Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Respirators should be used in areas where dust, fumes, or mist exposure exceeds Federal standards of where brief concentrations exceed the TWA, and for emergencies. Dust, fumes, and mist filter-type respirators or supplied air respirators should be supplied to all workers exposed, depending on concentration of exposure. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, chromium(VI).

Respirator Selection: *Up to 2.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator) *up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter*; or any self-contained breathing apparatus with a full face-piece; or any supplied-air respirator with a full face-piece. *Up to 250 mg/m^3:* Any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* Any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus. *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green (metal, not powder): General storage may be used. Prior to working with chromium you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area. Chromium must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where chromium is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: For metal powder, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall in Hazard Class 4.2 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromium metal as dust/powder is combustible. The powder may explode in the air. In case of fire in the surroundings: all extinguishing agents allowed. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and recycling is a viable alternative to disposal for chromium in plating wastes; tannery wastes; cooling tower blowdown water; and chemical plant wastes.

Chromium carbonyl C:1140

Molecular Formula: C_6CrO_6
Common Formula: $Cr(CO)_6$
Synonyms: Chromium hexacarbonyl; Hexacarbonyl chromium.
CAS Registry Number: 13007-92-6
RTECS® Number: GB5075000
UN/NA & ERG Number: UN3077/171
EC Number: 235-852-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: [chromium(VI)], *carcinogenic to humans*, Group 1; NTP: [chromium(VI) compounds] Known to be a human carcinogen; The German MAK value is 3B. This value is for *in vitro* animal studies yielding evidence of carcinogenic effects. These effects are not sufficient for classification if this material is in one of the other categories.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chromium carbonyl is a colorless crystalline substance which sinters (forms a coherent mass without melting) at 90°C. Molecular weight = 220.06; Freezing/Melting point = 110°C (decomposes). Boiling point = explodes (in lieu of boiling) at 210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water; possible reaction.

Potential Exposure: Chromium carbonyl is used as a catalyst for hydrogenation, isomerization, water—gas shift reaction, and alkylation of aromatic hydrocarbons; gasoline additive to increase octane number; preparation of chromous oxide, CrO.

Incompatibilities: Violent reaction on contact with oxidizers. Decomposed by chlorine and fuming nitric acid; sensitive to heat and light (undergoes photochemical decomposition). Many carbonyls react with water, forming toxic and flammable vapors.

Permissible Exposure Limits in Air

OSHA PEL: None.
NIOSH REL: None.
ACGIH TLV®[1]: None for *organic* chromium compounds. However, based on its formula and synonym (chromium *hexa*carbonyl): 0.01 mg(Cr)/m^3 TWA [listed under "certain water insoluble forms" hexavalent chromium inorganic compounds]. A1: Confirmed Human Carcinogen *as hexavalent chromium compounds* (*certain water insoluble forms*).
DFG MAK: Carcinogen level 3B.
Protective Action Criteria (PAC)
TEEL-0: 0.0212 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 60 mg/m^3
PAC-3: 63.5 mg/m^3
DFG MAK: Carcinogen Category 3B.

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: *For the protection of freshwater aquatic life*: Trivalent chromium: not to exceed e[1.08 In (hardness) + 3.48] μg/L. Hexavalent chromium: 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. *For the protection of saltwater aquatic life*: Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* Hexavalent chromium 50 μg/L (US EPA).[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA has recently proposed a maximum drinking water level of 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Highly toxic. Emits toxic fumes of CO when heated. Thought to be carcinogenic.

Short Term Exposure: LD_{50} = (oral-rat) 230 mg/kg (moderately toxic). May cause eye and skin irritation. May cause skin sensitization. May cause chrome ulcers, deep lesions of the skin, usually on breaks in the skin, often found on hand and lower forearm. Ingestion may cause digestive tract irritation. Inhalation may cause irritation of the respiratory tract.

Long Term Exposure: May cause cancer in humans. May cause lung damage. Chronic exposure to water-insoluble hexavalent chromium compounds has been shown to be associated with lung cancer and gastrointestinal tract tumors.

Medical Surveillance: Preemployment physical examinations should include a work history to determine past exposure to chromic acid and hexavalent chromium compounds; exposure to other carcinogens; smoking history; history of skin or pulmonary sensitization to chromium; history or presence of dermatitis; skin ulcers; or lesions of the nasal mucosa and/or perforation of the septum; and a chest X-ray. Periodic examinations and evaluation should be made of skin and respiratory complaints especially in workers who demonstrate allergic reactions. Chest X-rays should be taken yearly for workers over age 40, and every 5 years for younger workers. Blood, liver, lungs, and kidney function should be evaluated periodically. Urine test for chromates. This test is most accurate shortly after exposure. Regulatory exams are required for carcinogens by OSHA 1910.1002-1016.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area or in a refrigerator. Protect from light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chromium carbonyl is not specifically cited by the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent paper dampened with 60−70% acetone to pick up remaining material. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromium carbonyl is a flammable compound and extreme care should be used in firefighting both due to the carcinogenic nature of the material and the emission of CO as a decomposition product. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Chromium nitrate C:1150

Molecular Formula: CrN_3O_9
Common Formula: $Cr(NO_3)_3$

Synonyms: Chromic nitrate; Chromium(III) nitrate; Chromium (3+) nitrate; Chromium trinitrate; Nitric acid, chromium(3+) salt; Nitrato cromico (Spanish)
nonahydrate: Chromium nitrate nonahydrate; Chromic nitrate nonahydrate; Chromium trinitrate nonahydrate; Nitric acid, chromium (3 +) salt, nonahydrate

CAS Registry Number: 13548-38-4; 7789-02-8 (nonahydrate); 10103-47-6; 17135-66-9

RTECS® Number: GB6280000

UN/NA & ERG Number: UN2720/141

EC Number: 236-921-1(trinitrate)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1997.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: Chromium(III) compounds: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Chromium(III) compounds, National Pollutant Release Inventory (NPRI); CEPA Priority Substance List (as chromium compounds).

WGK (German Aquatic Hazard Class): 2—Water polluting (CAS 7789-02-8).

Description: Chromium nitrate is a crystalline substance, variously stated to be green brown or purple and existing in various hydrated forms. Molecular weight = 238.03; 400.21 (nonahydrate); Freezing/Melting point = 60−100°C, depending on the degree of hydration. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Mutagen (nonhydrate). Chromium nitrate is used in the preparation of chrome catalysts, in textile printing operations, and as a corrosion inhibitor.

Incompatibilities: This chemical is a strong oxidizer. Contact with reducing agents, fuels, ethers, and other flammable and combustible materials cause a fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

Protective Action Criteria (PAC)
TEEL-0: 2.29 mg/m^3
PAC-1: 6.87 mg/m^3
PAC-2: 11.4 mg/m^3
PAC-3: 114 mg/m^3
nonahydrate
TEEL-0: 3.85 mg/m^3
PAC-1: 11.5 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 192 mg/m^3

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L; Hexavalent chromium 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA has recently proposed a maximum drinking water level of 0.1 mg/L.[62]

Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water.

The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Skin contact, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chromium nitrate can affect you when breathed in. Chromium nitrate may cause mutations. Handle with extreme caution. Skin contact may cause irritation, especially if repeated or prolonged. Skin allergy sometimes occurs, with itching, redness, and/or an eczema-like rash. If this happens, future contact can trigger symptoms. Eye contact may cause irritation.

Long Term Exposure: May cause genetic changes; birth defects; skin allergy with rash and itching.

Points of Attack: Irritation of eyes; sensitization dermatitis.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If chromium nitrate gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Chromium nitrate must be stored to avoid contact with strong reducing agents, fuels, and ether since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Chromium nitrate must be labeled “OXIDIZER.” It falls in Hazard Class 5.1 and Packing Group III.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep chromium nitrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Chromium nitrate itself does not burn but it will increase the intensity of a fire since it is an oxidizer. Poisonous gases are produced in fire, including nitrogen oxides and chromium oxide fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Precipitate chromium as the hydroxide. Dewater the sludge and dispose of in single-purpose dumps.[22]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1997; EPA (insoluble salts): Not Classifiable as to human carcinogenicity; Cannot be Determined.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical’s infrastructure. Form R *de minimis* concentration reporting level: Chromium(III) compounds: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Chromium(III) compounds, n.o.s; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Chromium oxide is a bright green, odorless powder. Molecular weight = 151.00; Freezing/Melting point = 2266°C (−25°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Chromium(III) oxide is used as a paint pigment, a fixative for certain textile dyes; in the manufacture of chromium; and a catalyst.

Incompatibilities: A strong oxidizer. Contact with reducing agents, organics, and combustibles may be violent.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.731 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 36.5 mg/m^3

PAC-3: 36.5 mg/m^3

chromium(III) oxide hydroxide

TEEL-0: 0.817 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 40.9 mg/m^3

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L (EPA).[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA’s maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation of dust or mist, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Skin allergy may occur with itching, redness, and/or an eczema-like rash. Persons allergic to other chromium compounds may be more likely to develop skin allergy to this chemical.

Long Term Exposure: There is limited evidence that chromium(III) oxide is a teratogen in animals, and until further testing is done, it should be treated as a possible teratogen in humans. Chromium(III) oxide has been tested and has *not* been shown to cause cancer in animals (NJ Department of Health, 5/1988). Skin allergy may develop from repeated exposure to this chemical.

Points of Attack: Irritation of eyes; sensitization dermatitis.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with Chromium(III) oxide. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. *Eye Protection:* Eye protection is included in the recommended respiratory protection.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (2) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Chromium(III) oxide must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), glycerol, and oxygen difluoride, since violent reactions occur. A regulated, marked area should be established where chromium(III) oxide is handled, used, or stored. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solids, oxidizing, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS, OXIDIZER." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Chromium(III) oxide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

PAC-1: 14.4 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 240 mg/m^3

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e [1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L; Hexavalent chromium 50 μg/L according to EPA.[6]

US EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA’s maximum drinking water level (MCL) is 0.1 mg/L.[62]

Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water.

The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, eyes, skin.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to mouth, nose, throat, and lungs. *Skin:* May cause irritation, redness and sores. Allergic reaction may occur in sensitive individuals. *Eyes:* May cause irritation. *Ingestion:* Large quantities may cause stomach irritation and nausea.

Long Term Exposure: Repeated skin contact may give rise to allergic sensitization.

Points of Attack: Skin.

Medical Surveillance: Examination by a qualified allergist. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Keep away from heat.

Shipping: Toxic solid, inorganic, n.o.s. must be labeled "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Use extinguisher appropriate for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1, 1997; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; EPA *(inhalation)*: Known human carcinogen; EPA *(oral)*: Not Classifiable as to human carcinogenicity; NTP: Known to be a human carcinogen.

OSHA Table Z-1-A Air Contaminant as chromic acid and chromates mg[CrO_3].

Banned or Severely Restricted (Some countries) (UN).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: Chromium(VI) compounds: 0.1%.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List.

European/International Regulations: Hazard Symbol: O, T, N; Risk phrases: R46; R9; R24/25; R26; R35; R42/43; R62; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chromium trioxide is a dark-red crystalline substance. It is odorless. Molecular weight = 100.00; Boiling point = (decomposes below BP) at 250°C; Freezing/Melting point = 196°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3 (Oxidizer). It is deliquescent. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Chromium trioxide is used in plating and metal treatment, as a corrosion inhibitor; and as an oxidant; in aluminum anodizing; dye, ink, and paint manufacturing; tanning; engraving; and photography.

Incompatibilities: Chromium trioxide is a strong oxidizer. The solution in water is a strong acid. Reacts violently with bases and is corrosive. Contact with reducing agents, fuels, organic chemicals, flammable and combustible materials, causing fire and explosion hazard. This chemical decomposes above 250°C to chromic oxide and oxygen with increased fire hazard. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

As chromium(VI) inorganic soluble compounds

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 TWA Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.05 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.00962 mg/m^3

PAC-1: 0.00962 mg/m^3

PAC-2: 0.01 mg/m^3

PAC-3: 28.8 mg/m^3

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Austria: carcinogen, 1999; Denmark: TWA 0.02 mg[Cr]/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.05 mg/m^3, VLE 0.1 mg/m^3, carcinogen, 1999; Japan: EOL 0.05 mg [Cr]/m^3, 1999; Norway: TWA 0.02 mg/m^3, 1999; Poland: TWA 0.1 mg[Cr]/m^3; STEL 0.3 mg[Cr]/m^3, 1999; Russia: STEL 0.01 mg/m^3 [skin] 1993; Switzerland: TWA 0.02 mg/m^3, carcinogen, 1999; United Kingdom: TWA 0.05 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed human carcinogen. Connecticut[60] has set a guideline for chromium trioxide in ambient air of 0.25 μg/m^3.

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: For the protection of freshwater aquatic life: Hexavalent chromium: 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* Hexavalent chromium 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Extremely corrosive to skin.

Short Term Exposure: *Inhalation:* Human exposure to concentrations between 0.18 and 1.4 mg/m^3 of acid mist for 2 weeks produced irritation of the nose; after 4 weeks, ulcers of the nose developed; and after 8 weeks, holes formed in the tissue separating the nostrils with bleeding, discharge or formation of a crust in the inner nose. Additional effects noted in humans exposed to unknown concentrations are irritation of the throat, voice-box, lungs; asthmatic attacks, headache, wheezing, coughing, shortness of breath, and painful breathing. Chromic trioxide can cause severe allergic lung reaction. *Skin:* Direct contact will produce severe irritation of the skin. Sensitization from such contact can occur and result in severe dermatitis from very small exposures at a later time. *Eyes:* Can cause severe irritation, burns, and possible loss of vision. *Ingestion:* Swallowing of chromic acid solutions can result in severe irritation and damage to the mouth, throat, and stomach.

Long Term Exposure: Prolonged exposure to chromic acid mist can result in perorations (holes) of the nasal septum (tissue separating the nostrils); lung irritation with symptoms similar to asthma and liver damage. Repeated or prolonged contact with skin may cause dermatitis and chrome ulcers or "chrome holes." May cause skin sensitization, allergy, irritation, and rashes. Repeated or prolonged inhalation exposure may cause asthma-like reactions. Wearing away of the surfaces of teeth has been noted in workers exposed to chromic acid mist for a prolonged time. This substance is carcinogenic to humans. It has been shown to cause lung and throat cancers. There is limited evidence that this chemical is a teratogen in animals. May cause kidney and liver damage.

Points of Attack: Skin, lungs, kidney, liver.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, complete blood count; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests, sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before first exposure and every 6−12 months, a medical history and exam is recommended, with very careful attention to the nose, skin, lungs, and voice box. If you notice skin, nose, or lung effects, seek prompt medical attention. Also check your skin daily for little bumps or blisters, the first sign of "chrome ulcers." If not treated early, these can last for years after exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear acid-resistant gloves and clothing to prevent any reasonable probability of skin contact. (as chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. AIHA recommends polyvinyl chloride for solutions of Chromium(VI) oxide in water as a protective material. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, chromium(VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with chromium(VI) oxide you should be trained on its proper handling and storage. Chromium(VI) oxide must be stored to avoid contact with reducing agents and organic chemicals since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from fuels and other flammable and combustible materials. Do not store chromium(VI) oxide on wood floors because prolonged contact with wood can produce a fire hazard. Protect from excess moisture to minimize rusting of containers. A regulated, marked area should be established where chromium(VI) oxide is handled, used, or stored. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chromic acid, solid, must be labeled "OXIDIZER, CORROSIVE." It falls in Hazard Class 5.1 and Packing Group II.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep chromium(VI) oxide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Chromium(VI) oxide itself does not burn but it will increase the intensity of a fire since it is an oxidizer. The substance decomposes above 250°C to chromic oxide and oxygen with increased fire hazard. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reduce to Cr(III). If material cannot be recovered and recycled, dispose of sludge in a chemical waste landfill.[22]

Safe Drinking Water Act: MCL, 0.1 mg/L; MCLG, 0.1 mg/L; Regulated chemical (47 FR 9352).

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as chromium(III) compounds, n.o.s.; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List as chromium compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chromosulfuric acid is a dark green powder. Molecular weight = 724.4; Highly soluble in water (reactive).

Potential Exposure: Chromosulfuric acid is used in chrome plating; paint, ink, and glaze manufacturing; tanning, catalyst preparation; and as a fixative in textile dyeing.

Incompatibilities: Violent reaction with water. Incompatible with caustic materials, ammonia, aliphatic amines, alkanolmines, isocyanates, epichlorohydrin.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

No TEEL available.

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: For the protection of freshwater aquatic life: Trivalent chromium: not to exceed e[1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: Trivalent chromium: 10,300 μg/L on an acute toxicity basis. *To protect human health:* Trivalent chromium: 170 μg/L. EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62]

Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] of 50 μg/L for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Chromosulfuric acid is a corrosive chemical, and skin or eye contact can cause severe irritation and burns. Inhalation can irritate the respiratory tract causing coughing and wheezing. Skin allergy sometimes occurs with itching, redness, and/or an eczema-like rash. If this happens, future contact can trigger symptoms.

Long Term Exposure: May cause skin allergy with itching and rash. Some related chromium compounds are known carcinogens. Although this chemical has not been identified as a carcinogen, it should be handled with extreme caution.

Points of Attack: Skin, respiratory system.

Medical Surveillance: Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or

P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with chromosulfuric acid you should be trained on its proper handling and storage. Chromosulfuric acid must be stored to avoid contact with water and other incompatible materials listed above since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials.

Shipping: Chromosulfuric acid requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group I.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep Chromosulfuric acid out of confined spaces, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromosulfuric acid may burn but does not readily ignite. It will increase the intensity of a fire since it is an oxidizer. Use dry chemical or CO_2 extinguishers. Use water spray to keep fire-exposed containers cool, but do not get water inside containers. Poisonous gases are produced in fire, including sulfur oxides and chromium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as chromium compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants.

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Chromium(II) compounds, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chromous chloride is a white-to-blue solid or lustrous needles which turn blue in water. Molecular weight = 122.90; Boiling point = 1300°C; Melting point = 824°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Mutagen. It is used in metal alloys and metal finishing; textile treatment, including mothproofing, waterproofing, printing; dying; leather tanning; making photographic chemicals; and green pigments for various uses.

