, Reactivity 0. Insoluble in water; (*oil):* Health 2, Flammability 2, Reactivity 0.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen, Human Data; Natural Product. Camphor is used as a plasticizer for cellulose esters and ethers, in lacquers and varnishes, and in explosives and pyrotechnics formulations. It is used as a moth repellent and as a medicine.

Incompatibilities: Forms explosive mixture with air. Violent, possibly explosive, reaction with strong oxidizers, especially chromic anhydride, potassium permanganate. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: 2 mg/m^3 TWA.
NIOSH REL: 2 mg/m^3 TWA.
ACGIH TLV®[1]: 2 ppm/12 mg/m^3 TWA; 3 ppm/19 mg/m^3 STEL, not classifiable as a human carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 19 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 200 mg/m^3
DFG MAK: 2 ppm/13 mg/m^3 TWA; Peak Limitation Category II(2).
NIOSH IDLH: 200 mg/m^3
Australia: TWA 2 ppm (12 mg/m^3); STEL 3 ppm (18 mg/m^3), 1993; Austria: MAK 2 ppm (13 mg/m^3), 1999; Belgium: TWA 2 ppm (12 mg/m^3); STEL 3 ppm (19 mg/m^3), 1993; Denmark: TWA 2 ppm (12 mg/m^3), 1999; Finland: TWA 0.3 ppm (2 mg/m^3); STEL 0.9 ppm (6 mg/m^3), 1993; France: VME 2 ppm (12 mg/m^3), 1999; Norway: TWA 2 ppm (12 mg/m^3), 1999; the Netherlands: MAC-TGG 12 mg/m^3, 2003; the Philippines: TWA 2 ppm, 1999; Russia: STEL 3 mg/m^3, 1993; Switzerland: MAK-W 2 ppm (13 mg/m^3), 1999; United Kingdom: TWA 2 ppm (13 mg/m^3); STEL 3 ppm (19 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 ppm. Several states have set guidelines or standards for camphor in ambient air[60] ranging from 80 μg/m^3 (Connecticut) to 120−180 μg/m^3 (Virginia) to 286 μ/m^3 (Nevada).

Determination in Air: Charcoal absorption is followed by CS_2, workup and analysis by gas chromatography. Use NIOSH Analytical Method #1301, Ketones II, Method #2553, or OSHA Analytical Method 7, Organic Vapors.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Inhalation can cause respiratory tract irritation and coughing. Exposure can cause nausea, vomiting, diarrhea, headaches, dizziness, excitement, irrational behavior, mental confusion, epileptiform convulsions. Higher exposures can cause unconsciousness and death.

Long Term Exposure: Camphor may cause kidney damage.

Points of Attack: Central nervous system, eyes, skin, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Whole blood (chemical/metabolite): blood urea nitrogen, calcium, carbon dioxide, blood sugar/glucose, urinalysis, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: OSHA: *50 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOvHie (APF = 25) (any air-purifying full-facepiece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *100 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-facepiece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter)] or PaprTOvHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *200 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with camphor you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Camphor must be stored to avoid contact with oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, and especially chromic anhydride since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flame. Sources of ignition, such as smoking and open flames are prohibited where camphor is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Synthetic camphor requires a “FLAMMABLE SOLID” label. It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Combustion produces lots of soot. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration of a solution in a flammable solvent.

Cantharidin C:0380

Molecular Formula: $C_{10}H_{12}O_4$

Synonyms: Can; Cantharides camphor; 1,2-Dimethyl-3,6-epoxyperhydrophthalic anhydride; 2,3-Dimethyl-7-oxabicyclo [2.2.1] heptane-2,3-dicarboxylic anhydride; 4,7-Epoxyisobenzofuran-1,3-dione, hexahydro-3a, 7a-dimethyl-, (3a a, 4 b, 7 b, 7a a)-; 7-Oxabicyclo[2.2.1]heptane-2,3-dicarboxylic anhydride, 2,3-dimethyl-

CAS Registry Number: 56-25-7

RTECS® Number: RN8575000

EC Number: 200-263-3

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence, Human No Data, *not classifiable as carcinogenic to humans*, Group 3, 1998.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cantharidin is a brown to black powder. Molecular weight = 196.2; Freezing/Melting point = 218°C (begins to sublime at 110°C). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Potential Exposure: Formerly used as a counter-irritant and vesicant. Also used for the removal of benign epithelial growths, e.g., warts. Used as an experimental antitumor agent. It is an active ingredient in “Spanish fly,” a reputed aphrodisiac.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.75 mg/m^3
PAC-1: 2.5 mg/m^3
PAC-2: 4.3 mg/m^3
PAC-3: 4.3 mg/m^3

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: A deadly poison by ingestion. Symptoms from ingestion include vomiting, abdominal pain, shock, bloody diarrhea, pain in throat and stomach, swelling and blistering of tongue, difficulty in swallowing, salivation, slow and painful urination, and thirst. There may be delirium, fainting, and titanic convulsions. Eye contact results in irritation with much swelling of the lids. Initial tissue reaction upon contact with the skin is swelling, followed by blister formation within 24 h. It is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste of less than 7 drops for a 70-kg (150 lb) person. It is very toxic by absorption through skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. For ingestion, induce vomiting with syrup of ipecac.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Cantharidin is not specifically listed in the DOT Performance-Oriented Packaging Standards[19] with respect to labeling requirements or restrictions on shipping quantities.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Caprolactam C:0390

Molecular Formula: $C_6H_{11}NO$

Synonyms: Aminocaproic lactam; 6-Aminohexanoic acid cyclic lactam; 2-Azacycloheptanone; e-Caprolactam; Caprolactama (Spanish); 6-Caprolactum; Caprolattame (French); Cyclohexanone isooxime; Hexahydro-2H-azepine-2-one; Hexahydro-2-azepinone; Hexahydro-2H-azepin-2-one; 6-Hexanelactum; Hexanone isoxime; Hexanonisoxim (German); 1,6-Hexolactam; 2-Ketohexamethyleneimine; 2-Ketohexamethylenimine; NCI-C50646; 2-Oxohexamethyleneimine; 2-Oxohexamethylenimine; 2-Perhydroazepinone

CAS Registry Number: 105-60-2

RTECS® Number: CM3675000

EC Number: 203-313-2 [*Annex I Index No.:* 613-069-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20/22; R36/37/38; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Caprolactam is a white crystalline combustible solid with an unpleasant odor. The odor threshold is 0.3 mg/m^3. Molecular weight = 113.18; Specific gravity (H_2O:1) = 1.01; Boiling point = 267°C; Freezing/Melting point = 69.6°C; Vapor pressure = 8×10^{-8} mmHg at 20°C; Flash point = 125°C (oc); 139°C (cc); Autoignition temperature = 375°C. Explosive limits: LEL = 1.84%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Highly soluble in water; solubility = 53%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Caprolactam is used in the manufacture of nylon, plastics, bristles, film, coatings, synthetic leather, plasticizers, and paint vehicles, as a cross-linking agent for curing polyurethanes, and in the synthesis of lysine.

Incompatibilities: Caprolactam decomposes on heating and on burning producing toxic fumes including nitrogen oxides, ammonia. Reacts violently with strong oxidizers, producing toxic fumes. Toxic decomposition above 400°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.63 mg/m^3.

OSHA PEL: none.

NIOSH REL: (*dust*): 1 mg/m^3 TWA; 3 mg/m^3 STEL; (*vapor*): 0.22 ppm/1 mg/m^3 TWA; 0.66 ppm/3 mg/m^3 STEL.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

DFG MAK: 5 mg/m^3, measured as the inhalable fraction. Peak Limitation Category I(2); Pregnancy Risk Group C.

Australia: (*dust*): TWA 1 mg/m^3; STEL 3 mg/m^3; (*vapor*): TWA 5 ppm (20 mg/m^3); STEL 10 ppm 1993; Austria: MAK 5 mg/m^3 (*dust*), 1999; Belgium: (*dust*): TWA 1 mg/m^3; STEL 3 mg/m^3; (*vapor*): TWA 4.3 ppm (20 mg/m^3); STEL 8.6 ppm (40 mg/m^3), 1993; Denmark: TWA 5 ppm (25 mg/m^3), 1999; (*dust*): TWA 1 mg/m^3, 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3 (*dust*), 1999; the Netherlands: Fume: MAC-TGG 20 mg/m^3; (*dust*): MAC-TGG 1 mg/m^3, 2003; France: VME 1 mg/m^3 (*dust*):; 5 ppm (20 mg/m^3) (*vapor*), 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3 (*dust*), 1993; Norway: TWA 5 ppm (25 mg/m^3), moist, 1999; Poland: MAC (TWA) 10 mg/m^3 (*dust*), 1999; Russia: STEL 10 mg/m^3 (*dust*), 1993; Sweden: TWA 5 mg/m^3; STEL 10 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3 (*dust*), 1999; United Kingdom: (*dust*): TWA 1 mg/m^3; STEL 3 mg/m^3; (*vapor*): TWA 5 ppm (23 mg/m^3); STEL 10 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 mg/m^3 (*particulate*). Several states have set guidelines or standards for caprolactam in ambient air ranging from 10 μg/m^3 (North Dakota) to 24 μg/m^3 (Nevada) to 160 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut).

Determination in Air: Use OSHA Analytical Method PV-2012, Caprolactam. Samples are collected by drawing a known volume of air through OSHA versatile sampler (OVS-7) tubes, containing a glass fiber filter and two sections of XAD-7 adsorbent. Samples are extracted with methanol and analyzed by high-performance liquid chromatography (HPLC) using an ultraviolet (UV) detector.

Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project[43] has adopted Russian value[35] of a MAC of 1 mg/L in water used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.19$.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The vapor irritates the eyes, skin, and respiratory tract. Inhalation may affect the central nervous system. Skin contact can cause irritation and serious burns if contact is prolonged and confined. Other symptoms of exposure include epistaxis (nosebleed), dermatitis, skin sensitization, asthma, dizziness, headache, abdominal cramps, diarrhea, nausea, vomiting. High exposures may also cause irritability, confusion, and convulsions (seizures). Exposure in airborne dust at 5 mg/m^3 causes skin irritation in some people but not at 1 mg/m^3. Sensitivity has not been related to race, skin pigmentation, or other common indices of sensitivity. The prevalence of dermatoses among workers in a caprolactam manufacturing plant showed that contact dermatitis and eczema of the hands were most prevalent. Dry erythematous squamous foci on smooth skin was a typical manifestation. Light sensitivity of the eyes was produced by inhalation of caprolactam at 0.11 mg/m^3 and higher. The olfactory threshold was 0.30 mg/m^3. An oral dose of 3−6 g was given daily for 3−5 years for the treatment of obesity in 90 subjects. No toxic effects were observed. There was no effect on appetite and only one person developed an allergy to caprolactam.

Long Term Exposure: Exposure may damage the developing fetus and may affect the reproductive ability of males. Caprolactam may damage the liver and/or kidneys. Repeated or prolonged contact may cause skin sensitization and dermatitis. The substance may have effects on the nervous system. Exposure to high concentrations over many years may cause irritability and confusion.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures (half the TLV or greater), the following are recommended: liver function tests and lung function tests. If symptoms develop or overexposure has occurred, the following may also be useful: EEG (brain wave test), skin testing with dilute Caprolactam may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm* (*vapor*) or 1 mg/m^3 (*dust*), use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with organic vapor cartridges and a particulate prefilter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Green: General storage may be used. Prior to working with caprolactam you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The DOT[19] has set no specific requirements for caprolactam in their performance oriented packaging standards.

Spill Handling: Restrict persons not wearing protective equipment from area of spill until cleanup is complete. Collect spilled material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical will burn but does not easily ignite. Extinguish fire using any agent suitable for the type of surrounding fire. If heated to more than 100°C, caprolactam boils, giving off poisonous gases, including oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices). Also, caprolactam may be recovered from caprolactam still-bottoms or nylon waste.[22]

EC Number: 219-363-3 [*Annex I Index No.:* 613-046-00-7]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal, Sufficient Evidence; Human, No Available Data; Group 2A.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Banned or Severely Restricted (Germany, Norway) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 10/1/88.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R42; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Captafol is a white crystalline solid. Molecular weight = 349.06; Boiling point = 161°C (decomposes); Freezing/Melting point = 160.5°C; Vapor pressure = 8×10^{-6} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.0001%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Those engaged in the manufacture, formulation, and application of this fungicide.

Incompatibilities: Reacts violently with bases, causing fire and explosion hazard. Not compatible with strong acids or acid vapor, oxidizers. Strong alkaline conditions contribute to instability. Attacks some metals.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA [skin]; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA [skin], not classifiable as a human carcinogen.

No TEEL available.

Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], carcinogen, 1993; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000. Several states have set guidelines or standards for captafol in air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.5 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method #0500.

Routes of Entry: Inhalation, ingestion, skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Captafol can affect you when breathed in and by passing through your skin. Caprafol may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Exposure can irritate the skin. It can also cause a skin allergy to develop. Exposure to the sun (or other ultraviolet light) after exposure to captafol may cause severe rash with itching, swelling, and blistering.

Long Term Exposure: Repeated or prolonged contact cause skin sensitization, dermatitis, allergic conjunctivitis. Repeated or prolonged inhalation exposure may cause asthma. The substance may have damaging effects on the liver and kidneys. Captafol is a probable carcinogen in humans. There is some evidence that it causes liver cancer in humans and it has caused kidney cancer in animals. Captafol may cause mutations. Handle with extreme caution.

Points of Attack: Skin, respiratory system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; lung function tests. Skin testing with dilute captafol may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with captafol. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear dust-proof goggles when working with powders or dust, unless full facepiece respiratory protection is worn. Use splash-proof chemical goggles and face shield when working with liquids containing Captafol.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a MSHA/NIOAH approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Green: General storage may be used. Prior to working with captafol you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, acids, acid fumes, or strong oxidizers (such as peroxides, chlorates, perchlorates, nitrates and permanganates), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Captafol fits the category of "Phthalimide derivative pesticides, solid, toxic." Commercial formulations use different carrier solvents which may change physical properties and affect Packing Group. It requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. If Captafol is in liquid or slurry form, absorb it with vermiculite, dry sand, earth or a similar material. Dispose of the absorbing material in an approved facility. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid but it may be dissolved in a flammable liquid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. The substance decomposes on heating or on burning, producing toxic and corrosive fumes, including hydrogen chloride, nitrogen oxides, sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis.[22]

UN/NA & ERG Number: UN2773 (Phthalimide derivative pesticides, solid, toxic)/151

EC Number: 205-087-0 [*Annex I Index No.:* 613-044-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data; Group 3; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat.

FDA—over-the-counter drug.

Banned or Severely Restricted (Finland, Sweden) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 1/1/90.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23; R40; R41; R43; R50; Safety phrases: S1/2; S26; S29; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Captan, when pure, is a colorless crystalline solid. The technical grade is a cream to yellow powder with a strong odor. It is commonly dissolved in a "carrier" which may be combustible or flammable. Molecular weight = 300.6; Boiling point = 177°C (decomposes); Freezing/Melting point = about 160°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Very slightly soluble in water; solubility = 0.0003% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Hormone, Human Data; Primary Irritant. Used as an agricultural fungicide and as a preservative in cosmetics. An over-the counter drug.

Incompatibilities: Incompatible with tetraethyl pyrophosphate, parathion. Keep away from strong alkaline materials (e.g., hydrated lime) as captan may become unstable. May react with water releasing hydrogen chloride gas. Corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: Carcinogen 5 mg/m^3 TWA; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990].

ACGIH TLV®[1]: 5 mg/m^3 TWA, inhalable fraction [sensitizer]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, carcinogen, 1999; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for captan in ambient air[60] ranging from 11.9 μg/m^3 (Kansas) to 35 μg/m^3 (Pennsylvania) to 50 μg/m^3 (North Dakota) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Reagent; High-pressure liquid chromatography/Ultraviolet detection; IV NIOSH Analytical Method #5601.

Permissible Concentration in Water: A no-adverse-effect level of drinking water has been calculated by NAS/NRC as 0.35 mg/L. The former USSR/UPEN joint project[43] set a MAC of 2.0 mg/L in water bodies used for domestic purposes. Guidelines have been set in two states for Captan in drinking water ranging from 100 μg/L in Maine to 350 μg/L in California.

Determination in Water: Fish Tox = 25.36705000 ppb MATC (Maximum Acceptable Toxicant Concentration) (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 2.352.

Routes of Entry: Skin contact, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes and the skin. The acute oral LD_{50} value for rats is 9000 mg/kg (insignificantly toxic). Most of the chronic-oral-toxicity data on captan suggest that the no-adverse-effect or toxicologically safe dosage is about 1000 ppm (50 mg/kg/day). However, on the basis of fetal mortality observed in monkeys exposed to captan (12.5 mg/kg/day), the acceptable daily intake of captan has been established at 0.1 mg/kg of body weight by the FAO/WHO. Based on long-term feeding studies results in rats and dogs, ADIs were calculated at 0.05 mg/kg/day for captan. A rebuttal presumption against registration for captan was issued on August 19, 1980 by EPA on the basis of possible oncogenicity, mutagenicity, and teratogenicity.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy to develop. Once this occurs, even very small future exposures can cause itching and a skin rash. Exposure may cause mutations or damage the developing fetus; however, this needs further study. Animal studies have found the development of cancer in animals. Whether captan is a human cancer hazard is currently being studied. Human Tox = 145.83333 ppb CHCL (Chronic Human Carcinogen Level) (VERY LOW).

Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract, liver, kidneys. Cancer site in animals: duodenum.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Skin testing with dilute captan may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with captan you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, heat, and incompatible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Captan fits the category of "Phthalimide derivative pesticides, solid, toxic." Commercial formulations use different carrier solvents which may change physical properties and affect Packing Group. It requires a shipping label of "POISONOUS/TOXIC MATERIALS." It is in Hazard Class 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquid-containing captan in vermiculite, dry sand, earth, or similar material. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 200.

Fire Extinguishing: Captan may burn, but does not ignite readily. Use dry chemical, CO_2, or foam extinguishers. *Do not use water.* At high temperatures, captan decomposes and produces poisonous gases, including oxides of sulfur and nitrogen, hydrogen chloride and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Captan decomposes fairly readily in alkaline media (pH>8). It is hydrolytically stable at neutral or acid pH but decomposes when heated alone at its Freezing/Melting point. Alkaline hydrolysis is recommended.[22]

EC Number: 200-127-3

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Carbachol chloride is a crystalline odorless powder which, on standing in an open container, develops a faint odor resembling that of an aliphatic amine. Molecular weight = 182.68; Freezing/Melting point = 203°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Used in veterinary medicine as a cholinergic; parasympathomimetic, used chiefly in large animals, especially for colic in the horse.

Incompatibilities: Carbachol chloride, a carbamate ester is incompatible with strong oxidizers, hydroperoxides, strong acids, especially oxidizing acids, bases, and especially incompatible with strong reducing agents such as hydrides. Contact with active metals or nitrides form explosive hydrogen gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 15 mg/m^3

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Highly toxic by ingestion. LD_{50} = (oral-rat) 40 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbachol chloride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials.

Shipping: Carbachol chloride is not specifically listed in the DOT Performance-Oriented Packaging Standards.[19] However given its uses and its status as an EHS chemical it may be defined as "Medicine, solid, toxic, n.o.s." This would require a "POISONOUS/TOXIC MATERIALS" label. It would fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with scrubber for chloride and nitrogen oxide removal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.006; Nonwastewater (mg/kg), 0.14.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer: 2/5/10; Developmental/Reproductive toxin (male) 8/7/09.

Canada: Drinking water MAC = 0.09 mg/L.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/22; R40; R50; Safety phrases: S2; S36/37; S46; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Carbaryl is a white or grayish, odorless, crystalline solid; or various other forms including liquid and paste. Molecular weight = 201.2; Boiling point = (decomposes below BP); Freezing/Melting point = 142°C; Vapor pressure = <0.00004 mmHg at 25°C; Flash point = about 200°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.01%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as a broad-spectrum insecticide and as an acaricide and molluscicide. Workers engaged in production, formulation, and application of carbaryl as a contact insecticide for fruits, vegetables, cotton, and other crops.

Incompatibilities: Contact with strong oxidizers can cause fire and explosions.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 100 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 1.5 mg/m^3

PAC-3: 100 mg/m^3

DFG MAK: 5 mg/m^3 measured as the, inhalable fraction TWA; Peak Limitation Category II(4) [skin].

Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, [skin], 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg/m^3, 1999; Hungary: STEL 1 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Japan: 5 mg/m^3, [skin], 1999; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 8 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Switzerland: MAK-W 5 mg/m^3, [skin], 1999; Thailand: TWA 5 mg/m^3, 1993; United Kingdom: LTEL 5 mg/m^3; STEL 10 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen

Several states have set guidelines or standards for carbaryl in ambient air[60] ranging from 3.5 μg/m^3 (Pennsylvania) to 11.9050 μg/m^3 (Kansas) to 50 μg/m^3 (North Dakota) to 80 μ/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5601, NIOSH Analytical Method #5006, and OSHA Analytical Method 63.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been calculated as 0.574 mg/L by NAS/NRC. The UNEP/USSR joint project[43] set a MAC of 0.1 mg/L in water used for domestic purposes and 0.0005 mg/L in water bodies used for fishery purposes. Some states have set guidelines for carbaryl in drinking water[61] ranging from 10 μg/L (Wisconsin) to 60 μg/L (California) to 164 μg/L (Maine) to 574 μg/L (Kansas). See Regulatory section for Canada drinking water level.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.6.

Routes of Entry: Inhalation, skin contact or eye contact, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Carbaryl irritates the eyes, skin, and respiratory tract. The hot liquid may cause severe skin burns. The substance may affect the nervous system resulting in convulsions and respiratory failure. The effects may be delayed. LD$_{50}$ = (oral-rat) 250 mg/kg (moderately toxic). Single doses of up to about 140 mg (0.005 oz) have been reported to cause no effect. However, a single dose of about 200 mg has caused stomach pain and excessive sweating. Individual responses may vary. Several milliliters (0.1-oz fluid) of an 80% solution of carbaryl have caused nausea, salivation, headache, tremors, and excessive tearing. 500 mL (1 pint) of an 80% solution has resulted in death.

Long Term Exposure: The major health problem associated with occupational exposure to Carbaryl is related to its inhibition of the enzyme cholinesterase in the central, autonomic, and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to overstimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to carbaryl in the work-place environment are manifestations of excessive cholinergic stimulation, e.g., nausea, vomiting, mild abdominal cramping, dimness of vision, dizziness, headache, difficulty in breathing, and weakness. Carbaryl may affect the kidneys and nervous system. It may cause mutations and may be a teratogen in humans. There is limited evidence that it reduces fertility in both males and females.

Points of Attack: Respiratory system, skin, central nervous system, cardiovascular system.

Medical Surveillance: NIOSH recommends that workers subject to carbaryl exposure have comprehensive preplacement medical examinations, with subsequent annual medical surveillance. If symptoms develop or overexposure has occurred, the following may be useful: kidney function tests. Urine (chemical/metabolite), urinalysis. Examination of the nervous system. If done within 2−3 h after exposure, serum and RBC cholinesterase levels may be helpful. Levels can return to normal before the exposed person feels well.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact; **4 h:** natural rubber gloves, Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots. Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is contaminated. Work clothing should be changed daily if it is possible that clothing is contaminated. Remove nonimpervious clothing promptly if contaminated. Any employee whose work involves likely exposure of the skin to carbaryl or carbaryl formulations, e.g., mixing of formulations, shall wear full-body coveralls or the equivalent, impervious gloves, i.e., highly resistant to the penetration of carbaryl, impervious footwear, and when there is danger of carbaryl coming in contact with the eyes, goggles or a face shield. Any employee engaged in field application of carbaryl shall be provided with, and required to wear, the following protective clothing and equipment: goggles, full-body coveralls, impervious footwear, and a protective head covering. Employees working as flaggers in the aerial application of carbaryl shall be provided with, and required to wear, full-body coveralls or waterproof rain suits, protective head coverings; impervious gloves and impervious footwear. Significant engineering controls are recommended for this chemical in NIOSH Criteria Document #77-107.

Respirator Selection: Engineering controls should be used, wherever feasible, to maintain carbaryl concentrations below the prescribed limits, and respirators should only be used in certain nonroutine or emergency situations. During certain agricultural applications, however, respirators must be used. *Up to 50 mg/m^3:* Sa* (APF = 10) (any supplied-air respirator). *Up to 100 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with carbaryl you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Carbaryl must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where carbaryl is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Carbaryl requires a "POISONOUS/TOXIC MATERIALS" label. It is in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. If spill involves a liquid containing carbaryl, absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Carbaryl is a noncombustible solid but may be dissolved in flammable liquids. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Submit to alkaline hydrolysis before disposal.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.006; Nonwastewater (mg/kg), 0.14.

Safe Drinking Water Act: MCL, 0.04 mg/L; MCLG, 0.04 mg/L; Regulated chemical (47 FR 9352).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
Canada: Drinking water quality, 0.09 mg/L MAC.
Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as dustable powder formulations containing a combination of Benomyl at or >7%; carbofuran at or >10%; thiram at or >15%).
European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26/28; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Carbofuran is white, odorless crystalline solid. Molecular weight = 221.3; Specific gravity (H_2O:1) = 1.18; Boiling point = 149°C (decomposes); Freezing/Melting point = 151°C; Vapor pressure = 3×10^{-6} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 0.07%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, and application of this insecticide, acaricide, and nematocide.

Incompatibilities: Alkaline substances, acid, strong oxidizers, such as perchlorates, peroxides, chlorates, nitrates, permanganates.

Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 0.1 mg/m^3 TWA.
ACGIH TLV®[1]: 0.1 mg/m^3 TWA, inhalable fraction and vapor; BEI issued; not classifiable as a human carcinogen (2001).
Protective Action Criteria (PAC)
TEEL-0: 0.1 mg/m^3
PAC-1: 0.3 mg/m^3
PAC-2: 0.43 mg/m^3
PAC-3: 0.5 mg/m^3
Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, 1999; France: VME 0.1 mg/m^3, 1993; India: TWA 0.1 mg/m^3, 1993; Norway: TWA 0.1 mg/m^3, 1999; Poland: MAC (TWA) 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for carbofuran in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method #5006, Method #5601, and OSHA Analytical Method 63.

Permissible Concentration in Water: EPA[47] has determined 1-day, 10-day, and longer-term health advisories of 50 μg/L of Carbofuran for a 10-kg child. The longer term (1 year) value for a 70-kg adult is 0.18 mg/L or 180 μg/L. A lifetime health advisory for a 70-kg adult has been determined to be 36 μg/L of Carbofuran. Most recently, EPA has proposed a limit of 40 μg/L in drinking water.[62] Some states have set guidelines for carbofuran in drinking water[61] ranging from 10 μg/L (Massachusetts) to 15 μg/L (New York) to 36 μg/L (Arizona and Minnesota) to 50 μg/L (Kansas and Wisconsin).

Determination in Water: Analysis of Carbofuran is by a high-performance liquid chromatographic procedure used for the determination of *n*-methyl carbamoyloximes and *n*-methylcarbamates in drinking water (US EPA 1984). In this method, the water sample is filtered and a 400-μL aliquot is injected into a reverse-phase HPLC column. Separation of compounds is achieved using gradient elution chromatography. After elution from the HPLC column, the compounds are hydrolyzed with sodium hydroxide. The methylamine formed during hydrolysis is reacted with *o*-phthalaldehyde (OPA) to form a fluorescent derivative which is detected using a fluorescence detector. The method detection limit has been estimated to be approximately 0.9 μg/L for carbofuran. Octanol−water coefficient: Log K_{ow} (octanol/water partition coefficient) = 2.32.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Carbofuran may affect the nervous system resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. The effects may be delayed and exposed personnel should be kept under medical observation. Symptoms include headache, giddiness, blurred vision weakness, nausea, cramps, diarrhea, chest discomfort, sweating, contraction of pupils, tearing, salivation, blue lips, lungs and abdomen filled with fluid, convulsions, coma, loss of reflexes and sphincter control. This material is extremely poisonous. The LD_{50} for rat is 5.3 mg/kg. May be fatal if swallowed, inhaled, or absorbed through skin. Contact may burn skin or eyes. Probable lethal oral dose to humans is 5−50 mg/kg or 7 drops to 1 teaspoon for a 150-lb person.

Long Term Exposure: The major health problem associated with occupational exposure to carbofuran is related to its inhibition of the enzyme cholinesterase in the central, autonomic, and peripheral nervous systems. The inhibition of cholinesterase allows acetylcholine to accumulate at these sites and thereby leads to over stimulation of innervated organs. The signs and symptoms observed as a consequence of exposure to Carbofuran in the work-place environment are manifestations of excessive cholinergic stimulation, e.g., nausea, vomiting, mild abdominal cramping, dimness of vision, dizziness, headache, difficulty in breathing, and weakness. Carbofuran may affect the immune system.

Points of Attack: Central nervous system, peripheral nervous system, blood cholinesterase.

Medical Surveillance: Before starting work, at regular times after that, and if any symptoms develop, or overexposure occurs, the following is recommended: serum and red blood cell cholinesterase levels (a special test for the substance in the body that Carbofuran affects). For this substance these tests are accurate only if done within about 2 h of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved respirator with a pesticide cartridge. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbofuran you should be trained on its proper handling and storage. Carbofuran must be stored to avoid contact with acids and strong oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates). Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Carbamate insecticides, solid, toxic, n.o.s., have a DOT label requirement of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1, the Packing Group is II.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers for reclamation or for disposal in an approved facility. Absorb liquid containing carbofuran in vermiculite, dry sand, earth, or similar material. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Carbofuran itself does not burn. The substance decomposes on heating, producing toxic fumes including nitrogen oxides. Dike fire control water for later disposal, do not scatter the material. Stay at maximum distance from fire. Extinguish fire using an agent suitable for the type of surrounding fire; use dry chemical, carbon dioxide, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately.

Disposal Method Suggested: Alkaline hydrolysis is the recommended mode of disposal.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Carbon black C:0450

Molecular Formula: C
Synonyms: Acetylene black; Channel black; C.I. Pigment black 7; Elemental carbon; Furnace black; Lamp black; Thermal black
CAS Registry Number: 1333-86-4
RTECS® Number: FF5800000
UN/NA & ERG Number: UN1361 (Carbon, Animal, or Vegetable origin)/133
EC Number: 215-609-9
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human, Inadequate Evidence, Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1996.[1]
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Water Pollution Standard Proposed (UNEP).[43]
California Proposition 65 Chemical: (*airborne, unbound particles of respirable size*), Cancer 1/21/03
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): Nonwater polluting agent.
Description: Carbon black (substantially elemental carbon), C, is a black, odorless solid. Molecular weight = 12; Freezing/Melting point = about 3550°C (sublimes). Hazard Identification (based on NFPA-704 M Rating System) (*activated, type C-1*): Health 1, Flammability 1, Reactivity 1. Insoluble in water. Combustible solid that may contain flammable hydrocarbons.
Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen. Used as reinforcing agent and filler for rubber, colorants for ink, paint, and plastics. Workers in carbon black production or in its use in rubber compounding, ink and paint manufacture, plastics compounding, dry-cell battery manufacture.
Incompatibilities: Carbon blacks containing over 8% volatiles may pose an explosion hazard. Dust can form an explosive mixture in air. A reducing agent; keep away from strong oxidizers, such as chlorates, bromates, nitrates.
Permissible Exposure Limits in Air
OSHA PEL: 3.5 mg/m^3 TWA.
NIOSH REL: 3.5 mg/m^3 TWA; Potential human carcinogen, in the presence of PAHs, NIOSH recommends that exposure to carbon black be limited to the lowest feasible concentration. 0.1 mg[PAHs]/m^3 [10 h.] TWA [Carbon black, in the presence of polycyclic aromatic hydrocarbons (PACs)]. See *NIOSH Pocket Guide*, Appendix A & C.
ACGIH TLV®[1]: 3.5 mg/m^3 TWA; not classifiable as a human carcinogen.
DFG MAK: Carcinogen Category 3B, inhalable dust.
NIOSH IDLH: 1750 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 3.5 mg/m^3
PAC-1: 10.5 mg/m^3
PAC-2: 17.5 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: Carcinogen Category 3B, inhalable fraction.
Australia: TWA 3 mg/m^3, 1993; Belgium: TWA 3.5 mg/m^3, 1993; Denmark: TWA 3.5 mg/m^3, 1999; Finland: TWA 3.5 mg/m^3; STEL 7 mg/m^3, 1999; France: VME 3.5 mg/m^3, 1999; Norway: TWA 3.5 mg/m^3, 1999; the Philippines: TWA 3.5 mg/m^3, 1993; the Netherlands: MAC-TGG 3.5 mg/m^3, 2003; Sweden: NGV 3 mg/m^3 [dust], 1999; United Kingdom: TWA 3.5 mg/m^3; STEL 7 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The former USSR-UNEP/IRPTC joint project[43] set a MAC in ambient air in residential areas of 0.15 mg/m^3 on a momentary basis and 0.005 mg/m^3 on an average daily basis. Several states have set guidelines or standards for carbon black in ambient air[60] ranging from 117 μg/m^3 (New York) to 35 μg/m^3 (North Dakota) to 50 μg/m^3 (Virginia) to 70 μg/m^3 (Connecticut) to 83 μg/m^3 (Nevada).
Determination in Air: Filtration from air is followed by gravimetric analysis as described in NIOSH Analytical Method #5000.[18] See also NIOSH Analytical Method 5800, Polycyclic aromatic compounds (PAC), and OSHA Analytical Method ID-196.
Permissible Concentration in Water: The former USSR-UNEP/IRPTC joint project[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.
Routes of Entry: Inhalation, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Inhalation may cause irritation to respiratory tract. Skin contact may cause irritation. Eye contact may cause irritation. *Ingestion:* Animal studies show that toxic effects are unlikely, although carbon black contains several substances that are toxic and known carcinogens.
Long Term Exposure: Exposure to levels well above 3.5 mg/m^3 for several months may result in damage to the skin and nails, temporary or permanent damage to the lungs and breathing passages, and adversely affect the heart. Carbon black containing PAH greater than 0.1% should be considered a suspect carcinogen. Lungs may be affected by repeated or prolonged exposure at very high concentrations: Some carbon blacks may contain compounds which are carcinogenic, and as organic extracts of these have been classified as possibly carcinogenic to humans, special care should be taken to avoid exposure to such extracts. Lung effects remain controversial and may be due to contaminants. It is probable that minor effects reported are nonspecific effects

associated with exposure to nuisance dusts in general. Polynuclear aromatic hydrocarbons (PAH) are reportedly present in some carbon blacks. Depending on the process of manufacture, there are variations in their chemical compositions.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: chest X-ray (to be read by a special NIOSH "B reader" radiologist); lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin and PAH contamination is present, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *Up to 17.5 mg/m^3:* Qm (APF = 5) (any quarter-mask respirator). *Up to 35 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 87.5 mg/m^3:* Sa:Cf (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 175 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter). Any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter. Any self-contained breathing apparatus with a full face-piece. Any supplied-air respirator with a full face-piece. *Up to 1750 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

In presence of polycyclicaromatic hydrocarbons: NIOSH *at concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode) *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with carbon black you should be trained on its proper handling and storage. Carbon black must be stored to avoid contact with chlorates, bromates, and nitrates since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where carbon black is used, handled, or stored in a manner that could create a potential fire or explosion hazard. If carbon black contains more than 0.1% PAHs it should be used, handled, and stored in a regulated area as a carcinogen. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Carbon in various forms must carry a "SPONTANEOUSLY COMBUSTIBLE" label. It falls in Hazard Class 4.2 and Packing Group III. The symbol "I" identifies proper shipping names (Carbon, animal, or vegetable origin) which are appropriate for describing materials in international transportation. An alternate proper shipping name may be selected when only domestic transportation is involved.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Carbon black will ignite and burn slowly. Use dry chemical, sand, water spray, or foam extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested

Dump into a landfill or incinerate as a slurry.[22]

Regulatory Authority and Advisory Bodies

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Carbon dioxide is a colorless, odorless, noncombustible gas. Molecular weight = 44.01; Boiling point = (sublimes); Freezing/Melting point = −78.3°C (sublimes). It is commonly shipped in the compressed liquid form and the solid form (dry ice). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.2% at 25°C.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Gaseous Carbon dioxide is used to carbonate beverages; as a weak acid in the textile, leather, and chemical industries; in water treatment; and in the manufacture of aspirin and white lead; for hardening molds in foundries; in food preservation, in purging tanks, and pipelines; as a fire extinguisher, in foams; and in welding. Because it is relatively inert, it is utilized as a pressure medium. It is also used as a propellant in aerosols, to promote plant growth in green houses; it is used medically as a respiratory stimulant, in the manufacture of carbonates, and to produce an inert atmosphere when an explosive or flammable hazard exists. The liquid is used in fire extinguishing equipment, in cylinders for inflating life rafts, in the manufacturing of dry ice, and as a refrigerant. Dry ice is used primarily as a refrigerant. Occupational exposure to carbon dioxide may also occur in any place where fermentation processes may deplete oxygen with the formation of carbon dioxide, e.g., in mines, silos, wells, vats, ships' holds, etc.

Incompatibilities: The substance decomposes on heating above 2000°C producing toxic carbon monoxide. Reacts violently with strong bases and alkali metals. Various metal dusts from chemically active metals, such as magnesium, zirconium, titanium, aluminum, chromium, and manganese are ignitable and explosive when suspended and heated in carbon dioxide.

Permissible Exposure Limits in Air

OSHA PEL: 5000 ppm/9000 mg/m^3 TWA.

NIOSH REL: 5000 ppm/9000 mg/m^3 TWA; 30,000 ppm/54,000 mg/m^3 STEL.

ACGIH TLV®[1]: 5000 ppm/9000 mg/m^3 TWA; 30,000 ppm/54,000 mg/m^3 STEL.