Incompatibilities: Very hygroscopic. The substance is a strong reducing agent. Reacts with oxidizers. Reacts with water, forming flammable hydrogen gas.

Permissible Exposure Limits in Air

Chromous chloride may reduce the oxygen content of air in confined spaces.

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH: 0.5 mg[Cr]/m^3 TWA; Limit exposures to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix C.

Protective Action Criteria (PAC)

TEEL-0: 1.18 mg/m^3

PAC-1: 3.55 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: Use NIOSH Analytical Methods #7024, 7300, 7301, 7303, 9102 and OSHA Analytical Methods ID-121 and ID-125G.[58]

Permissible Concentration in Water: See "Chromium" entry.

Routes of Entry: Inhalation, eyes and/or skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact may cause damage. Inhalation can cause coughing and/or shortness of breath. May cause pulmonary irritation. Moderately toxic to humans. Between 1 oz and 1 lb may be fatal. LD_{50} = (oral-rat) 1870 mg/kg.

Long Term Exposure: May cause skin allergy. Chrome ulcers or sores of the skin or nasal septum; holes in the nasal septum, sometimes with bleeding may result. May cause lung damage.

Points of Attack: Skin, lungs.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: In case of fume inhalation, treat pulmonary edema. Consider administering prednisone or other corticosteroid to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3*: Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with chromous chloride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: The DOT does not set out any specific label requirements or maximum shipping quantities for chromous chloride.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid solution: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Chromous chloride may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chromous salts, chromic salts, and fumes of chromium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: O, T, C, N; Risk phrases: R49; R46; R8; R35; R43; R50/53; Safety phrases: S50/53; S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Chromyl chloride is a dark red fuming liquid with a musty, burning odor. Molecular weight = 154.90; Specific gravity (H_2O:1) = 1.91 at 25°C; Boiling point = 117°C; Freezing/Melting point = −96.5°C; Vapor pressure = 20 mmHg at 25°C. Soluble in water (decomposes).

Potential Exposure: Compound Description: Tumorigen, Mutagen. Chromium oxychloride is used in making chromium complexes and dyes; and used in various organic oxidation and chlorination reactions.

Incompatibilities: Contact with water is violent and forms hydrochloric, chromic acids, and chlorine gas. A powerful oxidizer. Reacts violently with acetone, alcohol, ammonia, ether, fuels, organic solvents, moist phosphorus, phosphorus trichloride, sodium azide, sulfur, reducing agents, turpentine. Contact with nonmetal halides, such as disulfur dichloride, phosphorus trichloride; and phosphorus tribromide; nonmetal hydrides, such as hydrogen sulfide; hydrogen phosphide; and urea, causes a danger of fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.001 mg[CrO_3]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, tert-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.025 ppm/0.16 mg/m^3 TWA.

No TEEL available.

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 1.

NIOSH IDLH: Not determined.

Austria: Suspected: carcinogen, 1999; Belgium: TWA 0.025 ppm (0.16 mg/m^3), 1993; Finland: carcinogen, 1999; Japan: 0.05 mg[Cr]/m^3, 1999; the Netherlands: MAC-TGG 0.15 mg/m^3, 2003; Norway: TWA 0.5 mg[Cr]/m^3, 1999; Switzerland: MAK-W 0.5 mg[Cr]/m^3, 1999; United Kingdom: TWA 0.05 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.025 ppm.

This chemical can be absorbed through the skin, thereby increasing exposure. Some states have set guidelines or standards for chromyl chloride in ambient air[60] ranging from 1.5 μg/m^3 (North Dakota) to 4.0 μg/m^3 (Nevada) to 15.0 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Methods #7600, 7604, 7605, 7703, 9101 and OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: This material reacts with water, but to the extent that it affects the chromium content of water see the following. For the protection of freshwater aquatic life: Hexavalent chromium: 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: Hexavalent chromium: 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* Hexavalent chromium 50 μg/L according to EPA.[6] EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μ filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Chromium chloride can affect you when breathed in and by passing through your skin. Chromium chloride should be handled as a carcinogen, with extreme caution. Eye contact can cause severe damage with this corrosive chemical. Skin contact can cause deep ulcers or an allergic rash or severe irritation.

Long Term Exposure: May cause cancer of the lungs and throat; birth defects, fetus damage, possible miscarriage; skin allergy, with itching and rash; lung allergy with cough, wheezing, and difficult breathing; kidney damage; damage to the bone (septum) in the nose.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: urine test for chromates. This test is most accurate shortly after exposure. Examination of the nose and skin. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. If any skin bumps or blisters develop, seek medical attention promptly. If not treated early, "chrome ulcers" can develop which can last for years. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite); biologic tissue/biopsy; chest X-ray; pulmonary function tests; red blood cells/count; urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- & postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. (as chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129, chromium(VI).

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with Chromium chloride you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Chromium chloride must be stored to avoid contact with water since violent reactions occur, releasing poisonous materials including chromic acid, hydrogen chloride, chromic chloride, and chlorine. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials, ammonia, alcohol and turpentine, and other incompatible materials listed above.

Shipping: Chromium chloride must carry a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the potential for an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN 1758 (Chromium chloride) is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water*: Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: Chromium chloride does not burn, but it will increase the intensity of a fire since it is an oxidizer. Extinguish surrounding fire with dry chemicals or CO_2. *Do not use water* to control a small fire. Poisonous gases are produced in fire, including chromic acid, hydrogen chloride, chromic chloride, and chlorine. Vapors may travel to a source of ignition and flash back. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire especially if water gets in them. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1998. *Note*: Coal-tar, polynuclear aromatic compounds, and other materials which are known to be a human carcinogens; may contain chrysene.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1002) as coal tar pitch volatiles.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 307 Toxic Pollutants, 40CFR401.15 (effluent limitations); as polynuclear aromatic hydrocarbons (PAH).

US EPA Hazardous Waste Number (RCRA No.): U050.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.059; Nonwastewater (mg/kg), 3.4.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8100 (200); 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA (Section 313): as polycyclic aromatic compounds (PAC); Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% as chrysene and coal tar pitch volatiles.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R68; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Chrysene is a combustible, white[2] (when pure), red, or blue, fluorescent crystalline solid. Odorless. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 228.28[2]; Boiling point = 448°C at 760 mmHg[2]; Freezing/Melting point = 254°C[2]. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Almost never found by itself, chrysene is found in gasoline and diesel exhaust as well as in cigarette smoke; and in coal tar; coal tar pitch; creosote. It is used in organic synthesis.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air: As coal tar pitch volatiles.

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 80 mg/m^3

DFG MAK: Category 1, human carcinogen.

Guidelines for chrysene concentration in ambient air[60] have been set at zero by North Dakota and at 3.0 μg/m^3 by Virginia.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: In view of the carcinogenicity of polynuclear aromatic hydrocarbons, the concentration in water is preferably zero as noted by EPA.[6] Kansas[61] gives a guideline for chrysene in drinking water of 0.029 μg/L.

Determination in Water: Extraction with methylene chloride may be followed by measurement by ultraviolet or by HPLC/flame spectrometry or by gas chromatography and mass spectrometry as reviewed in the ATSDR document referenced below. Octanol−water coefficient: Log K_{ow} = 5.59.

Routes of Entry: Inhalation, skin contact, ingestion. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Chrysene can affect you when breathed in and by passing through your skin. Chrysene should be handled as a carcinogen—with extreme caution. Skin contact may cause a rash. If skin in exposed to sunlight, a "sunburn" can occur. Sunlight exposure on skin contaminated with coal tar chemicals such as chrysene can cause rash and later, pigment changes. Persons who smoke cigarettes may be at increased lung cancer risk with this chemical. This can be significantly reduced by stopping smoking, as well as by reducing exposures.

Long Term Exposure: May cause cancer of the skin and kidneys; birth defects; miscarriage; dermatitis, changes in skin pigment. May cause bronchitis with phlegm and/or shortness of breath. The DFG[3] states that PAHs are present at particularly high levels in coal tar oils and related pyrolysis products of organic materials; and are carcinogenic (Category 1) in animal studies.

Points of Attack: Skin, respiratory system, bladder, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: complete blood count; chest X-ray; pulmonary function tests: forced vital capacity; forced expiratory volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria; liver, kidney, and bladder function tests recommended for coal tar pitch volatiles.[2] Monthly, carefully look at any skin areas that are exposed. Any growth (like a mole) that increases in size or shows changes in color should be examined by a physician. Skin cancer is curable when detected early. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with chrysene you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Chrysene is not specifically cited in DOT's Performance-Oriented Packaging Standards.[19] However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Coal tar pitch volatiles are combustible but may not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Chrysene may be destroyed by permanganate oxidation, by high-temperature incinerator with scrubbing equipment, or by microwave plasma treatment.

C.I. Basic green 1 C:1230

Molecular Formula: $C_{27}H_{34}N_2O_4S$

Common Formula: $C_{27}H_{33}N_2 \cdot HSO_4$

Synonyms: Brilliant Green; Ethyl Green; Emerald Green; Malachite Green G

CAS Registry Number: 633-03-4

RTECS® Number: BP6825000

UN/NA & ERG Number: UN3143 (Dyes, solid, toxic, n.o.s.)/151

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: C.I. Basic Green 1 is a metallic green, odorless crystal or powder. Molecular weight = 482.69; Melting point = 210°C. Soluble in water.

Potential Exposure: C.I. Basic Green 1 is used in dyeing silk, wool, leather, jute, and cotton; manufacturing green ink; as staining constituent of bacteriological media; indicator, an intestinal anthelmintic; a wound antiseptic; treatment of mycotic infections; agricultural fungicide (not registered as a pesticide in the United States).

Incompatibilities: Oxidizing agents, reducing agents, anionics, and aqueous solutions of bentonite. Keep away from moisture.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

It is classified as very toxic; probable lethal dose is 50−500 mg/kg in humans (between 1 teaspoon and 1 oz for a 150-lb person). It is a skin irritant. Ingestion causes diarrhea and abdominal pain.

Short Term Exposure: C.I. Basic green can irritate and burn the skin and eyes. Ingestion causes nausea, vomiting, diarrhea, and abdominal pain. It is classified as very toxic; probable lethal dose is 50−500 mg/kg in humans (between 1 teaspoon and 1 oz for a 150-lb person).

Long Term Exposure: Skin contact can cause drying and cracking.

Points of Attack: Skin.

Medical Surveillance: There are no special tests for this substance.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is a potential for overexposure: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location.

Shipping: Dyes, solid, toxic, n.o.s. require a DOT shipping label reading "POISONOUS/TOXIC MATERIALS" for Packing Group II. The Hazard Class is 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. For small fires use dry chemical, carbon dioxide, water spray, or foam. For large fires use water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear self-contained (positive-pressure if available) breathing apparatus and full protective clothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer (benzidine-based dyes) 10/1/92.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R63; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: C.I. Direct red 28(Congo Red) is an odorless, brownish-red powder. Molecular weight = 698.72. Melting point = 359°C. Soluble in water; solubility = 25 g/L at 25°C.
Potential Exposure: It is used as an indicator dye, a biological stain; a diagnostic aid in medicine; and a dye for fabric and paper.
Incompatibilities: Contact with oxidizers may cause fire and explosion hazard. Incompatible with strong acids; reducing agents.
Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: Use NIOSH Analytical Method #5013, Dyes.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact may cause irritation. Exposure can cause nausea, vomiting, and diarrhea; and increase the formation of platelets; and increasing the ability of the blood to clot.
Long Term Exposure: While this chemical has not been designated a carcinogen, the parent compound, benzidine, causes bladder cancer. May decrease fertility in males. May cause skin allergy with itching and rash. *EC Labeling:* Restricted to professionals. Toxic; (R45) May cause cancer; (R63) Possible risk of harm to the unborn child; (S53) Avoid exposure: obtain special instructions before use; (S45) In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).
Points of Attack: Skin, blood.
Medical Surveillance: Complete blood count (CBC). Evaluation by a qualified allergist.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is a potential for over-exposure: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).
Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, reducing agents, and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: Dyes, solid, corrosive, n.o.s. [or] Dye intermediates, solid, corrosive, n.o.s. have a label requirement of "CORROSIVE." This chemical is in DOT/UN Hazard Class 8.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including ammonia, carbon monoxide, nitrogen, and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services. (May 1999). *Hazardous Substances Fact Sheet: C.I Direct red 28*. Trenton, NJ

C.I. Food red 15 C:1250

Molecular Formula: $C_{28}H_{31}N_2O_3 \cdot Cl$

Synonyms: 11411 Red; Acid brilliant pink B; ADC rhodamine B; Aizen rhodamine BH; Aizen rhodamine BHC; Akiriku rhodamine B; Ammonium, [9(*o*-Carboxyphenyl)-6-(diethylamino)-3H-xanthen-3-ylidene]diethyl-, chloride; Basic violet 10; Calcozine red BX; Calcozine rhodamine BXP; 9-*o*-Carboxyphenyl-6-diethylamino-3-ethylimino-3-isoxanthrene, 3-ethochloride; [9-(*o*-Carboxyphenyl)-6-(diethylamino)-3-xanthen-3-ylidene]diethylammonium chloride; Cerise toner X 1127; C.I. 45170; C.I. basic violet 10; Cosmetic brilliant pink bluish D concentrate; D and C red No. 19; Diabasic rhodamine B; Edicol supra rose B; Edicol Supra Rose BS; Eriosin rhodamine B; Ethanaminium *n*-[9-(2-carboxyphenyl)-6-(diethylamino)-3H-xanthern-3-ylidene]-*N*-ethyl-, chloride; FD and C red No. 19; Flexco red 540; Hexacol rhodamine B extra; Ikada rhodamine B; Japan red 213; Japan red No. 213; Mitsui rhodamine BX; Red No. 213; Rheonine B; Rhodamine B; Rhodamine B 500; Rhodamine B 500 hydrochloride; Rhodamine BA; Rhodamine BA export; Rhodamine B extra; Rhodamine B extra M 310; Rhodamine B extra S; Rhodamine BN; Rhodamine BS; Rhodamine BX; Rhodamine BXL; Rhodamine BXP; Rhodamine FB; Rhodamine lake red B; Rhodamine O; Rhodamine S; Rhodamine, tetraethyl-; Sicilian Cerise toner A 7127; Symulex magenta F; Symulex rhodamine B toner F; Takaoka rhodamine B; Tetraethyldiamino-*o*-carboxyphenyl-xanthenyl chloride; Tetraethylrhodamine; Xanthylium, 9-(2-carboxyphenyl)-3,6-bis(diethylamino)-, chloride

CAS Registry Number: 81-88-9

RTECS® Number: BP3675000

UN/NA & ERG Number: UN3143 (Dyes, solid, toxic, n.o.s.)/151

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Group 3, 1998.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 7/1/90.

Canada, On DSL List; WHMIS Classification D2A, D2B.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R40; Safety phrases: S/36/37; S/45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: C.I. Food red 15 is a green crystalline or red-violet powdered solid. Molecular weight = 479.1. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: It is used as a color additive in drugs, foods, cosmetics, and fabric dyes. It is also used as a tracing agent in water pollution studies.

Incompatibilities: Reducing agents and oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.4 mg/m^3

PAC-1: 1.25 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 50 mg/m^3

Determination in Air: Use NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin, eyes, and respiratory tract. Eye or skin contact can cause burns and permanent damage. Can cause headaches, difficult breathing, and chest tightness.

Long Term Exposure: May cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is a potential for overexposure: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with C.I. Food red 15 you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Dyes, solid, toxic, n.o.s. require a DOT shipping label reading "POISONOUS/TOXIC MATERIALS" for Packing Group II. The Hazard Class is 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide, nitrogen oxides, hydrogen chloride, and ammonia. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cisplatin C:1260

Molecular Formula: $Cl_2H_6N_2Pt$

Common Formula: $Pt(NH_3)_2Cl_2$

Synonyms: CDDP; DDP; *cis*-Diamminedichloroplatinum; *cis*-Platinous diaminodichloride; *cis*-Platinum

CAS Registry Number: 15663-27-1

RTECS® Number: TP2450000

UN/NA & ERG Number: UN3249/151

EC Number: 239-733-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, probably carcinogenic to humans, *probably carcinogenic to humans*, Group 2A, 1998; NTP: Reasonably anticipated to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 10/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cisplatin is a white powder or yellow crystalline solid; Freezing/Melting point = 270°C (decomposes). Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and administration of this anticancer chemotherapy agent. Contact with water causes decomposition.

Incompatibilities: Aluminum reacts with cisplatin and decreases the drug's effectiveness. Do not use any aluminum equipment to prepare or administer cisplatin.

Permissible Exposure Limits in Air

As platinum, soluble salts

ACGIH TLV®[1]: 1 mg/m^3 (metal); 0.002 mg[Pt]/m^3 TWA, soluble salts, as Pt.

OSHA PEL: None (metal); 0.002 mg[Pt]/m^3 TWA, soluble salts, as Pt.

NIOSH REL: 1 mg/m^3 (metal); 0.002 mg[Pt]/m^3 TWA, soluble salts, as Pt.

No TEEL available.

DFG MAK: No numerical value established. Data may be available; however, 2 μg[Pt]/m^3 peak should not be exceeded; danger of skin and airway sensitization, as chloroplatinates.

NIOSH IDLH: 4 mg [Pt]/m^3.

Determination in Air: Use NIOSH II[7] Method #S191, (IV) #7300, Elements.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with the skin or eyes can cause irritation with possible loss of vision. Inhalation can irritate the nose and throat. Exposure to high levels can cause tintinus (ringing in the ears) and possible hearing loss. LD_{50} = (oral-rat) 25.8 mg/kg (highly toxic).