NIOSH IDLH: 40,000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 5000 ppm

PAC-1: 30,000 ppm

PAC-2: 30,000 ppm

PAC-3: 40,000 ppm
DFG MAK: 5000 ppm/9100 mg/m^3 TWA; Peak Limitation Category II(2).
Australia: TWA 5000 ppm (9000 mg/m^3); STEL 30000 ppm, 1993; Austria: MAK 5000 ppm (9000 mg.m^3), 1999; Belgium: TWA 5000 ppm (9000 mg/m^3); STEL 30000 ppm, 1993; Denmark: TWA 5000 ppm (9000 mg/m^3), 1999; Finland: TWA 5000 ppm (9000 mg/m^3), 1999; Hungary: STEL 9000 mg/m^3, 1993; Japan: 5000 ppm (9000 mg/m^3), 1999; the Netherlands: MAC-TGG 9000 mg/m^3, 2003; Norway: TWA 5000 ppm (9000 mg/m^3), 1999; the Philippines: TWA 5000 ppm (9000 mg/m^3), 1993; Poland: MAC (TWA) 9000 mg/m^3, MAC (STEL) 27000 mg/m^3, 1999; Russia: TWA 5000 ppm, 1993; Sweden: NGV 5000 ppm (9000 mg/m^3), KTV 10000 ppm (18000 mg/m^3), 1999; Switzerland: MAK-W 5000 ppm (9000 mg/m^3), 1999; Thailand: TWA 5000 ppm (9000 mg/m^3), 1993; Turkey: TWA 5000 ppm (9000 mg/m^3), 1993; United Kingdom: TWA 5000 ppm (9150 mg/m^3); STEL 15000 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 30,000 ppm. States with guidelines or standards for CO_2 in ambient air[60] are: 150 mg/m^3 (Virginia) and 214 mg/m^3 (Nevada).

Determination in Air: Gas collection bag; none; Gas chromatography/Thermal conductivity detector; IV NIOSH Analytical Method #6603. Collection in a bag followed by gas chromatography. See OSHA Analytical Method ID-172.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation of high concentrations of this gas may cause headache, shortness of breath, nausea, vomiting, dizziness, hyperventilation, and unconsciousness. Rapid evaporation of the liquid or skin contact with "dry ice" may cause frostbite. On loss of containment, this liquid evaporates very quickly causing supersaturation of the air with serious risk of suffocation when in confined areas. Carbon dioxide is a simple asphyxiant. Concentrations of 10% (100,000 ppm) can produce unconsciousness and death from oxygen deficiency. A concentration of 5% may produce shortness of breath and headache. Continuous exposure to 1.5% CO_2 may cause changes in some physiological processes. The concentration of carbon dioxide in the blood affects the rate of breathing.

Long Term Exposure: Long-term exposure at levels between 5000 and 20,000 ppm of carbon dioxide can affect the acid−base balance, causing acidosis, and can affect calcium metabolism.

Points of Attack: Lungs, skin, cardiovascular system.

Medical Surveillance: Consider evaluation of body calcium and acid−base balance.

First Aid: If dry ice gets into the eyes, get medical attention. If this chemical contacts the skin, get medical attention for frostbite. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform rescue breathing and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Carbon dioxide is a heavy gas and accumulates at low levels in depressions and along the floor. Generally, adequate ventilation will provide sufficient protection for the worker. Where concentrations are of a high order, supplied air respirators are recommended.

Respirator Selection: *40,000 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbon dioxide you should be trained on its proper handling and storage. Carbon dioxide must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc) especially in combination with peroxides, since violent reactions occur. Protect containers from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Carbon dioxide (UN1013, UN2187) must carry a "NONFLAMMABLE GAS" label. Dry ice (UN1845) does not require a label. The gas and refrigerated liquid fall in Hazard Class 2.2 and there is no Packing Group; solid, dry ice falls in Hazard Class 9 and Packing Group III. Solid, dry ice carries the symbol "AW." The letter "A" restricts the application of requirements of this subchapter to materials offered or intended for transportation by aircraft, unless the material is a hazardous substance or a hazardous waste. The letter "W" restricts the application of requirements of this subchapter to materials offered or intended for transportation by vessel, unless the material is a hazardous substance or a hazardous waste.

Spill Handling: Inhalation hazard. If carbon dioxide gas is leaked, take the following steps. Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. If carbon dioxide liquid or solid is spilled or leaked, take the following steps: restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate the area of spill or leak.

Fire Extinguishing: Containers may explode in fire. Extinguish fire using an agent suitable for type of surrounding fire. Carbon dioxide itself does not burn. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere.[22]

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Carbon disulfide is a highly refractive, flammable liquid, which, in pure form has a sweet odor and in commercial and reagent grades has a foul smell. It can be detected by odor at about 1 ppm but the sense of smell fatigues rapidly and, therefore, odor does not serve as a good warning property. Molecular weight = 76.13; Specific gravity (H_2O:1): 1.26; Boiling point = 46.3°C; Freezing/Melting point = −110.8°C; Vapor pressure = 279 mmHg at 25°C; Flash point = −30°C; Autoignition temperature = 90°C. The explosive limits are LEL = 1.3%; UEL = 50%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.3%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Carbon disulfide is used in the manufacture of viscose rayon, ammonium salts, carbon tetrachloride, carbanilide, xanthogenates, flotation agents, soil disinfectants, dyes, electronic vacuum tubes, optical glass, paints, enamels, paint removers, varnishes, varnish removers, tallow, textiles, explosives, rocket fuel, putty, preservatives, and rubber cement; also used as a solvent for phosphorus, sulfur, selenium, bromine, iodine; alkali cellulose; fats, waxes, lacquers, camphor, resins, and cold vulcanized rubber. It is also used in degreasing, chemical analysis, electroplating, grain fumigation, oil extraction, and dry-cleaning. It is widely used as a pesticide intermediate.

Incompatibilities: Strong oxidizers, chemically active metals (such as sodium, potassium, zinc), azides, organic amines, halogens. May explosively decompose on shock, friction, or concussion. May explode on heating. The substance may spontaneously ignite on contact with air and on contact with hot surfaces, producing toxic fumes of sulfur dioxide. Reacts violently with oxidants to produce oxides of sulfur and carbon monoxide and causing fire and explosion hazard. Attacks some forms of plastic, rubber, and coating.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.11 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm TWA; 30 ppm, Ceiling Concentration; 100 ppm [30-min maximum peak per 8-h shift].

NIOSH REL: 1 ppm/3 mg/m^3 TWA; 10 ppm/30 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 1 ppm/3.13 mg/m^3 TWA, [skin]; Not Classifiable as a Human carcinogen, BEI: 5 mg/g [2-Thiothiazolidine-4-carboxylic acid (TTCA)] creatinine in urine at end-of-shift.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 1 ppm

PAC-1: **13** ppm

PAC-2: **160** ppm

PAC-3: **480** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/16 mg/m^3 TWA; Peak Limitation II(2) [skin] Pregnancy Risk Group B; BAT: 4 mg/g [2-Thio-4-thiazolidine carboxylic acid (TTCA)] creatinine in urine at end-of-shift.

Arab Republic of Egypt: TWA 10 ppm (30 mg/m^3), [skin], 1993; Australia: TWA 10 ppm (30 mg/m^3), [skin], 1993; Austria: MAK 10 ppm (30 mg/m^3), [skin], 1999; Belgium: TWA 10 ppm (31 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (15 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (15 mg/m^3), [skin], 1999; France: VME 10 ppm (30 mg/m^3), VLE 25 ppm (75 mg/m^3), 1999; India: TWA 10 ppm (30 mg/m^3), [skin], 1993; Japan: 10 ppm (31 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 30 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (15 mg/m^3), 1999; the Philippines: TWA 20 ppm (60 mg/m^3), [skin], 1993; Poland: MAC (TWA) 18 mg/m^3, MAC (STEL) 30 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 1 mg/m^3, 1993; Sweden: NGV 5 ppm (16 mg/m^3), KTV 8 ppm (25 mg/m^3), [skin], 1999; Thailand: TWA 20 ppm (60 mg/m^3); STEL 30 ppm (90 mg/m^3), 1993; Turkey: TWA 10 ppm (65 mg/m^3), [skin], 1993; United Kingdom: TWA 10 ppm (32 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppp [skin]. Russia[43] set a MAC of 1.0 mg/m^3 in work-place air, of 0.03 mg/m^3 in ambient residential air on a momentary basis, and 0.003 mg/m^3 in residential ambient air on a daily average basis. Several states have set guidelines or standards for carbon disulfide in ambient air[60] ranging from 60 μg/m^3 (Connecticut) to 100 μg/m^3 (New York) to 150 μg/m^3 (South Carolina) to 186 μg/m^3 (North Carolina) to 300 μg/m^3 (Florida and North Dakota) to 714 μg/m^3 (Nevada). The WHO[35] has recommended a TWA of 10 mg/m^3 for male workers and a TWA of 3 mg/m^3 for women of fertile age.

Determination in Air: Adsorption on charcoal, workup with benzene, gas chromatographic analysis per NIOSH Analytical Method #1600 and Method #3800.[18]

Permissible Concentration in Water: In view of the relative paucity of data on the mutagenicity, carcinogenicity, and long-term oral toxicity of carbon disulfide, it was stated that estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence. It was recommended by NAS/NRC that studies to produce such information be conducted before limits in drinking water are established. Now, however, EPA[32] has suggested a permissible ambient goal of 830 μg/L. Russia[43] has suggested that limits in drinking water be set on an organoleptic basis and that a MAC of 1 mg/L be set in water bodies used for fishery purposes. Arizona has set a guideline for CS$_2$ in drinking water of 830 μg/L.[61]

Determination in Water: Octanol–water coefficient: Log K_{ow} = 1.82.

Routes of Entry: Inhalation of vapor which may be compounded by percutaneous absorption of liquid or vapor, ingestion, and skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Carbon disulfide irritates the eyes, skin, and respiratory tract. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical pneumonitis. This chemical may affect the central nervous system. In acute poisoning, early excitation of the central nervous system occurs, followed by depression with stupor, restlessness, and unconsciousness. If recovery occurs, the patient usually passes through the after-stage of narcosis, with nausea, vomiting, headache, etc. Also possible are motor disturbances of the bowel, anemia, disturbances of cardiac rhythm, loss of weight, polyuria, and menstrual disorders. Severe chronic poisoning may also result in liver degeneration and jaundice. Exposure can cause a loss of consciousness. Exposure far above the PEL may result in death. The probable oral lethal dose for a human is between 0.5 and 5 g/kg or between 1 oz and 1 pint (or 1 lb) for a 70-kg (150 lb) person. In chronic exposures, the central nervous system is damaged and results in the disturbance of vision and sensory changes as the most common early symptoms. Lowest lethal dose for humans has been reported at 14 mg/kg or 0.98 g for a 70-kg person. Alcoholics and those suffering from neuropsychic trouble are at special risk.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy, dermatitis, increased cholesterol, atherosclerosis, high blood pressure, heart disease, and damage to the eyes and other organs from its effects on arteries. Carbon disulfide may affect the central nervous system resulting in severe neurobehavioral effects, polyneuritis, and psychoses. Animal tests show that this substance possibly causes toxic effects upon human reproduction.

Points of Attack: The material affects the central nervous system, cardiovascular system, eyes, kidneys, liver, and skin.

Medical Surveillance: Preplacement and periodic medical examinations should be concerned especially with skin, eyes, central and peripheral nervous system, cardiovascular disease, as well as liver and kidney function. Electrocardiograms should be taken. CS_2 can be determined in expired air, blood, and urine. The iodine−azide test detects carbon disulfide metabolites in the urine and it may indicate other sulfur compounds. Examination of the nervous system. NIOSH lists the following medical tests: blood urea nitrogen, electrocardiogram, expired air, ophthalmic examination; urine (chemical/metabolite)/sediment; liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. NIOSH recommends the use of Viton™ and polyvinyl alcohol as protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with carbon disulfide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The DOT-required shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." The Hazard Class is 3 and the Packing Group is I.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. For small leaks, absorb on paper towels. Evaporate the spills in a safe place, such as a fume hood. Large quantities can be reclaimed or collected and atomized in a suitable combustion chamber equipped with an appropriate effluent gas-cleaning device. If carbon disulfide is spilled in water, neutralize with agricultural lime, crushed limestone, or sodium bicarbonate. If dissolved, apply activated carbon at ten times the spilled amount. Use mechanical dredges or lifts to remove immobilized masses of pollutants and precipitates. In case of a spill or leak from a drum or smaller container or a small leak from a tank, isolate 50 feet in all directions. In case of a large spill, first isolate 100 feet in all directions, then evacuate in a downwind direction an area 0.2 miles wide and 0.3 miles long. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Wear positive-pressure breathing apparatus and special protective clothing. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Note that the ignition temperature is dangerously low: 100°C. Vapors may be ignited by contact with ordinary light bulb; when heated to decomposition, it emits highly toxic fumes of oxides of sulfur. If the vapor concentration exceeds 2% by volume or is unknown, self-contained breathing mask with full face should be used by all persons entering contaminated area to fight fires. Wear special protective clothing. Isolate for ½ mile in all directions if tank car or truck is involved in fire. Use dry chemical, carbon dioxide, or other inert gas extinguishers. Foam may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This compound is a very flammable liquid which evaporates rapidly. It burns with a blue flame to carbon dioxide (harmless) and sulfur dioxide. Sulfur dioxide has a strong suffocating odor; 1000 ppm in air is lethal to rats. The pure liquid presents an acute fire and explosion hazard. The following disposal procedure is suggested[22]: all equipment or contact surfaces should be grounded to avoid ignition by static charges. Absorb on vermiculite, sand, or ashes and cover with water. Transfer underwater in buckets to an open area. Ignite from a distance with an excelsior trail. If quantity is large, Carbon disulfide may be recovered by distillation and repackaged for use.

UN/NA & ERG Number: UN1016 (compressed)/119; NA9202 (cryogenic liquid)/168

EC Number: 211-128-3 [*Annex I Index No.:* 006-001-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin 7/1/89.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: F+, T; Risk phrases: R61; R12; R23; R48/23; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Carbon monoxide is a flammable, colorless, odorless, tasteless gas, partially soluble in water. Molecular weight = 28.01; Boiling point = − 192°C; Freezing/Melting point = −205°C; Relative vapor density (air = 1) = 0.97; Vapor pressure = >35 atm; Autoignition temperature = 605°C. The explosive limits are LEL = 12.5%; UEL = 74.20%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water; solubility = 2% at 20°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data. Carbon monoxide is used in metallurgy as a reducing agent, particularly in the Mond process for nickel; in organic synthesis, especially in the Fischer-Tropsch process for petroleum products, and in the oxo reaction; and in the manufacture of metal carbonyls. It is usually encountered in industry as a waste product of incomplete combustion of carbonaceous material (complete combustion produces CO_2). The major source of CO emission in the atmosphere is the gasoline-powered internal combustion engine. Special industrial processes which contribute significantly to CO emission are iron foundries, particularly the cupola; fluid catalytic crackers; fluid coking; and moving-bed catalytic crackers in thermal operations in carbon black plants; beehive coke ovens; basic oxygen furnaces, sintering of blast furnace feed in steel mills; and formaldehyde manufacture. There are numerous other operations in which a flame touches a surface that is cooler than the ignition temperature of the gaseous part of the flame where exposure to CO may occur, e.g., arc welding, automobile repair, traffic control, tunnel construction, fire fighting, mines, use of explosives, etc.

Incompatibilities: Forms extremely explosive mixture with air. Keep away from strong oxidizers. In the presence of finely dispersed metal powders the substance forms toxic and flammable carbonyls. May react vigorously with oxygen, acetylene, chlorine, fluorine, nitrous oxide.

Permissible Exposure Limits in Air

OSHA PEL: 50 ppm/55 mg/m^3 TWA.

NIOSH REL: 35 ppm/40 mg/m^3 TWA; 200 ppm/229 mg/m^3, Ceiling Concentration.

ACGIH TLV®[1]: 25 ppm/29 mg/m^3 TWA; BEI: 3.5% carboxyhemoglobin (CO-Hb) in blood at end-of-shift; 20 ppm CO in end-exhaled air at end-of-shift.

Protective Action Criteria (PAC)*

TEEL-0: 50 ppm

PAC-1: 83 ppm

PAC-2: **83** ppm

PAC-3: **330** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 30 ppm/35 mg/m^3 TWA; Peak Limitation Category II(1); Pregnancy Risk Group B; BAT: 5% carboxyhemoglobin (CO-Hb) in blood at end-of-shift.

NIOSH IDLH: 1200 ppm.

Arab Republic of Egypt: TWA 50 ppm (55 mg/m^3), 1993; Australia: TWA 50 ppm (55 mg/m^3); STEL 400 ppm (440 mg/m^3), 1993; Austria: MAK 30 ppm (33 mg/m^3), 1999; Belgium: TWA 50 ppm (57 mg/m^3); STEL 400 ppm (458 mg/m^3), 1993; Denmark: TWA 35 ppm (40 mg/m^3), 1999; Finland: TWA 30 ppm (34 mg/m^3); STEL 75 ppm (86 mg/m^3), 1999; France: VME 50 ppm (55 mg/m^3), 1999; India: TWA 50 ppm (55 mg/m^3); STEL 400 ppm (440 mg/m^3), 1993; Japan: 50 ppm (57 mg/m^3), 1999; the Netherlands: MAC-TGG 29 mg/m^3, 2003; Norway: TWA 35 ppm (40 mg/m^3), 1999; the Philippines: TWA 50 ppm (55 mg/m^3), 1993; Poland: MAC (TWA) 30 mg/m^3, MAC (STEL) 180 mg/m^3, 1999; Russia: TWA 50 ppm; STEL 20 mg/m^3, 1993; Sweden: NGV 35 ppm (40 mg/m^3), KTVSTEL 100 ppm (120 mg/m^3), 1999; Switzerland: MAK-W 30 ppm (35 mg/m^3), KZG-W 60 ppm (70 mg/m^3), 1999; Thailand: TWA 50 ppm (55 mg/m^3), 1993; Turkey: TWA 50 ppm (55 mg/m^3), 1993; United Kingdom: LTEL 50 ppm (55 mg/m^3); STEL 300 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 20 mg/m^3 in work-place air and MAC values for ambient air in residential areas of 3 mg/m^3 on a momentary basis and 1 mg/m^3 on an average daily basis. Several states have set guidelines or standards for CO in ambient air[60] ranging from 10−40 μg/m^3 (Arizona) to 1310 μg/m^3 (Nevada) to 10,000 μg/m^3 (10 mg/m^3) (Connecticut).

Determination in Air: NIOSH Analytical Method (IV) #6604, OSHA Analytical Methods ID-209 and ID-210.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient level of 552 μg/L based on health effects.

Routes of Entry: Inhalation of gas.

Harmful Effects and Symptoms

Short Term Exposure: Carbon monoxide may affect the blood, cardiovascular system, and central nervous system. Exposure at high levels may result in a loss of consciousness and death. Carbon monoxide combines with hemoglobin to form carboxyhemoglobin which interferes with the oxygen-carrying capacity of blood, resulting in a state of tissue hypoxia. The typical signs and symptoms of acute CO poisoning are headache, dizziness, drowsiness, vomiting, collapse, coma, and death. Initially the victim is pale; later the skin and mucous membranes may be cherry-red in color. Loss of consciousness occurs at about the 50% carboxyhemoglobin level. The amount of carboxyhemoglobin formed is dependent on concentration and duration of CO exposure, ambient temperature, and health and metabolism of the individual. The formation of carboxyhemoglobin is a reversible process. Recovery from acute poisoning usually occurs without sequelae unless tissue hypoxia was severe enough to result in brain cell degeneration. Carbon monoxide at low levels may initiate or enhance deleterious myocardial alterations in individuals with restricted coronary artery blood flow and decreased myocardial lactate production. Severe carbon monoxide poisoning has been reported to permanently damage the extrapyramidal system, including the basal ganglia.

Long Term Exposure: Carbon monoxide may affect the nervous system and the cardiovascular system, causing neurological and cardiac disorders. Suspected to cause reproductive effects, such as neurological problems, low-birth weight, increased still births, and congenital heart problems. The DFG lists pregnancy risk to fetus probable.

Points of Attack: Central nervous system, lungs, blood, cardiovascular system.

Medical Surveillance: Preplacement and periodic medical examinations should give special attention to significant cardiovascular disease and any medical conditions which could be exacerbated by exposure to CO. Heavy smokers may be at greater risk. Methylene chloride exposure may also cause an increase in carboxyhemoglobin. Smokers usually have higher levels of carboxyhemoglobin than nonsmokers (often 5−10% or more). Carboxyhemoglobin levels are reliable indicators of exposure and hazard. Carboxyhemoglobin should be tested within a few hours following exposure to the gas. EKG. Examination of the nervous system. Persons with heart disease should not be exposed to levels of CO above 35 ppm. Medical tests listed by NIOSH: whole blood (chemical/metabolite)/carboxyhemoglobin (end-of-shift, end of work-week), complete blood count, expired air (end-of-shift, end of work-week).

First Aid: *Gas:* Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 min. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation for 24−48 h. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Refrigerated liquid: Move victims to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 min. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Personal Protective Methods: Under certain circumstances where carbon monoxide levels are not exceedingly high, gas masks with proper canisters can be used for short periods but are not recommended. In areas with high concentrations, self-contained air apparatus is recommended.

Respirator Selection: NIOSH: *350 ppm:* Sa (APF = 10) (any supplied-air respirator). *875 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *1500 ppm:* GmFS *end of service life indicator (ESLI) required.* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS *end of service life indicator (ESLI) required* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with Carbon monoxide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Carbon monoxide must be stored to avoid contact with strong oxidizers, such as chlorine or chlorine dioxide since violent reactions occur. Keep containers in a cool, well-ventilated area away from heat, flame, and sunlight. Metal containers involving the transfer of 5 gallons or more of liquid carbon monoxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of carbon monoxide. Sources of ignition, such as smoking and open flames, are prohibited where carbon monoxide is used, handled, or stored. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Carbon Monoxide (compressed or cryogenic liquid) must carry a "POISON GAS, FLAMMABLE GAS" label.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package) UN1016/UN 9202

Carbon monoxide & Carbon monoxide, compressed

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.7/2.7

Fire Extinguishing: This chemical is a flammable gas that can cause explosion. Use dry chemical extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Carbon monoxide can also be recovered from gas mixtures as an alternative to disposal.

EC Number: 207-340-0

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (carbon oxysulfide); *Theft hazard* 500 (≥56.67% concentration) (carbonyl sulfide).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Carbonyl oxysulfide is a colorless gas or cold liquid. Molecular weight = 60.07. Boiling point = −50°C. Flammable limits: LEL = 12%; UEL = 29%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 1.

Potential Exposure: Carbon oxysulfide is an excellent source of usable atomic sulfur; therefore, it can be used in various chemical syntheses, such as the production of episulfides, alkenylthiols, and vinylicthiols. It is also used to make viscose rayon.

It is probable that the largest source of Carbon oxysulfide is as a by-product from various organic syntheses and petrochemical processes. Carbon oxysulfide is always formed when carbon, oxygen, and sulfur, or their compounds, such as carbon monoxide, carbon disulfide, and sulfur dioxide, are brought together at high temperatures. Hence, carbon oxysulfide is formed as an impurity in various types of manufactured gases and as a by-product in the manufacture of carbon disulfide. Carbon oxysulfide is also often present in refinery gases.

Incompatibilities: COS can form explosive mixtures with air. Incompatible with strong bases. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 10 ppm
PAC-1: 30 ppm
PAC-2: **55** ppm
PAC-3: **150** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Can cause irritation of the eyes, skin, and respiratory tract. Contact with the liquefied gas can cause frostbite. Inhalation can cause irritation, coughing, and sneezing. High exposure can cause salivation, nausea, vomiting, diarrhea, sweating, weakness, and muscle cramps. It may cause tachycardia or arrhythmia. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. COS is an irritant to the lungs and trachea. It depresses the central nervous system. It can be fatal by paralysis of the respiratory system.[24] The acute toxicity of carbon oxysulfide was examined by Japanese workers. Exposure of laboratory animals to this contaminant of coal gas and petroleum gas was associated with pathological changes in the brain, medulla oblongata, liver, kidney, and lung. When rats were placed in chambers containing 0.05% and 0.2% Carbon oxysulfide, death occurred in 10 h and 0.5−1.0 h, respectively.

Long Term Exposure: High or repeated exposure may affect the nervous system causing headache, dizziness, and confusion with memory problems. May cause brain damage, reduced memory, inability to concentrate, and/or personality changes. COS can cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Lungs, brain, central nervous system.

Medical Surveillance: Evaluate the cerebellar, autonomic, and peripheral nervous systems. Brain functions. Tests include: EKG, complete nervous system evaluation, chest X-ray following acute overexposure.

First Aid: *Gas:* Move victim to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Do not use mouth-to-mouth method if victim ingested or inhaled the substance; induce artificial respiration with the aid of a pocket mask equipped with a one-way valve or other proper respiratory medical device. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 min. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves.

Refrigerated liquid: Move victims to fresh air. Call emergency medical care. Apply artificial respiration if victim is not breathing. Administer oxygen if breathing is difficult. Remove and isolate contaminated clothing and shoes. In case of contact with substance, immediately flush skin or eyes with running water for at least 20 min. In case of contact with liquefied gas, thaw frosted parts with lukewarm water. Keep victim warm and quiet. Keep victim under observation. Effects of contact or inhalation may be delayed. Ensure that medical personnel are aware of the material(s) involved and take precautions to protect themselves. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented impact-resistant goggles when working with gasses. When working with liquid, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear rubber gloves and coveralls.[24]

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with carbon oxysulfide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Carbon oxysulfide must be stored to avoid contact with bases and strong oxidizers since violent reactions occur. Keep containers in a cool, well-ventilated area away from heat, flame, and sunlight. Metal containers involving the transfer of 5 gallons or more of liquid carbon oxysulfide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of COS. Sources of ignition, such as smoking and open flames, are prohibited where carbon oxysulfide is used, handled, or stored. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Carbonyl oxysulfide must carry a "POISON GAS, FLAMMABLE GAS" label. It falls in Hazard Class 2.3 and there is no Packing Group listed. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and allow to vaporize. Or, cover the spill with weak hypochlorite solution (up to 15%). After 12 h, the produce may be neutralized and flushed to a sewer with abundant water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 2.1/3.3
Night 5.4/8.7

Fire Extinguishing: COS is a flammable gas or liquid. Fire may restart after it has been extinguished. Poisonous gases, including hydrogen sulfide and sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only

respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent, such as alcohol, benzene, etc. Burn in a furnace with afterburner and scrubber to remove SO_2.[22]

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Carbon tetrabromide is a colorless powder, white crystalline solid, or yellow-brown crystals. Slight odor. Molecular weight = 331.65; Boiling point = 189.8°C; Freezing/Melting point = 90°C; Vapor pressure = 40 mmHg at 96.1°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Very slightly soluble in water; solubility = 0.02%.

Potential Exposure: CBr_4 is used in organic synthesis.

Incompatibilities: Incompatible with strong oxidizers, lithium, and hexacyclohexyldilead since violent reactions occur.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 13.57 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.1 ppm/1.4 mg/m^3 TWA; 0.3 ppm/4 mg/m^3 STEL.

ACGIH TLV®[1]: 0.1 ppm/1.4 mg/m^3 TWA; 0.3 ppm/4.1 mg/m^3 STEL.

No TEEL available.

Australia: TWA 0.1 ppm (1.4 mg/m^3); STEL 0.3 ppm, 1993; Belgium: TWA 0.1 ppm (1.4 mg/m^3); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (1.4 mg/m^3), 1999; Finland: TWA 0.1 ppm (1.4 mg/m^3); STEL 0.4 ppm, [skin], 1999; France: VME 0.1 ppm (1.4 mg/m^3), 1999; Norway: TWA 0.1 ppm (1.4 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (1.4 mg/m^3), 1999; the Netherlands: MAC-TGG 1.4 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.3 ppm. Several states have set guidelines or standards for CBr_4 in ambient air[60] ranging from 14−40 μg/m^3 (North Dakota) to 20 μg/m^3 (Virginia) to 28 μg/m^3 (Connecticut) to 33 μg/m^3 (Nevada).

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: The material is a potent lachrymator even at low concentrations. Carbon tetrabromide is corrosive to the eyes and skin and may cause permanent damage. Inhalation can cause severe irritation of the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. It can affect the nervous system, liver, and kidneys. Exposure to high concentrations may result in unconsciousness.

Long Term Exposure: The substance may damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: liver, kidney, and lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: kidney, liver, and lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 0.1 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Green: General storage may be used. Prior to working with carbon tetrabromide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatible materials listed above.

Shipping: Carbon tetrabromide must carry a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Absorb liquid-containing Carbon tetrabromide in vermiculite, dry sand, earth, or similar material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Poisonous gases are produced in fire. Use any agent suitable for surrounding fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Purify by distillation and return to suppliers.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Carbon tetrachloride is a colorless, nonflammable liquid with a characteristic ether-like odor. The odor threshold is 0.52 mg/L in water and 140−548 ppm in air. Molecular weight = 153.84; Boiling point = 76.5°C; Freezing/Melting point = − 23°C; Vapor pressure = 91 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Very slightly soluble in water; solubility = 0.05%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Carbon tetrachloride is used as a solvent for oils, fats, lacquers, varnishes, rubber, waxes, and resins. Fluorocarbons are chemically synthesized from it. It is also used as an azeotropic drying agent for spark plugs, a dry-cleaning agent, a fire extinguishing agent, a fumigant, and an anthelmintic agent. The use of this solvent is widespread, and substitution of less toxic solvents when technically possible is recommended.

Incompatibilities: Oxidative decomposition on contact with hot surfaces, flames, or welding arcs. Carbon tetrachloride decomposes forming toxic phosgene fumes and hydrogen chloride. Decomposes violently (producing heat) on contact with chemically active metals, such as aluminum, barium, magnesium, potassium, sodium, fluorine gas, allyl alcohol, and other substances, causing fire and explosion hazard. Attacks copper, lead, and zinc. Attacks some coatings, plastics, and rubber. Becomes corrosive when in contact with water; corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 6.29 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 10 ppm TWA; 25 ppm STEL; 200 ppm [5-min maximum peak in any 3 h] STEL.
NIOSH REL: 2 ppm/12.6 mg/m^3 STEL [60 min] STEL; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. *See NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 5 ppm/31 mg/m^3 TWA; 10 ppm/63 mg/m^3 STEL [skin]; Suspected Human Carcinogen.
Protective Action Criteria (PAC)*
TEEL-0: 10 ppm
PAC-1: **44** ppm
PAC-2: **190** ppm
PAC-3: **520** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 0.5 ppm/3.2 mg/m^3 TWA; Peak Limitation Category.
II(2) [skin]; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 3.5 μg/L in blood end-of-shift.
NIOSH IDLH: 200 ppm.
Arab Republic of Egypt: TWA 5 ppm (30 mg/m^3), [skin], 1993; Australia: TWA 5 ppm (30 mg/m^3), [skin], carcinogen, 1993; Austria: MAK 10 ppm (65 mg/m^3), [skin], Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (31 mg/m^3), [skin], carcinogen, 1993; Denmark: TWA 2 ppm (13 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (31 mg/m^3); STEL 10 ppm (63 mg/m^3), [skin], carcinogen, 1999; France: VME 2 ppm (12 mg/m^3), VLE 10 ppm (60 mg/m^3), carcinogen, 1999; India: TWA 5 ppm (30 mg/m^3), [skin], carcinogen, 1993; Japan: 5 ppm (31 mg/m^3), [skin], 2B carcinogen, 1999; Norway: TWA 2 ppm (13 mg/m^3), 1999; the Philippines: TWA 10 ppm (65 mg/m^3), [skin], 1993; Poland: MAC (TWA) 20 mg/m^3, MAC (STEL) 100 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 20 mg/m^3, 1993; Sweden: NGV 2 ppm (13 mg/m^3), KTV 3 ppm (19 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-W 5 ppm (30 mg/m^3); STEL 10 ppm (60 mg/m^3), [skin], 1999; Thailand: TWA 10 ppm; STEL 25 ppm, 1993; the Netherlands: MAC-TGG 3.2 mg/m^3, [skin], 2003; United Kingdom: TWA 2 ppm (13 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 ppm [skin]. Several states have set guidelines or standards for CCl_4 in ambient air[60] ranging from zero (North Dakota) to 0.03 μg/m^3 (Rhode Island) to 0.0667 μ/m^3 (Indiana) to 0.67 μg/m^3 (Massachusetts and North Carolina) to 72 μg/m^3 (Pennsylvania) to 100 μg/m^3 (New York) to 150 μg/m^3 (South Carolina) to 300 μg/m^3 (Connecticut and Virginia) to 714 μg/m^3 (Nevada).

Determination in Air: Charcoal adsorption followed by workup with CS_2 and analysis by gas chromatography; Use NIOSH Analytical Method #1003 for Hydrocarbons, Chlorinated or OSHA Analytical Method 7, Organic Vapors.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 2000 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 50,000 μg/L on an acute toxicity basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of 4.0 μg/L. Mexico's drinking water criteria is 0.004 mg/L.

The former USSR-UNEP/IRPTC joint project[43] set a MAC of 0.3 mg/L in water bodies used for domestic purposes. The US EPA[48] has set a lifetime health advisory of 0.0007 mg/kg/day and a drinking water equivalent level of 25 μg/L. Several states have set standards and guidelines for CCl_4 in drinking water[61] ranging from standards of 2 μg/L (New Jersey) to 3 μg/L (Florida) to 10 μg/L (New Mexico) and guidelines of 2.7 μg/L (Minnesota) to 5 μg/L (California, Kansas and Maine, Colorado).

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} (octanol/water partition coefficient) = 2.6.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, skin, and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Carbon tetrachloride irritates the eyes, causing redness.

Inhalation: Levels of 20 ppm may cause dizziness, headache, vomiting, visual disturbances, extreme fatigue, nose and throat irritation. Other symptoms may include restlessness, loss of balance, twitching, and tremors. Severe exposure can lead to liver, kidney, eye, and nerve damage that may be delayed after exposure; can cause stoppage of breathing, coma, and death. 1000 ppm for an unspecified time has caused death. *Skin:* May cause irritation and redness; carbon tetrachloride is readily absorbed through the skin. Symptoms as listed above may occur through skin absorption even when vapor concentrations are below OSHA Standards. *Ingestion:* May cause severe abdominal pain with diarrhea, followed by symptoms described under inhalation. Death may occur by ingestion of as little as ½ teaspoon. Between 45 and 100 ppm, carbon tetrachloride may cause headache, drowsiness, fatigue, nausea, and vomiting. 100−300 ppm may cause additional effects of mental confusion, weight loss, and sluggishness. Liver, kidney, eye, and nerve damage can result from more severe exposures. Coma and death may occur.

Long Term Exposure: Repeated or prolonged skin contact may cause dermatitis. Carbon tetrachloride is a possible human carcinogen. Cancer site in animals: liver.

Points of Attack: Central nervous system, eyes, lungs, liver, kidneys, skin.

Medical Surveillance: Preplacement and periodic examinations should include an evaluation of alcohol intake and appropriate tests for liver and kidney functions. Special attention should be given to the central and peripheral nervous system, the skin, and blood. Expired air and blood levels may be useful as indicators of exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm²/min): polyvinyl alcohol gloves; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Responder™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 0.1 μg/cm²/min): Teflon™ gloves, suits, boots. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 500) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carbon tetrachloride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Carbon tetrachloride must be stored to avoid contact with chemically active metals, such as sodium, potassium, and magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Carbon tetrachloride requires a “POISONOUS/TOXIC MATERIALS” label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of

spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire, including phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.[22] Recover and purify by distillation where possible.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Carbonyl fluoride is a carboxy halide. It is colorless or light yellow, hygroscopic, compressed liquefied gas, with a pungent, highly irritating and suffocating odor. Molecular weight = 66.01; Specific gravity (H_2O:1) = 1.39 at −190°C; Boiling point = −83°C; Freezing/Melting point = −114°C; Relative vapor density (air = 1) = 2.29; Vapor pressure = 55.4 atm. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity ₩. Reacts with water.

Potential Exposure: The major source of exposure to COF_2 results from the thermal decomposition of fluorocarbon plastics, such as PTFE in air. Carbonyl fluoride is used for synthesizing fluoroalkanes, difluoroisocyanates, and fluorinated alkyl isocyanates. It has been suggested for use as a military poison gas.

Incompatibilities: Reacts with water to form toxic and corrosive hydrogen fluoride (HF) gas. HF gas is highly reactive and forms explosive hydrogen gas on contact with metals. Do not use cast iron or malleable fittings with carbonyl fluoride. Carbonyl fluoride decomposes on heating above 450°C producing toxic gases, including hydrogen fluoride. Not compatible with hexafluoroisopropylidene-amino lithium.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2 ppm/5 mg/m^3 TWA; 5 ppm/15 mg/m^3 STEL.
ACGIH TLV®[1]: 2 ppm/5.4 mg/m^3 TWA; 5 ppm/13 mg/m^3 STEL.
Protective Action Criteria (PAC)*
TEEL-0: 0.28 ppm
PAC-1: 0.28 ppm
PAC-2: **0.28** ppm
PAC-3: **0.83** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Australia: TWA 2 ppm (5 mg/m^3); STEL 5 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Denmark: TWA 2.99 m (6 mg/m^3), 1999; Finland: STEL 2 ppm (5 mg/m^3), 1999; France: VME 2 ppm (5 mg/m^3), 1999; Norway: TWA 2 ppm (5 mg/m^3), 1999; Poland: MAC (TWA) 1 mg(HF)/m^3, MAC (STEL) 3 mg(HF)/m^3, 1999; Switzerland: MAK-W 2 ppm (5 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 5 ppm. Several states have set guidelines or standards for COF_2 in ambient air[60] ranging from 50−150 μg/m^3 (North Dakota) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: None available.

Routes of Entry: Inhalation, skin and/or eye contact. May be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Rapid evaporation of the liquid may cause frostbite. On an acute basis, COF_2 is about as toxic as HF as a respiratory irritant gas. Carbonyl fluoride is rapidly hydrolyzed to hydrofluoric acid and carbon dioxide. Hydrogen fluoride burns on skin or in eyes cause immediate redness, severe pain, possible swelling, and may lead to early necrosis. See entry on hydrogen fluoride: H:0450. Prompt medical attention is essential, if not mandatory.