Long Term Exposure: Cisplatin is a probable carcinogen in humans—handle with extreme caution. It has been shown to cause lung and skin cancer in animals. It may damage the developing fetus and may damage the testes (male reproductive glands). Repeated exposure to high levels can cause the same side effects seen in patients. These include kidney damage, hearing loss, low blood cell count, and nausea and committing. Exposure may cause anemia. May damage the nervous system causing numbness and weakness in the hands and feet. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Points of Attack: Skin, lungs, nervous system, bone marrow, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: examination of the nervous system; Audiogram (hearing test); Complete blood count (CBC); Kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood levels of cisplatin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA platinum as soluble salts as Pt: *up to 0.05 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.1 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 4 mg/m^3:* SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained reathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cisplatin you should be trained on its proper handling and storage. A regulated, marked area should be established where cisplatin is handled, used, or stored in manufacturing and packaging operations. Store cisplatin in sealed vials or tightly closed containers in a cool, well-ventilated area away from aluminum.

Shipping: Cisplatin is not specifically cited in DOT's Performance-Oriented Packaging Standards[19] but Medicine, solid, toxic, n.o.s. requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Clopidol C:1270

Molecular Formula: $C_7H_7Cl_2NOP$ 842

Synonyms: Clopindol; Coccidiostat C; Coyden®; 3,5-Dichloro-2,6-dimethyl-4-pyridinol; 3,5-Dichloro-4-pyridnol; Farmcoccid; Lerbek®; Methylchloropindol; Methylchlorpindol; Metilchlorpindol

CAS Registry Number: 2971-90-6

RTECS® Number: UU7711500

UN/NA & ERG Number: UN3249/151

EC Number: 221-008-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Clopidol is a white to light brown powder. Molecular weight = 192.1; Freezing/Melting point ≥320°C. Insoluble in water.

Potential Exposure: Those engaged in formulation, application, or manufacture of this veterinary antibiotic.

Incompatibilities: Noncombustible solid, but dust may explode in cloud form. Contact with strong oxidizers may cause a fire or explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3, total dust; 5 mg/m^3 TWA, respirable fraction; 20 mg/m^3, total dust STEL.

ACGIH TLV®[1]: 10 mg/m^3; Not classified as a human carcinogen.

No TEEL available.

Several states have set guidelines for clopidol in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH IV, Particulates NOR: Method #0500, total dust, Method #0600 (respirable).

Harmful Effects and Symptoms

Short Term Exposure: Clopidol may cause irritation of eyes, skin, nose, and throat. Clopidol has a low order of toxicity. Rats fed 15 mg/kg/day for 2 years showed no ill effects. LD_{50} = (oral-rat) 18 g/kg (slightly toxic).

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with clopidol you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Medicine, solid, toxic, n.o.s. requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Extinguish fire using an agent suitable for the type of surrounding fire; Clopidol itself does not burn. Poisonous gases are produced in fire, including hydrogen chloride and organic nitrogens. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Coal dust C:1280

Molecular Formula: $C_{3n}H_{4n}$

Common Formula: $(C_3H_4)_n$

Synonyms: Anthracite coal dust; Bituminous coal dust; Coal facings; Lignite coal dust; Sea coal

RTECS® Number: GF8281000

UN/NA & ERG Number: UN1361/133

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Description: Coal dust is a combustible dark brown-black solid dispersed in the air. Properties vary depending on type of coal.

Potential Exposure: Compound Description: Tumorigen. Those involved in the mining, preparation, delivery, or use of powdered coal.

Incompatibilities: Keep dust away from strong oxidizers. The dust can act as a reducing agent. Slightly explosive when exposed to flame.

Permissible Exposure Limits in Air [SiO_2 = quartz]

OSHA PEL: 2.4 mg/m^3 TWA (containing less than 5% SiO_2), respirable fraction; 10 mg/m^3/(%% SiO_{2+2}) TWA (containing more than 5% SiO_2), respirable fraction.

ACGIH TLV®[1]: 2 mg/m^3 TWA (containing less than 5% SiO_2), respirable fraction; 0.1 mg/m^3 TWA (containing more than 5% SiO_2), respirable fraction; 0.9 mg/m^3 TWA Bituminous and 0.4 mg/m^3 TWA for Anthracite, not classifiable as a human carcinogen.

United Kingdom: LTEL 2 mg/m^3 (respirable), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 2 mg/m^3 TWA (containing less than 5% SiO_2), respirable fraction.

Determination in Air: Coal dust may be determined gravimetrically: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0600, Particulates NOR (respirable). See also Method #7500. See also OSHA Analytical Method ID-142. No TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Long Term Exposure: The inhalation of coal dust may cause coal workers’ pneumoconiosis (CWP), chronic bronchitis, decreased pulmonary function, emphysema. This can result in reduction in ventilatory capacity, pulmonary hypertension, and premature death.

Points of Attack: Respiratory system.

Medical Surveillance: Preplacement and annual physical examinations should be performed with emphasis on the respiratory system including chest X-rays.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear thick working gloves and safety glasses.[24]

Respirator Selection: Use NIOSH/MSHA-approved dust respirator.

Storage: Color Code—Yellow Stripe [*dust* (*strong reducing agent*)]: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this material you should be trained on its proper handling and storage. Store in a cool, well-ventilated area away from strong oxidizers and open flame. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Carbon, animal, or vegetable origin requires a shipping label of “SPONTANEOUSLY COMBUSTIBLE.” It falls in Hazard Class 4.2 and Packing Group III.[19] The letter “I” identifies proper shipping names which are appropriate for describing materials in international transportation. An alternate proper shipping name may be selected when only domestic transportation is involved.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Remove to containers which are readily disposable to land reclamation or dumps. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste.

Fire Extinguishing: This chemical is a combustible solid. Coal dust is explosive when exposed to flame. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases can be produced in fire, including carbon monoxide. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use land reclamation or dumps.[24]

Coal tar pitch and volatiles C:1290

Synonyms: *8001-58-9:* AWPA No. 1; Brick oil; Coal tar creosote; Coal tar distillate; Coal tar oil; Creosota de alquitran de hulla (Spanish); Creosote, coal tar; Creosote, from coal tar; Creosote oil; Creosote P1; Creosotum; Cresylic creosote; Dead oil; Heavy oil; Liquid pitch oil; Naphthalene oil; Preserv-*o*-Sote; Tar oil; Wash oil

Note: Synonyms vary depending upon the specific compound that are covered as separate records (e.g. acridine, anthracene, benzo(a)pyrene, chrysene, pyrene, phenanthrene). NIOSH considers coal tar, coal tar pitch, and creosote to be coal tar products.

CAS Registry Number: 65996-93-2 (coal tar pitch); 8007-45-2 (coal tar); 65996-92-1 (coal tar distillate); 8001-58-9 (coal tar creosote)

RTECS® Number: GF8655000 (coal tar pitch); GF8600000 (coal tar); GF8617500 (coal tar distillate); GF8615000 (coal tar creosote)

UN/NA & ERG Number: UN2713 (Acridine)/153; see also UN1999 (coal tar)/130; UN1136/128 (coal tar distillate); UN1993 (coal tar creosote)/128

EC Number: 266-028-2 [*Annex I Index No.:* 648-055-00-5] (pitch, coal tar, high-temp); 232-361-7 [*Annex I Index No.:* 648-081-00-7] (tar, coal); 266-027-7 [*Annex I Index No.:* 648-047-00-1] [distillates (coal tar)]; 232-287-5 [*Annex I Index No.:* 648-101-00-4] (creosote); 232-361-7 [*Annex I Index No.:* 648-081-00-7] (coal tar pitch).

Regulatory Authority and Advisory Bodies

European/International Regulations [*65996-93-2; (The residue from the distillation of high temperature coal tar. A black solid with an approximate softening point from 30°C to 180°C/86°F to 356°F. Composed primarily of a complex mixture of three or more membered condensed ring aromatic hydrocarbons*)]; [*8007-45-2 (The by-product from the destructive distillation of coal. Almost black semisolid. A complex combination of aromatic hydrocarbons, phenolic compounds, nitrogen bases and thiophene.)*]; [*65996-92-1 (The distillate from coal tar having an approximate distillation range of 100−450°C/212−842°F. Composed primarily of two to four membered condensed ring aromatic hydrocarbons, phenolic compounds, and aromatic nitrogen bases.)*]: Hazard Symbol: T; Risk phrases: R45; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters. [Coal tar pitch, softening point >80°C, ground to grain size <1 cm.]; 2 [Coal tar pitch, softening point >80°C, molten or pieces (grain size >1 cm.)].

Description: The term "coal tar products," as used by NIOSH, includes coal tar and two of the fractionation products of coal tar, creosote and coal tar pitch, derived from the carbonization of bituminous coal. Coal tar, coal tar pitch, and creosote derived from bituminous coal often contain identifiable components which by themselves are carcinogenic, such as benzo(a)pyrene, benzanthracene, chrysene, and phenanthrene. Other chemicals from coal tar products, such as anthracene, carbazole, fluoranthene, and pyrene, may also cause cancer, but these causal relationships have not been adequately documented. Also, the research chemical methylcholanthrene [CAS: 56-49-5], a powerful carcinogen, fits this category. Boiling point = >260°C; Melting point = 250-180°C; Flash point = 207°C (coal tar pitch); 74°C (creosote oil); Autoignition temperature = >510°C. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Human Data (coal tar pitch volatiles); Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector (coal tar creosote). The coke-oven plant is the principal source of coal tar. The hot gases and vapors produced during the conversion of coal to coke are collected by means of a scrubber, which condenses the effluent into ammonia, water, crude tar, and other by-products. Crude tar is separated from the remainder of the condensate for refining and may undergo further processing. Employees may be exposed to pitch and creosote in metal and foundry operations; when installing electrical equipment; in construction, railway, utility; and briquette manufacturing.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen; BEIp issued.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)

Coal tar pitch volatiles

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 80 mg/m^3

Protective Action Criteria (PAC)

Coal tar, aerosol

TEEL-0: 0.4 mg/m^3

PAC-1: 1.25 mg/m^3

PAC-2: 7.5 mg/m^3

PAC-3: 500 mg/m^3

Protective Action Criteria (PAC)

Coal tar creosote

TEEL-0: 0.2 mg/m^3

PAC-1: 35 mg/m^3

PAC-2: 80 mg/m^3

PAC-3: 80 mg/m^3

DFG MAK: Category 1, human carcinogen.

Denmark: TWA 0.2 mg/m^3, 1999: France: VME 0.2 mg/m^3, 1999: United Kingdom: LTEL 0.14 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for coal tar pitch volatiles in ambient air[60] ranging from zero (North Carolina) to 0.0161 μg/m^3 (Kansas) to 0.48 μg/m^3 (Pennsylvania) to 2.0 μg/m^3 (Connecticut and Virginia) to 5.0 μg/m^3 (Nevada).

Determination in Air: Collection on a filter, extraction, column chromatography; spectrophotometric measurement. Benzene solubility may be determined by collection of particulates on a filter, ultrasonic extraction with benzene, evaporation and gravimetric determination. Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Determination in Water: No method established. Octanol−water coefficient: Log K_{ow} = about 6.0.

Routes of Entry: Inhalation, skin and eye contact.

Harmful Effects and Symptoms

Based on a review of the toxicologic and epidemiologic evidence presented, it has been concluded that some materials contained in coal tar pitch, and therefore, in coal tar, can cause lung and skin cancer; and perhaps cancer at other sites. Based on a review of experimental toxicologic evidence, it is also concluded that creosote can cause skin and lung cancer. While the evidence on creosote is not so strong as that on pitch (in part because of difficulties in chemical characterization of such mixtures), the conclusion on the carcinogenic potential of creosote is supported by information on the presence of polynuclear aromatic hydrocarbons, and imputations and evidence of the carcinogenicity of such hydrocarbons. The overwhelming scientific evidence in the record supports the finding that coke oven emissions are carcinogenic. This finding rests on epidemiological surveys as well as animal studies and chemical analyses of coke oven emissions. Coke oven workers have an increased risk of developing cancer of the lung and urinary tract. In addition, observations of animals and of human populations have shown that skin tumors can be induced by the products of coal combustion and distillation. Chemical analyses of coke oven emissions reveal the presence of a large number of scientifically recognized carcinogens as well as several agents known to enhance the effect of chemical carcinogens, especially on the respiratory tract.

Points of Attack: Respiratory system, lungs, bladder, kidneys, skin.

Medical Surveillance: Medical surveillance shall be made available, as specified below, to all employees occupationally exposed to coal tar products.

Preplacement Medical Examinations: These examinations shall include comprehensive initial medical and work histories, with special emphasis directed toward identifying preexisting disorders of the skin, respiratory tract, liver, and kidneys. A physical examination giving particular attention to the oral cavity, skin, and respiratory system. This shall include posteroanterior and lateral chest X-rays (35 × 42 cm). Pulmonary function tests, including forced vital capacity (FVC) and forced expiratory volume at 1 s

(FEV 1.0), and a sputum cytology examination shall be offered as part of the medical examination of exposed employees. Other tests, such as liver function and urinalysis, should be performed as considered appropriate by the responsible physician. In addition, the mucous membranes of the oral cavity should be examined. A judgment of the employee's ability to use positive-pressure respirators.

Periodic Examinations: These examinations shall be made available at least annually and shall include interim medical and work histories. A physical examination as outlined above.

Initial Medical Examinations: These examinations shall be made available to all workers as soon as practicable after the promulgation of a standard based on these recommendations.

Pertinent Medical Records: These records shall be maintained for at least 30 years after termination of employment. They shall be made available to medical representatives of the government, the employer, or the employee.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Employers shall use engineering controls when needed to keep the concentration of airborne coal tar products at, or below, the specified limit. Employers shall provide protective clothing and equipment impervious to coal tar products to employees whenever liquid coal tar products may contact the skin or eyes. Emergency equipment shall be located at well-marked and clearly identified stations and shall be adequate to permit all personnel to escape from the area or to cope safely with the emergency on reentry. Protective equipment shall include eye and face protection; protective clothing; and respiratory protection as spelled out in detail by NIOSH.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where coal tar creosote is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of coal tar creosote should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Entry into areas containing coal tar creosote is to be controlled by permit only.

Shipping: The "Acridine" DOT number is used by NIOSH for coal tar pitch volatiles. The required label is "POISONOUS/TOXIC MATERIALS." It would fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep coal tar creosote out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

Fire Extinguishing: *For combustible solids.* Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

For combustible liquids. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. Coal tar creosote is a combustible liquid. Use dry chemical, CO_2, water spray, or foam extinguishers.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cobalt compounds.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): total dust 6010 (70); 7200 (500); 7201 (10) (cobalt metal).

EPCRA (Section 313): Form R *de minimis* concentration reporting level: 1.0% (cobalt metal).

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) Note: Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure (cobalt compounds).

EPCRA (Section 313): Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0% (cobalt compounds).

California Proposition 65 Chemical: Cancer (cobalt metal powder) 7/1/92; (cobalt oxide) 7/1/92.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (cobalt); National Pollutant Release Inventory (NPRI).

Mexico, Wastewater, Toxic Pollutant.

WGK (German Aquatic Hazard Class): No value assigned (oxides); Nonwater polluting agent (metal).

Description: Cobalt is a silver-gray to black, hard, brittle, magnetic metal. It is relatively rare; the important mineral sources are the arsenides, sulfides, and oxidized forms. It is generally obtained as a by-product of other metals, particularly copper. Molecular weight = 58.93 (cobalt); 74.93 [cobalt(II) oxide]; 165.86 [cobalt(III) oxide]; Specific gravity (H_2O:1) = 8.92; Boiling point = 2870°C; Freezing/Melting point = 1495°C. Hazard Identification (based on NFPA-704 M Rating System): (dust) Health 2, Flammability 3, Reactivity 2. Cobalt is insoluble in water. Cobalt fume and dust have the composition Co/CoO/Co_2O_2/Co_2O_4. Cobaltic oxide: Freezing/Melting point = (decomposes) 895°C. Insoluble in water.

Potential Exposure: Compound Description (cobalt): Tumorigen, Mutagen. Nickel–aluminum–cobalt alloys are used for permanent magnets. Alloys with nickel, aluminum, copper, beryllium, chromium, and molybdenum are used in the electrical, automobile, and aircraft industries. Cobalt is added to tool steels to improve their cutting qualities and is used as a binder in the manufacture of tungsten carbide tools. Various cobalt compounds are used as pigments in enamels, glazes, and paints; as catalysts in afterburners; and in the glass, pottery, photographic, electroplating industries. Radioactive cobalt (^{60}Co) is used in the treatment of cancer. Cobalt has been added to beer to promote formation of foam but cobalt acts with alcohol to produce severe cardiac effects at concentrations as low as 1.2−1.5 mg/L of beer. Cobalt is part of the vitamin B_{12} molecule and as such is an essential nutrient. The requirement of humans for cobalt in the form of vitamin B_{12} is about 0.13 μg/day.

Incompatibilities: Cobalt metal dust/powder may spontaneously ignite on contact with air, when finely divided. Reacts with acids, strong oxidizers, ammonium nitrate, causing fire and explosion hazard. Can promote decomposition of various organic substances. Cobaltic oxide reacts with reducing agents; and violently with hydrogen peroxide.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Co]/m^3 TWA as metal dust and fume.

NIOSH REL: 0.05 mg[Co]/m^3 TWA as metal dust and fume.

ACGIH TLV®[1]: 0.02 mg[Co]/m^3 TWA, animal carcinogen; BEI: 15 μg/L [Co] in urine at end-of-shift at end-of-work-week; 1 μg/L [Co] in blood at end-of-shift at end-of-work-week.

NIOSH IDLH: 20 mg[Co]/m^3.

Protective Action Criteria (PAC)

Metal

TEEL-0: 0.02 mg/m^3
PAC-1: 0.3 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 20 mg/m^3

Oxide

TEEL-0: 0.0272 mg/m^3
PAC-1: 0.0187 mg/m^3
PAC-2: 0.136 mg/m^3
PAC-3: 27.2 mg/m^3

[(II) oxide]

TEEL-0: 0.0254 mg/m^3
PAC-1: 0.0763 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 25.4 mg/m^3

DFG MAK: (*as inhalable fraction*) [skin] Danger of airway sensitization; Carcinogen Category 2 (includes cobalt-containing hard metals); Germ Cell Mutation Category 3A; TRK: 5 μg/L [Co] in whole blood; 60 μg/L [Co] in urine.

Arab Republic of Egypt: TWA 0.1 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.05 mg/m^3, 1999; Denmark: TWA 0.05 mg/m^3, 1999; Finland: TWA 0.05 mg/m^3 [skin] 1999; Hungary: TWA 0.1 mg/m^3; STEL 0.2 mg/m^3, 1993; the Netherlands: MAC-TGG 0.02 mg[Co]/m^3; MAC-TGG 0.02 mg/m^3, 2003; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, 1993; Poland: MAC (TWA) 0.05 mg/m^3, MAC (STEL) 0.2 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, 1993; Sweden: NGV 0.05 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, carcinogen, 1999; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia, for ambient air in residential areas: 0.001 mg/m^3 is the MAC on an average daily basis for cobalt metal. Several states have set guidelines or standards for cobalt in ambient air[60] ranging from 0.33 μg/m^3 (New York) to 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (Florida and North Dakota) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Cobalt metal, dust, and fume may be determined by filter collection, acid dissolution, digestion, and measurement by atomic absorption spectrophotometry. See NIOSH Analytical Method (IV)s #NIOSH 7027, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G, and ID-213.

Permissible Concentration in Water: The EPA[32] has suggested a permissible ambient goal of 0.7 μg/L based on health effects. Russia[43] set a MAC of 1 mg/L in water bodies used for domestic purposes. Limits in water bodies for fishery purposes have been set at 0.01 mg/L for freshwater and 0.05 mg/L for seawater.

Determination in Water: Atomic absorption spectroscopy gives a detection limit of 0.05 mg/L in water. Neutron activation can detect cobalt in urine below 0.5 μg/L.

Routes of Entry: Inhalation of dust or fume, ingestion, skin or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cobalt dust is mildly irritating to the eyes and to a lesser extent to the skin. It is an allergen and has caused allergic sensitivity type dermatitis in some industries where only minute quantities of cobalt are used. The eruptions appear in the flexure creases of the elbow, knee, ankle, and neck. Cross sensitization occurs between cobalt and nickel; and to chromium when cobalt and chromium are combined. Inhalation of dust and fume may cause irritation of the lungs with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingestion of cobalt or cobalt compounds is rare in industry. Vomiting, diarrhea, and a sensation of hotness may occur after ingestion; or after the inhalation of excessive amounts of cobalt dust.

Long Term Exposure: Repeated or prolonged inhalation exposure may affect lungs and cause an asthma-like disease with cough and dyspnea. This situation may progress to interstitial pneumonia with marked fibrosis. Pneumoconiosis may develop which is believed to be reversible. Since cobalt dust is usually combined with other dusts, the role cobalt plays in causing the pneumoconiosis is not entirely clear. Cobalt may decrease fertility in males.

Repeated or prolonged contact may cause skin sensitization. The substance may have effects on the heart, resulting in cardiomyopathy. Cobalt may affect the thyroid and kidneys. Cobalt is possibly carcinogenic and mutagenic to humans. Some isotopes of cobalt emit ionizing radiation; such exposure is associated with an increased risk of developing cancer.

Points of Attack: Respiratory system, skin.

Medical Surveillance: In preemployment examinations, special attention should be given to a history of skin diseases; allergic dermatitis; baseline allergic respiratory diseases; and smoking history. A baseline chest X-ray should be taken and chest X-ray for scarring should be done every 2–3 years following 5 or more years of exposure. Periodic examinations should be directed toward skin and respiratory symptoms and lung function. Evaluation for heart failure. Kidney and thyroid function tests. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure. NIOSH lists (cobalt): end-of-shift/end-of-shift at end-of-work-week/end-of-work-week, Blood Serum, Chest X-ray; pulmonary function tests: forced vital capacity; forced expiratory volume (1s), urine (chemical/metabolite) end-of-shift/end-of-shift at end-of-work-week/end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Where dust levels are excessive, dust respirators should be used by all workers. Protective clothing should be issued to all workers and changed on a daily basis. Showering after each shift is encouraged prior to change to street clothes. Gloves and barrier creams may be helpful in preventing dermatitis. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA, for cobalt metal dust and fume: *0.25 mg/m^3: if not present as a fume* Qm* (APF = 25) (any quarter-mask respirator). *0.5 mg/m^3*: 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *20 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Cobalt must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), acids, and ammonium nitrate since violent reactions occur. It should be stored in a cool place under an inert atmosphere. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: For metal powder, flammable, n.o.s. the required label is "SPONTANEOUSLY COMBUSTIBLE." They fall in Hazard Class 4.2 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. If spill involves radioactive cobalt, evacuate area and delay cleanup until properly instructed by qualified radiation authorities. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid, however, powdered cobalt will ignite. Use dry chemical such as sand, dolomite, and graphite powder for extinguishing powdered metal fires. *Do not use water*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For cobalt chloride: chemical reaction with water, caustic soda, and slaked lime, resulting in precipitation of the metal sludge, which may be landfilled. Cobalt metal may be recovered from scrap and cobalt compounds from spent catalysts as alternatives to disposal.[22]

Cobalt carbonyl C:1310

Molecular Formula: $C_8Co_2O_8$

Common Formula: $Co_2(CO)_8$

Synonyms: Cobalt octacarbonyl; Cobalto tetracarbonilo (Spanish); Cobalt tetracarbonyl; Cobalt tetracarbonyl dimer; Di-μ-carbonylhexacarbonyldicobalt; Dicobalt carbonyl; Dicobalt octacarbonyl; Octacarbonyldicobalt

CAS Registry Number: 10210-68-1; 37264-96-3; *(alt.)* 90043-99-5

RTECS® Number: GG0300000

UN/NA & ERG Number: UN1325 (flammable solid, organic)/133

EC Number: 233-514-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, possibly carcinogenic to humans, *possibly carcinogenic to humans*, Group 2B, 1991.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Carcinogenicity: IARC: Human Inadequate Evidence, group 2B, 1991.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cobalt compounds.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cobalt carbonyl is a pyrophoric (spontaneously flammable in air), red-orange (when pure) to dark-brown crystalline solid. Molecular weight = 341.94; Boiling point = (decomposes) 52°C; Freezing/Melting point = (decomposes) 50.5°C; Vapor pressure = 0.7 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen. This material is used as a catalyst for a number of reactions. It is also used in antiknock gasoline and for high-purity cobalt salts.

Incompatibilities: Reacts with strong acids and strong oxidizers. Decomposes on exposure to air or heat (at about 52°C) producing toxic fumes of carbon monoxide and cobalt. Stable in atmosphere of hydrogen and carbon monoxide.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 mg/m^3 TWA.

NIOSH IDLH: 20 mg[Co]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.27 mg/m^3

PAC-1: 0.27 mg/m^3

PAC-2: 27 mg/m^3

PAC-3: 60 mg/m^3

DFG MAK: Not established; TRK: 5 μg/L [Co] in whole blood; 60 μg/L [Co] in urine; Carcinogen Category 2.

Australia: TWA 0.01 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg[Co]/m^3, 1999; France: VME 0.1 mg/m^3, 1999; Hungary: TWA 0.01 mg/m^3; STEL 0.02 mg/m^3, 1993; Japan: 0.05 mg[Co]/m^3, 2B carcinogen, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; United Kingdom: TWA 0.1 mg[Co]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg[Co]/m^3. Several states have set guidelines or standards for cobalt in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: OSHA ID-125G.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: May cause sensitization and allergic reaction by skin contact and inhalation. The carbonyls are direct irritants. Carbon monoxide causes breathlessness, headache, weakness, fatigue, nausea and vomiting, dimness of vision, collapse, and coma. Cobalt carbonyl is corrosive to the eyes, skin, and severely irritates the respiratory tract. Inhalation of the aerosols can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Cobalt carbonyls share the general high toxicity of carbonyls because of the direct irritant and systemic action of the compound coupled with the effects of carbon monoxide, which is released from their decomposition. The oral LD_{50} = (oral, rat) 754 mg/kg (slightly toxic).

Long Term Exposure: May cause lung irritation and decreased pulmonary function, wheezing, dyspnea (breathing difficulty). Animal tests produce liver and kidney injury.

Points of Attack: Eyes, skin, respiratory system, blood, central nervous system.

Medical Surveillance: Lung function tests. Liver and kidney function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Decomposes on exposure to air or heat; stable in atmosphere of hydrogen and carbon monoxide. Store in airtight, unbreakable containers in a cool, well-ventilated area away from strong oxidizers and acids.

Shipping: FLAMMABLE SOLID, N.O.S., Hazard Class 4.1, Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. If appropriate, moisten spilled material to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in airtight, sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including cobalt and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure,

explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, possibly carcinogenic to humans, *possibly carcinogenic to humans*, Group 2B, 1991.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). *Note*: Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure.

EPCRA (Section 313): Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cobalt hydrocarbonyl is a highly flammable and toxic gas or liquid which decomposes rapidly at room temperature to toxic cobalt carbonyl. It has an offensive odor. Molecular weight = 171.98; Boiling point = 10°C; Freezing/Melting point = $-26°C$; Flash point = flammable gas. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 1. Very slightly soluble in water.

Potential Exposure: Those involved in manufacture and use of this material as a catalyst for organic reactions.

Incompatibilities: Unstable gas; decomposes rapidly in air at room temperature to toxic cobalt carbonyl and explosive hydrogen gas. A strong reducing agent; violent reaction with oxidizers and acids.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.292 ppm

PAC-1: 0.292 ppm

PAC-2: **0.9** ppm

PAC-3: **3** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.1 mg[Co]/m^3; TRK: 5 μg/L [Co] in whole blood; 60 μg/L [Co] in urine; Carcinogen Category 2.

Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg[Co]/m^3, 1999; France: VME 0.1 mg/m^3, 1999; Japan: 0.05 mg[Co]/m^3, 2B carcinogen, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Norway: TWA 0.1 mg[Co]/m^3, 1999; Russia: STEL 0.01 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg [Co]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg[Co]/m^3. Some states have set guidelines or standards for cobalt in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use OSHA: Method #ID-125G.[rtecs]

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. The 30-min LD_{50} = (inh, rats) 165 mg/m^3. The clinical effects are similar to nickel carbonyl and iron pentacarbonyl, but it has about one-half the toxicity of nickel carbonyl. In animals: irritation of respiratory system, dyspnea (breathing difficulty), cough.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Preemployment physical examinations should give particular attention to the respiratory tract and skin. Periodic examinations should include the respiratory tract and nasal sinuses, smoking history as well as general health. A baseline chest X-ray should be available and pulmonary function followed.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Where the danger of splash or spill of liquids exists, impervious protective clothing should be used. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, well-ventilated area. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Cobalt hydrocarbonyl fits the description of compressed gases, toxic, flammable, n.o.s. It requires a label of "POISON GAS, FLAMMABLE GAS."[19]

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

American Council of Governmental Industrial Hygienists, Inc. (1986). *Documentation of the Threshold Limit Values: Supplemental Documentation* (5th ed.). Cincinnati, OH

Cobalt naphthenate C:1330

Molecular Formula: $C_{12}H_{18}CoO_4$

Common Formula: $(C_5H_9COO)_2Co$

Synonyms: Cobalt naphtha; Cobalt naphthenate powder; Cobaltous naphthenate; Naphtenate de cobalt (French); Naphthenate de cobalt (French); Naphthenic acid, cobalt salt

CAS Registry Number: 61789-51-3

RTECS® Number: QK8925000

UN/NA & ERG Number: UN2001/133

EC Number: 263-064-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1991.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112). *Note:* Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure.

EPCRA (Section 313): Includes any unique chemical substance that contains cobalt as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cobalt naphthenate is a brown powder or bluish-red solid; Freezing/Melting point = 140°C; Flash point = 49°C; Autoignition temperature = 276°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Primary Irritant. Cobalt naphthenate is used as a drying agent in paints, varnishes, inks, and for curing plastics.

Incompatibilities: Contact with strong oxidizers causes a fire and explosion hazard. Highly flammable, powder or dust can form an explosive mixture with air.

Permissible Exposure Limits in Air

Cobalt and compounds

No TEEL available.

DFG MAK: Carcinogen Category 2, as inhalable fraction; [skin] danger of sensitization of the skin and airways; Germ Cell Mutation Category 3A.

Determination in Air: Cobalt metal, dust, and fume may be determined by filter collection, acid dissolution, digestion, and measurement by atomic absorption spectrophotometry. See NIOSH Analytical Method (IV) #7027. See also Method #7300, Elements, and OSHA Analytical Methods ID121 and ID125.

Permissible Concentration in Water: No criteria set. See Cobalt Metal.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Cobalt naphthenate can affect you when breathed in. Breathing the dust or fumes can cause lung allergy (asthma) to develop. Repeated exposures can cause lung scarring. High exposure can damage the heart and/or cause a large thyroid (goiter). Exposure can irritate the nose, throat, and lungs. Higher levels can cause a buildup of fluid (pulmonary edema). This can cause death. Repeated exposure can cause a loss of the sense of smell. Contact can cause a skin allergy to develop.

LD_{50} = (oral-rat) 3900 mg/kg (slightly toxic).

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated exposure to cobalt naphthenate can cause lung irritation, bronchitis, lung scarring with shortness of breath, coughing, and kidney damage.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. Chest X-ray (every 5 years) beginning 10 years after exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. GTT and serum lipid studies (to check for blood sugar and fat changes). CBC exam of the cardiovascular system. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 hours after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA, for cobalt metal dust and fume: *0.25 mg/m³: if not present as a fume* Qm* (APF = 25) (any quarter-mask respirator). *0.5 mg/m³*: 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *1.25 mg/m³:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m³:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *20 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where cobalt naphthenate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Cobalt naphthenate powder requires a "FLAMMABLE SOLID" label. They fall in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cobalt naphthenate is a combustible solid. Use dry chemical, sand, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Developmental/Reproductive toxin (male) 10/1/92.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R46; R28; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Colchicine is a pale yellow powder. It has little or no odor. It darkens on contact with light. Molecular weight = 399.88; Freezing/Melting point = 142–157°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Colchicine is a drug used to treat gouty arthritis, pseudogout, sarcoidal arthritis, and calcific tendonitis.

Incompatibilities: Oxidizers, mineral acids. Keep away from light.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.04 mg/m^3

PAC-1: 0.125 mg/m^3

PAC-2: 0.9 mg/m^3

PAC-3: 0.9 mg/m^3

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Colchicine can irritate and burn the eyes, skin, nose, and throat. Exposure can cause nausea, vomiting, diarrhea, loss of appetite, and abdominal pain may occur several hours after exposure. Inhalation can cause lung irritation with coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Colchicine can affect the heart causing arrhythmia. Shock occurs because of extensive vascular damage. Kidney damage resulting in bloody urine and diminished urine output may occur. It is classified as super toxic. The LD_{low} oral (dog, cat) is 0.125 mg/kg. Probable oral lethal dose in humans is less than 5 mg/kg, i.e., less than 7 drops for a 70-kg (150-lb) person. Death results from respiratory arrest. The fatal dose varies considerably; as little as 7 mg of colchicine has proved fatal.

Long Term Exposure: May cause genetic changes; liver and kidney damage. High exposure can cause headache, confusion, muscle weakness, coma, and death.

Points of Attack: Heart, liver, kidneys, lungs.

Medical Surveillance: Complete blood count. Liver and kidney function tests. EKG. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: This material is an alkaloid. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry place or a refrigerator. Protect from exposure to light, and keep away from mineral acids and oxidizers.

Shipping: Medicine, solid, toxic, n.o.s. requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using dry chemical, carbon dioxide, or water spray extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and carbon monoxide. Avoid breathing dusts and fumes from burning material. Keep upwind. Wear full protective clothing. Wear self-contained breathing apparatus. Avoid bodily contact with the material. Wash away any material which may have contacted the body with copious amounts of water or soap and water. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Conjugated estrogens C:1350

Synonyms: Amnestrogen; Ces; Climestrone; Co-Estro; Conest; Conestron; Conjes; Conjugated estrogenic hormones; Equigyne (sodium estrone sulfate and sodium equilin sulfate, or synthetic estrogen piperazine estrone sulfate); Estratab; Estrifol; Estroate; Estrocon; Estromed; Estropan; Evex; Femacoid; Femest; Fem H; Femogen; Formatrix; Ganeake; Genisis; Glyestrin; Kestrin; Menest; Menogen; Menotab; Menotrol; Milprem; MsMed; Neo-Estrone; Novoconestron; Oestrilin; Oestro-Feminal; Oestropak; Morning; Ovest; Palopause; Par; Estro; Piperazine oestrone sulphate; PMB; Premarin; Presomen; Promarit; SK-Estrogens; Sodestrin-H; Sodium equilin sulphate; Tag-39; Transannon; Trocosone; Zeste

CAS Registry Number: 12126-59-9

RTECS® Number: GL1224000

EC Number: 235-199-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence (Equigyne), *carcinogenic to humans*, Group 1, 1998; NTP: 7th Report on Carcinogens.[10]

California Proposition 65 Chemical: Cancer 1/27/87; Developmental/Reproductive toxin 4/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Conjugated estrogens generally occur as butter-colored powders that are soluble in water. The sodium equilin sulfate component is unstable to light and air. Piperazine estrone sulfate occurs as a white to yellowish white crystalline powder that is slightly soluble in water. Piperazine estrone sulfate melts at 245°C with decomposition. Conjugated estrogens are naturally occurring substances excreted in the urine of pregnant mares; piperazine estrone sulfate is not known to occur naturally.

Potential Exposure: Conjugated estrogens are used in the treatment of climacteric symptoms, vulvae dystrophies, female hypogonadism, and dysfunctional uterine bleeding. They are also used as a treatment following ovariectomy; for chemotherapy of mammary cancer and prostate carcinogema; and for the prevention of postpartum breast engorgement. Additionally, conjugated estrogens have been found in cosmetic preparations.

Incompatibilities: Estrogens are incompatible with strong oxidizers, strong bases, acid chlorides, and acid anhydrides.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set. Because conjugated estrogens are used as pharmaceuticals and in low quantities relative to other chemicals, they are not regulated by EPA. There may be a small pollution problem relative to hospital wastes.