Long Term Exposure: The long-term effects are due to the fluoride ion generated by hydrolysis; this inhibits succinic dehydrogenase activity, since this is a fluoride-sensitive enzyme. May cause liver and kidney damage. Repeated exposure may cause bronchitis. Chronic exposure: gastrointestinal pain, muscle fibrosis, skeletal fluorosis (NIOSH).

Points of Attack: Eyes, skin, respiratory system, bone, liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact-resistant goggles when working with gas. Wear indirect-vent and splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH: *(fluorides) 12.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA (APF = 10)* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or *† *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Storage area must be absolutely dry.

Shipping: Carbonyl fluoride must be labeled “TOXIC GAS, CORROSIVE.” It falls in Hazard Class 2.3 and there is no Packing Group listed. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. *Do not use water or wet method.* Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120 (q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Carbonyl fluoride and carbonyl fluoride, compressed

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.9/3.1

Fire Extinguishing: This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 212-324-1 [*Annex I Index No.:* 015-044-00-6]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (India) (UN).[13]

Very Toxic Substance (World Bank).[15]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R24/25; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Carbophenothion is a colorless to light amber liquid with a characteristic odor. Molecular weight = 342.87.

Specific gravity (H_2O:1) = 1.3; Boiling point = 82°C at 0.01 mmHg; Relative vapor density (air = 1) = 11.78. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Those engaged in the manufacture or application of this material, which is an insecticide and acaricide; primarily for citrus crops and deciduous fruits and nuts. Compound Description: Agricultural Chemical; Mutagen.

Incompatibilities: The substance decomposes on heating or on burning, producing toxic fumes including phosphorus oxides, sulfur oxides, hydrogen chloride. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 6.8 mg/m^3

PAC-3: 6.8 mg/m^3

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} (octanol/water partition coefficient) = 5.1.

Routes of Entry: Inhalation, ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance may affect the nervous system, resulting in convulsions and respiratory failure. Cholinesterase inhibitor. Exposure may result in death. Produces headaches, nausea, weakness, and dizziness. Symptoms may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, weakness, muscle twitching, difficult breathing, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. This material is highly toxic; the estimated fatal oral dose is 0.6 g for a 150-lb (70 kg) person. Oral LD_{50} for rats is 6.8 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible: see acute hazards/symptoms. The state of Massachusetts lists this chemical as a neurotoxin.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Requires a DOT label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19,20]

Spill Handling: Stay upwind; keep out of low areas. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The substance decomposes on heating or on burning producing toxic fumes including phosphorus oxides, sulfur oxides, hydrogen chloride. This material may burn, but does not ignite readily. For small fires: use dry chemicals, carbon dioxide; water spray, or foam. For large fires: use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in heat of fire. Fire and runoff from fire control water may produce irritating or poisonous gases. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis by hypochlorites may be used, as may incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 226-031-1

Regulatory Authority and Advisory Bodies

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Carboxin is a white crystalline solid. Molecular weight = 235.32; Freezing/Melting point = 91.5−95°C (depending on crystal structure); Vapor pressure = 1.78×10^{-7} mmHg. Practically insoluble in water; solubility = 25 mg/L; 0.15 g/L at 20°C.

Potential Exposure: Those involved in the production, formulation, and application of this systemic fungicide, seed protectant and wood preservative. Human toxicity (long term)[77]: Extra high—0.91 ppb, Health Advisory; Fish toxicity (threshold)[77]: High—1.06008 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Incompatibilities: Keep away from strong oxidizers. Avoid heat and humidity. Decomposition products include cyanide gas and cyanide salts.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: The no-observed-adverse-effect level has been determined by EPA to be 10 mg/kg body weight/day. This results in a long-term health advisory of 3.5 mg/L and a lifetime health advisory of 0.7 mg/L.

Determination in Water: Analysis of carboxin is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen-phosphorus-containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen-phosphorus detector. The method detection limit has not been determined for carboxin, but it is estimated that detection limits for analyses included in this method are in the range of 0.1−2 μg/L.

Harmful Effects and Symptoms

LD_{50} = (oral-mouse) 3550 mg/kg (slightly toxic). A value for LD_{50} rat of 430 mg/kg puts carboxin in the moderately toxic category.

Short Term Exposure: Harmful if inhaled or absorbed by the skin or eyes.

Long Term Exposure: Based on animal studies, carboxin may cause kidney effects or result in damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with carboxin you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Requires a DOT label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1; Packing Group N/A.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including cyanide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Carmustine C:0550

Molecular Formula: $C_5H_9C_{12}N_3O_2$
Synonyms: BCNU; BiCNU; Bischloroethyl nitrosourea; *N, N′*-Bis(2-chloroethyl)-*N*-nitrosourea; Carmubris; Carmustin; FDA 0345
CAS Registry Number: 154-93-8
RTECS® Number: YS2625000
UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151
EC Number: 205-838-2
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: (BCNU) Animal Sufficient Evidence; Human, Limited Evidence, *probably carcinogenic to humans*, Group 2A, 1998; NTP: Reasonably anticipated to be a human carcinogen; NCI: some evidence, rat; clear evidence, mouse.
California Proposition 65 Chemical: Cancer 7/1/87; Developmental/Reproductive toxin 7/1/90.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Carmustine is an orange-yellow crystalline solid or powder. Molecular weight = 114.1; Freezing/Melting point = 30−32°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0.
Potential Exposure: BCNU has been used since 1971 as an antineoplastic agent in the treatment of Hodgkin's lymphoma, multiple myeloma, and primary or metastatic brain tumors. It also has been reported to have antiviral, antibacterial, and antifungal activity, but no evidence was found that it is used in these ways. BCNU is not known to be naturally occurring. Health professionals who handle this drug (e.g., pharmacists, nurses, and physicians) may possibly be exposed to BCNU during drug preparation, administration, or cleanup; however, the risks can be avoided through use of containment equipment and proper work practices.
Incompatibilities: Acids and acid solutions above pH 7 cause rapid decomposition. Most stable at pH 4 in aqueous solution or petroleum ether.[NTP]
Permissible Exposure Limits in Air
No standards or TEEL available.
As a confirmed carcinogen, exposure must be kept to the lowest feasible level.
Harmful Effects and Symptoms
Short Term Exposure: Symptoms include nausea, vomiting, diarrhea, dyspnea; flushing of the skin; esophagitis; cytotoxic effects on the liver, kidneys, and central nervous system; delayed bone marrow suppression (e.g., leukopenia and thrombocytopenia). LD_{50} = (oral-rat) 120 mg/kg (highly toxic).
Long Term Exposure: Potential human carcinogen. May cause liver, kidney, and nervous system damage.
Points of Attack: Liver, kidney, central nervous system, bone marrow.
Medical Surveillance: Liver and kidney function tests. Examination of the nervous system.
First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: When thresholds for carcinogens that would protect 100% of the population had not been identified, NIOSH usually recommended that occupational exposures to carcinogens be limited to the lowest feasible concentration. To ensure maximum protection from carcinogens through the use of respiratory protection, NIOSH also recommended that only the most reliable and protective respirators be used. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Escape: 100F (APF = 50) (any air-purifying, full-face-piece respirator with and N100, R100, or P100 filter ck-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids.[52] A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Requires a DOT label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% ethanol to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carvone C:0560

Molecular Formula: $C_{10}H_{14}O$

Synonyms: D-Carvone; δ-Carvone; dextro-Carvone; 1-6, 8 (9)-*p*-Menthadien-2-one; δ-1-Methyl-4-isopropenyl-6-cyclohexen-2-one

CAS Registry Number: 2244-16-8

RTECS® Number: OS8670000

EC Number: 218-827-2

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Carvone is a pale yellow to white clear liquid. Molecular weight = 150.22; Boiling point = 230°C; Flash point = 93°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 2, Reactivity 0.

Potential Exposure: Compound Description*:* Mutagen, Primary irritant. Carvone is found in various natural oils, including caraway and dill seed, mandarin peel and spearmint oils. A food additive, it is used in flavoring liqueurs; in perfumes and soaps.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. This material is highly toxic by ingestion on skin absorption. LD_{50} = (oral-rat) 3.71 mg/kg.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to all rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in a cool, dry place or in a refrigerator.

Shipping: "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter, or has a flash point above 60.5°C/141°F but *below* 93°C. This chemical has a flash point of 93°C.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well first with alcohol, then with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to

clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Animal Sufficient Evidence, Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1999.

Banned or severely restricted (The Czech Republic) (In Cosmetics).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 7/15/03.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20/21/22; R36/38; Safety phrases: S2; S22; S26; S27 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Catechol is a white crystalline solid. Turns brown on contact with light and air. Molecular weight = 110.12; Specific gravity (H_2O:1) = 1.3; Boiling point = 245.5°C; Freezing/Melting point = 104°C. It sublimes readily; Vapor pressure = 10 mmHg at 117°C; Flash point = 127°C; Autoignition temperature = 512°C. Explosive Limits in air: LEL = 1.4%; UEL−Unknown. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 1, Reactivity 2. Solubility in water = 44%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Used as a chemical intermediate; pharmaceutical and veterinary drug; as an antiseptic; in photography; in dyestuff manufacture and application. It is also used in electroplating, in the formulation of specialty inks, in antioxidants, and light stabilizers.

Incompatibilities: Strong oxidizers, nitric acid.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 ppm/20 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/23 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 5 ppm

PAC-2: 7.5 ppm

PAC-3: 25 ppm

Australia: TWA 5 ppm (20 mg/m^3), 1993; Austria: MAK 5 pppm (20 mg/m^3), 1999; Belgium: TWA 5 ppm (23 mg/m^3), 1993; Denmark: TWA 5 ppm (20 mg/m^3), 1999; Finland: TWA 5 ppm (22 mg/m^3); STEL 10 ppm (45 mg/m^3), 1999; France: VME 5 ppm (20 mg/m^3), 1999; the Netherlands: MAC-TGG 20 mg/m^3, 2003; Norway: TWA 5 ppm (20 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (23 mg/m^3), 1999; United Kingdom: TWA 5 ppm (23 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for catechol in ambient air[60] ranging from 200 μg/m^3 (North Dakota) to 350 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 476 μg/m^3 (Nevada).

Determination in Air: None available.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 280 μg/L on a health basis. Russia set a MAC of 0.1 mg/L in surface water.

Determination in Water: Log $K_{ow} = 0.9$.

Routes of Entry: Skin absorption, skin and eye contact, inhalation of vapors, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Catechol can affect you when breathed in. It can also rapidly enter the body through the skin. Death can occur from extensive skin contact. Lower exposures can cause skin burns, headaches, nausea, muscle twitching, and convulsions. Skin allergy with rash can also occur. Catechol is a lacrimator. It irritates the respiratory and digestive tracts. It is corrosive to the eyes and can cause severe burns. The substance may affect the central nervous system causing depression, convulsions, and respiratory failure. Because this is a mutagen, handle it as a possible cancer-causing substance, with extreme caution. Exposure lowers the ability of the blood to carry oxygen, causing a bluish color of the skin. Absorption through the skin results in illness akin to that which phenol produces except convulsions are more pronounced. Catechol increases blood pressure, apparently from peripheral vasoconstriction. Catechol can cause death, apparently initiated by respiratory failure. LD_{50} = (rat-oral) 260 mg/kg (moderately toxic).

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. A mutagen that may have a cancer or reproductive risk. High or repeated damage may cause kidney and liver damage. Repeated lower exposures can cause methemoglobinemia, with blue color to the skin, rapid breathing, and dizziness.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: tests for liver and kidney function. Blood methemoglobin level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered, air-purifying respirator. If while wearing a filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect 1,2-Dihydroxybenzene, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with catechol you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and acids. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic solids, organic, require a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust or use a vacuum. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, alcohol foam, or carbon dioxide. Water and conventional foam may be ineffective.[41] Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cesium hydroxide C:0580

Molecular Formula: CsHO

Common Formula: CsOH

Synonyms: Caesium hydroxide; Cesium hydrate; Cesium hydroxide dimer

CAS Registry Number: 21351-79-1

RTECS® Number: FK9800000

UN/NA & ERG Number: UN2682 (solid)/157; UN2681 (solution)/154

EC Number: 244-344-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cesium hydroxide is a colorless-to-yellow crystalline compound. It is often used in a water solution. Molecular weight = 142.92; Specific gravity (H_2O:1) = 3.68; Freezing/Melting point = 272°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 0, Reactivity 0. Highly soluble in water; solubility 395% at 15°C.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Cesium hydroxide may be used as a raw material for other cesium salts; such as the chloride which in turn may be used to produce cesium metal. Cesium metal is used in electronic devices.

Incompatibilities: Cesium hydroxide is the strongest base known. It must be stored in silver or platinum and out of contact with air because of its reactivity with glass. CsOH causes the generation of considerable heat in contact with water or moisture. Contact with many organic compounds, many metals (i.e., aluminum, lead, tin, zinc), glass, oxygen, or carbon dioxide causes a violent reaction.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2 mg/m^3 TWA.

ACGIH TLV®[1]: 2 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 250 mg/m^3

Australia: TWA 2 mg/m^3, 1993; Belgium: TWA 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3, 1999; France: VME 2 mg/m^3, 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Russia: STEL 0.3 mg/m^3, 1993; United Kingdom: TWA 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg/m^3. Several states have set guidelines or standards for CsOH in ambient air[60] ranging from 20 μg/m^3 (North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 48 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. This chemical is corrosive to the eyes and can cause permanent damage. LD_{50} = (oral-rat) 570 mg/kg (slightly toxic).

Long Term Exposure: May cause lung irritation with the development of bronchitis, shortness of breath, coughing, phlegm.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: *Clothing:* Avoid skin contact with cesium hydroxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. ACGIH recommended protective gloves be made of butyl rubber, natural rubber, nitrile rubber, Neoprene™, or polyvinyl chloride. *Eye Protection:* Wear dust-proof goggles and face shield when working with powders or dusts unless full face-piece respiratory protection is worn. Wear gas-proof goggles and face shield where cesium hydroxide is in solution, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures over 2 mg/m^3, use a MSHA/NIOSH-approved full face-piece respirator equipped with a particulate (dust/fume/mist) filter. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—White: Corrosive or Contact Hazard: Store separately in a corrosion-resistant location. Prior to working with cesium hydroxide you should be trained on its proper handling and storage. Cesium hydroxide should be stored in silver or platinum away from air because it reacts violently with oxygen. Store in tightly closed containers in a cool, well-ventilated area away from moisture and incompatible materials listed above.

Shipping: Cesium hydroxide must bear a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water* in cleanup. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area of spill or leak after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Do not use water*. Use dry chemical appropriate for extinguishing metal fires. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chloral C:0590

Molecular Formula: C_2HCl_3O

Common Formula: CCl_3CHO

Synonyms: Acetaldehyde, trichloro-; Anhydrous chloral; Chloral, anhydrous, inhibited; Cloralio; Ethanal, trichloro-; Grasex; 2,2,2-Trichloroacetaldehyde; Trichloroacetaldehyde; Trichloroethanal; Tricloroacetaldehido (Spanish)

CAS Registry Number: 75-87-6 (chloral); 302-17-0 (chloral hydrate)

RTECS® Number: FM7870000 (chloral); FM8750000 (chloral hydrate)

UN/NA & ERG Number: UN2075 (chloral, anhydrous, inhibited); UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 200-911-5; 206-117-5 [*Annex I Index No.:* 605-014-00-6 (chloral hydrate)]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (*chloral and chloral hydrate*): Animal, limited evidence; Human, inadequate evidence, *not classifiable as carcinogenic to humans*, Group 3, 1995; NCI: Carcinogenesis Studies (gavage); equivocal evidence: mouse, rat; EPA (*chloral hydrate*): Possible Human Carcinogen; (*oral*): Cannot be determined.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U034, as chloral.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, as chloral.

Reportable Quantity (RQ): 5000 lb (2270 kg), as chloral.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as chloral.

European/International Regulations: Hazard Symbol: T (*chloral hydrate*); Risk phrases: R25; R36/38; Safety phrases: S1/2; S25; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*chloral hydrate*).

Description: Chloral is a combustible, oily liquid with a pungent irritating odor. Molecular weight = 147.38; Boiling point = 97−98°C; Flash point = 75°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 1. Soluble in water. Chloral hydrate is colorless crystals, with characteristic odor. Molecular weight = 165.40; Boiling point = 97°C (decomposes); Freezing/Melting point = 57−60°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 1. Very soluble in water.

Potential Exposure: Compound Description (chloral hydrate): Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Chloral is used as an intermediate in the manufacture of such pesticides as DDT, methoxychlor, DDVP, naled, trichlorfon, and TCA. Chloral is also used in the production of chloral hydrate; used as a therapeutic agent with hypnotic, sedative, and narcotic effects; used in a time prior to the introduction of barbiturates.

Incompatibilities: Chloral hydrate reacts with strong bases forming chloroform. Contact with acids, or exposure to light may cause polymerization. Reacts with water, forming chloral hydrate. Reacts with oxidizers, with a risk of fire or explosions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 40 mg/m^3
PAC-3: 40 mg/m^3

Chloral hydrate

TEEL-0: 7.5 mg/m^3
PAC-1: 25 mg/m^3
PAC-2: 125 mg/m^3
PAC-3: 125 mg/m^3

Russia has recommended a maximum concentration in work-room air of 220 mg/m^3.

Permissible Concentration in Water: There are no US criteria but Russia has set 0.2 mg/L as the MAC for water bodies used for domestic purposes.[43]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <1$.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, respiratory tract. Skin and eye contact may cause burns. Chloral may affect the central nervous system, kidneys, liver, and the cardiovascular system causing impaired functions or damage. Exposure to high levels may cause tiredness, dizziness, lightheadedness, and loss of consciousness. Specific information on the pharmacokinetic behavior, carcinogenicity, mutagenitcity, teratogenicity, and other reproductive effects of chloral was not found in the available literature. However, the pharmacokinetic behavior of chloral may be similar to chloral hydrate, where metabolism to ritchloroethanol and trichloroacetic acid and excretion via the urine (and possibly bile) have been observed. Chloral hydrate produced skin tumors in 4 of 20 mice dermally exposed. Alcohol synergistically increases the depressant effect of the compound, creating a potent depressant commonly referred to as "Mickey Finn" or "knock-out drops." Addiction to chloral hydrate through intentional abuse of the compound has been reported.

Long Term Exposure: Repeated skin contact may cause acne-like rash. Repeated contact may cause sedation. Chronic effects from respiratory exposure to chloral as indicated in laboratory animals include reduction of kidney function and serum transaminase activity; change in central nervous system function (unspecified); decrease in antitoxic and enzyme-synthesizing function of the liver; and alteration of morphological characteristics of peripheral blood. Slowed growth rate, leukocytosis, and changes in the arterial blood pressure were also observed.

Points of Attack: Inhalation, ingestion.

Medical Surveillance: Lung function tests. Serum trichloroethanol level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for exposure to chloral:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloral you should be trained on its proper handling and storage. Protect from light, moisture, air, and acids. DEA regulations require storage in a locked storage area. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloral, anhydrous, inhibited, and chloral hydrate require a "POISONOUS/TOXIC MATERIALS" label. Chloral falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire, including hydrogen chloride. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with another combustible fuel; care must be taken to assure complete combustion to prevent phosgene formation; an acid scrubber is necessary to remove the halo acids produced.

Chloramben C:0600

Molecular Formula: $C_7H_5Cl_2NO_2$

Synonyms: ACP-M-728; Amben®; Ambiben®; Amiben®; Amibin®; 3-Amino-2,5-dichlorobenzoic acid; 3-Amino-2,6-dichlorobenzoic acid; Amoben; Benzoic acid, 3-amino-2,5-dichloro-; Chlorambed; Chloramben, aromatic carboxylic acid; Chloramben benzoic acid herbicide; Chlorambene; 2,5-Dichloro-3-aminobenzoic acid; NCI-C00055; Ornamental weeder; Vegaben®; Vegiben®; Weedone garden weeder

CAS Registry Number: 133-90-4

RTECS® Number: DG1925000

UN/NA & ERG Number: UN2588/151

EC Number: 205-123-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: Carcinogenesis Studies; positive evidence: mouse; NCI: Results negative, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloramben is a colorless, odorless, crystalline solid. Molecular weight = 206.03; Freezing/Melting point = 200−201°C; Vapor pressure = 6.8×10^{-3} mmHg at 100°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 690 ppm at 25°C.

Potential Exposure: A General Use Pesticide (GUP) that is no longer produced or sold in the United States. It is used as a herbicide for grasses, broadleaf weeds, soybeans, beans, and some vegetables. Workers involved in the manufacture, formulation, or application of this reemergence herbicide. Human toxicity (long term)[77]: Very low—100.00 ppb, Health Advisory. Fish toxicity (threshold)[77]: Very low—1584.89319 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Incompatibilities: Rapidly decomposed by light. Strong acids and acid fumes.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.04 mg/m^3
PAC-1: 0.125 mg/m^3
PAC-2: 0.75 mg/m^3
PAC-3: 500 mg/m^3
Russia set a MAC of 0.01 mg/m^3 in ambient air in residential areas on a momentary basis and 0.006 mg/m^3 on an average daily basis.
Pennsylvania[60] set a guideline for chloramben in ambient air of 1.3333 mg/m^3.

Permissible Concentration in Water: The USR[35] set a MAC of 0.5 mg/L in surface water. A lifetime health advisory of 0.105 mg/L has been determined by EPA (see "References" below).

Routes of Entry: Inhalation, passes through the skin.

Harmful Effects and Symptoms
The available data on Chloramben are very sparse. Much additional information is needed regarding its chronic toxicity, teratogenicity, and carcinogenicity before limits can be confidently set. No-observed-adverse-effect doses for chloramben were 15 mg/kg/day. Based on these data an ADI was calculated at 0.015 mg/kg/day. The LD_{50} rat is 3500 mg/kg (slightly toxic).

Short Term Exposure: Skin or eye contact may cause irritation.

Long Term Exposure: There is evidence that this chemical causes cancer in animals. It may cause cancer of the liver. Repeated exposure may cause skin rash with itching.

Points of Attack: Skin, liver.

Medical Surveillance: Liver function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When thresholds for carcinogens that would protect 100% of the population had not been identified, NIOSH usually recommended that occupational exposures to carcinogens be limited to the lowest feasible concentration. To ensure maximum protection from carcinogens through the use of respiratory protection, NIOSH also recommended that only the most reliable and protective respirators be used. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with and N100, R100, or P100 filter ck-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloramben you should be trained on its proper handling and storage. Store in a cool, dry place, or a refrigerator, and avoid contact with strong acids, acid fumes, and light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pesticides, solid, toxic, n.o.s., require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including toxic chloride fumes and nitrous oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chloramben is stable to heat, oxidation, and hydrolysis in acidic or basic media. The stability is comparable to that of benzoic acid. Wet oxidation or incineration are recommended disposal methods.[22]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human, Sufficient Evidence; Animal, Sufficient Evidence, *carcinogenic to humans*, Group 1, 1998; NTP: Known to be a human carcinogen.

US EPA Hazardous Waste Number (RCRA No.): U035.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Cancer 2/27/87; Developmental/Reproductive toxin 1/1/89.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlorambucil is a crystalline solid. Molecular weight = 304.24; Freezing/Melting point = 64–66°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Chlorambucil, an anticancer drug, is a derivative of nitrogen mustard. This drug is primarily used as an antineoplastic agent for the treatment of lymphocytic leukemia, malignant lymphomas, follicular lymphoma, and Hodgkin's disease. The treatments are not curative but do produce some marked remissions. Chlorambucil has also been tested for treatment of chronic hepatitis, rheumatoid arthritis, and as an insect chemosterilant. All of the chemical used in this country is imported from the United Kingdom. Work exposure in the United States would be limited to workers formulating the tablets, or to those patients receiving the drug.

Incompatibilities: Moisture.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Chlorambucil is carcinogenic in rats and mice following intraperitoneal injection, producing lymphomas in rats and lymphosarcomas, ovarian tumors in mice. Excesses of acute leukemia were reported in a number of epidemiological studies of people treated with chlorambucil, either alone or in combination with other therapies, for both nonmalignant and malignant diseases. Other cancers have also been associated with the use of chlorambucil and other agents. An excess of acute leukemia in association with Chlorambucil was seen in a further study in which 431 previously untreated patients with polycythemia vera were given phlebotomy alone or chlorambucil with phlebotomy and followed for a mean of 6.5 years. Of the 26 cases of acute leukemia that occurred, 16 were in the group receiving chlorambucil. The risk increased with increasing dose and time of treatment. LD_{50} = (oral-rat) 76 mg/kg (moderately toxic). Causes nausea and vomiting and CNS excitation in humans.

Short Term Exposure: Irritates the eyes and respiratory tract. Exposure can cause dizziness, loss of coordination, numbness, weakness, muscle twitching, convulsions, and unconsciousness.

Long Term Exposure: This chemical is a carcinogen in humans. It has been shown to cause lung cancer and leukemia. It is a probable teratogen in humans and may damage the testes in males and decrease fertility in females.

Points of Attack: Lung, kidney, liver, blood.

Medical Surveillance: Liver and kidney function tests, lung function tests, complete blood count (CBC).

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.
Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.
Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.
Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When thresholds for carcinogens that would protect 100% of the population had not been identified, NIOSH usually recommended that occupational exposures to carcinogens be limited to the lowest feasible concentration. To ensure maximum protection from carcinogens through the use of respiratory protection, NIOSH also recommended that only the most reliable and protective respirators be used. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).
Escape: 100F (APF = 50) (any air-purifying, full-face-piece respirator with and N100, R100, or P100 filter ck-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorambucil you should be trained on its proper handling and storage. Store in cool, dry place. Store in sealed ampules or in amber screw-capped bottles or vials with Teflon™ cap liners. Solutions may be stored in bottles or vials with a silicone system having a Teflon™ liner and sampled with needle and syringe. Prevent exposure to light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic Solid, Organic, n.o.s [4-[bis(2-Chloroethyl) amino]-benzenebutanoic acid] "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide, nitrogen oxides, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Permanganate oxidation, high-temperature incineration with scrubbing equipment, or microwave plasma treatment.

Carcinogenicity: IARC[9]: Human, Limited Evidence, animal Inadequate Evidence, *probably carcinogenic to humans*, Group 2A, 1990; NTP: Reasonably anticipated to be a human carcinogen.

Banned or severely restricted (Medical Uses Restricted) (UN).[13]

California Proposition 65 Chemical: Cancer 1/1/89.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloramphenicol is a white to grayish-white or yellowish-white crystalline solid. Molecular weight = 323.2; Freezing/Melting point = 151°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: An antibiotic derived from *Streptomyces venezuelae*; Those involved in the manufacture, formulation, and application of this antibiotic and antifungal agent.

Permissible Exposure Limits in Air

AIHA WEEL: 0.5 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 350 mg/m^3

The FDA (Food and Drug Administration) has set standards for *Good Manufacturing Practices for Drugs and Pharmaceuticals.* These should be followed for personal protection as well as product quality. See the FDA regulation 21 CFR 210. Also, there may be no safe level of exposure to a carcinogen, so all contact should be reduced to the lowest possible level. It should be recognized that this chemical can be absorbed through the skin, thereby increasing exposure.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chloramphenicol can affect you when breathed in and by passing through your skin. Skin or eye contact can cause irritation. Exposure can damage the bone marrow's ability to make blood cells and/or platelets (for blood clotting). This can lead to severe illness or death.

Long Term Exposure: High or repeated exposure can damage the liver. Effects on the nervous system may also occur, such as numbness and tingling in the fingers or toes and blurred vision. Chloramphenicol is a carcinogen, mutagen, and teratogen. LD_{50} = (oral-rat) 2500 mg/kg (slightly toxic).

Points of Attack: Liver, nervous system, blood.

Medical Surveillance: Before beginning work and monthly after that, the following is recommended: complete blood count (CBC) with platelet count. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests; exam of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: When thresholds for carcinogens that would protect 100% of the population had not been identified, NIOSH usually recommended that occupational exposures to carcinogens be limited to the lowest feasible concentration. To ensure maximum protection from carcinogens through the use of respiratory protection, NIOSH also recommended that only the most reliable and protective respirators be used. *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with and N100, R100, or P100 filter ck-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Chloramphenicol you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Chloramphenicol is not specifically cited by DOT, but reference may be made to the category "Medicine, solid, toxic, n.o.s." It requires a label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chlorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlordane is a colorless, or light-yellow or amber, thick liquid with a pungent, chlorine-like odor. It may occur as a crystalline solid. Molecular weight = 409.76; Specific gravity (H_2O:1) = 1.6 at 25°C; Boiling point = 175°C; Freezing/Melting point = 104−107°C; Vapor pressure = 0.00001 mmHg; Practically insoluble in water; solubility = 0.0001%. The *commercial grade* of chlordane is a noncombustible liquid, but may be utilized in flammable solutions: Flash point = 56°C has been found in the literature, but his may vary depending on the carrier. Hazard Identification (based on NFPA 704 M Rating System): *(in a flammable solution such as n-hexane)* Health 3, Flammability 3, Reactivity 0; (*dry*) Health 3; Flammability 1; Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Chlordane is a broad-spectrum insecticide of the group of polycyclic chlorinated hydrocarbons called cyclodiene insecticides. Chlordane has been used extensively since the 1950s for termite control; as an insecticide for homes and gardens; and as a control for soil insects during the production of crops such as corn. Both the uses and the production volume of chlordane have decreased extensively since the issuance of a registration suspension notice for all food crops and home and garden uses of chlordane by the US Environmental Protection Agency. However, significant commercial use of chlordane for termite control continues. Special groups at risk include children as a result of milk consumed; fishermen and their families because of the high consumption of fish and shellfish, especially freshwater fish; persons living downwind from treated fields; and persons living in houses treated with chlordane pesticide control agents. Human toxicity (long term)[77]: High—2.00 ppb, MCL (Maximum Contaminant Level); Fish toxicity (threshold)[77]: Extra high—0.04936 ppb, MATC (Maximum Acceptable Toxicant Concentration).

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. High heat and contact with alkaline solutions cause decomposition with the production of toxic fumes including chlorine, phosgene, hydrogen chloride. Attacks iron, zinc, plastics, rubber, and coatings.

Permissible Exposure Limits in Air
OSHA PEL: 0.5 mg/m^3 TWA [skin].
NIOSH REL: 0.5 mg/m^3 TWA [skin]. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: 100 mg/m^3.
Protective Action Criteria (PAC)
57-74-9
TEEL-0: 0.5 mg/m^3
PAC-1: 7.5 mg/m^3

PAC-2: 50 mg/m^3
PAC-3: 100 mg/m^3
DFG MAK: 0.5 mg/m^3, inhalable fraction [skin]; Peak limitation II(8); Carcinogen Category 3B.

Arab Republic of Egypt: TWA 0.5 mg/m^3 [skin], 1993; Australia: TWA 0.5 mg/m^3; STEL 2 mg/m^3 [skin], Carcinogen 1993; Austria: MAK 0.5 mg/m^3 [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.5 mg/m^3; STEL 2 mg/m^3 [skin], 1993; Denmark: TWA 0.5 mg/m^3 [skin], 1999; Finland: carcinogen, 1999; France: VME 0.5 mg/m^3 [skin], carcinogen, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3 [skin], 2003; Norway: TWA 0.5 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3 [skin], 1993; Russia: STEL 0.01 mg/m^3 [skin], 1993; Switzerland: MAK-W 0.5 mg/m^3 [skin], 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg/m^3 [skin], 1993; United Kingdom: LTEL 0.5 mg/m^3; STEL 2 mg/m^3 [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for chlordane in ambient air[60] ranging from 0.068 μg/m^3 (Massachusetts) to 0.36 μg/m^3 (Pennsylvania) to 1.19 μg/m^3 (Kansas) to 1.7 μ/m^3 (New York) to 2.5 μg/m^3 (Connecticut and South Carolina) to 5.0 μg/m^3 (Florida) to 5–20 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 12.0 μg/m^3 (Nevada).

Determination in Air: Filter/Chromosorb tube-102; Toluene; Gas chromatography/Electrochemical detection; NIOSH Analytical Method (IV) #5510 or OSHA Analytical Method 67.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0043 μg/L as a 24-h average, not to exceed 2.4 μg/L at any time. *To protect saltwater aquatic life:* 0.0040 μg/L as a 24-h average, never to exceed 0.09 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of 0.0046 μg/L.[6] The EPA[47] has found a lowest-observed-adverse-effect-level (LOAEL) of 0.045 mg/kg body weight/day which results in a lifetime health advisory of 2 μg/L. Several states have set standards and guidelines for chlordane in drinking water.[61] Standards range from 0.5 μg/L (New Jersey) to 3.0 μg/L (Illinois) and guidelines range from 0.055 μg/L (California) to 0.22 μg/L (Kansas and Minnesota) to 0.50 μg/L (Arizona) to 0.55 μ/l (Maine). See values listed under Regulatory Authority and Advisory Bodies for Canada and Mexico. It is strongly advised not to let the chemical enter into the environment because it persists in the environment. The substance may cause long-term effects in the aquatic environment.

Determination in Water: Filter/Chromosorb tube-102; Toluene; Gas chromatography/Electrochemical detection; NIOSH Analytical Method (IV) #5510. Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol–water coefficient: Log $K_{ow} = 2.8$.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Chlordane can irritate the eyes and skin and can cause burns on contact. Skin rash or acne may develop. The vapor can irritate the respiratory tract. Exposure can cause blurred vision, nausea, headache, abdominal pain, and vomiting. Exposure at high levels may result in disorientation, tremors, convulsions, respiratory failure, and death. Medical observation is indicated. Symptoms include increased sensitivity to stimuli, tremors; lack of muscular coordination; and convulsions with or without coma. Fatal oral dose to adult humans is between 6 and 60 g with onset of symptoms within 45 min to several hours after ingestion, although symptoms have occurred following very small doses either orally or by skin exposure. Some reports of delayed development of liver disease, blood disorders, and upset stomach. Chlordane is considered to be borderline between a moderately and highly toxic substance. The oral LD_{50} for rats is 283 mg/kg.

Long Term Exposure: This chemical has been shown to cause liver cancer in animals and may be a human carcinogen. It may damage the developing fetus. Chlordane may damage the kidneys, liver, and affect the immune system. May cause an acne-like rash following skin contact.

Points of Attack: Central nervous system, eyes, lungs, liver, kidneys, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Examination by a qualified allergist. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): CPF3™ suits, Trellchem HPS™ suits; **4 h** (at least 4 h but <8 h of resistance to breakthrough > 0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Chlordane you should be trained on its proper handling and storage. Chlordane must be stored to avoid contact with strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: There are no shipping regulations specific to chlordane, perhaps because its use is so widely banned. However, "Pesticides, liquid, toxic, n.o.s.," or "Organochlorine pesticide, liquid, toxic," require a "POISONOUS/TOXIC MATERIALS" label. Chlordane falls in Hazard Class 6.1 and Packing Group III.[19,20]

Spill Handling: Do not touch spilled material. Use water spray to reduce vapors. Stay upwind. Avoid breathing vapors. Wear positive-pressure breathing apparatus and full protective clothing. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small spills*: absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid but it may be dissolved in flammable or combustible liquids for commercial application. Poisonous gases, including chlorine, phosgene, hydrogen chloride, are produced in fire. If the flammable or combustible commercial material catches fire, use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chlordane is dehydrochlorinated in alkali to form "nontoxic" products, a reaction catalyzed by traces of iron, but the reaction is slow. The environmental hazards of the products are uncertain. Chlordane is completely dechlorinated by sodium in isopropyl alcohol. The UN recommends incineration methods for disposal of chlordane.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

List of Stockholm Convention POPs: Annex A (Elimination).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R24/25; R40; R50/53; Safety phrases: S1/2; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Kepone is a tan to white, odorless crystalline solid. Molecular weight = 490.60; Freezing/Melting point = 360°C (sublimes); Vapor pressure = 3×10^{-7} mmHg at 25°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solubility = 0.5 at 100°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector. Kepone was registered for the control of root-borers on bananas with a residue tolerance of 0.01 ppm. This constituted the only food or feed use of Kepone. Nonfood uses included wireworm control in tobacco fields and bait to control ants and other insects in indoor and outdoor areas. A rebuttable presumption against registration of chlordecone was issued by the US EPA on March 25, 1976, on the basis of oncogenicity. The trademarked Kepone™ and products of six formulations were the subject of voluntary cancellation according to a US EPA notice dated July 27, 1977. In a series of decisions, the first of which was issued on June 17, 1976, the EPA effectively canceled all registered products containing Kepone as of May 1, 1978.

Incompatibilities: Acids, acid fumes.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: Carcinogen, 0.001 mg/m³ TWA. Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A.

Protective Action Criteria (PAC)

TEEL-0: 0.001 mg/m³

PAC-1: 5 mg/m³

PAC-2: 35 mg/m³

PAC-3: 40 mg/m³

DFG MAK: Carcinogen Category 3B.

Austria: Suspected: carcinogen, 1999; France: carcinogen, 1993. Guidelines or standards for Kepone in ambient air have been set[60] ranging from 0 (South Carolina) to 0.03 μ/m³ (New York) to 0.88 μg/L (Pennsylvania).

Determination in Air: Collection by membrane filter and backup impinger containing NaOH solution, workup with benzene, analysis by gas chromatography with electron capture detector. Use NIOSH Analytical Method #5508.

Routes of Entry: Inhalation of dust, ingestion, skin absorption.

Harmful Effects and Symptoms

In July 1975, a private physician submitted a blood sample to the Center for Disease Control (CDC) to be analyzed for Kepone, a chlorinated hydrocarbon pesticide. The sample had been obtained from a Kepone production worker who suffered from weight loss, nystagmus, and tremors. CDC notified the state epidemiologist that high levels of Kepone were present in the blood sample, and he initiated an epidemiologic investigation which revealed other employees suffering with similar symptoms. It was evident to the state official after visiting the plant that the employees had been exposed to Kepone at extremely high concentrations through inhalation, ingestion, and skin absorption. He recommended that the plant be closed, and company management complied. Of the 113 current and former employees of this Kepone-manufacturing plant examined, more than half exhibited clinical symptoms of Kepone poisoning. Medical histories of tremors (called "kepone shakes" by employees), visual disturbances, loss of weight, nervousness, insomnia, pain in the chest and abdomen, and, in some cases, infertility and loss of libido were reported. The employees also complained of vertigo and lack of muscular coordination. The intervals between exposure and onset of the signs and symptoms varied between patients but appeared to be dose-related. NIOSH has received a report on a carcinogenesis bioassay of technical grade Kepone which was conducted by the National Cancer Institute using Osborne-Mendel rats and B6C3F1 mice, Kepone was administered in the diet at two tolerated dosages. In addition to the clinical signs of toxicity, which were seen in both species, a significant increase ($P<0.05$) of hepatocellular carcinoma in rats given large dosages of Kepone and in mice at both dosages was found. Rats and mice also had extensive hyperplasia of the liver. In view of these findings, NIOSH must assume that Kepone is a potential human carcinogen. LD_{50} = (oral-rat) 95 mg/kg (moderately toxic).

Short Term Exposure: May be poisonous if absorbed through the skin. Skin or eye contact may cause irritation and rash. Poisonous if swallowed. Exposure can cause headache, nervousness, tremor; liver, kidney damage; visual disturbance; ataxia, chest pain; skin erythema (skin redness).

Long Term Exposure: Has been shown to cause liver cancer in animals; potential human carcinogen. May cause testicular atrophy; low sperm count; damage to the developing fetus; reproductive damage; sterility, breast enlargement; skin changes; liver and kidney damage; brain and nervous system damage with hyperactivity; hyperexcitability; muscle spasms, tremors.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys, reproductive system. Cancer site in animal: liver cancer.

Medical Surveillance: Employers shall make medical surveillance available to all workers occupationally exposed to Kepone, including personnel periodically exposed during routine maintenance or emergency operations. Periodic examinations shall be made available at least on an annual basis.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Qualified medical personne may consider the administration of cholestyramine resin (QUESTRAN). Medical personnel should wear Neoprene™ gloves as protection against contamination (Dreisbach).

Personal Protective Methods: *Protective Clothing: a:* Coveralls or other full-body protective clothing shall be worn in areas where there is occupational exposure to Kepone. Protective clothing shall be changed at least daily at the end of the shift and more frequently if it should become grossly contaminated. *b:* Impervious gloves, aprons, and footwear shall be worn at operations where solutions of Kepone may contact the skin. Protective gloves shall be worn at operations where dry Kepone or materials containing Kepone are handled and may contact the skin. *c:* Eye protective devices shall be provided by the employer and used by the employees where contact of Kepone with eyes is likely. Selection, use, and maintenance of eye protective equipment shall be in accordance with the provisions of the American National Standard Practice for Occupational and Educational Eye and Face Protection, ANSI Z87.1-1968. Unless eye protection is afforded by a respirator hood or face-piece, protective goggles or a face shield shall be worn at operations where there is danger of contact of the eyes with dry or wet materials containing Kepone because of spills, splashes, or excessive dust or mists in the air. *d:* The employer shall ensure that all personal protective devices are inspected regularly and maintained in clean and satisfactory working condition. *e:* Work clothing may not be taken home by employees. The employer shall provide for maintenance and laundering of protective clothing. *f:* The employer shall ensure that precautions necessary to protect laundry personnel are taken while soiled protective clothing is being laundered. *g:* The employer shall ensure that Kepone is not discharged into municipal waste treatment systems or the community air.

Respiratory Protection from Kepone: Engineering controls shall be used wherever feasible to maintain airborne Kepone concentrations at or below that recommended. Compliance with the environmental exposure limit by the use of respirators is allowed only when airborne Kepone concentrations are in excess of the work-place environmental limit because required engineering controls are being installed or tested, when nonroutine maintenance or repair is being accomplished, or during emergencies. When a respirator is thus permitted, it shall be selected and used in accordance with NIOSH requirements.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Kepone you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in a cool, dry place in a refrigerator under inert atmosphere.[52] Keep away from acids and acid fumes.

Shipping: While not specifically cited, chlordecone may be classified under Organochlorine pesticides, solid, toxic n.o.s., which requires a “POISONOUS/TOXIC MATERIALS” label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Do not touch spilled material. Use water spray to reduce vapors. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. For larger spills, dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, halon, water spray, or standard foam. Poisonous gases are produced in fire, including toxic chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A process has been developed which effects chlordecone degradation by treatment of aqueous wastes with UV radiation in the presence of hydrogen in aqueous sodium hydroxide solution. Up to 95% decomposition was effected by this process. Chlordecone previously presented serious disposal problems because of its great resistance to bio- and photodegradation in the environment. It is highly toxic to normally occurnring degrading microorganisms. Although it can undergo some photodecomposition when exposed to sunlight to the dihydro compound (leaving a compound with 8 chloro substituents) that degradation product does not significantly reduce toxicity. Disposal by incineration with HCl scrubbing is recommended.[22]

EC Number: 207-432-0 [*Annex I Index No.:* 015-071-00-3]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chlorfenvinphos is a nonflammable, yellow or amber liquid with a mild odor. Molecular weight = 359.58; Boiling point = 110°C at 0.001 mmHg; 168−170°C at 0.5 mmHg; Freezing/Melting point = −23−19°C. Hazard Identification (based on NFPA 704 M Rating System): Health 4, Flammability 1, Reactivity 0. Very slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Human Data. Used as a soil insecticide for root maggots, rootworms, and cutworms. Those engaged in the production, formulation, and application of this insecticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. May be corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 10 mg/m^3

Poland: MAC (TWA) 0.01 mg/m^3, MAC (STEL) 0.1 mg/m^3.

However, it should be recognized that this chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method IV #5600, Organophosphorus pesticides.

Permissible Concentration in Water: 0.1 mg/L in drinking water is a recommended drinking water limit.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.79$.

Routes of Entry: Inhalation, passes through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Highly toxic (LD_{50} for rats is 10 mg/kg). Symptoms exhibited on chlorfenvinphos exposure are typical of cholinesterase poisoning. Nausea is often first symptom, with vomiting, abdominal cramps, diarrhea, and excessive salivation. Headache, giddiness, weakness, tightness in chest, blurring of vision, pinpoint pupils, loss of muscle coordination, and difficulty breathing. Convulsions and coma precede death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chlorfenvinphos can cause the heart to beat slower (bradycardia) or irregularly (arrhythmia).

Long Term Exposure: There is limited evidence that this chemical may damage the developing fetus. Symptoms resembling influenza with headache, nausea, and weakness have been reported. Cholinesterase inhibitor; cumulative effect is possible. Chlorfenvinphos may damage the nervous system with repeated exposure, resulting in impaired memory, depression, anxiety, or irritability, convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including

resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorfenvinphos you should be trained on its proper handling and storage. Should be protected from moisture and stored in glass-lined or polyethylene-lined containers. Keep away from strong bases. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1[19, 20] and Packing Group I.

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The state of New Jersey has assigned a flammability rating of "2" to chlorfenvinphos. This chemical may burn, but does not readily ignite. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride, phosphorous oxides, and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destruction by alkali hydrolysis or incineration.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Chlorinated diphenyl oxide C:0655

Molecular Formula: $C_{12}H_4Cl_6O$
Common Formula: $C_{12}H_{10-n}Cl_nO$ (general, for chlorinated diphenyl oxides)
Synonyms: Benzene, 1,1′-Oxybis, hexachloro derivatives; Chlorinated biphenyl oxide; *o*-Chlorinated diphenyl oxide; Ether, hexachlorophenyl; Hexachlorodiphenyl ether; Hexachlorodiphenyl oxide; Phenyl ether, hexachloro derivative; Trichloro diphenyl ether; Trichloro diphenyl oxide
hexachloro-isomer: see PCBs.
CAS Registry Number: 31242-93-0; 57321-63-8 (trichloro-); *(alt.)*
RTECS® Number: KO4200000 (trichloro-); KO0875000 (hexachloro-)
UN/NA & ERG Number: UN3077/171
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Chlorinated diphenyl oxide is a white or yellowish waxy solid or very viscous liquid. Molecular weight = 376.88; Boiling point = 230−260°C at 8 mmHg; 361.2 °C at 760 mmHg; Vapor pressure = 4.37^{-5} mmHg at 25°C; Flash point = 123°C.
Hexachloro Diphenyl Oxide: Autoignition temperature = 620°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 1, Reactivity 0.
Potential Exposure: These materials are used as dielectric fluids in the electrical industry; they may be used as organic intermediates to make other chemicals and in dry cleaning detergents.
Incompatibilities: Strong oxidizers or heat may cause fire and explosion. May be able to form unstable peroxides.
Permissible Exposure Limits in Air
OSHA PEL: 0.5 mg/m³ TWA.
NIOSH REL: 0.5 mg/m³ TWA.
ACGIH TLV®[1]: 0.5 mg/m³ TWA.
NIOSH IDLH: 5 mg/m³.
No TEEL available.
DFG MAK: [skin], *as chlorinated biphenyl oxide*.
Australia: TWA 0.5 mg/m³; STEL 2 mg/m³, 1993; Austria: MAK 0.5 mg/m³ [skin], 1999; Belgium: TWA 0.5 mg/m³; STEL 2 mg/m³, 1993; Finland: TWA 0.5 mg/m³; STEL 1.5 mg/m³ [skin], 1999; France: CME 0.5 mg/m³, 1999; the Netherlands: MAC-TGG 0.5 mg/m³, 2003; Norway: TWA 0.5 mg/m³, 1999; Switzerland: MAK-W0.5 mg/m³ [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg/m³.
Several states have set guidelines or standards for Chlorinated Diphenyl Oxide in ambient air[60] ranging from 5 μg/m³ to 20 μg/m³ (North Dakota) to 8 μg/m³ (Virginia) to 10 μg/m³ (Connecticut) to 12 μg/m³ (Nevada).
Determination in Air: Collect on filter, work up with isooctane, analyze by gas chromatography. Use NIOSH Analytical Method IV #5025.[18]
Permissible Concentration in Water: Because of the lack of data on both toxicologic effects and environmental contamination, the hazard posed by these compounds cannot be estimated according to the Environmental Protection Agency.[6]
Routes of Entry: Inhalation, ingestion, eye and skin contact.
Harmful Effects and Symptoms
Acne-form dermatitis and liver damage.
Short Term Exposure: Contact can cause skin irritation, rash, burning sensation, chloracne. LD_{50} (oral-rat) = > 500 mg/kg. Moderately toxic by ingestion, inhalation, and skin absorption.
Long Term Exposure: May cause acne-form dermatitis and liver damage. More than light alcohol consumption may increase the liver damage.
Points of Attack: Skin, liver.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Examination by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: OSHA: *5 mg/m³:* Sa (APF = 10) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode; SCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary

self-contained positive-pressure breathing apparatus). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOvAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor and acid gas canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with chlorinated diphenyl oxides you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid or liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Although chlorinated diphenyl oxide is listed as a "noncombustible solid or liquid" by the state of New Jersey; and in some of the literature; however, hexachloro diphenyl oxide has a NFPA Flammability rating of "1." Poisonous gases, including chlorine, are produced in fire. Use dry chemical or carbon dioxide extinguishers. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For trichlorophenyl ether, solution in a flammable solvent and incineration in a furnace with afterburner and scrubber is recommended.[22]

WGK (German Aquatic Hazard Class): 2—Water polluting (1-chloro-); 3—Highly water polluting (*polychlorinated naphthalenes*).

Description: The chlorinated naphthalenes in which one or more hydrogen atoms have been replaced by chlorine to form wax-like substances, beginning with monochloronaphthalene and going on to the octachlor derivatives. Their physical states vary from mobile liquids to waxy solids depending on the degree of chlorination; Freezing/Melting points of the pure compounds range from 17°C for 1-chloronaphthalene to 198°C for 1,2,3,4-tetrachloronaphthalene.

1-chloro-isomer: Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 1, Reactivity 0.

2-chloro-isomer: Molecular weight = 162.62; Boiling point = 256°C; Freezing/Melting point = 61°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

hexa-isomer: White to light-yellow solid with an aromatic odor. Molecular weight = 334.82; Boiling point = 343−388°C; Freezing/Melting point = 137°C. Insoluble in water.

octa-isomer: Waxy, pale yellow solid with an aromatic odor. Molecular weight = 403.74; Boiling point = 410−440°C; Freezing/Melting point = 185−192°C. Insoluble in water.

penta-isomer: Colorless to white crystalline solid with a benzene-like odor. Molecular weight = 300.40; Boiling point = 336°C; Freezing/Melting point = 120°C. Slightly soluble in water.

tetra-isomer: Colorless to pale yellow solid with an aromatic odor. Molecular weight = 265.96; Boiling point = 315−360°C; Freezing/Melting point = 182°C; Flash point = 210°C (oc). Insoluble in water.

tri-isomer: Colorless to pale yellow solid with an aromatic odor. Molecular weight = 231.51; Boiling point = 304−354°C; Freezing/Melting point = 93°C; Flash point: 198°C (oc). Insoluble in water.

Potential Exposure: Industrial exposure from individual chlorinated naphthalenes is rarely encountered; rather it usually occurs from mixtures of two or more Chlorinated naphthalenes. Due to their stability, thermoplasticity, and nonflammability, these compounds enjoy wide industrial application. These compounds are used in the production of electric condensers; in the insulation of electric cables and wires; as additives to extreme-pressure lubricants; as supports for storage batteries; and as a coating in foundry use. *octachloro-:* Used as a fireproof and waterproof additive and lubricant additive. *Pentachloro-:* Used in electric wire insulation and in additives to special lubricants. *tetrachloro-:* Used in electrical insulating materials and as an additive in cutting oils. *trichloro-:* Used in lubricants and in the manufacture of insulation for electrical wire.

Because of the possible potentiation of the toxicity of higher Chlorinated naphthalenes by ethanol and carbon tetrachloride, individuals who ingest enough alcohol to result in liver dysfunction would be a special group at risk. Individuals, for example, analytical and synthetic chemists, mechanics and cleaners, who are routinely exposed to carbon tetrachloride or other hepatotoxic chemicals would also be at a greater risk than a population without such exposure. Individuals involved in the manufacture, utilization, or disposal of polychlorinated naphthalenes would be expected to have higher levels of exposure than the general population.

Incompatibilities: All are incompatible with strong oxidizers. Keep away from heat. Penta- is also incompatible with acids, alkalis.

Permissible Exposure Limits in Air

1-chloro- 90-13-1

TEEL-0: 6 mg/m^3

Determination in Air: *Hexa-isomer:* Filter; Hexane; Gas chromatography/Electrochemical detection; NIOSH II(2) Method #S100.

Octa-isomer: Filter; Hexane; Gas chromatography/Flame ionization detection; NIOSH II(2) Method #S97.

Penta-isomer: Filter/Bubbler; Isooctane; Gas chromatography/Electrochemical detection; NIOSH II(2) Method #S96.

Tetra-isomer: Filter/Bubbler; none; Gas chromatography/ Flame ionization detection; NIOSH II(2) Method #S130 (II-1).

Tri-isomer: Filter/Bubbler; none; Gas chromatography/ Flame ionization detection; NIOSH II(2) Method #S128.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 1600 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 7.5 μg/L on an acute toxicity basis. For the protection of human health from the toxic properties of chlorinated naphthalenes ingested through water and through contaminated aquatic organisms, there are insufficient data to permit establishment of criteria.[6] Russia has set MAC limits in surface water of 0.01 mg/L for 1-Chloronaphthalene and for 2-Chloronaphthalene.

Determination in Water: 2-Chloronaphthalene may be determined by gas chromatography (EPA Method 612) or by gas chromatography plus mass spectrometry (EPA

Method 625). Octanol−water coefficient: Log K_{ow} = *Tetra-isomer:* about 6.1; *Tri-isomer*: 5.12−7.56; *Penta-isomer:* 8.73−9.13.

Routes of Entry: Inhalation of fumes and percutaneous absorption of liquid, ingestion, eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate eyes and skin. Cases of systemic poisoning are few in number and they may occur without the development of chloracne. It is believed that chloracne develops from skin contact and inhalation of fumes, while systemic effects result primarily from inhalation of fumes. Symptoms of poisoning may include headaches, fatigue, vertigo, and anorexia. Jaundice may occur from liver damage. Highly chlorinated naphthalenes seem to be more toxic than those chlorinated naphthalenes with a lower degree of substitution.

Long Term Exposure: May cause acne-like dermatitis. May affect the liver, resulting in jaundice. Can affect the nervous system. Chronic exposure to chlorinated naphthalenes can cause chloracne, which consists of simple erythematous eruptions with pustules, papules, and comedones. Cysts may develop due to plugging of the sebaceous gland orifices.

Points of Attack: Skin, liver, nervous system.

Medical Surveillance: Preplacement and periodic examinations should be concerned particularly with skin lesions, such as chloracne and with liver function. Liver function tests. Examination by a qualified allergist. Examination of the nervous system. More than light consumption of alcohol may increase liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection:

hexa-isomer: up to 2 mg/m^3: SA*: (any supplied-air respirator); or SCBAF: (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*May require eye protection.

octa-isomer: up to 1 mg/m^3: SA*: (any supplied-air respirator); or SCBAF: (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

penta-isomer: up to 5 mg/m^3: SA*: (any supplied-air respirator); or SCBAF: (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*May require eye protection.

tetra-isomer: up to 20 mg/m^3: SCBAF: (any self-contained breathing apparatus with a full face-piece); or SAF: (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH* *conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

tri-isomer: up to 50 mg/m^3: SCBAF: (any self-contained breathing apparatus with a full face-piece); or SAF: (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in a refrigerator or a cool, dry place.[52]

Shipping: The chlorinated naphthalenes are not specifically cited in the DOT Performance-Oriented Packaging Standards.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen material with toluene. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are noncombustible solids. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with flue gas scrubbing. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Chlorine is a greenish-yellow gas with a pungent, irritating odor. Shipped as a liquefied compressed gas. It is the commonest of the four halogens which are among the most chemically reactive of all the elements. It is not flammable; but it is a strong oxidizer, and contact with other materials may cause fire. The odor threshold is 0.01 ppm in air. Molecular weight = 70.91; Specific gravity = (H_2O:1) = 1.4 at 20°C, 6.86 atm (liquid); Boiling point = −34.6°C; Freezing/Melting point = − 101°C; Relative vapor density (air = 1) = 2.47; Vapor pressure = 6.8 atm; 5168 mmHg at 20°C. Slightly soluble in water; solubility = 0.7%. Hazard Identification (based on NFPA 704 M Rating System): Health 4, Flammability 0, Reactivity 0, Oxidizer.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Environmental danger. Chlorine is a toxic gas with corrosive properties. Gaseous chlorine is widely used as a bleaching agent in the paper, pulp, and textile industries for bleaching cellulose for artificial fibers. It is used in the manufacture of chlorinated lime; inorganic and organic compounds, such as metallic chlorides; chlorinated solvents; refrigerants, pesticides; and polymers, for example, synthetic rubber and plastics; it is used as a disinfectant, particularly for water and refuse; and in detinning and dezincing iron. CL has been used as a warfare choking/pulmonary agent.

Note: The lowest level at which humans can detect chlorine through smell and become alert to its irritant properties generally provides sufficient warning of exposure. However, chronic exposure to chlorine causes olfactory fatigue and tolerance to its irritant effects. Those with a history of prolonged exposure to chlorine may eventually lose their ability to identify incidents of exposure.

Incompatibilities: A powerful oxidizer. Reacts explosively or forms explosive compounds with many organic compounds and common substances, such as acetylene, ether, turpentine, ammonia, fuel gas, hydrogen, and finely divided metals. Keep away from combustible substances and reducing agents. Corrosive to some plastic, rubber, and coating materials. Reacts with water to form hypochlorous acid. Corrosive to many metals in presence of water.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.90 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/3 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.5 ppm/1.45 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 0.5 ppm/1.5 mg/m^3 TWA; 1 ppm/2.9 mg/m^3 STEL, not classifiable as a human carcinogen.

NIOSH IDLH: 10 ppm.

Arab Republic of Egypt: TWA 1 ppm (3 mg/m^3), 1993; Australia: TWA 1 ppm (3 mg/m^3), 1993; Austria: MAK 0.5 ppm (1.5 mg/m^3), 1999; Belgium: TWA 0.5 ppm (1.5 mg/m^3); STEL 1 ppm, 1993; Denmark: TWA 0.5 ppm (1.5 mg/m^3), 1999; Finland: TWA 0.5 ppm (1.5 mg/m^3); STEL 1 ppm (3 mg/m^3), 1999; France: VLE 1 ppm (3 mg/m^3), 1999; India: TWA 1 ppm (3 mg/m^3); STEL 3 ppm

(9 mg/m^3), 1993; Japan: 1 ppm (2.9 mg/m^3), 1999; the Netherlands: MAC 3 mg/m^3, 2003; Norway: TWA 0.5 ppm (1.5 mg/m^3), 1999; the Philippines: TWA 1 ppm (3 mg/m^3), 1993; Poland: MAC (TWA) 1.5 mg/m^3; STEL 9 mg/m^3, 1999; Russia: TWA 1 ppm; STEL 1 mg/m^3, 1993; Sweden: NGV 0.5 ppm (1.5 mg/m^3), TGV 1 ppm (3 mg/m^3), 1999; Switzerland: MAK-W 0.5 ppm (1.5 mg/m^3), KZG-W 1 ppm (3 mg/m^3), 1999; Thailand: TWA 1 ppm (3 mg/m^3), 1993; Turkey: TWA 1 ppm (3 mg/m^3), 1993; United Kingdom: TWA 0.5 ppm (1.5 mg/m^3); STEL 1 ppm (2.9 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1 ppm. Russia set a MAC in work-place air of 1.0 mg/m^3 and values for ambient air in residential areas of 0.1 mg/m^3 on a momentary basis and 0.03 mg/m^3 on an average daily basis. Several states have set guidelines or standards for chlorine in ambient air[60] ranging from 0 (North Carolina) to 7.143 μg/m^3 (Kansas) to 10.0 μg/m^3 (New York) to 30.0 μ/m^3 (Florida) to 30−90 μg/m^3 (North Dakota) to 39 μ/m^3 (Massachusetts) to 50 μg/m^3 (Virginia) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada) to 75 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #6011, OSHA Analytical Method ID-101, ID-126SGX.

Permissible Concentration in Water: EPA has suggested the following limits: Total residual chlorine: 2.0 μg/L for salmonid fish; 10.0 μg/L for other freshwater and marine organisms. Russia[43] recommends an absence of active chlorine (taking into account the absorbing capacity of water) in domestic water supplies and a MAC of zero in water for fishery purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.85$.

Routes of Entry: Inhalation, eye, and skin contact.

Harmful Effects and Symptoms

Chlorine reacts with body moisture to form acids. It is itself extremely irritating to skin, eyes, and mucous membranes; and it may cause corrosion of teeth. Prolonged exposure to low concentrations may produce chloracne.

Chlorine in high concentrations acts as an asphyxiant by causing cramps in the muscles of the larynx (choking), swelling of the mucous membranes, nausea, vomiting, anxiety, and syncope. Acute respiratory distress including cough, hemoptysis, chest pain, dyspnea, and cyanosis develop, and later tracheobronchitis, pulmonary edema, and pneumonia may supervene. Exposure to 1.0 ppm may produce irritation of the nose, mouth, and throat; at 1.3 ppm and above, irritation may be more pronounced with coughing and labored breathing; high concentrations may cause throat muscle spasm leading to suffocation and death; delayed effects may include accumulation of fluid in the lungs, bronchitis, and pneumonia. Death may occur after a few breaths at 1000 ppm.

Short Term Exposure: A lacrimator. Chlorine is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause permanent damage. Inhalation of the gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Rapid evaporation of the liquid may cause frostbite.

Long Term Exposure: Repeated exposure may permanently damage the lungs, or cause chronic bronchitis. Chlorine may affect the teeth, resulting in erosion, and cause skin rash. A single high exposure may cause similar health effects.

Points of Attack: Lungs, respiratory system.

Medical Surveillance: Special emphasis should be given to the skin, eyes, teeth, and cardiovascular status in placement and periodic examinations. Chest X-rays should be taken and pulmonary function followed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Whenever there is likelihood of excessive gas levels, workers should use respiratory protection in the form of full-face gas masks with proper canisters or supplied-air respirators. The skin effects of chlorine can generally be controlled by good personal hygiene practices. Where very high gas concentrations or liquid chlorine may be present, full protective clothing, gloves, and eye protection should be used. Saranex™, Butyl rubber/Neoprene™, Viton™, Neoprene™, butyl rubber, and Viton™/Neoprene™ are among the recommended protective materials. Changing work clothes daily and showering following each shift where exposures exist are recommended.

Respirator Selection: *5 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) (any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern); or CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorine you should be trained on its proper handling and storage. Protect containers against physical damage. Store cylinders and containers in a cool, dry, relatively isolated area, protected from weather and extreme temperature changes.

Shipping: This chemical requires a shipping label of "POISON GAS, CORROSIVE." The Hazard Class is 2.3 and there is no Packing Group.[19,20] Subsidiary Hazardous Class or Division 8. Chlorine is a DOT regulated marine pollutant.

Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. If the gas is leaked, stop the flow of gas if it can be done safely. If the source of the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair the leak or allow the cylinder to empty. If the leak can be stopped in place, bubble chlorine through a sodium sulfide and excess sodium bicarbonate solution including a trap in the line. For liquid spills, ventilate area and wash down spill with water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

CL, when used as a weapon—not listed in current DOT manual

UN1017 Chlorine

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.0/1.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2000/600
Then: Protect persons downwind (miles/kilometers)
Day 2.2/3.6
Night 5.0/8.0

Fire Extinguishing: Chlorine is a noncombustible solid, but it will increase the intensity of a fire and cause fire upon contact with combustible materials. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Vapors are heavier than air and will collect in low areas. Hydrogen and chlorine mixtures (5−95%) are exploded by almost any form of energy (heat, sunlight, sparks, etc.). May combine with water or steam to produce toxic and corrosive fumes of hydrochloric acid. Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only

respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Introduce into large volume and solution of reducing agent (bisulfite, ferrous salts, or hypo), neutralize and flush to sewer with water. Recovery is an option to disposal for chlorine in the case of gases from aluminum chloride electrolysis and chlorine in waste waters. See also "Spill Handling." Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 1000 (≥1.00% concentration).

Carcinogenicity: EPA: Cannot be Determined; Not Classifiable as to human carcinogenicity.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 1000 lb (454 kg).

Safe Drinking Water Act: Priority List (55 FR 1470).

In 1998 EPA set an MCL for TTHM (total trihalomethane) at MCLs to 0.80 mg/L (down from 0.100 mg/L set in 1976), Maximum Residual Disinfectant level Goals (MRDG) for chlorine dioxide was set at 0.8 mg/L.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; C (Oxidizing Material); D1B (Toxic); E (Corrosive Material); F (Dangerously Reactive); National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: O, T+, N; Risk phrases: R6; R8; R26; R34; R50; Safety phrases: S1/2; S23; S26; S28; S36/37/39; S38; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlorine dioxide is a flammable, reddish-yellow gas or reddish-brown liquid (below 11°C/52°F) with an irritating odor like chlorine or nitric acid. Molecular weight = 67.46; Specific gravity (H_2O:1) = 1.6 (liquid at 0°C); Boiling point = 11°C; Freezing/Melting point = −59°C; Relative vapor density (air = 1) = 2.3; Vapor pressure = >1 atm at 20°C. Explosive Limits in air: >10%. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 3, Reactivity 3 (Shock; Oxidizer). Soluble in water (reactive); solubility = 0.3% at 25°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Primary Irritant. Chlorine dioxide is used in bleaching cellulose pulp; bleaching flour; water purification; as a liquid sterilizer in an ultrasonic cleaner.

Incompatibilities: Unstable in light. A powerful oxidizer. Chlorine dioxide gas is explosive at concentrations over 10% and can be ignited by almost any form of energy, including sunlight, heat (explosions can occur in air in temperature above 130°C), or sparks, shock, friction, or concussion. This chemical reacts violently with dust, combustible materials, and reducing agents. Reacts violently with mercury, phosphorus, sulfur, and many compounds, causing fire and explosion hazard. Contact with water forms perchloric and hydrochloric acid. Corrosive to metals.

Permissible Exposure Limits in Air
OSHA PEL: 0.1 ppm/0.3 mg/m^3 TWA.
NIOSH REL: 0.1 ppm/0.3 mg/m^3 TWA; 0.3 ppm/0.9 mg/m^3 STEL.
ACGIH TLV®[1]: 0.1 ppm/0.28 mg/m^3 TWA; 0.3 ppm/0.83 mg/m^3 STEL.
NIOSH IDLH: 5 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 0.1 ppm
PAC-1: **0.15** ppm
PAC-2: **1.1** ppm
PAC-3: **2.4** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.
Emergency Response Planning Guidelines (AIHA).
ERPG-1: Not appropriate.
ERPG-2: 50 ppm.
ERPG-3: 5000 ppm.
DFG MAK: 0.1 ppm/0.28 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.
Australia: TWA 0.1 ppm (0.3 mg/m^3); STEL 0.3 ppm, 1993; Austria: MAK 0.1 ppm (0.3 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.28 mg/m^3); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (0.3 mg/m^3), 1999; Finland: TWA 0.1 ppm (0.3 mg/m^3); STEL 0.3 ppm (0.9 mg/m^3), 1999; France: VME 0.1 ppm (0.3 mg/m^3), VLE 0.3 ppm (0.8 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.3 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.3 mg/m^3), 1993; Poland: MAC (TWA) 0.3 mg/m^3, MAC (STEL) 0.9 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, 1993; Sweden: NGV 0.1 ppm (0.3 mg/m^3), KTV 0.3 ppm (0.8 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.3 mg/m^3), KZG-W 0.2 ppm (0.6 mg/m^3), 1999; Thailand: TWA 0.1 ppm (0.3 mg/m^3), 1993; Turkey: TWA 0.1 ppm (0.3 mg/m^3), 1993; United Kingdom: TWA 0.1 ppm (0.28 mg/m^3); STEL 0.3 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.3 ppm. Several states have set guidelines or standards for ClO_2 in ambient air[60] ranging from 1.0 μg/m^3 (New York) to 3.0 μg/m^3 (Florida) to 3.0–9.0 μg/m^3 (North Dakota) to 5.0 μg/m^3 (Virginia) to 6.0 μg/m^3 (Connecticut) to 7.0 μg/m^3 (Nevada).

Determination in Air: Collection by bubbler; Potassium iodide; Ion chromatography; OSHA Analytical Method #ID202.

Permissible Concentration in Water: Values in guidelines or standards for chlorine in drinking water[61] have been set by Maine at 110 μg/L and by the US EPA at 1000 μg/L.

Routes of Entry: Inhalation, ingestion, eye, and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator. Chlorine dioxide is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation at levels above 0.25 ppm may cause slight irritation to the nose, throat, and mouth. Levels above 5 ppm may cause severe irritation to the nose, throat, and mouth. 19 ppm for an unspecified time has caused death.

Long Term Exposure: Chlorine dioxide may affect the lungs, causing chronic bronchitis to develop with cough, phlegm, and/or shortness of breath. This chemical may affect the teeth, causing erosion. There is limited evidence that Chlorine dioxide may damage the developing fetus.

Points of Attack: Respiratory system, lungs, eyes.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquid, wear splash-proof chemical goggles and face shield when there is a potential for exposure to gas, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 ppm:* CcrS (APF = 10) (any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern); or Sa (APF = 10) (any supplied-air respirator). *2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection. Only nonoxidizable sorbents allowed (not charcoal).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with chlorine dioxide you should be trained on its proper handling and storage. This chemical is a powerful oxidizer, and is shock-, light- and heat-sensitive. It is violently explosive in air at concentrations over 10%. Keep frozen when not in use. Store in tightly closed containers in a cool, dark, well-ventilated area at temperatures well below 130°C. Gas explosions may occur above 130°C. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use explosion-proof electrical equipment and fittings in storage area. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: The frozen hydrate can be shipped but must be labeled "OXIDIZER, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak or spill. If the gas is leaked, stop the flow of gas if it can be done safely. If the source of the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air and repair the leak or allow the cylinder to empty. If the leak can be stopped in place, bubble chlorine dioxide through a solution made up of reducing agent sodium bisulfide and sodium bicarbonate with a trap in the line. For liquid spills, allow chlorine dioxide to evaporate with all available ventilation. Keep chlorine dioxide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-hour response line).

Small spills (from a small package or a small leak from a large package)

Chlorine dioxide, hydrate, frozen

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Fire Extinguishing: A powerful oxidizer, this chemical will increase the intensity of a fire, and can cause fire upon contact with combustibles. This chemical is an explosive at concentrations over 10% and can be ignited by almost any form of energy. Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Poisonous gases, including chlorine, are produced in fire. Use water only. *Do not* use dry chemical or carbon dioxide extinguishers. Use water with caution as chlorine dioxide reacts with water, forming hydrogen chloride gas. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use large volume of concentrated solution of ferrous salt or bisulfite solution as reducing agent. Then neutralize and flush to sewer with abundant water.[24]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlorine trifluoride is a greenish yellow, almost colorless, liquid (below 12°C/53°F) or colorless gas with a sweet, irritating odor. Shipped as a liquefied compressed gas. Molecular weight = 92.45; Boiling point = 11.8°C; Freezing/Melting point = − 76.3°C; Vapor pressure = 1.4 atm; Relative vapor density (air = 1) = 3.21. Hazard Identification (based on NFPA 704 M Rating System): Health 4, Flammability 0, Reactivity 3 (Oxidizer). Reacts with water.

Potential Exposure: Chlorine trifluoride is used as a fluorinating agent. It may be used as an igniter and propellant in rockets. It is used in nuclear fuel processing.

Incompatibilities: A powerful oxidizer. Most combustible materials ignite spontaneously on contact with chlorine trifluoride. Explodes on contact with organic materials. The liquid can explode if mixed with halocarbons or hydrocarbons. It reacts violently with oxidizable materials, finely divided metals and metal oxides, sand, glass, asbestos, silicon-containing compounds. Emits highly toxic fumes on contact with acids. Chlorine trifluoride decomposes above 220°C, forming poisonous gases, including hydrogen chloride and hydrogen fluoride. Reacts violently with water, forming chlorine gas and hydrofluoric acid. Reacts with most forms of plastics, rubber, coatings, and resins; except the highly fluorinated polymers, such as Teflon™ and "Kel-F."

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.78 mg/m^3.

OSHA PEL: 0.1ppm/0.4 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.1ppm/0.4 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.1 ppm/ 0.38 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 0.04 ppm

PAC-1: **0.12** ppm

PAC-2: **2.0** ppm

PAC-3: **21** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1:0.1 ppm

ERPG-2: 1 ppm

ERPG-3: 10 ppm

DFG MAK: No numerical value established. Data may be available. (2005)3.

NIOSH IDLH: 20 ppm.

Some states have set guidelines or standards for ClF_3 in ambient[60] air, ranging from 3.0 μg/m^3 (Virginia) to 4.0 μ/m^3 (North Dakota) to 10.0 μg/m^3 (Nevada).

Determination in Air: No test available.

Routes of Entry: Inhalation, ingestion, eye, and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Chlorine trifluoride is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact with the liquefied gas can cause frostbite.

Long Term Exposure: Can cause lung irritation; bronchitis may develop with cough, phlegm, and shortness of breath.

Points of Attack: Skin, eyes, respiratory tract.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles if working with the liquid and face shield when working with gas, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2.5 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *20 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color Code—Yellow Stripe: Reactivity Hazard; Store separately in a area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with chlorine trifluoride you should be trained on its proper handling and storage. Chlorine trifluoride must be stored to avoid contact with water, sand, glass, silicon-containing compounds, asbestos, and combustible materials, since violent reactions occur. See Incompatibilities. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Chlorine trifluoride must be labeled: "POISON GAS, OXIDIZER, CORROSIVE." It falls in Hazard Class 2.3 and there is no Packing Group.[19] It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. If in a building, shut down HVAC systems. Remove all ignition sources. Collect solid chlorine trifluoride in the most convenient and safe manner and deposit in sealed containers. If the gas has leaked, stop the flow of gas if it can be done safely. Ventilate area of leak or spill. If the source of the leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air and repair the leak or allow the cylinder to empty. Keep chlorine trifluoride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)

Day 0.3/0.5
Night 1.1/1.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 1.7/2.8
Night 4.5/7.2

Fire Extinguishing: This chemical does not burn but it will increase the activity of fire and will cause combustibles to ignite. *Do not use water* or foam. Use dry chemical, carbon dioxide. Poisonous gases are produced in fire, including hydrogen fluoride and hydrogen chloride. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 500 lb (227 kg).
Not registered as a pesticide in the US.
Reportable Quantity (RQ): 1 lb (0.454 kg).
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.
European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S27; S28; S36/37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlormephos is an organophosphate, colorless liquid. Molecular weight = 234.70; Boiling point = 81−85°C at 0.1 mmHg. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water; solubility = 60 mg/L at 20°C.

Potential Exposure: This material is a soil insecticide. Not registered as a pesticide in the US.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas. Contact with alkaline materials causes rapid hydrolysis. May corrode metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.25 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 7 mg/m^3
PAC-3: 35 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method IV #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin contact, passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is poisonous; it may be fatal if inhaled, swallowed, or absorbed through the skin. The acute oral LD_{50} for rats is 7 mg/kg (highly toxic). Symptoms exhibited on chlormephos exposure are typical of cholinesterase poisoning. Nausea is often first symptom, with vomiting, abdominal cramps, diarrhea, and excessive salivation, headache, giddiness, weakness, tightness in chest, blurring of vision, pinpoint pupils, loss of muscle coordination, and difficulty breathing. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. Convulsions and coma precede death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chlormephos can cause the heart to beat slower (bradycardia) or irregularly (arrhythmia).

Long Term Exposure: There is limited evidence that this chemical may damage the developing fetus. Can affect the nervous system and cause impaired memory, depression, anxiety, or irritability. Symptoms resembling influenza with headache, nausea, and weakness have been reported.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Chlormephos you should be trained on its proper handling and storage. Should be protected from moisture and stored in glass-lined or polyethylene-lined containers. Keep away from strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS" for organophosphorus pesticides, liquid, toxic. It falls in Hazard Class 6.1.[19,20]

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride, phosphorous oxides, and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Chlormequat chloride is a white to yellowish crystalline solid with a fish-like odor. Molecular weight = 158.1; Freezing/Melting point = 245°C (decomposes); Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 0, Reactivity 0. Highly soluble in water. Carrier solvents used in commercial products may alter physical and toxicological properties.