Harmful Effects and Symptoms

Long Term Exposure: There is sufficient evidence that conjugated estrogens are carcinogenic in humans. Liver tumors, endometrial cancer, ovarian cancer, breast cancer, vascular system, and testicular cancer are associated with the use of conjugated estrogens in humans. A large number of studies of cancer of the endometrium suggest that use of conjugated estrogens causes the disease. Several studies reported on the relative risk of breast cancer from use of conjugated estrogens; the evidence is conflicting, both overall and within subgroups.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Copper & oxides C:1360

Molecular Formula: Cu

Synonyms: 1721 gold; Allbri natural copper; Anac 110; Arwood copper; Bronze powder; CDA 101; CDA 102; CDA 110; CDA 122; C.I. 77400; C.I. Pigment metal 2; Cobre (Spanish); Copper bronze; Elemental copper; Gold bronze; Kafar copper; M2 copper; MI (copper); OFHC Cu; Raney copper

CAS Registry Number: 7440-50-8; *(alt.)* 72514-83-1; 1317-38-0 (CuO, copper oxide fume); 1317-39-1 (copper oxide)

RTECS® Number: GL5325000; GL7900000 (CuO, copper oxide fume)

EC Number: 231-159-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

FDA—proprietary drug

US EPA, FIFRA, 1998 Status of Pesticides: Supported

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15).

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): total dust 6010 (60); 7210 (200).

Safe Drinking Water Act: MCL, 1.3 mg/L; MCLG, 1 mg/L; SMLC, 1.0 mg/L; Regulated chemical (47 FR 9352).

Reportable Quantity (RQ): 5000 lb (2270 kg) (no reporting of releases of this hazardous substance is required if the diameter of the pieces of solid metal released is equal to 0.004 in).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited; Drinking Water Quality $\leq$ 1.0 mg/L.

Mexico, Drinking Water = 1.0 mg/L.

WGK (German Aquatic Hazard Class): No value assigned (*metal*); 3—Highly water polluting (*copper oxide*).

Description: Copper is a reddish-brown metal which occurs free or in ores, such as malachite, cuprite, and chalcopyrite. Copper fume is a finely divided black particulate dispersed in air. Copper dusts and mists have been assigned the formula $CuSO_4 \cdot 5H_2O/CuCl$ by NIOSH. Copper fume has been designated as $Cu/CuO/Cu_2O$ by NIOSH. Molecular weight = 63.54; Boiling point = 2595°C; Freezing/Melting point = 1083°C. It may form both mono- and divalent compounds. Ignition temperature of dust cloud = 900°C; Minimum explosive concentration = unknown oz/ft^3.[USBM] Hazard Identification (based on NFPA-704 M Rating System). *copper powder*: Health 1, Flammability 3, Reactivity 0. Copper is insoluble in water but soluble in nitric acid and hot sulfuric acid. Relative explosion hazard of dust: Fire.

Potential Exposure: Compound Description: Tumorigen, Drug. Exposure to fume may occur in copper and brass plants; and during the welding of copper alloys; Reproductive Effector; Human Data. Metallic copper is an excellent conductor of electricity and is widely used in the electrical industry in all gauges of wire for circuitry, coil, and armature windings; high conductivity tubes; commutator bars, etc. It is made into castings, sheets, rods, tubing, and wire; and is used in water and gas piping; roofing materials; cooking utensils; chemical and pharmaceutical equipment; and coinage. Copper forms many important alloys: Be−Cu alloy, brass, bronze; gunmetal, bell metal; German silver; aluminum bronze, silicon bronze; phosphor bronze; and manganese bronze. Copper compounds are used as insecticides, algicides, molluscicides, plant fungicides, mordants, pigments, catalysts, as a copper supplement for pastures, and in the manufacture of powdered bronze paint and percussion caps. They are also utilized in analytical reagents, in paints for ships' bottoms; in electroplating; and in the solvent for cellulose in rayon manufacture.

Incompatibilities: Copper dust, fume, and mists form shock-sensitive compounds with acetylene gas, acetylenic compounds, azides, and ethylene oxides. Incompatible with acids, chemically active metals, such as potassium, sodium, magnesium, zinc, zirconium, strong bases. Violent reaction, possibly explosive, if finely-divided material come in contact with strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg[Cu]/m^3 (dust, mist) TWA; 0.1 mg/m^3 (fume) TWA.

NIOSH: 1 mg[Cu]/m^3 (dust, mist) TWA; 0.1 mg/m^3 (fume) TWA.

ACGIH TLV®[1]: 1 mg[Cu]/m^3 (dust, mist) TWA; 0.2 mg/m^3 (fume) TWA.

NIOSH IDLH: 100 mg[Cu]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 100 mg/m^3

Fume

TEEL-0: 0.125 mg/m^3
PAC-1: 0.751 mg/m^3
PAC-2: 1.25 mg/m^3
PAC-3: 125 mg/m^3

1317-39-1 (copper oxide)

TEEL-0: 0.1 mg/m^3
PAC-1: 0.25 mg/m^3
PAC-2: 1.5 mg/m^3
PAC-3: 100 mg/m^3

Copper and its inorganic compounds

DFG MAK: 0.1 mg/m^3 measured as the inhalable fraction of the aerosol; Peak Limitation Category II(2); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.1 mg/m^3 (fume), 1993; Australia: TWA 0.2 mg/m^3 (fume), TWA 1 mg/m^3 (*dust*), 1993; Austria: MAK 1 mg/m^3, MAK 0.1 mg/m^3 (fume), 1999; Belgium: TWA 0.2 mg/m^3 (fume), 1993; TWA 1 mg/m^3 (*dust*), 1993; Denmark: TWA 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg/m^3 (fume), MAC-TGG 1 mg/m^3 (*dust*), 2003; Finland: TWA 1 mg/m^3 (*dust*), 1999; France: VME (fume) 0.2 mg/m^3, VME (*dust*): 1 mg/m^3, 1999, VME 1 mg/m^3; STEL 2 mg/m^3 (*dust*), 1993; Hungary: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3 (*dust*), 1993; India: TWA 0.2 mg/m^3 (fume), 1993; Norway: TWA 0.05 mg[Co]/m^3, TWA 0.1 mg/m^3, fume, 1999; the Philippines: TWA 1.0 mg/m^3 (fume), 1993; Poland: MAC (TWA) fume 0.1 mg/m^3, MAC (STEL) fume 0.3 mg/m^3, MAC (TWA) dust 1 mg/m^3, MAC (STEL) dust 2 mg/m^3, 1999; Russia: STEL 0.5 ppm (1 mg/m^3) (*dust*), 1993; Sweden: NGV 0.2 mg/m^3 (respirable dust), NGV 1 mg/m^3 (total dust), 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.2 mg/m^3 (fume), MAK-W 1 mg/m^3, KZG-W 1 mg/m^3, 1999; Thailand: TWA 0.1 mg/m^3 (fume), TWA 1 mg/m^3, 1993; United Kingdom: TWA 0.2 mg/m^3, fume, TWA 1 mg/m^3; STEL 2 mg/m^3, dusts and mists as Cu, TWA 1 mg (week)/m^3; STEL 3 mg (week)/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg[Cu]/m^3. Several states have set guidelines or standards for copper in ambient air[60] ranging from 0.26−1.57 μg/m^3 (Montana) to 2.0 μg/m^3 (North Dakota) to 2.0−20.0 μg/m^3 (Connecticut) to 4.0−20.0 μg/m^3 (Florida) to 5.0 μg/m^3 (Nevada) to 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (New York).

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G; NIOSH Analytical Methods (fume) #7029, #7300, #7301,

#7303 and OSHA Analytical Methods ID-121, ID-125G, ID-206.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5.6 μg/L as a 24-h average, never to exceed e[0.94 In (hardness) − 1.23] μg/L. *To protect human health:* 1000 μg/L.[6] Canada: Drinking Water Quality (AO) ≤ 1.0 mg/L. Mexico, Drinking Water = 1.0 mg/L. The Czech Republic[35] set a MAC of 0.1 mg/L in surface water and 0.05 mg/L in drinking water. Russia[35] and The former USSR-UNEP/IRPTC project have set a MAC of 1.0 mg/L in water used for domestic purposes and 0.001 mg/L in freshwater and 0.005 mg/L in seawater used for fishery purposes. States have set guidelines for copper in drinking water are Kansas at 1000 μg/L and Minnesota at 1300 μg/L[61].

Determination in Water: Total copper may be determined by digestion followed by atomic absorption, or by colorimetry (using neocuproine), or by inductively coupled plasma (ICP) or optical emission spectrometry. Dissolved copper may be determined by 0.45 μ filtration followed by the preceding methods.

Routes of Entry: Inhalation of dust or fume, ingestion, or skin or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Copper salts act as irritants to the intact skin causing itching, erythema, and dermatitis. In the eyes, copper salts may cause conjunctivitis and even ulceration and turbidity of the cornea. Metallic copper may cause keratinization of the hands and soles of the feet, but it is not commonly associated with industrial dermatitis. The fumes and dust cause irritation of the upper respiratory tract; metallic taste in the mouth; nausea; metal fume fever. Inhalation of dusts, fumes, and mists of copper salts may cause congestion of the nasal mucous membranes. If the salts reach the gastrointestinal tract, they act as irritants producing salivation, nausea, vomiting, gastric pain, hemorrhagic gastritis, and diarrhea. It is unlikely that poisoning by ingestion in industry would progress to a serious point as small amounts induce vomiting, emptying the stomach of copper salts. Chronic human intoxication occurs rarely and then only in individuals with Wilson's disease (hepatolenticular degeneration). This is a genetic condition caused by the pairing of abnormal autosomal recessive genes in which there is abnormally high absorption, retention, and storage of copper by the body. The disease is progressive and fatal if untreated.

Long Term Exposure: Copper may decrease fertility in both males and females. Repeated or prolonged contact may cause skin sensitization and allergy; thickening of the skin; and may give greenish color to the skin, teeth, and hair. Repeated exposure can cause chronic irritation of the nose and ulcers and hole in the septum dividing the inner nose. Repeated high exposure to copper can cause liver damage. There is evidence that workers in copper smelting plants have an increased risk of lung cancer, but this is thought to be due to arsenic trioxide and not copper.

Points of Attack: For copper dusts and mists: respiratory system, lungs, skin, liver, including risk with Wilson's disease, kidneys. For copper fume: respiratory system, skin, eyes, and risk with Wilson's disease.

Medical Surveillance: Serum and urine copper levels. Evaluation by a qualified allergist. Liver function tests. Copper often contains arsenic as an impurity. Wilson's disease is a rare hereditary condition which interferes with the body's ability to get rid of copper. If you have this condition, consult your doctor about copper exposure. NIOSH lists the following tests: whole blood (chemical/metabolite), blood serum, biologic tissue/biopsy, urine (chemical/metabolite), urine (chemical/metabolite) 24-h collection.

First Aid: If copper dust or powder gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If copper dusts or powder contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Personal Protective Methods: *For copper dusts, powder, or mists:* Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m*^{3}: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m*^{3}*:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *25 mg/m*^{3}*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m³*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Copper fume: Up to 1 mg/m³: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m³:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece*). Up to 100 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe (*copper powder*) Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with copper you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetylene gas, oxidizers, and other incompatible materials listed above. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. *Copper powder:* sources of ignition, such as smoking and open flames, are prohibited where copper powder is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Store to avoid conditions which create fumes or fine dusts.

Shipping: Copper, elemental is not specifically cited in DOT's Performance-Oriented Packaging Standards.[19]

Spill Handling: Warn other workers of spill. Put on proper protective equipment and clothing. Sweep or vacuum up solids being careful not to raise dust levels. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of copper dust and powder as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Copper powder can be a combustible solid. Copper metal does not burn. Use powdered dolomite, sodium chloride (common salt), or graphite. *Do not use water*. Copper may contain arsenic; poisonous gases may be produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Copper-containing wastes can be concentrated through the use of ion exchange, reverse osmosis, or evaporators to the point where copper can be electrolytically removed and sent to a reclaiming firm. If recovery is not feasible, the copper can be precipitated through the use of caustics and the sludge deposited in a chemical waste landfill.[22]

Copper chloride C:1370

Molecular Formula: Cl_2Cu

Synonyms: Copper bichloride; Copper(2+) chloride; Copper(II) chloride; Copper dichloride; Cupric chloride; Cupric chloride dihydrate; Cupric dichloride; Dicopper dichloride; Dikupferdichlorid (German); Kupferchlorid (CuCl) (German)

CAS Registry Number: 7447-39-4 (II); 7758-89-6 (I)

RTECS® Number: GL7237000

UN/NA & ERG Number: UN2802/154

EC Number: 231-210-2 (II); 231-842-9 (I)

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Section 307 Toxic Pollutants, 40CFR401.15 (effluent limitations); as copper and compounds.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, as copper compounds; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*dichloride*); 2—Water polluting (*monochloride*).

Description: Copper chloride is a brownish-yellow powder. Molecular weight = 134.44. Boiling point = 993°C (decomposes below this point); Freezing/Melting point = 498°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Copper chloride is used in petroleum, textiles, metallurgy, photography, agricultural products, feed additives, and wood preservation. It is also used in light-sensitive paper manufacturing, glass pigments, ceramics, and in making cyclonitrile.

Incompatibilities: Contact with strong acids forms monovalent copper salts and toxic hydrogen chloride gas. Forms shock-sensitive and explosive compounds with potassium, sodium, sodium hypobromite, nitromethane, acetylene. Keep away from moisture and alkali metals. Attacks metals in the presence of moisture. Reacts with moist air to form cupric chloride dihydrate. May be able to ignite combustible materials.

Permissible Exposure Limits in Air

NIOSH IDLH: 100 mg[Cu]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 2.12 mg/m^3

PAC-1: 6.35 mg/m^3

PAC-2: 10.6 mg/m^3

PAC-3: 212 mg/m^3

Copper and its inorganic compounds

DFG MAK: 0.1 mg/m^3 measured as the inhalable fraction of the aerosol; Peak Limitation Category I(1); Pregnancy Risk Group C.

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G, ID-206.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin or eye contact can cause corrosive burns and permanent damage. Irritates the stomach causing salivation, nausea, vomiting, stomach pain, and diarrhea.

Long Term Exposure: Repeated exposure may cause skin thickening and allergy. May cause a greenish color to the skin and hair. May damage the liver and kidneys. Repeated exposure can cause ulcers or a hole in the nasal septum with possible bleeding. May affect the blood.

Points of Attack: Kidneys, liver, skin, blood.

Medical Surveillance: Serum and urine copper levels. Liver and kidney function tests. Evaluation by a qualified allergist. Complete blood count (CBC). Wilson's disease is a rare hereditary condition which interferes with the body's ability to get rid of copper. If you have this condition, consult your doctor about copper exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, moisture, and heat.

Shipping: This chemical requires a shipping label of "CORROSIVE." Copper chloride is in DOT/UN Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical does not burn but may ignite combustible materials. Use any extinguisher suitable for surrounding fires. Poisonous gases are produced in fire, including hydrogen chloride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Copper cyanide C:1380

Molecular Formula: $CCuN$, C_2CuN_2

Common Formula: $CuCN$, $Cu(CN)_2$

Synonyms: *cupric cyanide:* Copper(II) cyanide; Copper cynanamide; Cyanure de cuivre (French)

cuprous cyanide: Cianuro de cobre (Spanish); Copper(1+) cyanide; Copper(I) cyanide; Cupricin

CAS Registry Number: 14763-77-0 (cupric cyanide); 544-92-3 (cuprous cyanide)
RTECS® Number: GL7150000 (cuprous cyanide); GL7175000 (cupric cyanide)
UN/NA & ERG Number: UN1587/151
EC Number: 238-826-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

As cuprous cyanide

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compounds.
Clean Water Act: Toxic Pollutant (Section 401.15).
US EPA Hazardous Waste Number (RCRA No.): P029.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Reportable Quantity (RQ): 10 lb (4.54 kg).
RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%. (copper).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%. (cyanide).
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (cupric cyanide); National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited, as copper compounds, n.o.s.; Drinking Water Quality = 0.2 mg (CN)/L MAC as cyanide compounds.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R26; R37; R40; R41; R43; R50/53; Safety phrases: S1/2; S28; ; S23; S36/37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: Cuprous cyanide is a white crystalline substance. Cupric cyanide, $Cu(CN)_2$ is a yellowish-green powder which decomposes on heating. Molecular weight = 89.56 (cuprous); 115.55 (cupric); Freezing/Melting point = 473°C (in nitrogen) (cuprous cyanide). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Copper cyanide is used in electroplating copper on iron and as an insecticide and a catalyst.

Incompatibilities: Contact with heat, strong acids (HCl, H_2SO_4, HNO_3) forms deadly hydrogen cyanide gas. May form hydrogen cyanide with water. Keep away from acetylene gas and chemically active metals, such as potassium, sodium, magnesium, and zinc; strong oxidizers (chlorine, fluorine, peroxides, etc.).

Permissible Exposure Limits in Air

As cyanides, as CN

OSHA PEL: 5 mg/m^3 [skin].
Protective Action Criteria (PAC)
544-92-3
TEEL-0: 1.41 mg/m^3
PAC-1: 1.41 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 25 mg/m^3
NIOSH IDLH: 100 mg[Cu]/m^3.

Copper and its inorganic compounds

DFG MAK: 0.1 mg/m^3 measured as the inhalable fraction of the aerosol; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group C.
NIOSH IDLH: 100 mg[Cu]/m^3.
The limit set by Russia[43] is 0.3 mg/m^3 as a MAC in workplace air and 0.009 mg/m^3 as a momentary value in ambient air of residential areas; the daily average MAC allowable in residential areas is 0.004 mg/m^3.

Determination in Air: Use NIOSH Analytical Method #7904.[18] For copper: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: The permissible concentration for copper set by US EPA to protect human health is 1 mg/L and for cyanide is 0.2 mg (CN) per liter.[6] The Canadian MAC is the same. Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes and 0.05 mg/L in water bodies used for fishery purposes.

Determination in Water: Cyanide may be determined titrimetrically by EPA Methods 335.2 and 9010 which give total cyanide.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Copper cyanide can affect you when breathed in. Eye contact can cause severe burns with loss of vision. Skin contact can cause irritation or burns. Breathing copper cyanide causes irritation of respiratory tract and may cause nose bleeds or sores in the nose.