Potential Exposure: People engaged in the manufacture, formulation, and application of this plant growth regulator said to be effective for cereal grains, tomatoes, and peppers.

Incompatibilities: Chlormequat chloride decomposes on heating or in fire, forming nitrogen oxides, carbon monoxide, and hydrogen chloride fumes. This chemical decomposes on heating with strong aqueous alkali solutions forming trimethylamine and other gaseous products. Contact with strong oxidizers may cause fire and explosions. Attacks many metals in presence of water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7 mg/m^3

PAC-3: 7.5 mg/m^3

Permissible Concentration in Water: Russia set a MAC of 0.2 mg/L in surface water.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The LD_{low} oral (human) is 10 mg/kg. It is an irritant and can be absorbed through the skin. Irritates the eyes and the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause nausea and vomiting. Higher levels can cause slow or irregular heartbeat; tremors, seizures, and coma. This can be fatal. Chlormequat chloride may affect the nervous system.

Long Term Exposure: May cause liver damage.

Points of Attack: Lungs, liver, nervous system.

Medical Surveillance: Liver function tests. Consider chest X-ray following acute overexposure. EKG examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Permeation data indicate that Neoprene™ gloves may provide protection from exposure to this compound. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlormequat chloride you should be trained on its proper handling and storage. Keep away from strong oxidizers. Store in a cool, dry place and protect from heat and moisture. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The label required for Poisonous Solids, n.o.s., is "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, or water extinguishers. Poisonous gases are produced in fire, including carbon monoxide, nitrogen oxide, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a unit with effluent gas scrubbing.[22]

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1998.

Banned or Severely Restricted (Israel) (UN).[13]

US EPA Hazardous Waste Number (RCRA No.): U026.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

California Proposition 65 Chemical: Cancer 2/27/87.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlornaphazine is composed of clear, colorless plates or may be a brown solid. Molecular weight = 268.2; Freezing/Melting point = 54−56°C. Slightly soluble in water; solubility = < 1 mg/mL at 22°C.

Potential Exposure: May be combustible and possibly explosive. Not produced or used commercially in the United States, Chlornaphazine has been used in other countries in the treatment of leukemia and related cancers. Currently, this drug does not have wide therapeutic usage.

Incompatibilities: Keep away from oxidizers, nucleophiles,[NTP] and nitromethanes. Amines may react violently with nitric acid, cellulose nitrate (of high surface area), 1-chloro-2,3-epoxypropane (exothermic reaction may occur). Incompatible with acids, acid halides, alcohols, aldehydes, alkylene oxides, anhydrides, cresols, caprolactam solution, epichlorohydrin, epoxides, isocyanates, glycols, peroxides, phenols. Contact with strong reducing agents may generate flammable hydrogen gas. May attack copper and copper alloys.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: Use NIOSH Analytical Method #5518, Naphthylamines; OSHA Analytical method 93.

Medical Surveillance: OSHA mandates the following tests or information for 1- and 2-naphthylamine which are related to this chemical: *Increased Risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking. NIOSH lists the following tests: *Increased Risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking, cystoscopy, urinalysis (routine).

First Aid: *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pesticides, solid, toxic, n.o.s., required label is "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% ethanol to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent paper dampened with 60−70% ethanol to pick up remaining material. Wash surfaces well with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chloroacetaldehyde C:0730

Molecular Formula: C_2H_3ClO

Common Formula: $ClCH_2CHO$

Synonyms: Acetaldehyde, chloro-; 2-Chloroacetaldehyde; Chloroacetaldehyde monomer; 2-Chloro-1-ethanal; 2-Chloroethanal; Cloroacetaldehido (Spanish); Monochloroacetaldehyde

CAS Registry Number: 107-20-0

RTECS® Number: AB2450000

UN/NA & ERG Number: UN2232/153

EC Number: 203-472-8 [*Annex I Index No.:* 605-025-00-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): P023.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24/25; R26; R34; R40; R50; Safety phrases: S1/2; S26; S28; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloroacetaldehyde is a combustible, colorless liquid with a very sharp, irritating odor. Molecular weight = 78.50; Specific gravity (H_2O:1) = 1.19 (40% solution); Boiling point = 85−100°C; Freezing/Melting point = 16°C (40% solution); Vapor pressure = 100 mmHg at 20°C; Flash point = 87.7°C (40%

solutions). Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 0 (able to polymerize on standing). Soluble in water.

Potential Exposure: Compound Description: Mutagen. Chloroacetaldehyde is used as a fungicide; as an intermediate in 2-aminothiazole manufacture; and in bark removal from tree trunks.

Incompatibilities: Heat and water sensitive; concentrations of >50% form insoluble hemihydrate material on contact with water. Reacts with oxidizers, acids. On heating, chloroacetaldehyde releases chlorine fumes. Polymerizable upon standing.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.21 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/3 mg/m^3 Ceiling Concentration.

NIOSH REL: 1 ppm/3 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 1 ppm/3.2 mg/m^3 Ceiling Concentration.

NIOSH IDLH: 45 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.4 ppm

PAC-1: **1.3** ppm

PAC-2: **2.2** ppm

PAC-3: **9.9** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 3B.

Arab Republic of Egypt: TWA 1 ppm (3 mg/m^3), 1993; Australia: TWA 1 ppm (3 mg/m^3), 1993; Austria: MAK 1 ppm (3 mg/m^3), 1999; Belgium: STEL 1 ppm (3.2 mg/m^3), 1993; Denmark: TWA 1 ppm (3 mg/m^3), 1999; Finland: STEL 1 ppm (3 mg/m^3), 1993; France: VLE 1 ppm (3 mg/m^3), 1999; the Netherlands: MAC 3 mg/m^3, 2003; Norway: TWA 1 ppm (3 mg/m^3), 1999; the Philippines: TWA 1 ppm (3 mg/m^3), 1993; Switzerland: MAK-W 1 ppm (3 mg/m^3), KZG-W 2 ppm (6 mg/m^3), 1999; Thailand: TWA 1 ppm (3 mg/m^3), 1993; Turkey: TWA 1 ppm (3 mg/m^3), 1993; United Kingdom: STEL 1 ppm (3.3 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 1 ppm (Ceiling Concentration). Several states have set guidelines or standards for chloroacetaldehyde in ambient air[60] ranging from 1.0 μ/m^3 (New York) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (North Dakota) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada).

Determination in Air: See NIOSH Analytical Method (IV) #2015 and OSHA Analytical Method 76.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.29$.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Irritation of skin, eyes, and mucous membrane, skin burns, eye damage, pulmonary edema, sensitization of skin, and respiratory system. Does have a mutagenic effect. LD_{50} = (oral-mouse) 21 mg/kg.

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause burns and permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: This chemical may cause mutations. It can cause skin allergy and an asthma-like lung allergy.

Points of Attack: Eyes, skin, respiratory system, lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests; Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact with liquids of >0.1% content or repeated or prolonged contact with liquids of <0.1% content. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)]; or Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)]. *45 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or GmFOv(any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister); or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Polymerizable upon standing. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloroacetaldehyde you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is I.[19,20]

Spill Handling: Avoid inhalation of vapors. Do not touch spilled material, stop leak, use water spray to reduce vapors. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.9/1.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.

Chloroacetic acid C:0740

Molecular Formula: $C_2H_3ClO_2$
Common Formula: $ClCH_2COOH$
Synonyms: Acetic acid, chloro-; Acide chloracetique (French); Acide monochloracetique (French); Acido cloroacetico (Spanish); Chloracetic acid; Chloroethanoic acid; MCA; Monochloracetic acid; Monochloressigsaeure (German); Monochloroacetic acid; Monochloroethanoic acid; NCI-C60231
CAS Registry Number: 79-11-8
RTECS® Number: AF8575000
UN/NA & ERG Number: UN1750 (liquid)/153; UN1751 (solid)/153
EC Number: 201-178-4 [*Annex I Index No.*: 607-003-00-1]
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R34; R50; Safety phrases: S1/2; S26; S36/37/39; S45; S61; S63 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Chloroacetic acid is a colorless to white crystalline solid. It has a strong vinegar-like odor and an odor threshold of 0.15 mg/m^3. Molecular weight = 94.50; Boiling point = 188°C; Freezing/Melting point = 63°C; Flash point = 126°C; Autoignition temperature $\geq$500°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. Monochloroacetic acid is used primarily as a chemical intermediate in the synthesis of sodium carboxymethyl cellulose; and such other diverse substances as ethyl chloroacetate, glycine, synthetic caffeine, sarcosine, thioglycolic acid, and various dyes. Hence, workers in these areas are affected. It is also used as an herbicide. Therefore, formulators and applicators of such herbicides are affected.
Incompatibilities: The solution in water is a strong acid. Contact with strong oxidizers, strong bases, and strong reducing agents can cause violent reactions. Chloroacetic acid decomposes on heating, producing toxic and corrosive hydrogen chloride, phosgene gases. Attacks metals in the presence of moisture.
Permissible Exposure Limits in Air
ACGIH TLV®[1]: 0.05 ppm/2 mg/m^3 inhalable fraction and vapor.
AIHA WEEL: 0.5 ppm TWA [skin].
Protective Action Criteria (PAC)*
TEEL-0: 0.5 ppm
PAC-1: 1.5 ppm
PAC-2: **6.6** ppm
PAC-3: 20 ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.
Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 4 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden; TWA 1 ppm (4 mg/m^3); STEL 2 ppm (8 mg/m^3) [skin], 1999; United Kingdom: TWA 0.3 ppm (1.2 mg/m^3) [skin], 2000; the Netherlands: MAC-TGG 4 mg/m^3 [skin], 2003. This chemical can be absorbed through the skin, thereby increasing exposure.
Routes of Entry: Inhalation, ingestion, and skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.
Harmful Effects and Symptoms
Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe irritation and burns. Inhaling this chemical can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Chloroacetic acid can cause a feeling of anxiety, restlessness, blurred vision, a feeling of "pins and needles" in the limbs, muscle twitching, and/or hallucinations; may affect the cardiovascular system, central nervous system, and kidneys, resulting in heart problems, convulsions, and kidney damage. These effects may be delayed. Symptoms of exposure include irritation and pain in skin. If chloroacetic acid is inhaled the patient may exhibit difficulty in breathing. Vomiting may occur if the material is ingested. It can burn the skin, cornea, and respiratory tract. This material is very toxic. The probable lethal oral dose is 50−500 mg/kg of body weight, between one teaspoon and one ounce, for a 150-lb person. Chloroacetic acid is irritating to the skin, cornea, and respiratory tract and causes burns. It may severely damage skin and mucous membranes. Ingestion may interfere with essential enzyme systems and cause perforation and peritonitis. Burns to skin result in marked fluid and electrolyte loss. Death may follow if more than 3% of the skin is exposed to this material. Other health hazards include central nervous system depression and respiratory system depression.
Long Term Exposure: Repeated exposure may cause kidney damage and affect the lungs.
Points of Attack: Lungs, kidneys, central nervous system.
Medical Surveillance: Lung function tests, kidney function tests. Examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Saranex™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. If you are working with dry material wear dust-proof chemical goggles and face shield if you are working with the liquid, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/ MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with chloroacetic acid you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metal, combustibles, strong oxidizers, strong bases, and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The DOT label required for *solid* chloroacetic acid is "POISONOUS/TOXIC MATERIALS, CORROSIVE." The Hazard Class is 6.1 and the Packing Group is II. For chloroacetic acid, *solution*, the label is "POISONOUS/TOXIC MATERIALS, CORROSIVE." The Hazard Class is 6.1 and the Packing Group is II.[19,20]

Spill Handling: Stay upwind; keep out of low areas. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Neutralize spilled materials with crushed limestone, soda ash, or lime. Waste water containing chloroacetic acid can be treated with ammonia, ammonium salts, or amines followed by separation of suspended solids. Collect spilled powdered material in the most convenient and safe manner and deposit in sealed containers. Dike *large spills* far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is extremely hazardous to health, but firefighters may enter areas with extreme care. Full protective clothing including a self-contained breathing apparatus, coat, pants, gloves, boots and bands around legs, arms, and waist should be provided. No skin surface should be exposed. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. This chemical may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chlorine and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); equivocal evidence: rat; no evidence: mouse.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Chloroacetophenone (CN) is a combustible, colorless-to-gray solid. CN has a sharp, irritating odor, has been described as smelling like "apple blossoms." It may be dissolved in a solvent. Odor threshold = 0.015 ppm. Molecular weight = 154.60; Boiling point = 247°C; Specific gravity = 1.32; Freezing/Melting point = 56.5°C; Vapor pressure = 0.0054 mmHg at 20°C; Flash point = 117.7°C (cc). Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Chloroacetophenone is used as a chemical warfare agent (Agent CN) and as a principal ingredient in the riot control agent Mace®. It is also used as a pharmaceutical intermediate. The United States considers agent CN and its mixtures with various chemicals to be obsolete for military deployment.

Incompatibilities: CN reacts with water, forming hydrochloric acid. Keep away from water, steam, strong oxidizers. CN reacts slowly with metals, causing mild corrosion and may evolve flammable hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: 0.05 ppm/0.3 mg/m^3 TWA.

NIOSH REL: 0.05 ppm/0.3 mg/m^3 TWA.

ACGIH TLV®[1]: 0.05 ppm/0.32 mg/m^3 TWA, not classifiable as a human carcinogen.

NIOSH IDLH; 15 mg/m^3.

No TEEL available.

Australia: TWA 0.05 ppm (0.3 mg/m^3), 1993; Austria: MAK 0.05 ppm (0.3 mg/m^3), 1999; Belgium: TWA 0.05 ppm (0.32 mg/m^3), 1993; Denmark: TWA 0.05 ppm (0.3 mg/m^3), 1999; Finland: STEL 0.05 ppm (0.3 mg/m^3) [skin] 1993; France: VME 0.05 ppm (0.4 mg/m^3), 1999; the Netherlands: MAC-TGG 0.3 mg/m^3, 2003; Norway: TWA 0.05 ppm (0.3 mg/m^3), 1999; Switzerland: MAK-W 0.05 ppm (0.3 mg/m^3), 1999; United Kingdom: TWA 0.05 ppm (0.32 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards[60] for chloroacetophenone in ambient air ranging from 1.0 μg/m^3 (New York) to 3.0 μg/m^3 (Florida and North Dakota) to 6.0 μg/m^3 (Connecticut) to 7.0 μg/m^3 (Nevada) to 7.5 μg/m^3 (South Carolina).

Determination in Air: Tenax Gas chromatography[2]; Thermal desorption; Gas chromatography/Flame ionization detection; NIOSH II(5) P&CAM Method #291.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.93$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator (a "tear gas"). This chemical can be absorbed through the skin, thereby increasing exposure. This chemical irritates the eyes, skin, and respiratory tract. Eye contact can cause severe irritation, burns, and permanent damage. Breathing the vapor can cause lung irritation, coughing, and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and skin allergy with itching and rash.

Points of Attack: Eyes, skin, respiratory system, lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Examination by a qualified allergist. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Decontamination: Decontaminate as soon as possible. This is extremely important. If you do not have the equipment and training, do not enter the hot zone to rescue and/or decontaminate victims. If the victim cannot move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash—strip—wash—evacuate upwind and uphill: The approach is to immediately wash with water; then have the victim (not the first responder) remove all the victim's clothing; then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 min. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear indirect-vent, impact, and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *3 mg/m³:* Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100. *7.5 mg/m³*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *15 mg/m³:* Any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter); or any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area away from oxidizers, heat, water, and steam. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloroacetophenone requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with toluene to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

CN, when used as a weapon

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day	0.2/0.3
Night	0.9/1.5

Fire Extinguishing: This chemical is a combustible solid but does not readily ignite. In case of fire, *do not put out the fire*. CN vapor is so bad that the fire is safer than the unburned CN. If there is some reason that you have to put out the fire—for example, there are things you cannot let burn nearby—use water or ordinary foam. It is always best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning liquid around. In the unlikely situation where there is a pile of CN canisters adjacent to a fire, cool the canisters with large amounts of water, but first evacuate the area—if the canisters rupture from heating, toxic gases could kill. CN can give off toxic hydrogen chloride in a fire or when heated. Poisonous gases are produced in fire, including carbon monoxide and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Tear gas-containing waste is dissolved in an organic solvent and sprayed into an incinerator equipped with an afterburner and alkaline scrubber utilizing reaction with sodium sulfide in an alcohol—water solution. Hydrogen sulfide is liberated and collected by an alkaline scrubber.

Chloroacetyl chloride C:0760

Molecular Formula: $C_2H_2Cl_2O$

Common Formula: $ClCH_2COCl$

Synonyms: Acetyl chloride, chloro-; Chloroacetic acid chloride; Chloroacetic chloride; Chlorure de chloracetyle (French); Cloruro de cloroacetilo (Spanish); Monochloroacetyl chloride

CAS Registry Number: 79-04-9

RTECS® Number: AO6475000

UN/NA & ERG Number: UN1752/156

EC Number: 201-171-6 [*Annex I Index No.:* 607-080-00-1]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, C, N; Risk phrases: R14; R23/24/25; R29; R35; R48/23; R50; Safety phrases: S1/2; S7/8; S9; S26; S28; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chloroacetyl chloride is a colorless to yellowish liquid with a very pungent, extremely irritating, odor. Molecular weight = 112.95; Specific gravity (H_2O:1) = 1.42; Boiling point = 105°C; Freezing/Melting point = −22°C; Vapor pressure = 19 mmHg at 20°C. NFPA 704 M Rating System: Health 3, Flammability 1, Reactivity 1₩. Reacts violently with water.

Potential Exposure: Highly toxic by inhalation. Chloroacetyl chloride is used in the manufacture of acetophenone. It is used in the manufacture of a number of pesticides including: alachlor, allidochlor, butachlor, dimethachlor, formothion, mecarbam, metolachlor, propachlor. It is also used in the manufacture of pharmaceuticals, such as chlordiazepoxide hydrochloride, diazepam, lidocaine, mianserin.

Incompatibilities: Reacts violently with water, steam forming chloroacetic acid and hydrogen chloride gas. Reacts with alcohols, powdered metals, sodium amide, combustibles, and many organics, causing toxic fumes, fire, and explosion hazard. On contact with air it emits corrosive gas. Decomposes when heated forming phosgene gas. Corrosive to metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.62 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.05 ppm/0.2 mg/m^3 TWA.

ACGIH TLV®[1]: 0.05 ppm/0.23 mg/m^3 TWA; 0.15 ppm/0.69 mg/m^3 STEL [skin].

Protective Action Criteria (PAC)*

TEEL-0: 0.04 ppm

PAC-1: **0.04** ppm

PAC-2: **1.6** ppm

PAC-3: **52** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 0.05 ppm (0.2 mg/m^3), 1993; Austria: MAK 0.05 ppm (0.2 mg/m^3), 1999; Belgium: TWA 0.05 ppm (0.23 mg/m^3), 1993; Denmark: TWA 0.05 ppm (0.2 mg/m^3), 1999; France: VME 0.05 ppm (0.2 mg/m^3), 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, 2003; Norway: TWA 0.05 ppm (0.2 mg/m^3), 1999; Switzerland: MAK-W 0.05 ppm (0.24 mg/m^3), 1999; United Kingdom: LTEL 0.05 ppm (0.2 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.15 ppm [skin]. Some states have set guidelines or standards for chloroacetyl chloride in ambient air[60] ranging from 3.0 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: No test available.

Permissible Concentration in Water: No criteria set. Chloroacetyl chloride decomposes in water.

Routes of Entry: Skin absorption, skin and eye contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: A tissue corrosive and a lacrimator (causes discharge of tears). Chloroacetyl chloride can severely irritate the eyes and cause permanent damage. It is corrosive to the skin and respiratory tract. Corrosive on ingestion. Inhalation of vapor or aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The substance may affect the cardiovascular system. Exposure far above the PEL may cause death. Medical reports of the effects of acute exposures include: mild-to-moderate skin burns and erythema; lachrymation and mild eye burns; mild-to-moderate respiratory effects with cough, dyspnea, cyanosis, and mild gastrointestinal effects.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Lungs may be affected by repeated or prolonged exposure.

Points of Attack: Skin, eyes, respiratory system.

Medical Surveillance: Should include attention to skin, eyes, and respiratory system in preplacement and regular physical examinations. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **4 h** (at least 4 h but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any* *detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, heat, and combustibles. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloroacetyl chloride must carry a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Soak up spill with quicklime, sodium/potassium chloride or absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled on land

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.9/1.5
Night 1.5/2.4

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.5/0.8

Fire Extinguishing: This chemical is a nonflammable liquid. *Do not use water* or water-based extinguishers. Use extinguishing agent suitable for surrounding fire. This chemical decomposes in heat, producing phosgene, chlorine, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: It may be discharged into sodium bicarbonate solution, then flushed to the sewer with water.

Description: The chloroanilines have the following properties:

m-isomer

Colorless to yellow liquid that may turn brown on exposure to air. Molecular weight = 127.57; Specific gravity (H_2O:1) = 1.216; Boiling point (decomposes) = 230°C; Melting point = −11°C; Vapor pressure = <0.1 mmHg at 20°C; Flash point = 118°C (cc); Autoignition temperature = >540°C. Slight solubility in water; solubility = 0.6%.

o-isomer

Colorless to yellow liquid that may turn brown on exposure to air. Molecular weight = 127.57; Specific gravity (H_2O:1) = 1.21; Boiling point = 208.7°C; Melting point = −2°C; Flash point = 108°C; Autoignition temperature = >500°C; solubility in water = 0.5% at 20°C.

p-isomer (see also P:0400)

The *p*-isomer is a colorless to pale yellow crystalline solid. Molecular weight = 127.6; Specific gravity (H_2O:1) = 1.4; Boiling point = 232°C; Melting point = 69.5−72.5°C; Vapor pressure = 0.015 mmHg at 20°C; Flash point = 120−123°C (oc); Autoignition temperature = 685°C. Hazard Identification (based on NFPA 704 M Rating System): *p-isomer* Health 3, Flammability 1, Reactivity 0. Soluble in hot water; solubility (cold) = 0.4% at 20°C.

Potential Exposure: RTECS Compound Description (*m*- and *o*-isomers): Tumorigen, Mutagen (*p*-isomer): Tumorigen, Mutagen, Primary Irritant. Chloroanilines are used to make dyes, other chemicals, insecticides, and many other industrial products.

Incompatibilities: Contact with strong oxidizers may cause fire and explosions. The aqueous solution of the *m*-isomer is a weak base. Incompatible with strong acids, organic anhydrides, isocyanates, aldehydes.

Permissible Exposure Limits in Air

m- and o-isomers

ACGIH TLV®[1]: 01 ppm TWA.

DFG MAK: [skin]; (*m*- and *p*-isomers) Danger of skin sensitization.

Poland: TWA 3 mg/m^3; STEL 10 mg/m^3 (99).

OSHA PEL: 0.1 mg/m^3 TWA[skin].

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

106-47-8

TEEL-0: 0.0025 ppm

PAC-1: 0.0075 ppm

PAC-2: 0.05 ppm

PAC-3: 250 ppm

DFG MAK: 0.1 mg/m^3, measured as the, inhalable fraction TWA; Peak Limitation Category II(2); [skin], danger of skin sensitization; Carcinogen Category 3; Pregnancy Risk Group C.

Austria: [skin], carcinogen, 1999; Poland: TWA 3 mg/m^3; STEL10 mg/m^3, 1999; Switzerland: [skin], carcinogen, 1999.

DFG MAK: [skin] Carcinogen Category 2.

The former USSR-UNEP/IRPTC joint project[43] has set MAC limits of 0.05 mg/m^3 in work-place air for the *m*-isomer and 0.3 mg/m^3 for the *p*-isomer, the MAC is 0.04 mg/m^3 on a temporary basis; 0.01 on an average daily basis. No standards were set for the *o*-isomer. This chemical can be absorbed through the skin, thereby increasing exposure. States which have set guidelines or standards for *p*-chloroaniline in ambient air[60] include Connecticut at 0.06 μg/m^3 and New York at 6.0 μg/m^3.

Permissible Concentration in Water: Limits in water bodies used for domestic purposes have been set by the former USSR-UNEP/IRPTC joint project[43] of 0.2 mg/L for the *m*- and *p*-isomers.

Determination in Water: Octanol−water coefficient: Log K_{ow} (all isomers) = 1.83−1.92.

Routes of Entry: Inhalation of vapor, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chloroanilines can affect you when breathed in and by passing through your skin. Exposure can lower the ability of the blood to carry oxygen (a condition called methemoglobinemia). This can cause headaches, trouble breathing, weakness, a bluish color to the nose and lips, collapse, and death. Contact can severely irritate and may burn the eyes. *o-isomer:* Irritates the eyes, skin, and respiratory tract. *m-isomer:* May affect the liver and kidneys. Exposure may result in death. The effects may be delayed. *p-isomer:* Irritates the eyes, skin, and respiratory tract. May affect the red blood cells, resulting in formation of methemoglobin and hemolysis. Exposure could cause headaches, trouble breathing, weakness, a bluish color to the nose and lips, loss of consciousness; and possible death.

Long Term Exposure: *o-isomer*: Repeated or prolonged contact with skin may cause dermatitis. The substance may have effects on the liver and kidneys and also the blood system, resulting in forming of methemoglobin. *m-isomer*: The substance may have effects on the blood system, resulting in forming of methemoglobin. *p-isomer:* Repeated or prolonged contact may cause skin sensitization. The substance may have effects on the spleen, liver, and kidneys, resulting in organ damage. Tumors have been detected in experimental animals but may not be relevant to humans. The methemoglobinemia described above can occur gradually over weeks instead of all at once.

Points of Attack: Blood, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: *Clothing:* Avoid skin contact with chloroaniline. Wear solvent-resistant gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove, clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures to chloroaniline, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison (*p-isomer*): Store in a secure poison location. Prior to working with chloroaniline you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chloroanilines are required by DOT[19] to carry a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: *ortho- and meta-iomers:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *p-isomer:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *p-isomer:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrous oxides and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. *o-* and *m-isomers*: These chemicals are combustible liquids. Poisonous gases are produced in fire, including nitrous oxides and hydrogen chloride. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent, such as alcohol or benzene, and spray into a furnace equipped with afterburner and scrubber.[24] Alternatively, pour into a mixture of sand and soda ash and burn in a furnace with paper as a fuel. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Chlorobenzene is a colorless liquid with an almond-like odor. The odor threshold is between 0.1 and 3.0 μg/L.[35] Also reported in the literature at 0.68 and 0.741 ppm. Molecular weight = 112.56; Boiling point = 131−132°C; Freezing/Melting point = −45°C; Flash point = 28°C; Autoignition temperature = 593°C. Flammable limits are: LEL = 1.3%; UEL = 9.6%. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Chlorobenzene is used in the manufacture of aniline, phenol, and chloronitrobenzene; as an intermediate in the manufacture of dyestuffs and many pesticides, as a solvent and emulsifier.

Incompatibilities: Reacts violently with strong oxidizers, dimethyl sulfoxide, sodium powder, silver perchlorate, causing fire and explosion hazard. Attacks some plastics, rubber, and coatings. Decomposes on heating, producing phosgene and hydrogen chloride fumes.

Permissible Exposure Limits in Air

OSHA PEL: 75 ppm/350 mg/m^3 TWA.

NIOSH REL: None.

ACGIH TLV®[1]: 10 ppm/46 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans; BEI: 150 mg [total 4-chlorocatechol]/g creatinine in urine/end-of-shift; 25 mg[total *p*-chlorophenol]/g creatinine in urine/end-of-shift.

DFG MAK: 10 ppm/47mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Rislk Group C; BAT: 70 mg/g [total 4-chlorocatechol] creatinine in urine at the beginning of the next shift; BAT: 300 mg/g [total 4-chlorocatechol] creatinine in urine at end-of-shift.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 10 ppm

PAC-1: **10** ppm

PAC-2: **150** ppm

PAC-3: **400** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Arab Republic of Egypt: TWA 1 ppm, 1993; Australia: TWA 75 ppm (350 mg/m^3), 1993; Austria: MAK 50 ppm (230 mg/m^3), 1999; Belgium: TWA 75 ppm (345 mg/m^3), 1993; Denmark: TWA 10 ppm (46 mg/m^3), 1999; Finland: TWA 50 ppm (230 mg/m^3); STEL 75 ppm (345 mg/m^3), 1999; France: VME 10 ppm, 1999; Japan: 10 ppm (46 mg/m^3), 1999; the Netherlands: MAC-TGG 46 mg/m^3, 2003; Norway: TWA 25 ppm (115 mg/m^3), 1999; Poland: MAC (TWA) 50 mg/m^3; STEL 150 mg/m^3, 1999; Switzerland: MAK-W 50 ppm (230 mg/m^3), KZG-W 100 ppm (460 mg/m^3), 1999; Turkey: TWA 75 ppm (350 mg/m^3), 1993; United Kingdom: LTEL 50 ppm (230 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for Chlorobenzene in ambient air[60] ranging from 6.3 μg/m^3 (Massachusetts) to 1,167 μ/m^3 (New York) to 2,200 μg/m^3 (New York) to 3,500 μg/m^3 (Florida and North Dakota) to 6000 μg/m^3 (Virginia) to 7000 μg/m^3 (Connecticut) to 8,333 μg/m^3 (Nevada).

Determination in Air: Charcoal absorption followed by workup with CS_2 and analysis by gas chromatography. Use NIOSH Analytical Method #1003 for hydrocarbons, halogenated.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 250 μg/L on an acute basis for chlorobenzenes as a class. *To protect saltwater aquatic life:* 160 μg/L on an acute basis and 129 μg/L on a chronic basis for chlorinated benzenes as a class. *To protect human health:* for the prevention of adverse toxicological effects, 488 μg/L; but to prevent adverse organoleptic effects, 20 μg/L. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes. The US EPA has set a lifetime health advisory of 0.3 mg/L (300 μg/L). Several states have set guidelines or standards for chlorobenzene in drinking water[61] ranging from 2 μg/L (New Jersey) to 30 μg/L (California) to 47 μg/L (Maine) to 60 μg/L (Arizona, Kansas, and Minnesota) to 600 μg/L (Vermont and Wisconsin).

Determination in Water: Gas chromatography (EPA Methods 601 and 602) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation, ingestion, eye and skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: The liquid can irritate and burn the skin. The vapor can irritate the eyes, nose, and throat. Chlorobenzene can affect you when breathed in and by passing through your skin. Exposure to high concentrations can cause you to become dizzy, lightheaded, and to pass out. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical pneumonitis. The effects may be delayed. Medical observation is indicated.

Long Term Exposure: May cause damage to the lungs, blood, nervous system, liver, and kidneys. Repeated exposure to the liquid may cause skin burns. Similar petroleum-based solvents cause brain damage, with reduced memory and concentration, personality changes, fatigue, sleep disturbances, reduced coordination.

Points of Attack: Respiratory system, eyes, skin, central nervous system, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure has occurred, the following may be useful: lung and kidney function tests. Interview for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Viton™ gloves, suits, Barricade™ coated suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h** (at least 4 h but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): polyvinyl alcohol gloves; Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* PD,PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-, mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with chlorobenzene you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Chlorobenzene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flames. Sources of ignition, such as smoking and open flames are prohibited where Chlorobenzene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of Chlorobenzene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of Chlorobenzene.

Shipping: Chlorobenzene must be labeled “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Keep Chlorobenzene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.[22]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (α,α,α-tetrachlorotoluene) Human Limited Evidence; Animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A; DFG, Carcinogen Category 2.

California Proposition 65 Chemical: Cancer *(as p-*α,α,α-Tetrachlorotoluene) 1/1/90.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R21/22; R37/38; R48/23; R62; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: *p*-Chlorobenzotrichloride, an organochloride, is a flammable, water-white liquid. Molecular weight = 229.92; Specific gravity (H_2O:1) = 1.49; Boiling point = 254°C; Melting/Freezing point = 5–6°C; Flash point = >110°C; Autoignition temperature = 500–505°C. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 1, Reactivity 0. Decomposes in water.

Potential Exposure: Used in agrochemicals manufacture as an intermediate; reaction with HF yields chlorobenzotrifluoride as a major intermediate for several pesticides; for making pharmaceuticals, UV absorbers, and dyestuffs. This chemical is manufactured in high volume (exceeds 1 million pounds per annum) in the United States.

Incompatibilities: A halogenated aromatic compound. Keep away from strong oxidizers and reducing agents. Hydrolyzes to hydrochloric acid and benzoic acid in all forms of moisture.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin] Carcinogen Category 2.

No numerical limits set. However, this chemical can be absorbed through the skin, thereby increasing exposure. Toxic by inhalation. A potential carcinogen: exposure should be kept to lowest feasible level.

Determination in Air: No test listed.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: A corrosive and lacrimator. May cause irritation by any route of exposure. Poisonous by inhalation. LD_{50} = (oral-rat) 820 mg/L.

Long Term Exposure: A skin sensitizer; may cause rash. A suspected human carcinogen, neuro-, and respiratory toxicant.[RTECS]

Points of Attack: Skin.

Medical Surveillance: Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a refrigerator. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Corrosive liquids, n.o.s., require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chlorobenzotrifluoride C:0800

Molecular Formula: $C_7H_4ClF_3$

Common Formula: $ClC_6H_4CF_3$

Synonyms: (*p*-Chlorophenyl)trifluoromethane; *p*-Chlorotrifluoromethylbenzene; 4-Chlorotrifluoromethylbenzene; 1-Chloro-4-(trimethyl)-benzene; OXSOL 100®; α,α,α-Trifluoro-4-chlorotoluene; *p*-(Trifluoromethyl)chlorobenzene; *p*-Trifluoromethylphenyl chloride; Trifluoromethylphenyl chloride

CAS Registry Number: 98-56-6; 52181-51-8

RTECS® Number: XS9145000

UN/NA & ERG Number: UN2234/130

EC Number: 202-681-1

WGK (German Aquatic Hazard Class): 2—Water polluting (98-56-6).

Description: Chlorobenzotrifluoride is a colorless, highly flammable liquid. Molecular weight = 180.6; Boiling point = 139°C; Melting/Freezing point = −36°C; Flash point = 43°C (cc); Autoignition temp = >500°C; Flammable limits are: LEL = 0.9%; UEL = 10.5%. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 2, Reactivity 0. The pure *o*-isomer: Boiling point = 152°C; Flash point = 59°C. Hazard Identification (based on NFPA 704 M Rating System):

Health 2, Flammability 2, Reactivity 1. Slightly soluble in water; solubility = <1 mg/mL at 20°C.

Potential Exposure: This material is used in the manufacture of pharmaceuticals; dyes, dielectrics, and insecticides.

Incompatibilities: Strong oxidizers, such as permanganates and dichromates.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: No tests available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.70$.

Harmful Effects and Symptoms

Short Term Exposure: Causes local irritation to skin, eyes, and mucous membranes. May cause irritation by any route of exposure. The LD_{50} rat is 13 gm/kg (13,000 mg/kg) (insignificantly toxic).

Long Term Exposure: There is evidence that this chemical is a mutagen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH: *(fluorides) 12.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or*† *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* HieF$^+$ (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF$^+$ (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with chlorobenzotrifluoride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chlorobenzotrifluoride must be labeled "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific

recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including fluorine and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

New York State Department of Health. (January 1986). *Chemical Fact Sheet: para-Chlorobenzotrifluoride*. Albany, NY: Bureau of Toxic Substance Assessment

o-Chlorobenzylidenemalononitrile (Agent CS, WMD) C:0810

Molecular Formula: $C_{10}H_5ClN_2$

Common Formula: $ClC_6H_4CH{=}C(CN)_2$

Synonyms: *o*-Chlorobenzalmalononitrile; 2-Chlorobenzalmalononitrile; 2-Chlorobenzylidene malononitrile; CS* (military designation); β,β-Dicyano-*o*-chlorostyrene; Propanedinitrile[(2-chlorophenyl)methylene]

*CS1, CS2, CSX all contain *o*-Chlorobenzylidenemalononitrile (CS) as agent.

CAS Registry Number: 2698-41-1

RTECS® Number: OO3675000

UN/NA & ERG Number: UN2810 (CS)/153

EC Number: 220-278-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

As a cyanide compound:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R28; R32; R50/53; Safety phrases: S1/2; S7/8; S23; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: *o*-Chlorobenzylidenemalonitrile is a combustible, white crystalline solid. Pepper-like odor. Molecular weight = 188.62; Boiling point = 310−315°C; Freezing/Melting point = 95°C; Vapor pressure = 0.00003 mmHg at 20°C. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. CS tear gas is used as a riot control agent and is also used as an agent in CS1, CS2, and CSX riot control and tear gases.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion. May be explosive if dust mixes with air.

Permissible Exposure Limits in Air

OSHA PEL: 0.05 ppm/0.4 mg/m^3 TWA.

NIOSH REL: 0.05 ppm/0.4 mg/m^3 Ceiling Concentration [skin].

ACGIH TLV®[1]: 0.05 ppm/0.39 mg/m^3 Ceiling Concentration [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 2 mg/m^3.

Protective Action Criteria (PAC)*

TEEL-0: 0.05 mg/m^3

PAC-1: **0.050** mg/m^3

PAC-2: **0.50** mg/m^3

PAC-3: **11** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Australia: TWA 0.05 ppm (0.4 mg/m^3) [skin], 1993; Belgium: STEL 0.05 ppm (0.4 mg/m^3) [skin], 1993; Denmark: TWA 0.05 ppm (0.4 mg/m^3) [skin], 1999; France: STEL 0.05 ppm (0.4 mg/m^3) [skin], 1999; the Netherlands: MAC 0.4 mg/m^3 [skin], 2003; Norway: TWA 0.05 ppm (0.4 mg/m^3), 1999; the Philippines: TWA 05 ppm (0.4 mg/m^3), 1993; Switzerland: MAK-W 0.05 ppm (0.4 mg/m^3) [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV®: Ceiling Concentration 0.05 ppm [skin]. Several states have set guidelines or standards for OCBM in ambient air[60] ranging from 3.0 μg/m^3 (Virginia) to 4.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada).

Determination in Air: Collection by charcoal tube, analysis by gas liquid chromatography. Use NIOSH Analytical Method P & CAM 304(II-5).

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator. Irritates the eyes, skin, and respiratory tract. OCBM is extremely irritating and acts on exposed sensory nerve endings (primarily in the eyes and upper respiratory tract). The signs and symptoms from exposure to the vapor are conjunctivitis and pain in the eyes, lacrimation; erythema of the eyelids; blepharospasms; irritation and running of the nose; burning in the throat; coughing and constricted feeling in the chest; and excessive salivation. Vomiting may occur if saliva is swallowed. Most of the symptoms subside after exposure ceases. Burning on the exposed skin is increased by moisture. With heavy exposure, vesiculation and erythema occur. Photophobia has been reported. LD_{50} = (oral-rat) 178 mg/kg.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Animal experiments indicate that OCBM has a relatively low toxicity. The systemic changes observed in human experiments are nonspecific reactions to stress. OCBM is capable of sensitizing guinea pigs; there also appears to be a cross-reaction in guinea pigs previously sensitized to 1-chloroacetophenone.

Points of Attack: Respiratory system, skin, and eyes.

Medical Surveillance: Consideration should be given to the eyes, skin, and respiratory tract in any placement or periodic evaluations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Decontamination: Decontaminate as soon as possible. This is extremely important. If you do not have the equipment and training, do not enter the hot zone to rescue and/or decontaminate victims. If the victim cannot move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash—strip—wash—evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 min. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles.*

Respirator Selection: OSHA: *2 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: CS a "Toxic, liquids, organic, n.o.s." requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

CS, when used as a weapon

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.3/2.0

Fire Extinguishing: This chemical is a combustible solid. In case of fire, *do not put out the fire*. CS vapor is so deadly that the fire is safer than the unburned CS. If there is some reason that you have to put out the fire (for example, there are things you cannot let burn nearby) use water or ordinary foam. It is always best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning liquid around. In the unlikely situation where there is a pile of CS canisters adjacent to a fire, cool the canisters with large amounts off water, but first evacuate the area—if the canisters rupture from heating, toxic gases could kill. CS can give off toxic hydrogen cyanide, chlorine, and nitrogen oxides in a fire or when heated. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Chlorobromomethane is a clear, colorless to pale yellow liquid with a chloroform-like odor. Odor threshold = 400 ppm. Molecular weight = 129.39; Specific gravity (H_2O:1) = 1.93; Boiling point = 68.3°C; Freezing/Melting point = −88°C; Vapor pressure = 115 mmHg at 20°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Drug, Mutagen. This compound is used in brominated flame retardants; a fire-extinguishing agent, and in organic synthesis.

Incompatibilities: Chemical active metals, such as calcium, powdered aluminum, zinc, magnesium. Liquid attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 200 ppm/1050 mg/m^3 TWA.
NIOSH REL: 200 ppm/1050 mg/m^3 TWA.
ACGIH TLV®[1]: 200 ppm/1060 mg/m^3 TWA.
NIOSH IDLH: 2000 ppm.

Protective Action Criteria (PAC)
TEEL-0: 200 ppm
PAC-1: 600 ppm
PAC-2: 2000 ppm
PAC-3: 2000 ppm
DFG MAK: [skin] Carcinogen Category 3B.

Australia: TWA 200 ppm (1050 mg/m^3); STEL 250 ppm, 1993; Austria: MAK 200 ppm (1050 mg/m^3), 1999; Denmark: TWA 200 ppm (1050 mg/m^3), 1999; Finland: TWA 200 ppm (1050 mg/m^3); STEL 250 ppm (1315 mg/m^3), 1999; France: VME 200 ppm (1050 mg/m^3), 1993; the Netherlands: MAC-TGG 1050 mg/m^3, 2003; Norway: TWA 100 ppm (525 mg/m^3), 1999; Poland: TWA 1000 mg/m^3; STEL 1300 mg/m^3, 1999; Switzerland: MAK-W 200 ppm (1050 mg/m^3), KZG-W 400 ppm (2100 mg/m^3), 1999; Turkey: TWA 200 ppm (1050 mg/m^3), 1993; United Kingdom: TWA 200 ppm (1080 mg/m^3); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietman: ACGIH TLV®: TWA 200 ppm. Several states have set guidelines or standards for CBM in ambient air[60] ranging from 10.5–13 mg/m^3 (North Dakota) to 17.5 mg/m^3 (Virginia) to 21.0 mg/m^3 (Connecticut) to 25.0 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, followed by gas chromatography. Use NIOSH Analytical Method #1003 for hydrocarbons, halogenated.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the skin and eyes. This chemical can irritate the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms include disorientation, dizziness; irritation of eyes, throat and skin; headaches, anorexia, nausea, vomiting; abdominal pain; weakness, tremors, and convulsions; narcosis. LD_{50} = (oral-rat) 5000 mg/kg (slightly toxic).

Long Term Exposure: May cause liver and kidney damage, which may be progressive, skin irritation, and cracking. May affect the lungs and cause bronchitis to develop. May cause weight loss, memory impairment, paralysis. Skin contact can cause drying and cracking.

Points of Attack: Skin, liver, kidneys, respiratory system, lungs, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Serum bromine level. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **4 h** (at least 4 h but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Teflon™ gloves, suits, boots; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance can cause eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Chlorobromomethane must be stored to avoid contact with chemically active metals, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Bromochloromethane must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Use any extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including hydrogen chloride and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate together with flammable solvent in furnace equipped with afterburner and alkali scrubber.

Chlorodifluorobromo-methane C:0830

Molecular Formula: $CBrClF_2$

Synonyms: Bromochlorodifluoromethane; Chlorodifluorobromomethane; Flugex 12B1; Fluorocarbon 1211; Freon 12B1; Halon 1211; R12B1

CAS Registry Number: 353-59-3

RTECS® Number: PA5270000

UN/NA & ERG Number: UN1974/126

EC Number: 206-537-9

Regulatory Authority and Advisory Bodies

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 3.0.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, CEPA Schedule I Toxic Substances (import/export, manufacturing, and processing restrictions).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Chlorodifluorobromomethane is a colorless gas or liquid under pressure. Molecular weight = 165.4; Boiling point = −4°C; Freezing/Melting point = −160.5°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Used as a refrigerant and fire extinguishing agent.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 12.5 ppm

PAC-1: 40 ppm

PAC-2: 250 ppm

PAC-3: 5000 ppm

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Contact with the liquid can cause frostbite. High exposure can cause dizziness, lightheadedness, and unconsciousness. Inhalation can cause irregular heartbeat.

Long Term Exposure: Can affect the heartbeat causing irregular rhythms and skipped beats.

Points of Attack: Heart.

Medical Surveillance: Special 24-h EKG (Holter monitor) for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Nonflammable gas. Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure sufficient oxygen (19%) exists. Store in tightly closed containers in a cool, well-ventilated area away from heat and sparks. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This chemical requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: *Gas:* If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including bromine, chlorine, and fluoride compounds. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chlorodifluoroethane C:0840

Molecular Formula: C_2H_5Cl

Common Formula: $ClCH_2CH_3$

Synonyms: CFC 142b; Chlorofluorocarbon 142b; 1,1,1-Chlorodifluoroethane; 1-Chloro-1,1-difluoroethane; α-Chloroethylidene fluoride; Chloroethylidene fluoride; 1,1,1-Difluorochloroethane; 1,1-Difluoro-1-chloroethane; Difluoro-1-chloroethane; Difluoromonochloroethane; Ethane, 1-chloro-1,1-difluoro-; FC-142b; Fluorocarbon 142b; Fluorocarbon FC 142b; Freon 142; Freon 142b; Genetron 101; Genetron 142b; Gentron 142B; HCFC-142B; Hydrochlorofluorocarbon 142b; Propellant 142b; R 142B

CAS Registry Number: 75-68-3

RTECS® Number: KH7650000; KH7630000 (chlorodifluoroethanes)

UN/NA & ERG Number: UN2517/115

EC Number: 200-891-8

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in aerosol sprays) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix B), Class II, Ozone Depletion Potential = 0.06.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chlorodifluoroethane is a flammable, colorless, nearly odorless gas. Molecular weight = 100.50; Specific gravity (H_2O:1) = 1.1; Boiling point = −9.5°C; Freezing/Melting point = −131°C; Flash point = flammable gas; Autoignition temperature = 632°C. The explosive limits are: LEL = 6.2%; UEL = 17.9%. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 2, Reactivity 1. Practically insoluble in water; solubility = 0.2% at 5°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector. Chlorodifluoroethane is used in refrigerants, solvents, as a propellent in aerosol sprays, and as an intermediate in the production of highly specialized fluoropolymers.

Incompatibilities: Oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates since vigorous reactions occur. Decomposes in heat to form phosgene, and hydrofluoric and hydrochloric acids.

Permissible Exposure Limits in Air

AIHA WEEL: 1000 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 10,000 ppm

PAC-2: 15,000 ppm

PAC-3: 25,000 ppm

DFG MAK: 1000 ppm/4200 mg/m^3 TWA; Peak Limitation II(8); Pregnancy Risk Group D, as 1-Chloro-1,1-difluoroethane (FC-142-b).

Austria: MAK 1000 ppm (4170 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; Russia: STEL 3000 mg/m^3, 1993; the Netherlands: MAC-TGG 8380 mg/m^3, 2003.

Determination in Air: No test available.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.58.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Chlorodifluoroethane can affect you when breathed in. Skin contact may cause frostbite. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels could cause death. High exposure could cause irregular heartbeat, which could lead to death.

Short Term Exposure: Chlorodifluoroethane can affect you when breathed in. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels could cause death. High exposure could cause irregular heartbeat, which could lead to death. Contact with the liquid may cause frostbite.

Long Term Exposure: Inhalation, rat, lowest published toxic concentration: 1000 ppm/6 h (3- to 15-days pregnant). Reproductive: Effects on fertility: Preimplantation mortality (e.g., reduction in number of implants per female; total number of implants per corpora lutea) [NTISOTS0555347].

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (halter monitor) to look for irregular heartbeat. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash affected parts in warm water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact-resistant chemical goggles when working with gas. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls should be used wherever feasible to maintain airborne concentrations of this chemical below the prescribed exposure limit. Respirators and protective equipment are less effective than engineering controls, and should be used only in nonroutine or emergency situations which may result in exposure concentrations in excess of the TWA environmental limit. NIOSH: *(fluorides) 12.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or*† *if not present as a fume* PaprHie (APF = 25) (any powered, air-purifying respirator with a high -efficiency particulate filter). *125 mg/m^3:* HieF† (any air-purifying, full-facepiece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF[†] (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

[†] May need acid gas sorbent.

Storage: Flammable gas. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with Chlorodifluoroethane you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Chlorodifluoroethane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Detached or outside storage is preferred. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: 1-Chloro-1,1-difluoroethanes or Refrigerant gas, R-142b must be labeled “FLAMMABLE GAS.” They fall in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep Chlorodifluoroethane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases, including phosgene, hydrogen fluoride, hydrogen chloride, and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chlorodifluoromethane is a nonflammable, colorless, nearly odorless gas. Molecular weight = 86.47; Specific gravity (H_2O:1) = 1.21; Boiling point = −40.5°C; Freezing/Melting point = −146°C; Vapor pressure = 9.4 atm at 20°C; Autoignition temperature = 632°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 0.3% at 25°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Chlorodifluoromethane is used as an aerosol propellant, refrigerant, and low-temperature solvent. It is used in the synthesis of polytetrafluoroethylene (PTFE).

Incompatibilities: Reacts violently with alkalies and alkaline earth metals, powdered aluminum, sodium, potassium, and zinc, causing fire and explosion hazard. Moisture and rust cause slow decomposition, forming toxic gases. Attacks some plastics, rubber, and coatings. Decomposes in heat forming fumes of chlorine, hydrogen chloride, hydrogen fluoride, and phosgene. Attacks magnesium and its alloys.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.54 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1000 ppm/3500 mg/m^3 TWA; 1250 ppm/4375 mg/m^3 STEL.

ACGIH TLV®[1]: 1000 ppm/3540 mg/m^3 TWA, not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 1250 ppm

PAC-2: 7500 ppm

PAC-3: 7500 ppm

DFG MAK: 500 ppm/1800 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group C.

Several states have set guidelines or standards for FC-22 in ambient air[60] ranging from 35.0 to 43.75 mg/m^3 (North Dakota) to 58 mg/m^3 (Virginia) to 70.0 mg/m^3 (Connecticut) to 83.3 mg/m^3 (Nevada).

Determination in Air: Charcoal tube;[2] Methylene chloride; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1018.

Permissible Concentration in Water: Russia/UNEP joint project[43] set a MAC of 10 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.1.

Harmful Effects and Symptoms

Short Term Exposure: Chlorodifluoromethane can affect you when breathed in. Inhalation can irritate the respiratory tract causing tightness in the chest and trouble breathing. Exposure can cause headache, nausea, dizziness and weakness, sleepiness, tremors, loss of coordination, cardiac arrhythmia (irregular heartbeat), coma, and asphyxiation, which could lead to death. Chlorodifluoromethane can irritate the nose, throat, and skin. It can also cause tightening in the chest and trouble breathing. Skin contact with the liquid can cause frostbite.

Long Term Exposure: Liver, kidney, spleen injury.

Points of Attack: Respiratory system, cardiovascular system, central nervous system, liver, kidneys, spleen.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heartbeat. Lung, liver, and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: Adrenergic agents are contraindicated.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 1000 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Nonflammable gas. Color Code—Green: General storage may be used. Prior to working with chlorodifluoromethane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorodifluoromethane must carry a "NONFLAMMABLE GAS" label. It falls in Hazard Class 2.2.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Liquid:* allow to evaporate. *Gas:* Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is nonflammable. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. On contact with fire, this chemical decomposes forming poisonous gases, including hydrogen fluoride, hydrogen chloride, phosgene, carbonyl fluoride, chloride fumes, and fluoride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return to vendor or send to licensed waste disposal company.[22]

2-Chloroethyl vinyl ether C:0860

Molecular Formula: C_4H_7ClO

Common Formula: $ClCH_2CH_2OCH{=}CH_2$

Synonyms: 2-Chlorethyl vinyl ether; (2-Chloroethoxy)ethene; 2-Cloroetilo vinil eter (Spanish); Vinyl-β-chloroethyl ether; Vinyl-2-chloroethyl ether

CAS Registry Number: 110-75-8

RTECS® Number: KN6300000

UN/NA & ERG Number: UN1992/131

EC Number: 203-799-6

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as 2-chloroethyl vinyl ether (mixed).

US EPA Hazardous Waste Number (RCRA No.): U042.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.062; Nonwastewater (mg/kg), N/A.

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Chloroethyl vinyl ether is a highly flammable, colorless liquid. Molecular weight = 106.55; Boiling point = 108.7°C; Freezing/Melting point = −70°C; Flash point = 27°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: The compound finds use in the manufacture of anesthetics, sedatives, and cellulose ethers. The number of potentially exposed individuals is greatest for the following areas: fabricated metal products, wholesale trade, leather, rubber, and plastic, and chemical products.

Incompatibilities: Peroxidizable Compound; may form unstable peroxides that can cause explosive polymerization. Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Contact with oxidizing materials may cause fire or explosion hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.25 ppm

PAC-1: 0.75 ppm

PAC-2: 5 ppm

PAC-3: 25 ppm

Permissible Concentration in Water: No criteria have been developed for aquatic life or for the protection of human health.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Eye, skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact with skin or eyes may cause severe irritation. The oral LD_{50} for 2-Chloroethyl vinyl ether in rats is 250 mg/kg (moderately toxic). Primary skin irritation and eye irritation studies have also been conducted for 2-Chloroethyl vinyl ether. Dermal exposure to undiluted 2-chloroethyl vinyl ether did not cause even slight erythema. Application of undiluted 2-Chloroethyl vinyl ether to the eyes of rabbits resulted in severe eye injury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where 2-chloroethyl vinyl ether may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This material may be classified as Flammable liquids, toxic, n.o.s. This class requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of

spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire, including toxic chlorides. Use dry chemical or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Residues may be packaged in epoxy-lined drums and disposed of by high-temperature incineration with HCl scrubbing of effluent gases.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R38; R40; R48/20/22; Safety phrases: S32; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chloroform is a noncombustible, clear, colorless liquid with a pleasant, sweet odor. The odor threshold is 12 ppm. Molecular weight = 119.37; Specific gravity (H_2O:1) = 1.5; Boiling point = 62°C; Freezing/Melting point = −63°C; Vapor pressure = 160 mmHg. Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; solubility 0.5% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Chloroform was one of the earliest general anesthetics, but its use for this purpose has been abandoned because of toxic effects. Chloroform is widely used as a solvent (especially in the lacquer industry); in the extraction and purification of penicillin and other pharmaceuticals; in the manufacture of artificial silk, propellents, plastics, floor polishes, and fluorocarbons (R-22); and in sterilization of catgut. Chemists and support workers as well as hospital workers are believed to be at a higher risk than the general population. Chloroform is widely distributed in the atmosphere and water (including municipal drinking water primarily as a consequence of chlorination). A survey of 80 American cities by EPA found chloroform in every water system in levels ranging from <0.3 to 311 ppb.

Incompatibilities: Though nonflammable, chloroform decomposes to form hydrogen chloride, phosgene, and chlorine upon contact with a flame. Chloroform decomposes slowly in air and light. Reacts violently with strong caustics (bases), strong oxidants, chemically active metals (especially powders), such as aluminum, lithium, magnesium, potassium, and sodium, causing fire and explosion hazard. Attacks plastic, rubber, and coatings. Corrodes iron and other metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: 50 ppm/240 mg/m^3 Ceiling Concentration.

NIOSH REL: Carcinogen 2 ppm/9.78 mg/m^3 [60 min] STEL. NIOSH considers chloroform to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/49 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: 2 ppm

PAC-2: **64** ppm

PAC-3: **3200** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: Not appropriate

ERPG-2: 50 ppm

ERPG-3: 5000 ppm

DFG MAK: 0.5 ppm/2.5 mg/m^3 Peak Limitation Category II (2) [skin]; Carcinogen Category 4; Pregnancy Risk Group C. Arab Republic of Egypt: TWA 10 ppm (50 mg/m^3), 1993; Australia: TWA 10 ppm (50 mg/m^3), carcinogen, 1993; Austria: MAK 10 ppm (50 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 10 ppm (49 mg/m^3), Carcinogen 1993; Denmark: TWA 2 ppm (10 mg/m^3), 1999; Finland: TWA 10 ppm (50 mg/m^3); STEL 20 ppm [skin] carcinogen, 1999; France: VME 5 ppm (25 mg/m^3), VLE 50 ppm (250 mg/m^3), carcinogen, 1999; India: TWA 10 ppm (50 mg/m^3), carcinogen, 1993; Japan: Occupational Exposure Limit 10 ppm (49 mg/m^3), 2B carcinogen, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Norway: TWA 2 ppm (10 mg/m^3), 1999; the Philippines: TWA 50 ppm (240 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, MAC (STEL) 225 mg/m^3, 1999; Russia: TWA 50 ppm, 1993; Sweden: NGV 2 ppm (10 mg/m^3), KTV 5 ppm (25 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 10 ppm (50 mg/m^3), KZG-W 20 ppm (100 mg/m^3), 1999; Thailand: TWA 50 ppm (240 mg/m^3), 1993; Turkey: TWA 50 ppm (240 mg/m^3), 1993; United Kingdom: TWA 2 ppm (9.9 mg/m^3) [skin] 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Russia set a MAC of 0.3 mg/m^3 for ambient air in residential areas. Several states have set guidelines or standards for chloroform in ambient air[60] ranging from 0 (North Dakota) to 0.04 μg/m^3 (Michigan and Rhode Island) to 0.43 μg/m^3 (Massachusetts and North Carolina) to 120 μ/m^3 (Pennsylvania) to 167 μg/m^3 (New York) to 250 μg/m^3 (Connecticut and South Carolina) to 500 μg/m^3 (Virginia) to 1190 μg/m^3 (Nevada) to 1200 μg/m^3 (Indiana).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography. See OSHA Analytical Method 5 and NIOSH Analytical Method #1003 for Hydrocarbons, halogenated, or OSHA Analytical Method 7.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 28,900 μg/L on an acute basis and 1240 μg/L on a chronic basis. *To protect saltwater aquatic life:* no value set due to insufficient data. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L.[6] Russia has set[35] a limit in surface water of 0.06 mg/L.

Some states have set standards and guidelines for chloroform in drinking water[61] ranging from 1 μg/L (Illinois) to 3 μg/L (Arizona) to 5 μg/L (Minnesota).

Determination in Water: Gas chromatography (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation of vapors, ingestion, skin and eye contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Chloroform irritates the eyes and contact can cause tearing, conjunctivitis, and permanent eye damage. Symptoms of acute chloroform exposure include fainting sensation, vomiting, dizziness, salivation, nausea, fatigue, and headache. Other symptoms are respiratory depression, coma, kidney damage, and liver damage. Chloroform is classified as moderately toxic. Probable oral lethal dose for humans is 0.5−5 g/kg (between 1 ounce and 1 pint) for a 150-lb person. The mean lethal dose is probably near 1 fluid ounce (44 g). It is a human suspected carcinogen. Also, it is a central nervous system depressant and a gastrointestinal irritant. It has caused rapid death attributable to cardiac arrest and delayed death from liver and kidney damage. A delayed reaction to high levels of chloroform or from administration of anesthetic to some individuals can develop in 3−5 days, causing drowsiness, nausea, and vomiting; kidney and liver damage; urine may contain acetone and bile pigmentation.

Long Term Exposure: Symptoms of chronic exposure include loss of appetite, hallucinations, moodiness, and physical and mental sluggishness. Repeated or prolonged contact with skin may cause skin drying, cracking, and dermatitis. May cause heart, thyroid, liver, and kidney damage. This substance is possibly carcinogenic to humans. It has been shown to cause liver, kidney, and thyroid cancer in animals. There is evidence that chloroform is a teratogen in animals.

Points of Attack: Liver, kidneys, heart, eyes, skin, central nervous system.

Medical Surveillance: Preplacement and periodic examinations should include appropriate tests for thyroid, liver, and kidney functions, and special attention should be given to the nervous system, the skin, and to any history of alcoholism. Expired air and blood levels may be useful in estimating levels of acute exposure. Special 24-h Holter monitor to detect irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2$/min): polyvinyl alcohol gloves; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h** (at least 4 h but <8 h of resistance to breakthrough >0.1 $0.1\ \mu g/cm^2$/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl chloride, Teflon™, polyurethane and VITON/chlorobutyl have been recommended as protective materials in the literature. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloroform, you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed dark bottles or cans in a cool, well-ventilated area.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is III.[19,20]

Spill Handling: Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small spills*: absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Use any extinguishing agents. Poisonous gases are produced in fire, including hydrogen chloride, phosgene, and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Where possible it should be recovered, purified by distillation, and returned to the supplier.

Carcinogenicity: IARC: (*95-69-2*) Human Limited Evidence; Animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A, 2000; IARC: (*95-79-4*) Animal Limited Evidence, Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3; NTP (*95-69-2 & 3165-93-3*): Reasonably anticipated to be a human carcinogen.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%. (4-chloro-*o*-; CAS: 95-69-2).

US EPA Hazardous Waste Number (RCRA No.): U049 (4-Chloro-*o*- HCl only) (3165-93-3).[4]

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. (4-Chloro-*o*- HCl only; CAS:3165-93-3).[4]

Reportable Quantity (RQ): 100 lb (45.4 kg). (4-chloro-*o*-HCl only; CAS:3165-93-3).[5]

California Proposition 65 Chemical: Cancer 1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as *4-chloro-o-toluidine* (*95-69-2*).

European/International Regulations (4-chloro-*o*-toluidine; 95-69-2) and (4-chloro-*o*-toluidine HCl*;* 3165-93-3): Hazard Symbol: T, N; Risk phrases: R45; R23/24/25; R68; R50/53; Safety phrases: S53; S45; S60; S61.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Water polluting (*87-60-5 and 95-74-9 and 95-69-2*).

Description: The chloromethylanilines are colorless or white crystalline solids or liquids, some have a mild fishy odor. Molecular weight (all isomers) = 141.61. Hazard Identification (based on NFPA 704 M Rating System): *(87-60-5)* Health 2, Flammability 1, Reactivity 0. All are soluble in water and include:

Isomer	**Melting Point (°C)**	**Boiling Point (°C)**	**Flash Point (°C)**
3-chloro-o-	245	>113	–
4-chloro-o-	29	241	100
5-chloro-o-	26	237	160
6-chloro-o-	–	–	99
2-chloro-p- (liq.)	7	257	99
3-chloro-p-	26	238	100
2-chloro-5-	–	–	107

Potential Exposure: Most of the isomers are used in dyestuff manufacture. The 3-chloro-*para* isomer is used to kill birds. It is marketed as pelleted bait for control of bird populations.

Incompatibilities: Incompatible with oxidizers, strong acids, chloroformates, and acid anhydrides, isocyanates, aldehydes forming fire and explosive hazards.

Permissible Exposure Limits in Air

4-chloro-o-toluidine [95-69-2]

No TEEL available.

DFG MAK: [skin] Carcinogen Category 1; Germ Cell Mutation Category 3A.

5-chloro-o-toluidine [95-79-4]

No TEEL available.

DFG MAK: Carcinogen Category 3B.

Routes of Entry: Inhalation, skin contact, ingestion. These chemicals can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Chloromethyl anilines can affect you when breathed in and by passing through your skin. Eye contact causes irritation and can lead to permanent damage. Skin contact can cause a rash and produce a burning feeling. Exposure can lower the ability of the blood to carry oxygen (methemoglobinemia) causing a bluish color of the skin, headaches, dizziness, nausea, and even death. They can damage the kidneys and bladder, causing painful, bloody urine.

Long Term Exposure: The methemoglobinemia condition described above may occur gradually from repeated exposure or all at once. Some of these chemicals like 4-chloro-2-methyl aniline and 5-chloro-2-methyl aniline are probable carcinogens in humans; they cause bladder and liver cancer in animals.

Points of Attack: Eyes, skin, kidneys, bladder, liver.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: Blood tests for methemoglobin levels. Kidney function tests. Urine tests for blood and for *n*-acetyl *p*-aminophenol.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids or solids wear indirect-vent, impact-resistant chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to chloromethyl anilines, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered, air-purifying respirator.

Where there is potential for high exposure to 3-chloro-2-methyl aniline exists, or to liquid form use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloromethyl anilines you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where Choromethyl anilines are handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorotoluidines require a label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.[19]

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solid: Evacuate persons not wearing protective equipment from area of spill or leak until clean up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals may burn, but according to the state of New Jersey, do not readily ignite. Use dry chemical or carbon dioxide extinguishers. Poisonous gases are produced in fire, including chlorine, hydrogen chloride, nitrogen oxides, and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chloromethyl methyl ether C:0890

Molecular Formula: C_2H_5ClO

Common Formula: $ClCH_2OCH_3$

Synonyms: Chlorodimethyl ether; Chloromethoxymethane; CMME; α,α-Dichlorodimethyl ether; Dimethylchloroether;

Ether, chloromethyl methyl; Ether, dimethyl chloro; Ether methylique monochlore (French); Methane, chloromethoxy-; Methoxychloromethane; Methoxymethyl chloride; Monochlorodimethyl ether; Monochloromethyl methyl ether

CAS Registry Number: 107-30-2

RTECS® Number: KN6650000

UN/NA & ERG Number: UN1239/131

EC Number: 203-480-1 [*Annex I Index No.:* 603-075-00-3]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (≥1.00% concentration).

Carcinogenicity: IARC[9]: (technical grade) Human Sufficient Evidence; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1; NTP (*includes technical grades*): 11th Report on Carcinogens, 2004: Known to be a human carcinogen; EPA: Human Carcinogen.

Banned or Severely Restricted (several countries) (UN).[13, 35]

Very Toxic Substance (World Bank).[15]

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1006).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 5000 lb (2270 kg).

US EPA Hazardous Waste Number (RCRA No.): U046.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Chloromethyl methyl ether (technical grade) Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; National Pollutant Release Inventory (NPRI).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

European/International Regulations: Hazard Symbol: F+, Xn; Risk phrases: R45; R11; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloromethyl methyl ether is a volatile, highly flammable, corrosive liquid with an ether-like odor. Molecular weight = 80.50; Specific gravity (H$_2$O:1) = 1.06; Boiling point = 58.8°C; Freezing/Melting point = −103.3°C; Vapor pressure = 192 mmHg at 20°C; Flash point = −17.8°C.[icsc] Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 3, Reactivity 2. Decomposes in water. Commercial chloromethyl methyl ether contains from 1 to 7% bis*(chloromethyl)ether*, a known cause of lung cancer in humans.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Chloromethyl methyl ether is a highly reactive methylating agent and is used in the chemical industry for synthesis of organic chemicals. Most industrial operations are carried out in closed process vessels so that exposure is minimized.

Incompatibilities: Forms explosive mixture with air. May be able to form unstable and explosive peroxides. Contact with oxidizers may cause fire and explosion. Decomposes on contact with water, forming hydrochloric acid and formaldehyde. Attacks various metals in presence of water.

Permissible Exposure Limits in Air

OSHA PEL: One of the thirteen OSHA-Regulated Carcinogens. A full OSHA Standard [1910.1006] has been adopted for this substance. See Code of Federal Regulations (CFR) 29,1926.1108.

NIOSH REL: Potential Occupational Carcinogen.

ACGIH TLV®[1]: A2, Suspected Human Carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 0.02 mg/m^3

PAC-1: 0.06 mg/m^3

PAC-2: **0.47** mg/m^3

PAC-3: **2.0** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

DFG MAK: Carcinogen Category 1, Confirmed Human Carcinogen.

Australia: carcinogen, 1993; Austria: carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; France: carcinogen, 1993; Russia: STEL 0.5 mg/m^3 [skin], 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. The Czech Republic has set a TWA of 0.003 mg/m^3.[35] Alberta, Canada set an airborne exposure limit of 0.005 ppm TWA and STEL of 0.015 ppm. Several states have set guidelines or standards for CMME in ambient air[60] ranging from 0 (North Dakota) to 0.02 ppb (Pennsylvania) to 0.03 μg/m^3 (New York) to 3.0 μ/m^3 (Virginia).

Determination in Air: See NIOSH II[1] P&CAM Method #220 or OSHA Analytical Method 10.

Permissible Concentration in Water: No criteria have been set for the protection of freshwater or saltwater aquatic life due to lack of data. For the protection of human health: preferably zero.[6]

Routes of Entry: Inhalation of vapor and possibly percutaneous absorption and ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms of exposure include sore throat, coughing; shortness of breath; fever; chills, difficulty in breathing; bronchial secretions from pulmonary edema. The liquid causes severe irritation of eyes and skin; and vapor exposure of 100 ppm is severely irritating to eyes and nose. This level is dangerous to life in 4 h. Due to an increased death rate from respiratory cancer among exposed victims, it is a regulated carcinogen.

Long Term Exposure: There is evidence that this chemical caused lung cancer in humans, and has caused skin and lung cancer in animals. Lungs may be affected by repeated or prolonged exposure causing bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preplacement and periodic medical examinations should include an examination of the skin and respiratory tract, including lung function tests and chest X-ray. Sputum cytology has been suggested as helpful in detecting early malignant changes; and in this connection a detailed smoking history is of importance. Possible effects on the fetus should be considered. Factors of increased risk: reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Those designed to supplement engineering controls and to prevent all skin or respiratory contact. Prevent skin contact. **4 h** (at least 4 h but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Full-body protective clothing and gloves should be used on entering areas of partial exposure. Those employed in handling operations should be provided with full-face, supplied-air respirators of continuous-flow or pressure-demand type. On exit from a regulated area, employees should be required to remove and leave protective clothing and equipment at the point of exit, to be placed in impervious containers as the end of the work shift for decontamination or disposal. Showers should be taken prior to dressing in street clothes.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloromethyl methyl ether, you should be trained on its proper handling and storage. Before entering confined space where chloromethyl methyl ether may be present, check to make sure that an explosive concentration does not exist. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloromethyl methyl ether requires a shipping label of "FLAMMABLE LIQUID, POISON." It falls in Hazard Class 6.1 (subsidiary risks: 3) and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small spill:* absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Large spill: dike far ahead of *large spills* for later disposal. Flood with water. Rinse with sodium bicarbonate or lime solution. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.2/0.3

Night 0.7/1.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200

Then: Protect persons downwind (miles/kilometers)

Day 1.5/2.4

Night 3.2/5.1

Fire Extinguishing: Chloromethyl methyl ether is a highly flammable liquid. Poisonous gases, including hydrogen chloride, are produced in fire. *Do not use water* or water-based extinguishers. Use dry chemical, carbon dioxide, aFFF. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated run-off enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

2-(4-Chloro-2-methyl-phenoxy) propionic acid C:0900

Molecular Formula: $C_{10}H_{11}ClO_3$

Synonyms: 2M-4CP; 2M4KHP; Acide 2-(4-chloro-2-methyl-phenoxy)propionique (French); Assassin; Banvel BP; Banvel P; BH Mecoprop; Ceridor; Chipco; Chipco turf herbicide MCPP; 2-(4-Chlor-2-methyl-phenoxy)-propionsaeure (German); 2-(4-Chloro-2-methylphenoxy)propanoic acid; α-(4-Chloro-2-methylphenoxy)propionic acid; (+)-α-(4-Chloro-2-methylphenoxy)propionic acid; (4-Chloro-2-methylphenoxy)propionic acid; 2-(4-Chloro-2-methylphenoxy)propionic acid; 4-Chloro-2-methylphenoxy-α-propionic acid; 2-(4-Chlorophenoxy-2-methyl)propionic acid; 2-(4-Chloro-*o*-tolyl)oxylpropionic acid; 2-(*p*-Chloro-*o*-tolyloxy)propionic acid; Cleaval; Clenecorn; Clovotox; CMPP; Compitox extra; *iso*-Cornox; *iso*-Cornox 64; Cornox plus; CR 205; Crusader; Docklene; EXP 419; Graslam; Harness; Harrier; Hedonal MCPP; Herrisol; Hymec; Hytane extra; Iotox; Kilprop; Liranox; 2-MCPP; MCPP; MCPP 2,4-D; MCPP-D-4; MCPP K-4; Mechlorprop; Mecobrom; Mecomec; Mecopeop; Mecoper; Mecopex; Mecoprop; Mecoturf; Mepro; Methoxone; 2-(2-Methyl-4-chlorophenoxy)propanoic acid; α-(2-Methyl-4-chlorophenoxy)propionic acid; 2-(2′-Methyl-4′-chlorophenoxy)propionic acid; 2-Methyl-4-chlorophenoxy-α-propionic acid; Musketeet; Mylone; N.B. Mecoprop; NSC 60282; Post-Kite; Propal; Propanoic acid, 2-(4-chloro-2-methylphenoxy)-; Propionic acid, 2-(4-chloro-2-methylphenoxy); Propionic acid, 2-(4-chloro-*o*-tolyl)oxy)-; Propionic acid, 2-(2-methyl-4-chlorophenoxy)-; Proponex-plus; Rankotex; RD 4593; Runcatex; Scotlene; Seloxone; Sel-oxone; Super green and weed; Supoertox; Swipe 560 EC; Terset; Tetralen-plus; U 46; U 46 KV-ester; U 46 KV-fluid; Verdone; VI-Par; Vipex; VI-Pex

CAS Registry Number: 93-65-2; *(alt.)* 7085-19-0

RTECS® Number: UE9750000

UN/NA & ERG Number: UN2765 (Phenoxy pesticides, solid, toxic)/152

EC Number: 202-264-4 [*Annex I Index No.:* 607-049-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Limited Evidence, Animal Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987.

US EPA, FIFRA 1998 Status of Pesticides: Unsupported.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R38; R41;R50/53; Safety phrases: S2; S13; S26; S37/39; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Mecoprop is a colorless, odorless, crystalline solid. Molecular weight = 214.66; Freezing/Melting point = 93−95°C. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. It is a chlorophenoxy-herbicide, used to control many broadleaf weeds. A derivative of phenoxy aryloxyalkanoic acid.

Incompatibilities: A weak acid. Incompatible with strong bases and oxidizers.

Permissible Exposure Limits in Air: This chemical can be absorbed through the skin, thereby increasing exposure.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Contact irritates the eyes and skin. Irritates the respiratory tract. Exposure can cause headache, weakness, convulsions, muscle cramps, loss of coordination, unconsciousness, and death.

Long Term Exposure: There is limited evidence that the chemical affects human reproduction. Exposure may damage blood cells, causing anemia, and damage the kidneys. Although this chemical has not been identified as a carcinogen, several related compounds have shown limited evidence of cancer.

Points of Attack: Blood, kidney, nervous system.

Medical Surveillance: Examination of the nervous system. Complete blood count. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and strong bases.