Long Term Exposure: Repeated exposure can cause copper to deposit in the liver and other body organs, causing damage, atrophy of the inner lining of the nose, with a watery discharge. Metallic taste may also occur. Repeated skin exposure can cause skin allergy and possibly a green discoloration of the skin and hair. May be able to affect the lungs.

Points of Attack: Skin, lungs, possibly other body organs.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful. Urine copper test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with copper cyanide you should be trained on its proper handling and storage. Copper cyanide must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium, and zinc) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acetylene gas.

Shipping: Copper cyanide must carry a "POISONOUS/TOXIC MATERIALS" label. It is classified by DOT[19] in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including cyanide gas and nitrous oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Copper-containing wastes can be concentrated to the point where copper can be electrolytically removed and reclaimed. If recovery is not feasible, the copper can be precipitated by alkali; the cyanide destroyed by alkaline oxidation yielding a sludge which can be sent to a chemical waste landfill.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3; EPA: Cannot be Determined; Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

As copper compounds

Clean Water Act: Toxic Pollutant (Section 401.15).

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure. This category does not include copper phthalocyanide compounds that are substituted with only hydrogen, and/or chlorine, and/or bromine. Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Copper sulfate is a greenish-white crystalline solid; the pentahydrate is blue powder or granules, or ultramarine crystalline solid. Molecular weight = 159.60; 249.70 (pentahydrate). Boiling point = 150°C (pentahydrate) with $-5H_2O$; Melting point = (decomposes) >200°C; decomposes >110°C (pentahydrate) with $-4H_2O$; copper sulfate decomposes to CuO at 650°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Highly soluble in water; forms a bright blue solution.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; (pentahydrate) Agricultural Chemical; Tumorigen, Mutagen; Human Data. Copper sulfate is used as an intermediate and wood preservative; also used in the production of copper compounds; to detect and to remove trace amounts of water from alcohols and organic compounds; as a fungicide and algicide; in veterinary medicine and others.

Incompatibilities: Aqueous solution is an acid. May form explosive materials on contact with acetylene and nitromethane. Incompatible with strong bases; hydroxylamine, magnesium; zirconium, sodium hypobromite, hydrazine.

Russia[43] has set limits in the ambient air of residential areas of 0.009 mg/m^3 on a momentary basis and 0.004 mg/m^3 on a daily average basis. The Czech Republic[35]: MAC: 0.1 mg/m^3, daily average basis; MAC: 0.3 mg/m^3, 30-min basis.

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: Russia[43] set a MAC of 0.004 mg/L (0.001 as Cu) in water used for fishery purposes. The EPA[6] has set a maximum of 1.0 mg/L in water to protect human health.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to nose, throat, and lungs, causing coughing and wheezing. *Skin:* May cause irritation of skin, localized coloration, itching, and burns. *Eyes:* May cause severe irritation, inflammation, burns, excessive tissue fluid, and a cloudy cornea; possible permanent damage. *Ingestion:* Poisonous if swallowed. May cause burning and metallic taste in mouth; blue skin coloration; intense inflammation of the stomach and intestines, abdominal pain, vomiting, diarrhea, blood in feces, headache, cold sweat, weak pulse, salivation, nausea, dehydration, low blood pressure, jaundice, and kidney failure. Death may result from a dose of a little as a teaspoon for a 150-lb person.

Long Term Exposure: May cause mutations in humans. May damage the testes and decrease fertility in both males and females. May cause skin allergy and thickening of the skin; copper deposits can cause discoloration in the skin and hair, leaving a green color. Repeated exposure can cause shrinking of the lining of the inner nose with watery discharge; liver damage. Individuals with Wilson's disease absorb, retain, and store copper excessively.

Points of Attack: Skin, reproductive system, liver.

Medical Surveillance: Serum and urine copper level. Liver and kidney tests. Examination by a qualified allergist. More than light alcohol consumption may exacerbate the liver damage caused by copper sulfate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Empty stomach by lavage with 0.1% solution of potassium ferrocyanide or milk. Liver or kidney function tests may be indicated. May result in methemoglobinemia.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials.

Shipping: Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including oxides of sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add soda ash to waste $CuSO_4$ solution; let stand 24 h. Decant and neutralize solution before flushing to sewer. Landfill sludge.[22]

Cotton dust (raw) C:1400

Molecular Formula: $C_{6n}H_{10n}O_{5n}$

Common Formula: $(C_6H_{10}O_5)_n$

Synonyms: Cotton fiber (raw)

CAS Registry Number: None

RTECS® Number: GN2275000

UN/NA & ERG Number: None assigned.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1043).

Description: Cotton dust is defined as dust generated into the atmosphere as a result of the processing of cotton fibers combined with any naturally occurring materials, such as stems, leaves, bracts, and inorganic matter which may have accumulated on the cotton fibers during the growing or harvesting period. Any dust generated from processing of cotton through the weaving of fabric in textile mills and dust generated in other operations or manufacturing processes using new or waste cotton fibers or cotton fiber by-products from textile mills are considered cotton dust. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0.

Potential Exposure: Compound Description: Human Data. The Occupational Safety and Health Administration has estimated that nearly a million workers are involved in work with cotton fibers and thus are potentially exposed to cotton dust in the workplace.

Incompatibilities: Strong oxidizers. Dust forms an explosive mixture with air.

Permissible Exposure Limits in Air

No TEEL available.

OSHA PEL: [Z-1-A & 1910.1043*] 1 mg/m^3 TWA [waste processing during waste recycling (sorting, blending, cleaning, and willowing (and garnetting))] 0.200 mg/m^3 TWA (textile yarn manufacturing and cotton washing operations) 0.750 mg/m^3 TWA (textile slashing and weaving operations) 0.500 mg/m^3 TWA [all other operations (for textile mill waste house operations or for dust from "lower grade washed cotton" used during yarn manufacturing)]. All PELs for cotton dust are mean concentrations of lint-free, respirable cotton dust collected by the vertical elutriator or an equivalent method and averaged over an 8-h period.

*The OSHA Standard in 29 CFR 1910.1043 does not apply to cotton harvesting, ginning, or the handling and processing of woven or knitted materials and washed cotton.

NIOSH REL: <0.200 mg/m^3 TWA (as lint-free cotton dust); Reduce exposures to cotton dust to the lowest feasible concentration to reduce the prevalence and severity of byssinosis.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA, 5 × PEL maximum for disposables, per OSHA cotton dust standard. If oil aerosol is present, use R or P95.

DFG MAK: 1.5 mg/m^3 (measured as the, inhalable fraction); Pregnancy Risk Group C.

NIOSH IDLH: 100 mg/m^3.

Finland: TWA 1 mg/m^3, 1999; France: VME 0.2 mg/m^3, fiber, 1999; India: TWA 0.2 mg/m^3, 1993; the Netherlands: MAC-TGG 0.2 mg/m^3, 2003; the Philippines: TWA 1 mg/m^3, 1993; Sweden: NGV 0.5 mg/m^3, 1999; Switzerland: MAK-W 0.32 mg/m^3, 1999; United Kingdom: LTEL 0.5 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 mg/m^3 (G).

Determination in Air: Vertical elutriator; none; Gravimetric; OSHA (1910.1043).

Routes of Entry: Inhalation of dust, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Human pulmonary effects. Breathing raw cotton fiber can cause coughing, fever (resembling metal fume fever), chills; and may cause nausea and vomiting, when first exposed. Allergens or fungi in the cotton or dust can cause illness.

Long Term Exposure: Repeated exposures can cause serious permanent lung damage ("brown lung" or byssinosis). The first symptoms are chest tightness and trouble breathing that occur a few hours after first starting work for the week. At first, the symptoms go away after a day or two but with continued exposure they can become constant.

Points of Attack: Cardiovascular system; respiratory system.

Medical Surveillance: NIOSH lists the following tests: pulmonary function tests; forced vital capacity; forced expiratory volume (1 s); forced expiratory volume (1 s)/forced vital capacity (ratio); percentage that the measured values of the forced expiratory volume (1 s) and forced vital capacity differ from the predicted values, using the standard tables in 29CFR1910.1043, Appendix C. Chest X-ray; pulmonary function tests: forced vital capacity; forced expiratory volume (1 s); pulmonary function tests: pre- and postshift.

(*a*) *Preplacement*: A comprehensive physical examination shall be made available to include as a minimum: medical history, baseline forced vital capacity (FVC); and forced vital expiratory volume at 1 s (FEV_1). The history shall include administration of a questionnaire designed to elicit information regarding symptoms of chronic bronchitis, byssinosis, and dyspnea. If a positive personal history of respiratory allergy, chronic obstructive lung disease, or other diseases of the cardiopulmonary system are elicited, or where there is a positive history of smoking, the applicant shall be counseled on his increased risk from occupational exposure to cotton dust. At the time of this examination, the advisability of the workers using negative- or positive-pressure respirators shall be evaluated.

(*b*) *Each newly employed person:* Shall be retested for ventilatory capacity (FVC and FEV_1) within 6 weeks of employment. This retest shall be performed on the first day at work after at least 40 h of absence from exposure to cotton dust and shall be performed before and after at least 6 h of exposure on the same day.

(*c*) *Each current employee exposed to cotton dust*: Shall be offered a medical examination at least yearly that shall include administration of a questionnaire designed to elicit information regarding symptoms of chronic bronchitis, byssinosis, and dyspnea.

(*d*) Each current employee exposed to cotton dust shall have measurement of forced vital capacity (FVC) and of forced expiratory volume at 1 s (FEV_2). These tests of ventilatory function should be performed on the first day of work following at least 40 h of absence from exposure to cotton dust and shall be performed before and after at least 6 h of exposure on the same day.

(*e*) Ideally, the judgment of the employee's pulmonary function should be based on preplacement values (values taken before exposure to cotton dust). When preplacement values are not available, then reference to standard pulmonary function value tables may be necessary. Note that these tables may not reflect normal values for different ethnic groups. For example, the average healthy black male may have an approximately 15% lower FVC than a Caucasian male of the same body build. A physician shall consider, in cases of significantly decreased pulmonary function, the impact of further exposure to cotton dust and evaluate the relative merits of a transfer to areas of less exposure or protective measures. A suggested plan for the management of cotton workers was proposed as a result of a conference on cotton workers' health.

(*f*) Medical records, including information on all required medical examinations, shall be maintained for persons employed in work involving exposure to cotton dust. Medical records with pertinent supporting documents shall be maintained at least 20 years after the individual's termination of employment. These records shall be available to the medical representatives of the Secretary of Health, Education, and Welfare; of the Secretary of Labor; of the employee or former employee; and of the employer.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Engineering control shall be used wherever feasible to maintain cotton dust concentrations below the prescribed limit. Administrative controls can also be used to reduce exposure. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield unless full face-piece respiratory protection is worn. Respirators shall also be provided and used for nonroutine operations (occasional brief exposures above the environmental limit and for emergencies) and shall be considered for use by employees who have symptoms even when exposed to concentrations below the established environmental limit. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 1 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 2 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 10 mg/m^3:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Cotton fiber must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect cotton dust in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cotton fiber and dust is flammable. Use water only. Do not use chemical or carbon dioxide extinguishers. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Cotton dust may be used as a cheap filling in quilt blankets. It contains a large organic fraction which can be digested anaerobically to produce manure plus biogas fuel.[22]

Coumafuryl C:1410

Molecular Formula: $C_{17}H_{14}O_5$

Synonyms: 3-(α-Acetonylfurfuryl)-4-hydroxycoumarin; Cumafuryl (German); Foumarin®; Fumarin®; 3-(α-Furyl-β-acetylaethyl)-4-hydroxycumarin (German); 3-(1-Furyl-3-acetylethyl)-4-hydroxycoumarin; Krumkil; Ratafin®; Rat-A-Way®; Tomarin®

CAS Registry Number: 544-92-3

RTECS®Number: GN4850000

UN/NA & ERG Number: UN3027 (Coumarin derivative pesticides, solid, toxic)/151

EC Number: 204-195-5 [607-058-00-1]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: Dropped from listing in 1988.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Coumafuryl is a colorless, white, crystalline solid. Molecular weight = 298.31; Freezing/Melting point = 124°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: This material is an anticoagulant rodenticide. Therefore, those involved in its manufacture, formulation, and application are at risk.

Incompatibilities: Strong oxidizers may create a fire and explosive hazard. Incompatible with acids. At room temperature this material can decompose rapidly to cobalt carbonyl and hydrogen gas; at 52°C cobalt carbonyl decomposes, producing toxic fumes of carbon monoxide and cobalt.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Coumafuryl is very similar to warfarin, a hemorrhagic agent. Inhalation may cause symptoms described in long-term exposure. A single large ingested dose may cause hemorrhagic shock. The LD_{50} oral (mouse) is 14.7 mg/kg (highly toxic). This chemical can be absorbed through the skin, thereby increasing exposure or hemorrhagic effect. High exposure can cause death.

Long Term Exposure: Chronic exposure may cause death by hemorrhagic shock. Absorption by the lungs or after a few days or few weeks of repeated ingestion may cause inhibition of prothrombin synthesis, nosebleeds and bleeding gums, hematoma; small reddish spots like a rash; bruises of the elbows, knees, and buttocks; blood in urine and stools; anemia, occasional paralysis due to a stroke.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed. Keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers.

Shipping: Coumarin derivative pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in the Hazard Class 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. For *small spills*, absorb with sand or other noncombustible absorbent material and place into containers for later disposal. For *small dry spills*, with clean shovel place material into clean, dry container and cover; move containers from spill area. For *large spills*, dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat.

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (455/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R 21; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Coumaphos is a white to brownish crystalline solid with a slight sulfurous odor. Molecular weight = 362.78; Freezing/Melting point = 91°C. Odor threshold = 0.02 ppm. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, and application of this material which is used for control of a wide variety of livestock insects including cattle grubs, lice, scabies, flies, and ticks; the common ectoparasites of sheep, goats, horse, swine, and poultry; as well as for screw worms in all these animals.

Incompatibilities: Piperonyl butoxide, oxidizers, strong bases. Slowly reacts with caustics to be hydrolyzed. Keep away from water and heat.

Permissible Exposure Limits in Air

ACGIH TLV®: 0.05 mg/m^3 TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI issued (2005).

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 125 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Mexico has set a maximum permissible concentration in estuaries of 0.02 mg/L.

Determination in Water: No method available. Octanol−water coefficient: Log $K_{ow} = 4.13$. Fish Tox: 16.96524000 ppb MATC (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin contact. This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Fatal skin absorption can occur even if there is no feeling of irritation after contact. Cholinesterase inhibitor. Exposure can cause rapid fatal organophosphate poisoning: with headache, sweating, nausea and vomiting, diarrhea, salivation, abdominal cramps; difficult breathing; stiffness of legs; blurring of vision; followed by loss of muscle coordination; muscle twitching; convulsions, coma, and death. LD_{50} = (oral-rat) 13 mg/kg (highly toxic). The probable oral lethal dose is 50−500 mg/kg; or between 1 teaspoonful and 1 oz for a 70-kg (150-lb) person. May be fatal if inhaled, swallowed, or absorbed through skin. The effects may be delayed.

Long Term Exposure: High or repeated exposure may cause nerve damage causing weakness, poor coordination in the arms and legs. May cause personality changes, depression, memory loss, or irritability. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox: 1.75000 ppb Health Advisory (HIGH).

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water, followed by alcohol. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. In case of poisoning with this substance specific treatment is required; the appropriate means, including instructions, should be available.

Respirator Selection: Where there is potential for exposure to coumaphos, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Coumarin derivative pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in the Hazard Class 6.1.[19,20] Regulated by US DOT as a severe marine pollutant.

Spill Handling: Do not touch spilled material; stop leak if you can do it without risk. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 18,000.

Fire Extinguishing: This material may burn but does not ignite easily. Extinguish with water, foam, carbon dioxide, or dry chemicals. This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chlorides, phosphorous oxides, sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Coumaphos can be decomposed by heating with concentrated alkali. Large amounts should be incinerated in a unit equipped with effluent gas scrubbing.[22]

RTECS®Number: GN7630000

UN/NA & ERG Number: UN3027 (Coumarin derivative pesticides, solid, toxic)/151

EC Number: 227-424-0 [*Annex I Index No.*: 607-059-00-7]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R48/24/25; R52/53; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Coumatetralyl is a yellowish-white, crystalline solid. Molecular weight = 292.35. Boiling point = 290°C; Freezing/Melting point = 69−70°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in hot water.

Potential Exposure: Coumatetralyl is used as a rodenticide, functioning as an anticoagulant that does not induce bait-shyness.

Incompatibilities: Contact with oxidizers may cause fire and explosion hazard. Keep away from metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 3 mg/m^3
PAC-1: 10 mg/m^3
PAC-2: 16.5 mg/m^3
PAC-3: 16.5 mg/m^3

Permissible Concentration in Water: No criteria set. Fish Tox = 16.96524000 ppb MATC (INTERMEDIATE); STV (Sediment Toxicity Value): VERY LOW.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause symptoms described in long-term exposure. A single large ingested dose may cause hemorrhagic shock. This chemical can be absorbed through the skin, thereby increasing exposure or hemorrhagic effect. High exposure can cause death. The LD_{50} oral (rat) is 16.5 mg/kg (highly toxic). Human Tox (ppb): 1.75000 (HIGH).