Shipping: Phenoxy pesticides, solid, toxic, n.o.s., have a DOT label requirement of "POISONOUS/TOXIC MATERIALS." This chemical falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, alcohol, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Chloromethyl phenyl isocyanate C:0910

Molecular Formula: C_8H_6ClNO
Common Formula: $OCN\text{-}C_6H_3 \cdot Cl \cdot CH_3$
Synonyms: 3-Chloro-4-methylphenyl isocyanate; Isocyanic acid, 3-chloro-*p*-tolyl ester
CAS Registry Number: 28479-22-3; *(alt.)* 51488-20-1
RTECS® Number: NQ8585000
UN/NA & ERG Number: UN2236/156
EC No: 249-050-7
Regulatory Authority and Advisory Bodies
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Chloromethyl phenyl isocyanate is a colorless to yellow liquid or beige, low-melting solid. Molecular weight = 167.59; Melting point = 143°C; Vapor pressure = Very low; Flash point ≥ 93°C. Soluble in water; solubility = 33 mg/L at 25°C. Insoluble in water.
Potential Exposure: This material is used in organic synthesis.
Incompatibilities: Acids, alkalis, and amines. Keep away from heat, light, and moisture. Do not store in temperatures above 30°C/86°F.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC) *Isocyanate-bearing waste (as CNs, n.o.s.)*
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3
Routes of Entry: Inhalation, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Chloromethyl phenyl isocyanate can affect you when breathed in. Little is known about the health effects of chloromethyl phenyl isocyanate. However, organic isocyanates can irritate the eyes, skin, and respiratory tract and cause lung allergies.
Long Term Exposure: Although the long-term effects of this chemical are unknown, many isocyanates cause allergic reactions and asthma-like allergy.
Points of Attack: Respiratory system.
Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test.
First Aid: If chloromethyl phenyl isocyanate gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposure to chloromethyl phenyl isocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloromethyl phenyl isocyanate you should be trained on its proper handling and storage. Chloromethyl phenyl isocyanate must be stored to avoid contact with acids (such as hydrochloric and nitric), alkalis (such as sodium hydroxide and potassium hydroxide), and amines (like ammonia), since violent reactions occur. Store in tightly closed

containers in a cool, well-ventilated area away from heat, light, and moisture. Do not store at temperatures above 30°C/86°F. Sources of ignition, such as smoking and open flames, are prohibited where 3-Chloro-4-methyl phenyl isocyanate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloromethyl phenyl isocyanate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.[17]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chloromethyl phenyl isocyanate may burn, but does not readily ignite. Containers may explode in fire. Poisonous gases are produced in fire, including hydrogen cyanide, nitrogen oxides, and hydrogen chloride. Use dry chemical, CO_2, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

1-Chloro-1-nitropropane C:0920

Molecular Formula: $C_3H_6ClNO_2$
Common Formula: $C_2H_5CHClNO_2$
Synonyms: 1,1-Chloronitropropane; Chloronitropropane; 1-Chloro-1-nitropropano (Spanish); Korax®; Korax 6®; Lanstan®; Propane, 1-chloro-1-nitro-
CAS Registry Number: 600-25-9
RTECS® Number: TX5075000
UN/NA & ERG Number: UN2810/153
EC Number: 209-990-0 [*Annex I Index No.:* 610-007-00-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20/22; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloronitropropane is a flammable, colorless liquid with an unpleasant odor that causes tears (lachrimator). Molecular weight = 123.5; Specific gravity (H_2O:1) = 1.2; Boiling point = 142.7°C; Vapor pressure = 6 mmHg at 25°C; Flash point = 62°C (oc). Hazard Identification (based on NFPA 704 M Rating System): Health (unknown), Flammability 3, Reactivity 2. Slightly soluble in water; solubility = 0.6% at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. This compound is used in the synthetic rubber industry, as a component in rubber cements, and as a fungicide.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause a fire and explosion hazard. May explode when exposed to heat.

Permissible Exposure Limits in Air

OSHA PEL: 20 ppm/100 mg/m^3 TWA.
NIOSH REL: 2 ppm/10 mg/m^3 TWA.
ACGIH TLV®[1]: 2 ppm/10 mg/m^3 TWA.
No TEEL available.
NIOSH IDLH: 100 ppm.

Australia: TWA 2 ppm (10 mg/m^3), 1993; Austria: MAK 20 ppm (100 mg/m^3), 1999; Belgium: TWA 2 ppm (10 mg/m^3), 1993; Denmark: TWA 2 ppm (10 mg/m^3), 1999; Finland: TWA 20 ppm (100 mg/m^3); STEL 30 ppm (150 mg/m^3), 1999; France: VME 2 ppm (10 mg/m^3), 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; the Philippines: TWA 20 ppm (100 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, 1999; Switzerland: MAK-W 2 ppm (10 mg/m^3), 1999; Turkey: TWA 20 ppm (100 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm. Several states have set guidelines or standards for chloronitropropane in ambient air[60] ranging from 10 μg/m^3 (North Dakota) to 150 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Chromosorb tube-108; Ethyl acetate; Gas chromatography/Flame ionization detection; See NIOSH II(5) Method #S-211.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: 1-Chloro-1-nitropropane can affect you when breathed in. Exposure can irritate and burn the eyes, skin, and cause respiratory tract irritation with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause damage to the heart, liver, and kidneys. Similar irritating substances can cause lung injury and bronchitis.

Points of Attack: In animals: respiratory system, lungs, liver, kidneys, cardiovascular system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. EKG. Lung function tests. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* Sa* (APF = 10) (any supplied-air respirator); *50 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode; or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]*. *100 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; requires eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 1-chloro-1-nitropropane you should be trained on its proper handling and storage. Before entering confined space where 1-chloro-1-nitropropane may be present, check to make sure that an explosive concentration does not exist. Store to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic, liquids, organic, n.o.s., requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is flammable. Poisonous gases, including nitrogen oxides and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s minimum for primary combustion; 1204°C, 1.0 s for secondary combustion) after mixing with other fuel. The formation of elemental chlorine may be prevented by injection of steam or using methane as a fuel in the process. Alternatively it may be poured over soda ash, neutralized and flushed into the sewer with large volumes of water.

Chloropentafluoroethane C:0930

Molecular Formula: C_2ClF_5

Common Formula: ClF_2CCF_3

Synonyms: CFC-115; Chloropentafluoroethane; 1-Chloro-1,1,2,2,2-pentafluoromethane; Ethane, Chloropentafluoro-; F-115; FC 115; Flurocarbon 115; Freon 115; Genetron 115; Halocarbon 115; HCFC-115; Monocloropentafluoetano (Spanish); Pentafluoromonochloroethane; Propellent 115; R 115; Refrigerant 115

CAS Registry Number: 76-15-3; *(alt.)* 12770-91-1

RTECS® Number: KH7877500

UN/NA & ERG Number: UN1020/126

EC Number: 200-938-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 0.6.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chloropentafluoroethane is a colorless, odorless, nonflammable gas with an ethereal odor. Shipped as a liquefied compressed gas. Molecular weight = 154.47; Specific gravity (H_2O:1) = 1.3; Boiling point = −38°C; Freezing/Melting point = −106°C; Vapor pressure = 7.9 atm at 21°C; 6035 mmHg at 21°C; Relative vapor density (air = 1) = 5.28. Practically insoluble in water; solubility 0.006% at 20°C.

Potential Exposure: This material is used as a refrigerant, as a dielectric gas, and as a propellant in aerosol food preparations.

Incompatibilities: Keep away from strong oxidizers, strong bases (alkalis), alkaline earth metals (e.g., aluminum powder, sodium, potassium, zinc), and beryllium. Keep away from open flames; decomposes forming toxic fumes including hydrogen chloride and hydrogen fluoride.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.32 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1000 ppm/6320 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/6320 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3000 ppm

PAC-2: 5000 ppm

PAC-3: 300,000 ppm

Australia: TWA 1000 ppm (6320 mg/m^3), 1993; Belgium: TWA 1000 ppm (6320 mg/m^3), 1993; Denmark: TWA 1000 ppm (6300 mg/m^3), 1999; France: VME 1000 ppm (6320 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; the Netherlands: MAC-TGG 6460 mg/m^3, 2003; Russia: STEL 3000 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (6400 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000 ppm. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 3000 mg/m^3 in work-place air. Several states have set guidelines or standards for FC-115 in ambient air[60] ranging from 0.1264 μg/m^3 (Connecticut) to 9,999 μg/m^3 (Virginia) to 63,200 μg/m^3 (North Dakota) to 151,000 μg/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.4.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chloropentafluoroethane can affect you when breathed in. Irritates the nose, throat, and lungs, causing coughing, chest tightness, wheezing, and shortness of breath. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels can cause death. Chloropentafluoroethane may irritate the skin causing a rash or burning feeling on contact. Exposure may affect the heart, causing irregular heartbeat, which could lead to death. Rapid evaporation of liquid chloropentafluoroethane may cause frostbite of the eyes and skin.

Long Term Exposure: Similar very irritating substances can cause lung damage.

Points of Attack: Skin, central nervous system, cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24 h EKG (Holter monitor) to look for irregular heartbeat. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over 1000 ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Green: General storage may be used. Prior to working with chloropentafluoroethane you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that sufficient oxygen (19%) exists. Store in tightly closed containers in a cool, well-ventilated area away from metals, including aluminum, zinc, and beryllium; and from open flames or temperatures above 52°C/125°F. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Chloropentafluoroethane must be labeled "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop the flow of gas if it can be done safely. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire, including fluorides, chlorides, phosgene, and acid gases. Use dry chemical or carbon dioxide extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chlorophacinone C:0940

Molecular Formula: $C_{23}H_{15}ClO_3$

Synonyms: Afnor; Caid; Chlorfacinon (German); 2-(α-*p*-Chlorophenylacetyl)indane-1,3-dione; [(4-Chlorophenyl)-1-phenyl]-acetyl-1,3-indandion (German); 2-[(*p*-Chlorophenyl)phenylacetyl]-1,3-indandione; 2[2-(4-Chlorophenyl)-2-phenylacetyl]indan-1,3-dione; 2 [(4-Chlorophenyl)phenylacetyl)-1H-indene-1,3(2H)-dione; 1-(4-Chlorphenyl)-1-phenyl-acetyl indan-1,3-dion

(German); Clorofacinona (Spanish); Delta; Drat; 1,3-Indandione, 2-[(*p*-chlorophenyl)phenylacetyl]-; 1H-Indene-1,3(2H)-dione, 2-[(4-Chlorophenyl)phenylacetyl]-; Liphadione; LM 91; Microzul; Muriol; 2-[2-Phenyl-2-(4-chlorophenyl)acetyl]-1,3-indandione; Quick; Ramucide; Ranac; Ratomet; Raviac; Rozol; Topitox

CAS Registry Number: 3691-35-8

RTECS® Number: NK5335000

UN/NA & ERG Number: UN3027 (Coumarin derivative pesticides, solid, toxic)/151

EC Number: 223-003-0 [*Annex I Index No.*: 606-014-00-9]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R23; R27/28; R48/24/25; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlorophacinone is a highly toxic crystalline solid. Molecular weight = 374.83; Freezing/Melting point = 140°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0.

Potential Exposure: Agricultural Chemical. This material is an anticoagulant rodenticide. Those involved in its manufacture, formulation, and application are at risk.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

Permissible Concentration in Water: No criteria set. Fish Tox (ppb): 27.64016000 MATC (Maximum Acceptable Toxicant Concentration).

Determination in Water: Octanol−water coefficient: Log K_{ow} = 5.49.

Routes of Entry: Ingestion and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Symptoms of exposure are similar to those of warfarin. Symptoms develop after a few days or a few weeks of repeated ingestion and include nosebleed and bleeding gums; pallor and sometimes a rash; massive bruises, especially of the elbows, knees, and buttocks; blood in urine and feces; occasionally paralysis from cerebral hemorrhage; and hemorrhagic shock and death. Chlorophacinone is highly toxic orally and by skin adsorption. The probable oral lethal dose for humans is less than 5 mg/kg to 50 mg/kg, or between a taste (less than 7 drops) and 1 teaspoonful for a 150-lb (70-kg) person. LD_{50} = (oral-rat) >5000 mg/kg; (oral-mouse) 1.06 mg/kg. Human Tox (ppb): 0.03500 (extra high).

Long Term Exposure: See above.

Points of Attack: Blood, cardiovascular system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Coumarin derivative pesticides, solid, toxic, n.o.s., require a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class is 6.1 and Packing Group I.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Small fires: dry chemicals, carbon dioxide, water spray or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration at high temperature with effluent gas scrubbing.[22]

WGK (German Aquatic Hazard Class): 2—Water polluting (*o-, m-, and p-isomers*).

Description: All have a characteristic odor. Odor threshold = 1.24 ppm (pure). Molecular weight (all isomers) = 128.56.

m-isomer

Colorless (in pure state) to pink or amber (technical grade, due to impurities) crystalline solid or liquid. Boiling point = 214°C; Freezing/Melting point = 32.8°C; Specific gravity (H_2O:1) = 1.245; Vapor pressure = 5 mmHg at 70°C; Flash point = >112°C. Solubility in water = 2.6–2.8.5% at 20°C. Hazard Identification (based on NFPA 704 M Rating System): Health 2, Flammability 0, Reactivity 0.

o-isomer

White crystalline (needle-like) solid. Boiling point = 175.6°C; Freezing/Melting point = 9.3–9.8°C; Specific gravity (H_2O:1) = 1.3; Vapor pressure, Pa at 20°C = 230; Relative vapor density (air = 1) = 4.4; Flash point = 64°C (cc). Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 2, Reactivity 0. Solubility in water = 2.7% at 20°C.

p-isomer

White to straw-colored, needle-like crystalline solid. Boiling point = 218°C; Freezing/Melting point = 43°C; Vapor pressure = 10 mmHg at 20°C; Vapor density (air = 1) = 4.44; Flash point = 121°C (cc). Hazard Identification (based on NFPA 704 M Rating System): Health 3, Flammability 1, Reactivity 0. Solubility in water = 2.71% at 20°C.

Potential Exposure: Compound Description (*m*-isomer): Tumorigen, Mutagen (*o*-isomer): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; (*p*-isomer): Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Monochlorophenols are used in the manufacture of fungicides, slimicides, bactericides, pesticides, herbicides, disinfectants, wood and glue preservatives; in the production of phenolic resins; in the extraction of certain minerals from coal; as a denaturant for ethanol; as an antiseptic; as a disinfectant, and others.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizing agents can cause fire and explosion hazard. Heat produces hydrogen chloride and chlorine. Corrosive to aluminum, copper, and other chemically active metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

o-isomer

TEEL-0: 1.5 ppm

PAC-1: 5 ppm

PAC-2: 35 ppm

PAC-3: 75 ppm

m-isomer

TEEL-0: 0.3 mg/m^3

PAC-1: 0.75 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 250 mg/m^3

o- and *m*-isomers

Denmark: TWA 0.5 mg/m^3 [skin], 1999; Sweden: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3 [skin], 1999.

p-isomer

Protective Action Criteria (PAC)

p-isomer

TEEL-0: 250 mg/m^3

PAC-1: 400 mg/m^3

PAC-2: 400 mg/m^3

PAC-3: 400 mg/m^3

Denmark: TWA 0.5 mg/m^3 [skin], 1999; Poland: MAC (TWA) 1 mg/m^3; STEL 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3 [skin]1993; Sweden TWA 0.5 mg/m^3; STEL 1.5 mg/m^3 [skin] 1999.

These chemicals can be absorbed through the skin, thereby increasing exposure. Russia set limits in ambient air in residential areas of 0.01 mg/m^3 for the *m*- and *p*-chlorphenols and 0.02 mg/m^3 for 2-chlorophenol.

Determination in Air: Use NIOSH: (*o*-chlorophenol) P&CAM Method #337.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 4380 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* no criteria set due to insufficient data. *To protect human health:* 0.1 μg/L for the prevention of adverse effects due to organoleptic properties.[6]

The state of Kansas has set guidelines for chlorophenols in drinking water[61] of 0.1 μg/L for the *o*-isomer and 0.3 μg/L for the *p*-isomer.

Determination in Water: Gas chromatography (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = (*m*-isomer) 2.51; (*o*-isomer) 2.2; (*p*-isomer) 2.4.

Routes of Entry: Skin absorption, inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause severe irritation, burns to the nose and throat; headache, dizziness, vomiting, lung damage; muscle twitchings; spasms, tremors, weakness, staggering and collapse. Skin contact can cause severe irritation and burns. Can be absorbed through the skin to cause or increase the severity of symptoms listed above. Eye contact causes severe irritation. May cause burns. Ingestion can cause irritation, burns to the mouth and throat; low blood pressure; profuse sweating; intense thirst; nausea, abdominal pain; stupor, vomiting, red blood cell damage and accumulation of fluid in the lungs followed by pneumonia. May also cause restlessness and increased breathing rate followed by rapidly developing muscle weakness. Tremors, convulsions, and coma can promptly set in and will continue until death. Based on animal studies, the estimated lethal dose is between one teaspoon and one ounce for a 150-pound adult. *p-isomer*: The substance irritates the eyes, skin, and the respiratory tract. The substance may cause effects on the central nervous system and bladder.

Long Term Exposure: Skin sensitivity may develop. May have effects on the blood, heart, liver, lung, kidney. The state of New Jersey lists 2-chloro- a probable carcinogen in humans; and that it causes leukemia and soft tissue cancers in humans.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Kidney function tests. Examination by a qualified allergist; EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles when working with powders or dust, unless full face-piece respiratory protection is worn.

Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to chlorophenols, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered, air-purifying respirator. Where there is potential for high exposure to chlorophenols, or to liquid form, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorophenols you should be trained on its proper handling and storage. Before entering confined space where chlorophenols may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorophenols must carry a “POISONOUS/TOXIC MATERIALS” label.[19] They fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *o*-Chlorophenol is a combustible liquid/solid. *m*- and *p*-chlorophenols may burn, but do not readily ignite. Poisonous gases, including phenols and chlorides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors from 2-chloro- may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in admixture with flammable solvent in furnace equipped with afterburner and scrubber.[22]

4-Chloro-*o*-phenylene-diamine C:0960

Molecular Formula: $C_6H_7ClN_2$
Common Formula: $ClC_6H_3(NH_2)_2$
Synonyms: 2-Amino-4-chloroaniline; 4-Chloro-1,2-benzenediamine; 4-Chloro-1,2-diaminobenzene; *p*-Chloro-*o*-phenylenediamine; 4-Chloro-1,2-phenylenediamine; 4-Cl-*o*-Pd; 1,2-Diamino-4-chlorobenzene; 3,4-Diamino-1-chlorobenzene; 3,4-Diaminochlorobenzene; NCI-C03292; Ursol olive 6G
CAS Registry Number: 95-83-0
RTECS® Number: SS8850000
UN/NA & ERG Number: UN3143 (Dyes, solid, toxic, n.o.s.)/151
EC Number: 202-456-8
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Sufficient Evidence, Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1998; NTP: 7th Report on Carcinogens; NCI: Clear evidence: mouse, rat[9]; a related chemical, 4-Chloro-*m*-phenylene-diamine (5131-60-2); NTP: Reasonably anticipated to be a human carcinogen.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
California Proposition 65 Chemical: Cancer 1/1/88.
WGK (German Aquatic Hazard Class): No value assigned.
Description: 4-Chloro-*o*-phenylene-diamine is a brown crystalline powder or leaflets from water; Freezing/Melting point = 67−70°C; also reported at 76°C.
Potential Exposure: This material has been patented as a hair dye component. It is believed to be used in production of photographic chemicals.
Incompatibilities: Strong oxidizers.
Permissible Exposure Limits in Air
No standards or TEEL available.
North Dakota has set a guideline for ambient air of zero concentration.[60]
Determination in Air: NIOSH Analytical Method #5013, Dyes.
Harmful Effects and Symptoms
Short Term Exposure: Can cause irritation of eyes, nose, skin, and mucous membranes.
Long Term Exposure: There is sufficient evidence that 4-chloro-*o*-phenylene-diamine is carcinogenic in experimental animals. In long-term feeding bioassays with technical grade 4-chloro-*o*-phenylene-diamine, rats developed tumors of the urinary bladder and fore-stomach. In mice, the compound induced hepatocellular carcinomas.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated place or a refrigerator.
Shipping: While not specifically cited by DOT, this may be classed as Dyes, solid, toxic, n.o.s. or as Toxic solids, organic, n.o.s. This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.2 and Packing Group III.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent paper dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous

waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chlorophenyltrichlorosilane C:0970

Molecular Formula: $C_6H_4Cl_4Si$

Common Formula: $ClC_6H_4SiCl_3$

Synonyms: Chlorofeniltriclorosilano (Spanish); Chlorophenyl trichlorosilane; Trichloro (chlorophenyl) silane

CAS Registry Number: 26571-79-9

RTECS® Number: VV2650000

UN/NA & ERG Number: UN1753/156

EC Number: 247-817-0

Regulatory Authority and Advisory Bodies

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chlorophenyltrichlorosilane is a combustible, colorless to pale yellow liquid. Molecular weight = 245.99; Boiling point = 230°C; Flash point = 123.8°C. Decomposes in water.

Potential Exposure: Chlorophenyltrichlorosilane is used as an intermediate for manufacture of silicones.

Incompatibilities: Chlorophenyltrichlorosilane decomposes on contact with water, steam, or other forms of moisture producing hydrogen chloride and heat. Attacks metals in the presence of moisture. Some chlorosilanes can self-ignite in air. Contact with ammonia may cause the formation of a self-igniting product. Keep chlorophenyltrichlorosilane away from combustible materials, such as wood, paper, and oil. Chlorophenyltrichlorosilane reacts with α-ketoacids, forming heterocyclic compounds of quinoxalones.[NTP]

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Based on 15 other trichlorosilanes with the same TEELs

TEEL-0: 0.2 ppm

PAC-1: 0.6 ppm

PAC-2: 7.3 ppm

PAC-3: 33 ppm

Routes of Entry: Skin contact, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Chlorophenyltrichlorosilane can affect you when breathed in. Chlorophenyltrichlorosilane is a corrosive chemical. Contact can cause severe eye and skin burns. Inhalation can cause irritation of the lungs, causing coughing and/or shortness of breath. High exposures can cause pulmonary edema, a medical emergency which can be delayed for several hours. This can cause death.

Long Term Exposure: Can cause lung irritation; bronchitis may develop.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning work and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. All respirators selected must be approved by NIOSH under the provisions of 42 CFR 84. The current listing of NIOSH-certified respirators can be found in the NIOSH/NPPTL Certified Equipment List, which is available on the NIOSH web site.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with chlorophenyltrichlorosilane you should be trained on its proper handling and storage. Chlorophenyltrichlorosilane should be stored to avoid contact with combustible materials, such as wood, paper, and oil. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive gases, including hydrogen chloride, can be produced.

Shipping: Chlorophenyltrichlorosilane requires a shipping label of "CORROSIVE."[19] It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Fire Extinguishing: Chlorophenyltrichlorosilane may burn, but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers. *Do not use water*. Poisonous gases are produced in fire, including chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloropicrin is a highly reactive, colorless, oily liquid with a sharp, penetrating odor that causes tears. Odor threshold = 1.1 ppm. Molecular weight = 164.38; Specific gravity (H_2O:1) = 1.66; Boiling point = 112.2°C; Freezing/Melting point = − 69.2°; Vapor pressure = 24 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3. Slightly soluble in water; solubility = 0.17% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. Chloropicrin is an important insecticide and is used in the manufacture of the dyestuff methyl violet and in other organic syntheses. It is used as a fumigant insecticide. It is a riot control and tear agent and has been used as a military poison gas. Some forms of tear gas also contain chloropicrin. Since tank trucks, tank cars, and tank vessels carry this throughout the world in large quantities, it is a potential problem.

Incompatibilities: Chloropicrin decomposes explosively when heated above 112°C. It can be dangerously self-reactive; and, may explode when heated under confinement or if shocked. Chloropicrin is stable except when it is heated to a high temperature; it explosively breaks down, releasing other poison gases including nitrogen oxides, nitrosyl chloride, chlorine, phosgene, and carbon monoxide. Liquid chloropicrin (PS) is unstable with high temperatures or severe shock, particularly when involving containers of greater than 30 gallons capacity. Chloropicrin reacts violently with aniline, sodium methoxide, and propargyl bromide; 2-bromopropyne and strong oxidizers. Violent reaction with reducing agents; aniline (especially in presence of heat), alcoholic sodium hydroxide. Quickly elevated temperatures, shock, contact with alkali metals or alkaline earth may cause explosions. It is a strong acid and will react violently with bases and alkali materials. Liquid attacks some plastics, rubber, and coatings. Chloropicrin reacts with iron, zinc, light metals including aluminum, magnesium, and alloys containing these metals. It reacts, sometimes violently, with some types of rubbers and plastics, as well as some chemicals including common sulfuric acid and bases. Contact with metals may evolve explosive hydrogen gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.72 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.7 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.7 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 ppm/0.67 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC) PS*

TEEL-0: 0.05 ppm

PAC-1: **0.05** ppm

PAC-2: **0.15** ppm

PAC-3: **1.4** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Emergency Response Planning Guidelines (AIHA)

ERPG-1: 0.1 ppm

ERPG-2: 0.3 ppm

ERPG-3: 1.5 ppm

DFG MAK: 0.1 ppm/0.68 mg/m^3 TWA; Peak Limitation Category I(1).

NIOSH IDLH: 2 ppm.

Australia: TWA 0.1 ppm (0.7 mg/m^3); STEL 0.3 ppm (2 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.7 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.67 mg/m^3); STEL 0.3 ppm, 1993; Denmark: TWA 0.1 ppm (0.7 mg/m^3), 1999; Finland: TWA 0.1 ppm (0.7 mg/m^3); STEL 0.3 ppm (2.1 mg/m^3), 1999; France: VME 0.1 ppm (0.7 mg/m^3), 1999; Japan: 0.1 ppm (0.67 mg/m^3), 1999; the Netherlands: MAC-TGG 0.7 mg/m^3, 2003; Norway: TWA 0.1 ppm (0.7 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.7 mg/m^3), 1993; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1.5 mg/m^3, 1999; Russia: TWA 0.1 ppm, 1993; Switzerland: MAK-W 0.1 ppm (0.7 mg/m^3), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.7 mg/m^3), 1993; United Kingdom: TWA 0.1 ppm (0.68 mg/m^3); STEL 0.3 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for chloropicrin in ambient air[60] ranging from 7−20 μg/m^3 (North Dakota) to 11.7 μg/m^3 (Virginia) to 14 μg/m^3 (Connecticut) to 17 μg/m^3 (Nevada).

Determination in Air: When liquid chloropicrin enters water, it mixes very slowly, falling to the bottom, where it breaks down in less than a day. Nevertheless, warn pollution control authorities and advise shutting water intakes. Chloropicrin is very poisonous to fish.

Permissible Concentration in Water: California[61] has set guidelines for chloropicrin in drinking water of 50 μg/L on a taste basis and 37 μg/L on an odor basis.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.09.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Chlorpicrin was used as poison gas in WW1. Exposure causes intense tearing of the eyes, headache, nausea and vomiting, diarrhea, and cough. Contact can severely irritate the skin causing rash or burning sensation. Higher exposures can irritate and burn the lungs, causing a buildup of fluid (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 250 mg/kg (moderately toxic).

Long Term Exposure: Repeated exposure can damage the lungs, causing bronchitis. It may also damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: lung function tests. If symptoms develop or overexposure has occurred, the following may be useful: liver and kidney function tests. Consider chest X-ray following acute overexposure. NIOSH suggests the following tests: electrocardiogram, expired air, pulmonary function tests: forced vital capacity and forced expiratory volume (1 s), sputum cytology, and white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Decontamination: Decontaminate as soon as possible. This is extremely important. If you do not have the equipment and training, do not enter the hot zone to rescue and/or decontaminate victims. If the victim cannot move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available), and subsequently move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 min. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. The International Technical Information Institute recommends wearing Neoprene™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with chloropicrin you should be trained on its proper handling and storage. Before entering confined space where chloropicrin may be present, check to make sure that an explosive concentration does not exist. Chloropicrin must be stored to avoid contact with strong oxidizers, such as chlorine or chlorine dioxide, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. High temperatures or severe shock may cause an explosion, particularly with containers having capacities of greater than 30 gallons. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chloropicrin must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.[19] A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Note: There is no specific information for "PS" Chloropicrin, used as a weapon in the current DOT tables.

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.6/1.4

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.2/1.9
Night 2.1/3.3

Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate the area of spill or leak.

Fire Extinguishing: Chloropicrin is a noncombustible liquid. However, in the case where a chloropicrin tank is adjacent to a fire, the tank will heat causing extremely high pressurization and explosion. Evacuate area. Even if the tank does not fail, the safety valve may open releasing chloropicrin, so evacuate. If necessary, fight fire from an explosion-resistant location. When heated, chloropicrin breaks down to poison gases like phosgene (another good reason to evacuate); and at high temperature it can violently break down into several poisonous gases, including hydrogen chloride and nitrous vapors. The danger from a heated chloropicrin tank is too great to risk a manned firefighting effort; if possible, an unattended fire monitor aimed at the upper part of the chloropicrin tank will cool the tank and may prevent tank failure. In general, it is best to use a spray or fog pattern rather than a solid stream to avoid spreading the burning fuel around. If there is a reason that you have to extinguish a fire near a chloropicrin tank, use a firefighting agent (water, ordinary foam, alcohol foam, or dry chemical) appropriate for that fuel. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s minimum for primary combustion; 1204°C, 1.0 s for secondary combustion) after mixing with other fuel. The formation of elemental chlorine may be prevented by injection of steam or using methane as a fuel in the process. Chloropicrin reacts readily with alcoholic sodium sulfite solutions to produce methanetrisulfonic acid (which is relatively nonvolatile and less harmful). This reaction has been recommended for treating spills and cleaning equipment. Although not specifically suggested as a decontamination procedure, the rapid reaction of chloropicrin with ammonia to produce guanidine ($LD_{50} = 500$ mg/kg) could be used for detoxification. The Chemical Manufacturers' Association has suggested two procedures for disposal of Chloropicrin: (a) Pour or sift over soda ash. Mix and wash slowly into large tank. Neutralize and pass to sewer with excess water. (b) Absorb on vermiculite. Mix and shovel into paper boxes. Drop into incinerator with afterburner and scrubber.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 241-010-7 [*Annex I Index No.*: 078-009-00-4]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R25; R35; R42/43; Safety phrases: S1/2; S22; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloroplatinic acid is a reddish-brown deliquescent solid. Molecular weight = 409.8; Freezing/Melting point = 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Chloroplatinic acid has many uses, among them are platinum plating, photography, and catalysis.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.002 mg[Pt]/m^3 TWA, soluble salts.

OSHA PEL: 0.002 mg[Pt]/m^3 TWA, soluble salts.

NIOSH REL: 0.002 mg[Pt]/m^3 TWA, soluble salts.

Protective Action Criteria (PAC)

TEEL-0: 0.0042 mg/m^3

PAC-1: 0.25 mg/m^3

PAC-2: 1.5 mg/m^3

PAC-3: 8.4 mg/m^3

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

NIOSH IDLH: 4 mg [Pt]/m^3.

Determination in Air: Use NIOSH II(7) Method #S-19 (soluble salts).

Routes of Entry: Skin contact, inhalation of vapors, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chloroplatinic acid can affect you when breathed in. It is a highly corrosive chemical; contact can severely irritate and burn the eyes. Inhalation can irritate the respiratory tract. Exposure can cause severe allergies affecting the nose, skin, and lungs. Symptoms include sneezing, coughing, nose and throat irritation and nasal discharge. Irritation and even ulcers can develop in the nose. Once lung allergy develops, even very small future exposures cause cough, wheezing, chest tightness, and shortness of breath. Skin allergy with a rash and itching can also develop.

Long Term Exposure: Repeated exposure may lead to permanent lung damage (pulmonary fibrosis), skin allergy, asthma-like allergy.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.05 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode), *up to 0.1 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 4 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Solid chloroplatinic acid must carry a "CORROSIVE" label.[19] It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, CO_2, water spray, or foam extinguishers. Chloroplatinic acid may burn but does not readily ignite. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.057; Nonwastewater (mg/kg), 0.28.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8010 (50); 8240 (5).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 6/2/00.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: F+, T; Risk phrases: R45; R11; R20/22; R36/37/38; R48/20; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chloroprene is a colorless, flammable liquid possessing a pungent odor. The odor threshold is 0.4 mg/m^3.[41] Molecular weight = 88.54; Specific gravity (H_2O:1) = 0.96; Boiling point = 59.4°C; Freezing/Melting point = − 130°C; Vapor pressure = 188 mmHg at 20°C; Flash point = − 20°C (oc). The explosive limits are: LEL = 1.9%; UEL = 11.3%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water; solubility = 0.03% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. The major use of chloroprene is in the production of artificial rubber (Neoprene™, duprene); polychloroprene elastomers. Chloroprene is extremely reactive, e.g., it can polymerize spontaneously at room temperatures; the process being catalyzed by light, peroxides, and other free-radical initiators. It can also react with oxygen to form polymeric peroxides and because of its instability, flammability, and toxicity, chloroprene has no end-product uses as such.

Incompatibilities: Can form unstable peroxides; chloroprene may polymerize on standing with fire or explosion hazard. Forms explosive mixture with air. Reacts with liquid or gaseous fluorine, alkali metals, metal powders, oxidizers, creating a fire or explosion hazard. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.62 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/90 mg/m^3 TWA [skin].

NIOSH REL: 1 ppm/3.6 mg/m^3 [15 min] Ceiling Concentration; Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/36 mg/m^3 TWA [skin].

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 1 ppm

PAC-2: 1 ppm

PAC-3: 300 ppm

DFG MAK: [skin] Carcinogen Category 2.

NIOSH IDLH: 300 ppm.

Australia: TWA 10 ppm (35 mg/m^3), [skin], 1993; Austria: MAK 10 ppm (36 mg/m^3), 1999; Belgium: TWA 10 ppm (36 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (3.6 mg/m^3), [skin], 1999; Finland: TWA 10 ppm (36 mg/m^3); STEL 20 ppm (72 mg/m^3), [skin], 1999; France: VME 10 ppm (36 mg/m^3), 1999; Hungary: TWA 10 mg/m^3; STEL 30 mg/m^3, 1993; the Netherlands: MAC-TGG 18 mg/m^3, [skin], 2003; Norway: TWA 1 ppm (3.6 mg/m^3), 1999; Poland: MAC (TWA) 2 mg/m^3; STEL, 16 mg/m^3, 1999; Russia: STEL 0.05 mg/m^3, 1993; Sweden: NGV 10 ppm (35 mg/m^3), KTV 15 ppm (60 mg/m^3), [skin], 1999; Switzerland: MAK-W 10 ppm (36 mg/m^3), KZG-W 20 ppm (72 mg/m^3), [skin], 1999; United Kingdom: TWA 10 ppm (37 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm [skin]. Russia set a MAC of 0.02 mg/m^3 in ambient air in residential areas on a momentary basis and 0.002 mg/m^3 on a daily average basis.[35] Several states have set guidelines or standards for chloroprene in ambient air[60] ranging from 2.5 μg/m^3 (Massachusetts) to 175 μg/m^3 (South Carolina) to 350 μg/m^3 (North Dakota) to 420−3500 μg/m^3 (North Carolina) to 800 μg/m^3 (Virginia) to 900 μg/m^3 (Connecticut) to 1070 μg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2 and analysis by gas chromatography. Use NIOSH Analytical Method #1002 or OSHA Analytical Method 112.[18]

Permissible Concentration in Water: A MAC in water bodies used for domestic purposes of 0.01 mg/L has been set by Russia.[35]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.12.

Routes of Entry: Inhalation of vapor, skin absorption, ingestion, and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Chloroprene irritates the eyes, skin, and respiratory tract. Chloroprene acts as a primary irritant on contact with skin, conjunctiva, and mucous membranes; and may result in dermatitis, conjunctivitis, and circumscribed necrosis of the cornea. Inhalation of high concentrations may result in dizziness, lightheadedness and unconciousness, anesthesia, and respiratory paralysis. Chloroprene may affect the central nervous system, kidneys, and liver. The LD_{50} oral rat is only 900 mg/kg (slightly toxic).

Long Term Exposure: Chronic exposure may produce damage to the lungs, nervous system, liver, kidneys, spleen, and myocardium. Because this is a mutagen, handle it as a possible cancer-causing substance—with extreme caution. It may also damage the developing fetus, cause spontaneous abortions, and interfere with sperm production. Repeated or prolonged contact with skin may cause dermatitis. Chronic exposure may cause alopecia. Chloroprene is a potential occupational carcinogen. Temporary hair loss has been reported during the manufacture of polymers.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: Preplacement and periodic examinations should include an evaluation of the skin, eyes, respiratory tract, and central nervous system. Liver and kidney function should be evaluated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; Viton™ gloves, suits; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Engineering controls are recommended in NIOSH Criteria Document: 77-1210.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with chloroprene you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Chloroprene must be stored to avoid contact with peroxides and other oxidizers, such as permanganates, nitrates, chlorates, and perchlorates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area at temperatures below 10°C/50°F. Sources of ignition, such as smoking and open flames, are prohibited where chloroprene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of chloroprene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of chloroprene. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Shipment of uninhibited chloroprene is FORBIDDEN. Inhibited chloroprene must bear the label of "FLAMMABLE LIQUID, POISON." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chloroprene is a flammable liquid. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. May react with itself without warning, blocking relief valves and leading to container explosions. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
US EPA Hazardous Waste Number (RCRA No.): P027.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
WGK (German Aquatic Hazard Class): No value assigned.
Description: 3-Chloropropionitrile is a combustible, colorless liquid with an acrid odor. Molecular weight = 89.53; Boiling point = 175−176°C (decomposes); Flash point = 76°C. Hazard Identification (based on NFPA-704 M Rating System): Flammability 2, Reactivity 1.
Potential Exposure: This material is used in pharmaceutical manufacture and in polymer synthesis.
Incompatibilities: Contact with strong oxidizers may cause a fire and explosion hazard.
Permissible Exposure Limits in Air
NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.
Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 1.5 ppm
PAC-2: 2.46 ppm
PAC-3: 12.5 ppm
Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.
Routes of Entry: Inhalation, ingestion, skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.
Harmful Effects and Symptoms
Short Term Exposure: Symptoms of exposure include rapid and irregular breathing, anxiety, confusion, odor of bitter almonds (on breath or vomitus), nausea, vomiting (if oral exposure), irregular heartbeat, a feeling of tightness in the chest, bright pink coloration of the skin, sweating, protruding eyeballs, dilated pupils, unconsciousness followed by convulsions, involuntary urination and defecation, paralysis and respiratory arrest (heart will beat after breathing stops). Toxic effects are a result of systemic cyanide poisoning. Few poisons are more rapidly lethal. Average oral lethal dose for hydrogen cyanide is approximately 60−90 mg (corresponds to 200 mg of potassium cyanide). Cause of death is lack of oxygen to the body's cells (especially the brain and heart) as a result of the chemical inhibiting cell enzymes.
Medical Surveillance: Blood cyanide level.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.
Respirator Selection: *Up to 25 mg/m³:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-

pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where 3-chloropropionitrile may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Stay upwind. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.1
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including cyanides, are produced in fire. Use alcohol foam extinguishers and water spray. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Common Formula: $ClC_6H_4CH{=}CH_2$

Synonyms: Benzene, 1-chloro-2-ethenyl-; 1-Chloro-2-ethenylbenzene; *o*-Chlorostyrene; 2-Chlorostyrene; Chlorostyrene

CAS Registry Number: 1331-28-8; 2039-87-4 (*o*-isomer)

RTECS$^{®}$ Number: WL4150000

UN/NA & ERG Number: UN1993 (Flammable liquids, n.o.s.)/128

EC Number: 218-026-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *o*-Chlorostyrene is a flammable, colorless liquid. Molecular weight = 138.60; Specific gravity (H_2O:1) = 1.1; Boiling point = 188.8°C; Freezing/Melting point = −63.3°C; Vapor pressure = 0.96 mmHg at 25°C; Flash point = 58.8°C. Practically insoluble in water.

Potential Exposure: In organic synthesis; in the preparation of specialty polymers.

Incompatibilities: Contact with elevated temperatures, strong oxidizers, strong bases, or acids may cause fire or explosion. May form peroxides; explosive polymerization may occur.

Permissible Exposure Limits in Air

o-isomer

OSHA PEL: None.

NIOSH REL: 50 ppm/285 mg/m^3 TWA; 75 ppm/428 mg/m^3 STEL.

ACGIH TLV®[1]: 50 ppm/283 mg/m^3 TWA; 75 ppm/425 mg/m^3 STEL.

No TEEL available.

Australia: TWA 50 ppm (285 mg/m^3); STEL 75 ppm (430 mg/m^3), 1993; Austria: MAK 50 ppm (285 mg/m^3), 1999; Belgium: TWA 50 ppm; STEL 75 ppm, 1993; France: VME 50 ppm (285 mg/m^3), 1999; the Netherlands: MAC-TGG 285 mg/m^3, 2003; Norway: TWA 25 ppm (140 mg/m^3), 1999; Switzerland: MAK-W 50 ppm (215 mg/m^3), KZG-W 100 ppm (430 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 75 ppm. Several states have set guidelines or standards for chlorostyrene in ambient air[60] ranging from 2.85−4.30 mg/m^3 (North Dakota) to 4.8 mg/m^3 (Virginia) to 5.7 mg/m^3 (Connecticut) to 6.79 mg/m^3 (Nevada).

Determination in Air: No method listed by NIOSH.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.6.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *o*-Chlorostyrene can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes and skin. LD_{50} (50% kill) = 3810 μL/kg, oral, rat.

Long Term Exposure: Repeated exposures may damage the liver and kidneys. Animal studies show hematuria (blood in the urine), proteinuria, acidosis, enlarged liver, jaundice.

Points of Attack: Eyes, skin, liver, kidneys, central nervous system, peripheral nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with *o*-chlorostyrene you should be trained on its proper handling and storage. Before entering confined space where *o*-chlorostyrene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chlorostyrene is not specifically cited by DOT[19] in its Performance-Oriented Packaging Standards. Based on its flash point, it may be classified as Flammable liquids, n.o.s. (UN 1993). In this case it falls in Hazard Class 3, Packing Group III. The label requirement would be "FLAMMABLE LIQUID."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. The heat of fire produces poisonous gases, including hydrogen chloride, chlorine, and phosgene. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chlorosulfonic acid C:1030

Molecular Formula: $ClHO_3S$

Synonyms: Acido clorosulfonico (Spanish); Chlorosulfuric acid; Chlorosulphonic Acid*;* *p*-Chloro-*o*-toluidine hydrochloride; 4-Chloro-*o*-toluidine, hydrochloride; Monochlorosulfuric acid; Sulfonic acid, monochloride; Sulfuric chlorohydrin

CAS Registry Number: 7790-94-5

RTECS® Number: FX5730000

UN/NA & ERG Number: UN1754/137

EC Number: 232-234-6 [*Annex I Index No.:* 016-017-00-1]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R35; R37; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chlorosulfonic acid is a highly corrosive, colorless to yellow, slightly cloudy, fuming liquid with a sharp odor. Molecular weight = 115.52; Boiling point = 155°C; Freezing/Melting point = − 80°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2₩. Reactive with water.

Potential Exposure: Used to make pesticides, detergents, pharmaceuticals, dyes, resins, sulfonated oils; intermediate for dyes and pharmaceuticals; and pesticides. Although no military designation has been assigned, chlorosulfonic acid may have been used as a choking/pulmonary agent.

Incompatibilities: Explosively reacts with water, forming sulfuric and hydrochloric acid and dense fumes. Dangerously reactive, avoid contact with all other material. Strong oxidizer and strong acid; violent reaction with bases, reducing agents; combustibles, acids (especially sulfuric acid), alcohols, diphenyl ether, finely divided metals, silver nitrate. Contact with phosphorous may cause fire and explosions. Forms explosive material with ethyl alcohol. Attacks many metals; reaction with steel drums forms explosive hydrogen gas, which must be periodically relieved.

Permissible Exposure Limits in Air

AIHA WEEL: 0.1 mg/m^3, Ceiling.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 mg/m^3.

PAC-1: **0.1** mg/m^3

PAC-2: **4.4** mg/m^3

PAC-3: **25** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

United Kingdom: 1 mg/m^3 TWA, 2000. Due to its highly corrosive nature, all contact with this material should be reduced to the lowest possible level.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Skin or eye contact can cause severe irritation, burns, and permanent eye damage. Irritates the respiratory tract causing coughing, wheezing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} (50% kill): 4779 mg/m^3/4 h, inhalation, rat.

Long Term Exposure: Can cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Saranex™ and polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is a potential for overexposure: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—White Stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorosulfonic acid you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, acids, bases, alcohols, metal powders, and organic combustible materials. It is preferable to store this chemical under nitrogen. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This chemical requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." Chlorosulfonic acid is in DOT/UN Hazard Class 8 and Packing Group I.[19,20] A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Chlorosulfonic acid, used as a weapon—not listed in current DOT tables.

UN1754 Chlorosulfonic acid.

when spilled on land

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

when spilled in water

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.8/2.8

Fire Extinguishing: Chlorosulfonic acid does not burn but can readily ignite combustible materials on contact and will increase fire activity. Poisonous gases, including hydrogen chloride and sulfur oxides, are produced in fire. Decomposes explosively on contact with water. Use dry chemical, carbon dioxide, or foam extinguishers. *Do not use water*. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; no evidence: mouse.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R26; R37; R40; R41; R43; R50/53; Safety phrases: S1/2; S28; S36/37/39; S45; S60; S61.

As a cyanide compound

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures.

California Proposition 65 Chemical: Cancer 1/1/89.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26; R37; R40; R41; R43; R50/53; Safety phrases: S1/2; S28; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chlorothalonil is a combustible, white, odorless, crystalline solid. Molecular weight = 265.9; Specific gravity (H_2O:1) = 1.8; Boiling point = 350°C; Freezing/Melting point = 260°C; Vapor pressure = 1×10^{-3} mmHg at 20°C. Based on the NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Chlorothalonil is a broad-spectrum fungicide; used as fungicide in coatings; caulk, wood preservative, and antifouling systems. Therefore, people involved in its manufacture, formulation, and application can be exposed.

Incompatibilities: Contact with strong oxidizers may cause a fire and explosion hazard. Thermal decomposition may include fumes of hydrogen cyanide.

Permissible Exposure Limits in Air

NIOSH REL: Danger of sensitization of the skin; Carcinogen level 3B.

Protective Action Criteria (PAC)
TEEL-0: 3 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 30 mg/m^3

DFG MAK: Danger of sensitization of the skin; Carcinogen level 3B.

Austria: Suspected: carcinogen, 1999.

Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.

Permissible Concentration in Water: A 10-day health advisory for a 10-kg child has been calculated by EPA to be 0.25 mg/L. A long-term health advisory for a 10-kg child was calculated to be 0.15 mg/L and for a 70-kg adult was calculated to be 0.525 mg/L. The estimated excess cancer risk associated with lifetime exposure to drinking water containing 0.525 mg/L of chlorothalonil is 3.5×10^{-4}.

Determination in Water: Analysis of chlorothalonil is by a gas chromatographic (GC) method applicable to the determination of certain chlorinated pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using an electron capture detector. The method detection limit has not been determined for chlorothalonil, but it is estimated that the detection limits for analytes included in this method are in the range of 0.01−0.1 μg/L. Octanol−water coefficient: Log $K_{ow} = 4.4$. Fish Tox = 4.41591000 ppb MATC (Maximum Acceptable Toxicant Concentration) (HIGH).

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Johnson et al. (1983) reported that chlorothalonil exposure resulted in contact dermatitis in 14 of 20 workers involved in woodenware preservation. The wood preservative used by the workers consisted mainly of "white spirit," with 0.5% chlorothalonil as a fungicide. Workers exhibited erythema and edema of the eyelids, especially the upper eyelids, and eruptions on the wrist and forearms. Results of patch test conducted with 0.1% chlorothalonil in acetone were positive in 7 of 14 subjects. Reactions ranged from a few erythematous papules to marked papular erythema with a brownish hue without infiltration.

Wilson et al. (1985) gave chlorothalonil (98.1% pure with less than 0.03% hexachlorobenzene) to Fischer 344 rats (60/sex/dose) in their diet at dose levels of 0, 40, 80, or 175 mg/kg/day. Males were treated for 116 weeks, while females received the chemical for 129 weeks. Survival among the various groups was comparable. In both sexes, at the high dose level, there were significant decreases in body weights. In addition, there were also significant increases in blood urea nitrogen and creatinine, while there were decreases in serum glucose and albumin levels. In both sexes, there were dose-dependent increases in kidney carcinomas and adenomas at doses above 40 mg/kg/day. In the high-dose females, there was also a significant increase in stomach papillomas. The data show that, in the Fischer 344 rat, chlorothalonil is a carcinogen.

The oral LD_{50} (50% kill) rat is 10 g/kg. LC_{50} (50% kill) = 310 mg/m^3/1 h, inhalation, rat.

Short Term Exposure: Irritates the eyes, skin, respiratory tract. Inhalation can cause coughing, phlegm, and/or tightness in the chest.

Long Term Exposure: Repeated or prolonged contact with skin may cause nose bleeding, skin sensitization and dermatitis with skin rash. May affect the kidneys and gastrointestinal tract. This chemical causes cancer of the kidneys in animals. Human Tox = 45.69190 ppb CHCL (Chronic Human Carcinogen Level) (INTERMEDIATE).

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: Complete blood count (CBC). Lung function tests. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20−30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: *Where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorothalonil you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorothalonil is not cited specifically in DOT's Performance-Oriented Packaging Standards.[19] However, hazardous pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 1380.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen cyanide, hydrogen chloride, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a unit operating at 850°C equipped with off-gas scrubbing equipment.

o-Chlorotoluene C:1050

Molecular Formula: C_7H_7Cl

Common Formula: $CH_3C_6H_4Cl$

Synonyms: Benzene, 1-chloro-2-methyl-; 2-Chloro-1-methylbenzene; 2-Chlorotoluene; 1-Methyl-2-chlorobenzene; 2-Methylchlorobenzene; Toluene, *o*-chloro-; *o*-Tolylchloride

meta-isomer

1-Chloro-3-methylbenzene; 3-Chloro-1-methylbenzene; 3-Chlorotoluene; *m*-Methylchlorobenzene; 1-Methyl-3-chlorobenzene; 3-Methylchlorobenzene; *m*-Tolyl chloride; *meta*-Chlorotoluene; *meta*-Tolyl chloride; Toluene, *m*-chloro-

para-isomer

1-Chloro-4-methylbenzene; 4-Chloro-1-methylbenzene; 4-Chlorotoluene; *p*-Methylchlorobenzene; 1-Methyl-4-chlorobenzene; 4-Methylchlorobenzene; *p*-Tolyl chloride; *para*-Chlorotoluene; *para*-Tolyl chloride; Toluene, *p*-chloro-

CAS Registry Number: 95-49-8;108-41-8 (3-Chlorotoluene); 106-43-4 (4-Chlorotoluene)

RTECS® Number: XS9000000

UN/NA & ERG Number: UN2238 (Chlorotoluenes)/129

EC Number: 202-424-3 (2-, 3-, and 4-chlorotoluene) [*Annex I Index No.:* 602-040-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: (2-, 3-, and 4-chlorotoluene) Hazard Symbol: Xn, N; Risk phrases: R20; R51/53; Safety phrases: S2; S24/25; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *o*-Chlorotoluene is a flammable, colorless liquid with an aromatic odor. The odor threshold = 0.32 ppm. Molecular weight = 126.59; Boiling point = 160°C; Freezing/Melting point = − 35°C; Vapor pressure = 4 mmHg at 25°C; Flash point = 52°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Practically insoluble in water; solubility = 0.009% at 25°C.

Potential Exposure: Compound Description: Primary Irritant. *o*-Chlorotoluene is widely used as a solvent and intermediate in the synthesis of dyes, synthetic rubber; pharmaceuticals; and other organic chemicals. Used as an insecticide, bactericide.

Incompatibilities: Incompatible with acids, alkalis, oxidizers, reducing materials, water.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.18 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 50 ppm/250 mg/m^3 TWA; 75 ppm/375 mg/m^3 STEL.

ACGIH TLV®[1]: 50 ppm TWA.

Protective Action Criteria (PAC)
TEEL-0: 50 ppm
PAC-1: 75 ppm
PAC-2: 400 ppm
PAC-3: 400 ppm

This chemical can be absorbed through the skin, thereby increasing exposure.

Australia: TWA 50 ppm (250 mg/m^3); STEL 75 ppm, 1993; Austria: MAK 50 ppm (250 mg/m^3), 1999; Belgium: TWA 50 ppm (259 mg/m^3); STEL 75 ppm (388 mg/m^3), 1993; Denmark: TWA 50 ppm (285 mg/m^3), [skin], 1999; Finland: TWA 50 ppm (260 mg/m^3); STEL 75 ppm (390 mg/m^3), [skin], 1999; France: VME 50 ppm (250 mg/m^3), 1999; Norway: TWA 25 ppm (125 mg/m^3), 1999; the Netherlands: MAC-TGG 250 mg/m^3, [skin], 2003; Russia: STEL 10 mg/m^3, [skin], 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 50 ppm (250 mg/m^3), [skin], 1999; United Kingdom: TWA 50 ppm (264 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, KORE, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for chlorotoluene in ambient air[60] ranging from 2.5−3.75 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 5.0 mg/m^3 (Connecticut) to 5.95 mg/m^3 (Nevada).

Determination in Air: No methods listed by NIOSH or OSHA.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 3450 μg/L based on health effects.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the eyes and skin. Inhalation can irritate the respiratory tract, causing coughing and/or shortness of breath. High exposure can cause dizziness, loss of coordination, convulsions, and coma. Vasodilatation, labored respiration, and narcosis have been observed in test animals.

Long Term Exposure: May affect the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Prolonged or repeated contact may cause dermatitis.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Kidney function tests. Examination by a dermatologist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Barricade™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full face-piece powered-air-purifying respirators.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with *o*-chlorotoluene you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chlorotoluenes must carry a "FLAMMABLE LIQUID" label. They fall in Hazard Class 3 and Packing Group II.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Chloroxuron C:1060

Molecular Formula: $C_{15}H_{15}ClN_2O_2$

Common Formula: $(CH_3)_2NCONHC_6H_4OC_6H_4Cl$

Synonyms: C 1983; *N*′-[4-(4-Chlorophenoxy)phenyl]-*N*,*N*-dimethylurea; 3-[*p*-(*p*-Chlorophenoxy)phenyl-1,1]-dimethylurea; 3-[4-(4-Chlorophenoxy)phenyl]-1,1-dimethylurea; Chloroxifenidum; Ciba 1983; Cloroxuron (Spanish); Norex; Tenoran®; Urea, 3-[*p*-(*p*-chlorophenoxy)phenyl]-1,1-dimethyl-; Urea, *N*′-[4-(4-chlorophenoxy)phenyl]-*N*,*N*-dimethyl-

CAS Registry Number: 1982-47-4

RTECS® Number: YS6125000

UN/NA & ERG Number: UN2767 (Phenyl urea pesticides, solid, toxic)/151

EC Number: 217-843-7

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chloroxuron is a combustible, colorless crystalline solid. Molecular weight = 290.77; Freezing/Melting point = 15.5°C; Vapor pressure = 3.9×10^{-9} mmHg at 20°C. Practically insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of chloroxuron for use as a selective pre- and early postemergency herbicide in soybeans, strawberries, various vegetable crops, and ornamentals. It is a root- and foliage-absorbed herbicide selective in leek, celery, onion, carrot, and strawberry.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

Determination in Water: Octanol–water coefficient: Log K_{ow} = 3.98. Fish Tox: 49.75254000 ppb MATC (INTERMEDIATE).

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Slightly irritating to eyes and skin. The LD_{50} oral (dog) is 10 mg/kg (highly toxic). The LD_{50} oral (rat) is 3700 mg/kg. Chloroxuron is stated to be highly toxic to humans by ingestion and under certain conditions, it can form carcinogenic dimethylnitrosamine. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Long Term Exposure: No data available. Human Tox: 35.00000 ppb; Health Advisory (INTERMEDIATE).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing

material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chloroxuron you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Phenyl urea pesticides, solid, toxic, require a label of "POISONOUS/TOXIC MATERIALS." This compound falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 3000.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. Poisonous gases are produced in fire, including oxides of nitrogen and carbon, and corrosive fumes of chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in a unit with effluent gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Chlorpyrifos C:1070

Molecular Formula: $C_9H_{11}Cl_3NO_3PS$

Synonyms: Brodan; α-Chlorpyrifos 48EC (a); Chlorpyrifos-ethyl; Clorpirifos (Spanish); Detmol U.A.; *O*,*O*-Diaethyl-*O*-3,5,6-trichlor-2-pyridylmonothiophosphat (German); *O*,*O*-Diethyl; *O*,*O*-Dimethyl *O*-(3,5,6-trichloro-2-pyridinyl) phosphorothioate; Dowco® 179; Dursban®; Dursban® 4; Dursban® 5G; Dursban® F; EF 121; ENT 27311; Eradex; Global Crawling insect bait; Lorsban®; Murphy Super Root Guard; Phosphorothioic acid, *O*,*O*-diethyl *O*-(3,5,6-trichloro-2-pyridinyl) ester; 2-Pyridinol, 3,5,6-trichloro-, *O*-ester with *O*,*O*-diethyl phosphorothioate; Pyrinex; Spannit®; Talon®; *O*-3,5,6-Trichloro-2-pyridyl phosphorothioate; Twinspan®

CAS Registry Number: 2921-88-2

RTECS® Number: TF6300000

UN/NA & ERG Number: (organophosphorus pesticides, solid, toxic)/152

EC Number: 220-864-4 [*Annex I Index No.:* 015-084-00-4]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

Canada, Drinking Water Quality MAC = 0.09 mg/L.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R24/25; R50/53; Safety phrases: S1/2; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chlorpyrifos is a colorless crystalline compound (liquid at 43°C and commercial formulations may be combined with combustible liquids) with a mild mercaptan odor. The odor is also described as like natural gas. Boiling point = (decomposes) 160°C; Molecular weight = 350.59; Specific gravity (H_2O:1) = 1.40 (liquid at 43°C); Freezing/Melting point = 42.2°C; Vapor pressure = 0.00003 mmHg at 25°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, and application of this insecticide.

Incompatibilities: Above 130°C this chemical may undergo violent exothermic decomposition. The substance decomposes on heating at approximately 160°C and on burning, producing toxic and corrosive fumes including hydrogen chloride, nitrogen oxides, phosphorous oxides, sulfur oxides. Reacts with strong acids, strong bases, causing hydrolysis. Attacks copper and brass. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.2 mg/m^3 TWA; 0.6 mg/m^3 STEL.

ACGIH TLV®[1]: 0.1 mg/m^3 TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI issued. (2000).

Protective Action Criteria (PAC)
TEEL-0: 0.1 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 20 mg/m^3

Australia: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; Belgium: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; Denmark: TWA 0.2 mg/m^3, [skin], 1999; Finland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1999; France: VME 0.2 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Norway: TWA 0.2 mg/m^3, 1999; Poland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, 1999; United Kingdom: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for chlorpyrifos in ambient air[60] ranging from 2−6 μg/m^3 (North Dakota) to 3.0 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides, or OSHA Analytical Method 62.

Permissible Concentration in Water: Mexico[35] has set a limit of 3.0 μg/L in coastal waters and 0.03 mg/L in estuaries. Russia set a MAC of 5.0 μg/L in water bodies used for fishery purposes.

Determination in Water: Fish Tox = 0.3666 ppb MATC (Low); Octanol−water coefficient: Log $K_{ow} = 4.97$.

Routes of Entry: Skin absorption, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: May cause eye and skin irritation. Cholinesterase inhibitor. Exposure at high levels may result in death. The effects may be delayed. The LD_{50} rat is 82 mg/kg (moderately toxic). Chlorpyrifos can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic organophosphate chemical. Exposure can cause rapid severe poisoning with headache, sweating, nausea and vomiting, diarrhea, loss of coordination, and possible death.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Chlorpyrifos may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 20 ppb; Health Advisory (INTERMEDIATE).

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: *Clothing:* Avoid skin contact with chlorpyrifos. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures over *0.2 mg/m³*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a pesticide cartridge. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chlorpyrifos you should be trained on its proper handling and storage. Chlorpyrifos must be stored to avoid contact with strong bases, or acids, or acid fumes since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat.

Shipping: Organophosphorus pesticides, solid, toxic n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Absorb liquid containing chlorpyrifos in vermiculite, dry sand, earth, or similar material. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 6070.

Fire Extinguishing: Chlorpyrifos may burn but does not readily ignite. Poisonous gases are produced in fire, including hydrogen chloride, nitrogen oxides, phosphorous oxides, sulfur oxides, and organic sulfides. Use dry chemical, carbon dioxide, water spray, or standard foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Heat above 130°C may cause violent exothermic reaction. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This compound is 50% hydrolyzed in aqueous MeOH solution at pH 6 in 1930 days; and in 7.2 days at pH 9.96. Spray mixtures of <1% concentration are destroyed with an excess of 5.25% sodium hypochlorite in <30 min at 100°C; and in 24 h at 30°C. Concentrated (61.5%) mixtures are essentially destroyed by treatment with 100:1 volumes of the above sodium hypochlorite solution and steam in 10 min.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

CAS Registry Number: 21923-23-9

RTECS® Number: TF1590000

UN/NA & ERG Number: UN3018 (organophosphorus pesticides, liquid, toxic)/152

EC Number: 244-663-6 [015-115-00-1]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture: Germany, Malaysia) (UN).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chlorthiophos is a yellowish-brown liquid. Boiling point = 153−158°C at 13 mmHg, and crystallizes at less than 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide and acaricide (now discontinued in some cases).

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.35 mg/m^3
PAC-1: 1 mg/m^3
PAC-2: 7.8 mg/m^3
PAC-3: 7.8 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: The LD_{50} oral (rabbit) is 20 mg/kg, which is in the highly toxic class.

Symptoms of Chlorthiophos exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Chlorthiophos may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: *Clothing:* Avoid skin contact with this chemical. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Eye Protection: Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a pesticide cartridge. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Chlorthiophos you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. have a DOT label requirement of "POISONOUS/TOXIC MATERIALS." Chlorthiophos falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Choking/Lung/Pulmonary agents

The major chemical warfare agents in this category are listed below along with their record number for quick access.

Ammonia see A:0950
Bromine see B:0660
Chlorine, agent CL see C:0670
Chlorosulfonic acid see C:1030
Diphosgene, agent DP see P:0550
Hydrogen chloride see H:0430
Methyl bromide see M:0720
Methyl isocyanate see M:1010
Nitric oxide Agent NO see N:0350
Osmium tetroxide see O:0140
Phosgene, agent CG see P:0550
Red phosphorous, agent RP see P:0610
Sulfur trioxide see S:0810
Sulfuryl fluoride see S:0820
Titanium tetrachloride, agent FM see T:0580
Zinc oxide, agent HC see Z:0140

Chromic acetate C:1090

Molecular Formula: $C_6H_9CrO_6$

Common Formula: $Cr(C_2H_3O_2)_3$

Synonyms: Acetato cromico (Spanish); Acetic acid, chromium(3+) salt; Chromic acetate(III); Chromium acetate; Chromium(III) acetate; Chromium triacetate

CAS Registry Number: 1066-30-4

RTECS® Number: AG2975000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 213-909-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1997.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as chromium compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR 401.15 Section 307 Toxic Pollutants.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: Chromium III compounds: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Chromic acetate is a gray-green powder or blue-green pasty mass. Molecular weight = 229.15 (anhydrous), 247.16 (hydrate); Specific gravity (H_2O:1) = 1.30; Boiling point = 100°C (aqueous solution). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Chromic acetate is used to fix certain textile dyes, to harden photographic emulsions in tanning, and as a catalyst.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 25 mg/m^3

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L; EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause irritation of the eyes, nose, and throat. Eye and skin contact may cause irritation, redness, and tearing. Skin allergy sometimes occurs, with itching, redness, and/or an eczema-like rash. If this happens, future contact can trigger symptoms.

Long Term Exposure: Repeated or prolonged skin contact may cause skin sensitization, irritation, and dermatitis. Some chromium compounds can cause a sore or hole in the septum dividing the nose. Chromic acetate is a carcinogen—handle with extreme caution. May cause lung or throat cancer; birth defects; miscarriage; skin allergy with redness, itching, and rash.

Points of Attack: Eyes, skin.

Medical Surveillance: If illness occurs or overexposure is suspected, medical attention is recommended. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Chromic acetate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where Chromic acetate is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromic acetate may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dilute and stir in excess soda ash. Let stand, neutralize liquid and flush to sewer. Dispose of sludge in landfill.

Reportable Quantity (RQ): 10 lb (4.54 kg) (ester).

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chromic acid is dark purplish-red odorless flakes or crystalline powder. Molecular weight = 100.00 mg [CrO_3]; Boiling point = 250°C (decomposes); Freezing/Melting point = 197°C (decomposes). Often used in aqueous solution. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0, Oxidizer. Highly soluble in water. It may also be formulated as $H_2CrO_4(CrO_3 \cdot H_2O)$.

Potential Exposure: Chromic acid is used in chromium plating, medicine, ceramic glazers, and paints.

Incompatibilities: A strong oxidizer. Aqueous solution is strongly acidic. Reacts with acetic acid, acetic anhydride, acetone, anthracene, chromous sulfide, diethyl ether, dimethyl formamide, ethanol, hydrogen sulfide, methanol, naphthalene, camphor, glycerol, potassium ferricyanide, pyridine, turpentine, combustibles, organics, and other easily oxidized materials (such as paper, wood, sulfur, aluminum, and plastics). Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

As chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

Protective Action Criteria (PAC)

includes ester

TEEL-0: 0.113 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 1.18 mg/m^3

PAC-3: 34 mg/m^3

DFG MAK: [skin] Danger of skin sensitization; Carcinogen.

Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Several states have set guidelines or standards for chromic acid in ambient air[60] ranging from zero (North Carolina) to 0.001 μg/m^3 (Massachusetts) to 1.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: For the protection of freshwater aquatic life: Hexavalent chromium: 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* Hexavalent chromium 50 μg/L according to EPA.[6]

US EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption, or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Chromic acid can affect you when breathed in. It can also pass into inner layers of the skin. Chromic acid should be handled as a carcinogen with extreme caution. *Inhalation:* May be poisonous. Dust may cause severe irritation to the nose, throat, and lungs, causing coughing; shortness of breath. May cause flu-like symptoms including chills, muscle ache, headache, fever. High exposure may cause nausea, salivation, vomiting, cramps, diarrhea, chest pains, cough, a buildup of fluids in the lungs (pulmonary edema) and possible death. Pulmonary edema is a medical emergency and may be delayed from 1 to 2 days following exposure. *Skin:* May cause severe irritation and thermal and acid burns, especially if skin is wet. *Eyes:* May cause severe irritation, burns, pain, and possible blindness. *Swallowed:* May be poisonous. May cause severe burns of the mouth, throat, and stomach; vomiting; watery or bloody diarrhea. Damage to kidneys and liver; collapse; and convulsions can result.

Long Term Exposure: May cause lung cancer, birth defects, miscarriage, kidney and liver damage, skin allergy and ulcers, injury to the nasal septum (may cause a hole in the nose), discoloration of teeth, bronchitis, lung allergy.

Points of Attack: Blood, respiratory system, liver, kidneys, eyes, skin.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests; pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: exam of the mouth and larynx. If symptoms develop or overexposure is suspected, the following may also be useful: kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Specific engineering controls are recommended in NIOSH Criteria Documents: #73-11021 (chromic acid) and #76-129 [chromium(VI)].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. (Chromic acid) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with chromic acid you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetone, combustible, organic or other readily oxidizable material (such as paper, wood, sulfur, aluminum, and plastics). Sources of ignition, such as smoking and open flames, are prohibited where Chromic acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A storage hazard; sealed containers may burst from carbon dioxide release. Store in tightly closed containers in a dry, cool, well-ventilated place with nonwood floors. Keep away from combustible materials; alcohols; and acetone. Where possible, automatically transfer chromic acid from drums or other storage containers to process containers. Containers may explode in fire. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chromic acid, solid must be labeled "OXIDIZER, CORROSIVE." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, soda ash, CO_2, water spray, or foam extinguishers. Chromic acid may ignite other combustible materials, such as paper and wood. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chemical reduction to chromium(III) can be followed by landfill disposal of the sludge.[22]

Molecular Formula: Cl_3Cr
Common Formula: $CrCl_3$
Synonyms: Chromium chloride; Chromium(III) chloride (1:3); Chromium chloride (III) anhydrous; Chromium chloride, anhydrous; Chromium sesquichloride; Chromium trichloride; C.I. 77295; Cloruro cromico (Spanish); Puratronic chromium chloride; Trichlorochromium
CAS Registry Number: 10025-73-7
RTECS® Number: GB5425000
UN/NA & ERG Number: UN3077/171
EC Number: 233-038-3
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1997; EPA *(insoluble salts)*: Not Classifiable as to human carcinogenicity; Cannot be Determined.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as chromium compounds.
Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1/10,000 lb (0.454/4540 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: Chromium III compounds: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Chromic chloride is a highly corrosive, blue or greenish to black crystalline solid. Molecular weight = 158.35; Boiling point (decomposes) = 1300°C; Freezing/Melting point = 1152°C (dissociates above 1300°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water (reaction).
Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector. Chromic chloride is used for production of solutions of basic chlorides and as a catalyst for polymerization of olefins and other organic reactions; in chromizing; in the manufacture of chromium metal and compounds; as a textile mordant; in tanning; in corrosion inhibitors; and as a waterproofing agent. A nutritional supplement.
Incompatibilities: Reacts with water and strong oxidizers. Contact with strong acids or acid fumes may produce highly toxic chloride fumes. May attack certain steels, causing pitting attack and stress corrosion.
Permissible Exposure Limits in Air
OSHA PEL: 0.5 mg[Cr]/m^3 TWA.
NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.
ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.
NIOSH IDLH: 25 mg Cr(III)/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.35 mg/m^3
PAC-1: 1 mg/m^3
PAC-2: 7.8 mg/m^3
PAC-3: 7.8 mg/m^3
DFG MAK: [skin] danger of skin sensitization.
Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]
Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L.[6]
US EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62]
Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water.
The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.
Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Chromic chloride is highly corrosive. Irritates and burns the eyes and skin. Inhalation can irritate the respiratory tract, causing coughing and wheezing. It displays high dermal toxicity and moderate oral toxicity. The oral toxicity (rat) is given as 1870 mg/kg.
Long Term Exposure: It causes histologic fibrosis of the lungs. Signs for exposure to chromic chloride as for other chromium compounds include dermatitis; ulcers of the upper respiratory tract and inflammation of the larynx,

lungs, gastrointestinal tract, and nasal passages. Repeated skin contact can cause sensitization and dermatitis.

Points of Attack: Eyes, skin, lungs.

Medical Surveillance: Examination by a qualified allergist. Lung function tests. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m*^{3}: Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m*^{3}*:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m*^{3}*:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m*^{3}*:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents and water.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Do not touch spilled material. Avoid inhalation. Wear full protective clothing and proper respiratory protection. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromic chloride itself does not burn. It reacts with water, so use in flooding quantities only. Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitate as chromium hydroxide. Dewater the sludge and dispose of the compacted sludge in single-purpose dumps.[22]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997; EPA (insoluble salts): Not Classifiable as to human carcinogenicity; Cannot be Determined.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as chromium compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: Chromium III compounds: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Chromic sulfate is a peach-colored solid or red to violet, odorless powder. Molecular weight = 392.18. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: This compound is used in green paints, inks, dyes, and ceramics.

Incompatibilities: This chemical has weak oxidizing and reducing properties. Keep away from strong oxidizers (perchlorates, peroxides, permanganates, chlorates, nitrates, chlorine, bromine, and fluorine). When heated this chemical decomposes to chromic acid.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1.89 mg/m^3

PAC-1: 5.66 mg/m^3

PAC-2: 9.43 mg/m^3

PAC-3: 94.3 mg/m^3

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L; Hexavalent chromium 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation of dust or mist, skin, contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chromic sulfate can affect you when breathed in. Skin contact may cause irritation, especially if repeated or prolonged. Skin allergy sometimes occurs with itching, redness, and/or an eczema-like rash. If this happens, future contact can trigger symptoms. Eye contact may cause irritation and burns.

Long Term Exposure: May cause skin allergy. Some chromium compounds can cause an ulcer in the septum separating the nose. It is uncertain whether this chemical has this effect.

Points of Attack: Eyes, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3*: Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with chromic sulfate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and sources of heat.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromic sulfate may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Return to supplier where possible. Where this is not practical, the material should be encapsulated and buried in a specially-designated chemical landfill.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Chromium may exist in one of three valence states in compounds, [II (+2)], [III (+3)], and [VI (+6)]. The most stable oxidation state is trivalent chromium; Hexavalent chromium is a less stable state. Chromium (element) blue-white to steel-gray, lustrous, brittle, hard, odorless solid. Elemental: Molecular weight = 52.00; Specific gravity (H_2O:1) = 7.14; Boiling point = 2642°C; Melting point = 1900°C. Hazard Identification (based on Ignition temperature of dust cloud = unknown; Minimum explosive concentration = 0.23 oz/ft^3.[USBM] NFPA-704 M Rating System): [dust] Health 0, Flammability 1, Reactivity 0. Insoluble in water. Noncombustible solid in bulk form, but finely divided dust burns rapidly if heated in a flame. Relative explosion hazard of dust: Strong.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Chromium metal is used in stainless and other alloy steels to impart resistance to corrosion, oxidation, and for greatly increasing the durability of metals; for chrome plating of other metals.

Incompatibilities: Chromium metal (especially in finely divided or powder form) and insoluble salts react violently with strong oxidants, such as hydrogen peroxide, causing fire and explosion hazard. Reacts with diluted hydrochloric and sulfuric acids. Incompatible with alkalis and alkali carbonates.

PAC-2: 1 mg/m^3

PAC-3: 250 mg/m^3

Arab Republic of Egypt: TWA 0.05 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg[Cr]/m^3, 1999; Finland: TWA 0.01 mg/m^3, 1999; France: VME 0.5 mg/m^3, 1999; Japan: 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 1 mg/m^3, 1993; Poland: TWA 0.5 mg/m^3, 1999; Sweden: NGV 0.5 mg/m^3, 1999; United Kingdom: TWA 0.5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for chromium in ambient air[60] ranging from zero (North Carolina) to 0.00009 μg/m^3 (Rhode Island) to 0.068 μg/m^3 (Massachusetts) to 0.07−0.39 μg/m^3 (Montana) to 0.12 μg/m^3 (Pennsylvania) to 0.167 μg/m^3 (Virginia) to 2.5 μg/m^3 (Connecticut) to 5.0 μ/m^3 (North Dakota) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: *For the protection of freshwater aquatic life*: Trivalent chromium: not to exceed e 1.08 In (hardness) + 3.48] μg/L. Hexavalent chromium: 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. *For the protection of saltwater aquatic life*: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* Trivalent chromium: 170 μg/L; Hexavalent chromium 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, eye, and skin contact.

Harmful Effects and Symptoms

Chromium can affect you when breathed in. Chromium metal ore has been reported to cause lung allergy. Chromium fumes can cause "metal fume fever," a flu-like illness lasting about 24 h with chills, aches, cough, and fever. Chromium particles can irritate the eyes. The above cautions apply to chromium metal. Since chromium is a reasonably reactive metal, thought must be given to the actions of combined chromium and particularly to the presence or absence of carcinogenic effects in various chromium compounds. A table of differentiation between noncarcinogenic and carcinogenic chromium(VI) compounds has been presented by NIOSH as shown below. NIOSH has not conducted an in-depth study of the toxicity of chromium metal or compounds containing chromium in an oxidation state other than chromium(VI) compounds be reduced to 0.001 mg/m^3 and that these compounds be regulated as occupational carcinogens. NIOSH also recommends that the permissible exposure limit for noncarcinogenic chromium(VI) be reduced to 0.025 mg/m^3 averaged over a work shift of up to 10 h per day, 40 h per week, with a ceiling level of 0.05 mg/m^3 averaged over a 15-min period. It is recommended further that chromium(VI) in the workplace be considered carcinogenic, unless it has been demonstrated that only the noncarcinogenic chromium(VI) compounds mentioned below are present. The NIOSH Criteria Documents for chromic acid and chromium(VI) should be consulted for more detailed information.

Short Term Exposure: Chromium particles can irritate the eyes. Chromium fumes can cause "metal fume fever" a flu-like illness, lasting about 24–36 h with chills, aches, cough, and fever.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Chromium metal ore has been reported to cause lung allergy.

Points of Attack: Chromium metal and insoluble salts: respiratory system and lungs.

Medical Surveillance: Preemployment physical examinations should include a work history to determine past exposure to chromic acid and hexavalent chromium compounds; exposure to other carcinogens; smoking history; history of skin or pulmonary sensitization to chromium, history or presence of dermatitis; skin ulcers; or lesions of the nasal mucosa and/or perforation of the septum; and a chest X-ray. Periodic examinations and evaluation should be made of skin and respiratory complaints especially in workers who demonstrate allergic reactions. Chest X-rays should be taken yearly for workers over age 40, and every 5 years for younger workers. Blood, liver, lungs, and kidney function should be evaluated periodically. Urine test for chromates. This test is most accurate shortly after exposure. Regulatory exams are required for carcinogens by OSHA 1910.1002-1016.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4–12 h following exposure: it may last less than 36 h.