Long Term Exposure: Chronic exposure may cause death by hemorrhagic shock. Absorption by the lungs, or after a few days or few weeks of repeated ingestion, may cause inhibition of prothrombin synthesis; nosebleeds and bleeding gums; hematoma, small reddish spots like a rash; bruises of the elbows, knees, and buttocks; blood in urine and stools; anemia, occasional paralysis due to a stroke. Preexisting blood clotting disease or liver disease is aggravated by coumatetralyl exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−36 h following overexposure, as effects may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. The following might be considered in an emergency: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: Coumarin derivative pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in the Hazard Class 6.1.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. With clean shovel place material into clean, dry container and cover. Dike far ahead of *large spills* for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind, keep out of low areas. Wear positive-pressure breathing apparatus and special protective clothing. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire, including oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a solvent and burn in a furnace by spraying in the solution.[22]

Carcinogenicity: IARC: Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1982; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat; NTP: Reasonably anticipated to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; Safety phrases: S53; R45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: *p*-Cresidine is a white crystalline solid. Molecular weight = 137.20. Boiling point = 235°C; Freezing/Melting point = 52°C; Flash point ≥ 112°C; Autoignition temperature = 450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Primary Irritant. *p*-Cresidine is used as an intermediate in the production of various azo dyes, printing inks, and pigments; including 11 dyes that are produced commercially in the United States. Human exposure to *p*-Cresidine occurs primarily through inhalation of vapors or skin absorption of the liquid. Exposure to *p*-cresidine is believed to be limited to workers in dye-production facilities. The Consumer Product Safety Commission staff believes it is possible that residual levels or trace impurities of *p*-cresidine may be present in some dyes based on this chemical, and it may be present in the final consumer product. The presence of *p*-cresidine, even as a trace contaminant, may be a cause for concern. However, data describing the actual levels of impurities in the final product and the potential for consumer exposure and uptake are currently lacking.

Incompatibilities: Contact with oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: Carcinogen Category 2.

Austria: carcinogen, 1999; Finland: carcinogen, 1993; France: carcinogen, 1993; Switzerland: carcinogen, 1999. Zero in ambient air set by North Dakota.[60]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.67$.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include skin and eye irritation; nausea, vomiting, liver damage; cyanosis, methemoglobinemia, weakness, drowsiness, somnolence, and loss of consciousness. LD_{50} = (oral-rat) 1450 mg/kg (slightly toxic).

Long Term Exposure: May cause cancer in humans. When administered in the diet, *p*-cresidine was carcinogenic to rats, causing increased incidences of carcinomas and papillomas of the urinary bladder in both sexes; increased incidences of olfactory neuroblastomas in both sexes; and increased incidences of liver tumors in males. *p*-Cresidine was also carcinogenic in mice, causing carcinomas of the urinary bladders in both sexes and hepatocellular carcinomas in females. May cause anemia.

Points of Attack: Blood.

Medical Surveillance: Blood hemoglobin level. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. The following might be considered in an emergency: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue (*potential carcinogen*): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Store in a refrigerator under an inert atmosphere for prolonged storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: *p*-Cresidine is not specifically cited in DOT's Performance-Oriented Packaging Standards.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. The substance decomposes on heating or on burning, producing toxic and irritating fumes including oxides of carbon. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure,

explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Water polluting (*o-, m, and p-isomers*).

Description: Cresol is a mixture of the three isomeric cresols, *o-, m-*, and *p*-cresol. Cresols are slightly soluble in water.

m-isomer: Colorless or yellow liquid with characteristic odor. Molecular weight = 108.15; Specific gravity (H_2O:1) = 1.03; Boiling point = 202.7°C; Freezing/Melting point = 12.2°C; Vapor pressure = 0.14 mmHg at 25°C; Flash point = 86°C (cc); Autoignition point = 558°C. Explosive limits: LEL = 1.1% at 149°C. Hazard Identification (based on NFPA-704 M Rating System): (cresols) Health 3, Flammability 2, Reactivity 0. Solubility in water = 2%.

o-isomer: Colorless or yellow liquid or crystals that turn dark on exposure to air and light, with characteristic phenolic odor. Molecular weight = 108.15; Specific gravity (H_2O:1) = 1.05; Boiling point = 191.1°C; Freezing/Melting point = 31.1°C; Vapor pressure = 0.29 mmHg at 25°C; Flash point = 81°C (cc); Autoignition point = 599°C. Explosive limits: LEL = 1.4% at 149°C. Hazard Identification (based on NFPA-704 M Rating System): (cresols) Health 3, Flammability 2, Reactivity 0. Solubility in water = 2%.

p-isomer: Colorless to yellow crystals that turn dark on exposure to air and light, with characteristic odor. Molecular weight = 108.15; Specific gravity (H_2O:1) = 1.04; Boiling point = 201.8°C; Freezing/Melting point = 36°C; Flash point = 86°C (cc); Autoignition point = 558-560°C. Explosive limits: LEL = 1.1%; UEL = -%. Hazard Identification (based on NFPA-704 M Rating System): (cresols) Health 3, Flammability 2, Reactivity 0. Solubility in water = 2%.

mixed isomers: Molecular weight = 108.15; Boiling point = 202°C; Freezing/Melting point = 35°C; Vapor pressure = 0.11 mmHg at 25°C; Flash point = 43−82°C; Autoignition point = about 560°C. Explosive limits: LEL = 1.1%. Hazard Identification (based on NFPA-704 M Rating System): (cresols) Health 3, Flammability 2, Reactivity 0. Solubility in water = 2%.

Potential Exposure: Compound Description (*m*-, *o*-): Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. (*p*-isomer): Tumorigen, Drug, Mutagen, Natural Product; Primary Irritant. Cresol is used as a disinfectant and fumigant, as an ore flotation agent, and as an intermediate in the manufacture of chemicals, dyes, plastics, and antioxidants. A mixture of isomers is generally used; the concentrations of the components are determined by the source of the cresol.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, oxidizers, alkalies, aliphatic amines, amides, chlorosulfonic acid, oleum. Decomposes on heating, producing strong acids and bases, causing fire and explosion hazard. Liquid attacks some plastics and rubber. Attacks many metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.43 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/22 mg/m^3 TWA [skin].

NIOSH REL: 2.3 ppm/10 mg/m^3 TWA.

ACGIH TLV®[1]: 20 ppm TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

All isomers

TEEL-0: 5 ppm

PAC-1: 5 ppm

PAC-2: 24.9 ppm

PAC-3: 250 ppm

DFG MAK *(all isomers)*: [skin]; Germ Cell Mutation Category 3A.

NIOSH IDLH: 250 ppm.

Austria: MAK 5 ppm (22 mg/m^3), [skin], 1999; Denmark: TWA 5 ppm (22 mg/m^3), [skin], 1999; France: VME 5 ppm (22 mg/m^3), 1999; Japan: 5 ppm (22 mg/m^3), 1999; Norway: TWA 5 ppm (22 mg/m^3), 1999; United Kingdom: TWA 5 ppm (22 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm [skin]. Russia set a MAC of 0.5 mg/m^3 in work-place air.[35] They have also set a MAC of 0.005 mg/m^3 in ambient air in residential areas both on a momentary and on a daily average basis. Several states have set guidelines or standards for cresols in ambient air[60] ranging from 12.0 μg/m^3 (Massachusetts) to 73.0 μg/m^3 (New York) to 110 μg/m^3 (Indiana) to 200 μg/m^3 (Connecticut) to 220 μg/m^3 (Florida, North Dakota, South Carolina) to 370 μg/m^3 (Virginia) to 524 μg/m^3 (Nevada) to 2200 μg/m^3 (North Carolina).

Determination in Air: XAD-7® (tube); Methanol; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #2546, Cresols and Phenol, or OSHA Analytical Method 32.

Permissible Concentration in Water: No criteria set, but EPA has suggested a permissible ambient concentration, based on health effects, of 304 μg/L. Russia[43] set a MAC of 0.004 μg/L in water used for domestic purposes of *m*- and *p*-isomers. A limit of 0.003 mg/L of *o*-isomer is set for water bodies used for fishery purposes. Mexico[35] set a MAC of 1.5 mg/L of cresols in the waters in estuaries.

Routes of Entry: Inhalation of percutaneous absorption of liquid or vapor, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Corrosive on ingestion. May affect the central nervous system. Exposure may result in death. The effects may be delayed. *Inhalation:* A level of 4 ppm was reported not to cause symptoms. Exposure to 48 ppm for 5−10 min may cause irritation to the nose, throat, and lungs; nausea; vomiting; and general muscle weakness. High blood pressure, tremors, and convulsions have been reported in people exposed to Cresol at unspecified levels. Due to irritating effects, the inhalation of appreciable amounts of cresol vapor in the workplace under normal conditions is unlikely. *Skin:* This is a major route of exposure and the one which causes most work-related cresol injuries. Contact with 20 mL of 90% cresol resulted in burns, swelling, internal bleeding, and kidney damage, and has caused death in children; 10% cresol left on the skin for 2 h has caused inflammation, blistering, and scarring; 6% for 5−6 h has caused drying and peeling, inflammation, facial tremors, and tearing. A 4% solution tested on human skin produced no sensitization reaction. *Ingestion:* 250 mL of 50% Cresol has caused pneumonia, irritation of the pancreas, kidney failure, and unconsciousness. Symptoms reported from swallowing an unspecified amount of cresol include an immediate burning of the tissues, sweating, headache, dizziness; muscle weakness; ringing in the ears and pale skin appearance. Death has occurred from as little as 1 g (about ¼ teaspoon). Exposure may result in a burning pain in the mouth and throat; white necrotic lesions in the mouth, esophagus, and stomach; abdominal pain; vomiting, diarrhea, paleness, sweating; weakness, headache, dizziness; ringing in ears; shallow respiration with "phenol" odor on the breath; scanty, dark-colored or "smoky" urine; and possible delirium followed by unconsciousness. Convulsions are rarely seen, except in children. Hypersensitivity develops in certain individuals. The chemical is rated as a very toxic compound with a probable oral lethal dose in humans of 50−500 mg/kg, or between 1 teaspoon and 1 oz for a 70-kg (150-lb) person.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May cause lung damage. Repeated or prolonged exposure may affect the central nervous system, kidneys, and liver. *p-isomer:* Repeated or prolonged skin contact with the *p*-isomer may cause dermatitis.

Points of Attack: Central nervous system, respiratory system, liver, kidneys, skin, eyes.

Medical Surveillance: Consider the skin, eyes, respiratory system, liver, and kidney functions in placement or periodic examinations. Liver and kidney function tests. Evaluation by a qualified allergist. Consumption of alcohol may increase liver damage. NIOSH lists the following tests: Liver function tests; pulmonary function tests; urine (chemical/metabolite); urine (chemical/metabolite) Pre- and Postshift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. *m-Cresol 108-39-4* **4 h**: (at least 4 but <8 h of resistance to breakthrough >0.1 $\mu g/cm^2/min$): Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots. *p-Cresol 106-44-5* **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 $\mu g/cm^2/min$): 4H™ and Silver Shield™ gloves. Also, Saranex™ has been recommended as a protective material for cresols. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH as cresol: *23 ppm:* Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; Sa (APF = 10) (any supplied-air respirator). *57.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *115 ppm:* GmFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cresols you should be trained on its proper handling and storage. Before entering confined space where cresols may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Away from strong acids or oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: For cresols, this chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1 and the Packing Group is II.[19,20]

Spill Handling: Avoid inhalation. Wear proper respiratory protection and eye protection. Wear protective clothing. Do not touch spilled material. Stop leak if you can do so without risk. Use water spray to reduce vapors. For *small spills:* absorb the material with sand or other noncombustible absorbent material and place into containers for later disposal. For *small dry spills*, shovel up and place into clean, dry containers and cover. For *large spills*, dike far ahead of spill for later disposal. If clothing becomes contaminated remove immediately and isolate at the site. If a leak or spill has not ignited, use water spray to disperse the vapors and to provide protection for personnel attempting to stop a leak. Water spray may be used to flush spills away from exposures. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cresols are combustible. Stay upwind, keep out of low areas. Ventilate closed spaces before entering them. Use water to blanket the fire and dry chemical, foam, or carbon dioxide to extinguish the flames. Extinguish small fires with dry chemical, carbon dioxide, water spray, or foam. For large fires use water spray, fog, or foam. Move container from fire area if you can do so without risk. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Dike fire control water for later disposal; do not scatter the material. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Wastewaters may be subjected to biological treatment. Concentrations may be further reduced by ozone treatment. High concentration wastes may be destroyed in special waste incinerators.[22]

Crimidine C:1460

Molecular Formula: $C_7H_{10}ClN_3$

Common Formula: $C_7H_{10}N_3Cl$

Synonyms: Castrix®; 2-Chloro-4-methyl-6-dimethylaminopyrimidine; Crimidin (German); Pyrimidine, 2-chloro-4-(dimethylamino)-6-methyl-; W 491

CAS Registry Number: 535-89-7

RTECS®Number: UV8050000

UN/NA & ERG Number: UN2588/151

EC Number: 208-622-6 [*Annex I Index No.:* 613-004-00-8]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (Germany) (UN).[13]

Substances and Quantity Potential Likely to Cause Major Accidents (ILO): 100 kg.

Very Toxic Substance (World Bank).[15]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: r28; Safety phrases: S1/2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Crimidine is a brown, waxy solid. Molecular weight = 171.65; Boiling point = about 145°C; Freezing/Melting point = 87°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Crimidine is used as a rodenticide but is not registered in the United States as a pesticide.

Incompatibilities: Acids and acid fumes, strong bases.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.25 mg/m^3
PAC-1: 0.75 mg/m^3
PAC-2: 1.2 mg/m^3
PAC-3: 1.2 mg/m^3

Routes of Entry: Ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation and burns. Inhalation can irritate the nose and throat. Exposure may result in serious central nervous system damage with anxiety, restlessness, muscle stiffness, light sensitivity; noise sensitivity; touch sensitive; cold sweat; and leading to convulsions that may be fatal. If patient survives 5−6 h there may not be serious problems. Extremely toxic; the LD_{50} oral (rat) is 1.25 mg/kg; probable oral lethal dose in humans is less than 5 mg/kg or less than 7 drops for a 70-kg (150-lb) person.

Long Term Exposure: Chronic health effects are unknown at this time.

Points of Attack: Central nervous system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. *Skin Contact:* Quickly remove contaminated clothing. Immediately wash area with large amounts of water. Seek medical attention immediately. *Inhalation:* Remove the person from exposure, trying to avoid rapid, jerky motions or noise. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. If seizures occur, begin seizure first aid measures. Call for immediate medical attention to visit the patient prior to transfer if possible. Any facility using this chemical should have 24-h rapid access to medical personnel with training and equipment for emergency treatment. All area employees should be trained in first aid measures for Castrix, including seizure management and CPR.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Castrix, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air-purifying respirators. If while wearing a filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect castrix, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Castrix you should be trained on its proper handling and storage. Castrix must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and acid fumes, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. Crimidine falls in Hazard Class 6.1.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use organic vapor respiratory protection. Stay upwind; keep out of low areas. Wear self-contained (positive-pressure if available) breathing apparatus and full protective clothing. Do not touch spilled material; stop leak if you can do so without risk. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. If water pollution occurs, notify appropriate authorities. Ventilate area of spill or leak. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chloride fumes and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*cis*- and *trans-isomers*).

Description: Crotonaldehyde is water-white (turns pale yellow on contact with air) with an irritating, pungent, suffocating odor. Odor threshold = 0.11 ppm. Molecular weight = 70.10; Specific gravity (H_2O:1): 0.85; Boiling point = 103.8°C; Freezing/Melting point = (*trans-*) −73.8; (*cis-*) − 69°C; Vapor pressure = 19 mmHg at 25°C; Flash point = 13°C (oc); Autoignition temperature = 232°C. Explosive limits (*trans-*): LEL = 2.1%; UEL = 15.5%. NFPA 704 M Hazard Identification (*trans-*): Health 3-4, Flammability 3, Reactivity 2. Soluble in water; solubility = 18%.

Potential Exposure: Compound Description (*cis-*): Tumorigen, Mutagen; Human Data. Crotonaldehyde is used as a warning agent in fuel gases and gas line leaks; as solvent; in chemical warfare; as an intermediate in the manufacture of *n*-butanol and crotonic and sorbic acids; in resin and rubber antioxidant manufacture; also used as a solvent in mineral oil purification; as an alcohol denaturant.

Incompatibilities: A strong reducing agent. Forms explosive mixture with air. Readily converted by oxygen to peroxides and acids; heat or contact with alkalis and many other substances may cause polymerization. Incompatible with strong oxidizers; strong acids including nonoxidizing mineral acids; ammonia, organic amines; aliphatic amines; aromatic amines; 1,3-butadiene, strong bases. Liquid attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.87 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 2 ppm/6 mg/m^3 TWA.

NIOSH REL: 2 ppm/6 mg/m^3 TWA; See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.3 ppm/0.86 mg/m^3, Ceiling Concentration [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 50 ppm.

Protective Action Criteria (PAC) Crotonaldehyde, *trans-**

TEEL-0: 0.06 ppm

PAC-1: **0.19** ppm

PAC-2: **4.4** ppm

PAC-3: **14** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 3B; Germ Cell Mutation Category 3B.

Australia: TWA 2 ppm (6 mg/m^3), 1993; Belgium: TWA 2 ppm (5.7 mg/m^3), 1993; Denmark: TWA 2 ppm (6 mg/m^3), [skin], 1999; Finland: TWA 2 ppm (6 mg/m^3); STEL 6 ppm (17 mg/m^3), [skin], 1999; France: VME 2 ppm (6 mg/m^3), 1993; the Philippines: TWA 2 ppm (6 mg/m^3), 1993; Poland: TWA 6 mg/m^3; STEL 12 mg/m^3, 1999; Switzerland: MAK-W 2 ppm (6 mg/m^3), [skin], 1999; United Kingdom: LTEL 2 ppm (6 mg/m^3); STEL 6 ppm (18 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: ceiling 0.3 ppm [skin]. Several states have set guidelines or standards for Crotonaldehyde in ambient air[60] ranging from 60-180 μg/m^3 (North Dakota) to 100 μg/m^3 (Virginia) to 120 μg/m^3 (Connecticut) to 143 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3516 or OSHA Analytical Method 81.

Permissible Concentration in Water: No criteria set. Regulated by Clean Water Act.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.63.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator (causing tearing). Contact or vapor can cause severe and painful irritation and burn eyes (can cause corneal damage) and skin. The vapor can irritate the respiratory tract causing cough and shortness of breath. The substance may affect the lungs, resulting in impaired function, coughing, and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Medical observation is indicated. Although slightly less toxic, crotonaldehyde is similar chemically and toxicologically to acrolein which is rated as extremely toxic. LD_{50} = (oral-rat) 206 mg/kg (moderately toxic). A 15-min exposure at 4.1 ppm is highly irritating to the nose and upper respiratory tract and causes tearing. Brief exposure at 45 ppm proved very disagreeable, with prominent eye irritation. Toxic concentrations for human inhalation have been reported at 12 mg/m^3/10 min. As with acrolein, vapor exposures cause gastrointestinal distress when ingested.

Long Term Exposure: Crotonaldehyde causes mutations; such chemicals may have a cancer risk. There is limited evidence that this chemical causes cancer in animals, and may cause liver cancer. May cause skin allergy. Testing has not been completed to determine the carcinogenicity of low-molecular-weight aldehydes. However, the limited studies to date indicate that some aldehydes may have chemical reactivity and mutagenicity similar to potential occupational carcinogens, such as acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Consider the skin, eyes, and respiratory system in placement or periodic examinations. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including

resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Responder™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *20 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with crotonaldehyde you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat, caustics, ammonia, amines, oxidizing material, mineral acids, and 1,3-butadiene, since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Stabilized crotonaldehyde should be labeled: "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear positive pressure breathing apparatus and special protective clothing. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at

(800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. May be absorbed on vermiculite and burned in open incinerator or dissolved in solvent and sprayed into incinerator.

Crotonic acid C:1480

Molecular Formula: $C_4H_6O_2$

Synonyms: α-Butenoic acid; 2-Butenoic acid; α-Crotonic acid; β-Methylacrylic acid; 3-Methylacrylic acid

CAS Registry Number: 3724-65-0

UN/NA & ERG Number: UN2823

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Crotonic acid is a white or colorless, crystalline solid with a pungent odor. May be transported as a molten liquid. Molecular weight = 86.10; Boiling point = 187−189°C; Freezing/Melting point = 72°C; Flash point = 88°C (oc); Autoignition temperature = 396°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water; solubility = 9% at 25°C. This chemical is the commercially used *trans*-isomer. The *cis*-isomer is less stable and melts at 15°C.

Potential Exposure: Compound Description: Primary Irritant. Used to make plastics, resins, plasticizers, lacquers, and medicines.

Incompatibilities: Forms explosive mixture with air. A strong reducing agent. The aqueous solution is a weak acid. Violent reaction with oxidizers, combustibles, strong bases, peroxides. Moisture or strong sunlight (UV) may cause explosive polymerization. May accumulate static electrical charges, and may cause ignition of its vapors. Combustible when exposed to heat or flame.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 12 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 400 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Corrosive: contact with the skin or eyes can cause burns and permanent damage. Inhalation can cause coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Moderately toxic by ingestion, skin contact, and subcutaneous routes.

Long Term Exposure: Irritates the lungs; may cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (3) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with crotonic acid, you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases, and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This chemical requires a shipping label of "CORROSIVE." Crotonic acid is in DOT/UN Hazard Class 8 and Packing Group III.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, alcohol, or polymer foam extinguishers. Poisonous gases are produced in fire, including acrid fumes and organic acids. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS®Number: TB3850000

UN/NA & ERG Number: UN2783 (organophosphorus pesticides, solid, toxic)/152; UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 015-074-00-X

Regulatory Authority and Advisory Bodies

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Crufomate is a white crystalline solid; the commercial product is a yellow oil. Molecular weight = 291.71; Boiling point = (decomposes); Freezing/Melting point = (decomposes) 63°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector. Those involved in the manufacture, formulation, and application of this insecticide and anthelmintic for cattle.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas. Decomposes on heating, forming corrosive and toxic fumes of hydrogen chloride and nitrogen and phosphorous oxides. Incompatible with strongly alkaline and strongly acidic media. Unstable over long periods in aqueous preparations or above 60°C.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA; 20 mg/m^3 STEL.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen; BEI_A issued: Acetylcholinesterase inhibiting pesticides.

No TEEL available.

Australia: TWA 5 mg/m^3; STEL 20 mg/m^3, 1993; Belgium: TWA 5 mg/m^3; STEL 20 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Russia: STEL 0.5 mg/m^3, [skin], 1993; Switzerland: MAK-W 5 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for crufomate in ambient air[60] ranging from 50−200 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust. OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Skin absorption, inhalation of dust, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: A cholinesterase inhibitor. Crufomate irritates the eyes, skin, and respiratory tract. Crufomate can affect you when breathed in and quickly enters the body by passing through the skin. Severe poisoning can occur from skin contact. It is a moderately toxic organophosphate chemical. Exposure can cause effects on the nervous system; rapid severe poisoning with headache, sweating, nausea, and vomiting; diarrhea, loss of coordination; convulsions, respiratory failure; and death. The LD_{50} = (oral-rat) 460 mg/kg (slightly toxic). The health effects may be delayed.

Long Term Exposure: Exposure may affect the developing fetus. Crufomate may damage the testes. High or repeated exposure may cause nerve damage and poor coordination in arms and legs. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−36 h.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles when working with liquid or wear dust-proof goggles when working with powders or dusts unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for exposures over 5 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved full face-piece respirator with a pesticide cartridge. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from heat. Also, avoid contact with oxidizers (such as peroxides, permanganates, chlorates, perchlorates, and nitrates).

Shipping: A "POISONOUS/TOXIC MATERIALS" label is required for organophosphorus pesticides, solid, toxic. This chemical falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: If crufomate is in dry form, extinguish fire using an agent suitable for the type of surrounding fire; crufomate itself does not burn. If an oily or liquid form is used, consider the flammability of the solvent in determining appropriate procedures. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Corrosive and toxic fumes of hydrogen chloride, nitrogen oxides, and phosphorous oxides are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Crufomate decomposes above pH 7.0 in alkaline media. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Cumene C:1500

Molecular Formula: C_9H_{12}

Common Formula: $C_6H_5CH(CH_3)_2$

Synonyms: Benzene isopropyl; Benzene, (1-methylethyl-)-; Cum; Cumeno (Spanish); Cumol; Isopropylbenzene; Isopropylbenzol; Isopropyl-benzol (German); 1-Methylethyl benzene; 2-Phenylpropane

CAS Registry Number: 98-82-8

RTECS®Number: GR8575000

UN/NA & ERG Number: UN1918 (Isopropylbenzene)/130

EC Number: 202-704-5 [*Annex I Index No.:* 601-024-00-X]

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Cannot be Determined; Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

US EPA Hazardous Waste Number (RCRA No.): U055.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer: 4/6/10.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cumene is a colorless liquid with a sharp, penetrating, aromatic odor. The odor threshold is 0.008−0.132 ppm. Molecular weight = 120.21; Specific gravity (H_2O:1) = 0.90; Boiling point = 152°C; Melting point = −96°C; Vapor pressure = 8 mmHg at 25°C; Flash point = 36°C; Autoignition temperature = 420°C. Explosive limits are: LEL = 0.9%; UEL = 6.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Cumene is used as a high octane gasoline component; it is used in production of phenol and acetone and as a thinner for paints and lacquers; it is an important intermediate in phenol manufacture.

Incompatibilities: Vapor forms explosive mixture with air. Incompatible with strong acids (nitric, sulfuric acids), strong oxidizers. Air contact forms cumene hydroperoxide. Attacks rubber. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

DFG MAK: 50 ppm/250 mg/m^3 [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C.

NIOSH IDLH: 900 ppm [LEL].

Australia: TWA 50 ppm (245 mg/m^3), [skin], 1993; Austria: MAK 50 ppm (245 mg/m^3), [skin], 1999; Belgium: TWA 50 ppm (246 mg/m^3), [skin], 1993; Denmark: TWA 25 ppm (120 mg/m^3), [skin], 1999; Finland: TWA 50 ppm (245 mg/m^3); STEL 75 ppm (370 mg/m^3), [skin], 1999; France: VME 50 ppm (245 mg/m^3), [skin], 1999; Hungary: TWA 80 mg/m^3; STEL 100 mg/m^3, 1993; the Netherlands: MAC-TGG 100 mg/m^3, [skin], 2003; Norway: TWA 25 ppm (125 mg/m^3), 1999; the Philippines: TWA 50 ppm (245 mg/m^3), [skin], 1993; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 350 mg/m^3, 1999; Russia: STEL 50 mg/m^3, 1993; Sweden: NGV 25 ppm (120 mg/m^3), KTV 35 ppm (170 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (245 mg/m^3), [skin], 1999; United Kingdom: TWA 25 ppm (125 mg/m^3); STEL 75 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for Cumene in ambient air[60] ranging from 2.45−3.65 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 4.9 mg/m^3 (Connecticut) to 5.83 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography. Use NIOSH Analytical Method #1501 for hydrocarbons, aromatic.

Determination in Water: No method listed. Octanol−water coefficient: Log K_{ow} = 3.7.

Routes of Entry: Inhalation, ingestion, skin and eye contact. Passes through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact may cause a burning sensation and/or rash. Higher levels can cause dizziness, lightheadedness, headaches, unconsciousness, narcosis, coma. Levels of 4000 ppm may cause unconsciousness. LD_{50} = (oral-rat) 1400 mg/kg (slightly toxic).

Long Term Exposure: Drying and cracking of the skin. May cause lung, liver, and kidney damage. Although cumene has not been adequately tested to determine whether brain or nerve damage could occur with repeated exposure, many solvents and other petroleum-based chemicals have been shown to cause such damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Interview for brain effects, including recent memory, mood, concentration, altered sleep patterns; and nervous system evaluation. NIOSH lists the following tests: whole blood (chemical/metabolite); expired air; urine (chemical/metabolite): last 2 h of 8-h exposure; urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. *Do not* induce vomiting.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Tychem 1000™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Also, chlorinated polyethylene (CPE) may offer protection and is among the recommended protective materials. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if contaminated or wet.

Respirator Selection: *500 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Cumene must be stored to avoid contact with oxidizers, such as permanganates, nitrites, peroxides, chlorates, and perchlorates, since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where Cumene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Cumene requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Listed in the TSCA inventory.

OSHA: Considered Highly Hazardous.

US EPA Hazardous Waste Number (RCRA No.): U096.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; on DSL List; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: O, T, N; Risk phrases: R7; R20/22; R23; R34; R48/20/22; R51/53; Safety phrases: S1/2; S3/7; S14; S36/37/39; S45; S50; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Cumene hydroperoxide, an organic peroxide, is a colorless to pale yellow to green liquid. Mild odor. Molecular weight = 152.21; Boiling point = 153°C; Freezing/Melting point = − 10°C. It explodes on heating; Flash point = 79°C. Its explosive limits are: LEL = 0.9%; UEL = 6.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 4 (Oxidizer). Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Cumene hydroperoxide is used as a polymerization initiator, curing agent for unsaturated polyester resins and cross-linking agent; as an intermediate in the process for making phenol plus acetone from cumene.

Incompatibilities: The pure material is reported to explode on heating at elevated temperatures (various values given are 50°C, 109°C,[75] 150°C[11]) or in strong sunlight. The substance is a strong oxidizer; reacts violently with combustible and reducing agents, causing fire and explosion hazard. Contact with metallic salts of cobalt, copper, or lead alloys; mineral acids; bases; and amines may lead to violent decomposition. Vapor forms an explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

AIHA WEEL: 1 ppm TWA [skin].

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 5 ppm

PAC-2: 20 ppm

PAC-3: 20 ppm

DFG MAK: Organic peroxide (section Xa).

Routes of Entry: Inhalation, eyes, passing through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: Cumene hydroperoxide is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause burns and permanent damage. Corrosive on ingestion. Inhalation may include nosebleeds, sore throat, hoarseness, cough with phlegm, increased saliva, and shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema), a medical emergency, which can cause death. Other exposure symptoms may include headache, dizziness, poor coordination, and even unconsciousness. LD_{50} = (oral-rat) 382 mg/kg (moderately toxic).

Long Term Exposure: Cumene hydroperoxide may cause mutations. Handle with extreme caution. May cause skin allergy. High or repeated overexposure may damage lungs, kidneys, and liver.

Points of Attack: Lungs, skin, kidneys, liver.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Tests for kidney and liver function. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof

chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to cumene hydroperoxide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with cumene hydroperoxide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Cumene hydroperoxide must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric) and organic materials; reducing agents; copper, copper or lead alloys, cobalt and mineral acids, since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Cumene hydroperoxide, technically pure, requires an “ORGANIC PEROXIDE” label. It falls in Hazard Class 5.2 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep cumene hydroperoxide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an unstable, flammable liquid. Poisonous gases, including phenol, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cupferron C:1520

Molecular Formula: $C_6H_9N_3O_2$

Common Formula: $C_6H_5N(NO)ONH_4$

Synonyms: Ammonium-*N*-nitrosophenylhydroxylamine; Benzeneamine, *n*-Hydroxy-*N*-nitroso, ammonium salt; Hydroxylamine, *n*-nitroso-*N*-phenyl-, ammonium salt; Kupferron; NCI-C03258; *n*-Nitrosophenylhydroxylamin ammonium salz (German); *n*-Nitroso-*N*-phenylhydroxylamine ammonium salt; *n*-Nitrosophenylhydroxylamine ammonium salt

CAS Registry Number: 135-20-6

RTECS® Number: NC4725000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 205-183-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; mouse; California Proposition 65 Chemical: Cancer; NTP: Reasonably anticipated to be a human carcinogen.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cupferron is a creamy-white crystalline compound. Molecular weight = 156.21; Freezing/Melting point = 163°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Cupferron is used to separate tin from zinc, and copper and iron from other metals in the laboratory. Cupferron also finds application as a quantitative reagent for vanadates and titanium; and for the colorimetric determination of aluminum. The potential for exposure appears to be greatest for those engaged in analytical or research studies involving use of the chemical. Workers may also be exposed to the compound during manufacturing processes.

Incompatibilities: Forms unstable and possibly explosive compounds with thorium salts, titanium, zirconium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 7.5 mg/m^3
PAC-1: 25 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 75 mg/m^3
Russia: STEL 1 mg/m^3, 1993.

Routes of Entry: Human exposure to cupferron occurs mainly through ingestion or inhalation of the dust from the dry salt. Skin absorption is a secondary route of exposure.

Harmful Effects and Symptoms

Long Term Exposure: Cupferron, given in the diet, was carcinogenic to Fisher 344 rats, causing hemangiosarcomas, hepatocellular carcinomas, and squamous cell carcinomas of the forestomach in males and females, as well as carcinomas of the auditory sebaceous gland in females. The chemical was also carcinogenic to B6C3F1 mice, causing hemangiosarcomas in males; and hepatocellular carcinomas, carcinomas of the auditory sebaceous gland, a combination of hemangiosarcomas and hemangiomas; and adenomas of the Harderian gland in females. LD_{50} = (oral-rat) 257 mg/kg (moderately toxic).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. In an emergency, consider the following: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cupferron you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Cupferron should be stored in a refrigerator or in a cool dry place and protected from exposure to moisture.

Shipping: Cupferron can be classified as Toxic solids, organic, n.o.s. which requires a shipping label of "POISONOUS/TOXIC MATERIALS." Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cupric acetate C:1530

Molecular Formula: $C_4H_6CuO_4$

Common Formula: $Cu(OOCCH_3)_2$

Synonyms: Acetate de cuivre (French); Acetato de cobre (Spanish); Acetic acid, copper(2+) salt; Acetic acid, copper (II) salt; Acetic acid, cupric salt; Copper acetate; Copper (2+) acetate; Copper(II) acetate; Copper diacetate; Copper (2+) diacetate; Copper(II) diacetate; Crystallized verdigris; Crystals of venus; Cupric diacetate; Neutral verdigris

CAS Registry Number: 142-71-2; 6046-93-1 (monohydrate)

RTECS®Number: AG3480000

UN/NA & ERG Number: UN3077/171

EC Number: 205-553-3

Regulatory Authority and Advisory Bodies

Water Pollution Standard Proposed (EPA)[6] (Russia).[35]

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15); as copper and compounds.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as copper compounds, n.o.s.; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cupric acetate is a greenish blue powder or small crystals. Molecular weight = 181.64; Boiling point = 240°C (decomposes); Freezing/Melting point = 115°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Cupric acetate is used as a fungicide, as a catalyst for organic reactions; in textile dyeing and as a pigment for ceramics.

Incompatibilities: Forms explosive materials with acetylene gas, ammonia, caustic solutions, sodium hypobromite, nitromethane. Keep away from chemically active metals, strong acids, nitrates. Decomposes above 240°C forming acetic acid fumes.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

142-71-2, anhydrous

TEEL-0: 2.86 mg/m^3

PAC-1: 2.86 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 286 mg/m^3

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: Russia[43] set a MAC of 0.004 mg/L (0.001 as Cu) in water used for fishery purposes. The EPA[6] has set a maximum of 1.0 mg/L in water to protect human health.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhaling cupric acetate dust and vapors can irritate the respiratory tract causing coughing and wheezing. High levels may cause fluid to build up in the lungs (pulmonary edema). This can cause death. Corrosive: contact can irritate and may burn the skin and eyes. LD_{50} = (oral-rat) 595 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure can cause skin allergy, thickening of the skin, and/or a green discoloration of the skin and hair. Repeated exposure can cause shrinking (atrophy) of the inner lining of the nose; and may cause sores in the nose. Can cause liver and kidney damage.

Points of Attack: Skin, lung, liver, and kidney damage.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Serum and urine tests for copper can measure recent exposure. Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Cupric acetate must be stored to avoid contact with acetylene gas, chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including acetic acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cupric nitrate C:1540

Molecular Formula: CuN_2O_6
Common Formula: $Cu(NO_3)_2$
Synonyms: Copper dinitrate; Copper(2+) nitrate; Copper (II) nitrate; Cupric dinitrate; Nitrato de cobre (Spanish); Nitric acid, copper(2+) salt; Nitric acid, copper(II) salt
CAS Registry Number: 3251-23-8

RTECS®Number: WU7400000

UN/NA & ERG Number: UN1479/140

EC Number: 221-838-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15); as copper and compounds.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL µg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cupric nitrate is a blue crystalline solid. Molecular weight = 187.55; Boiling point = 170°C (decomposes below this point); Freezing/Melting point = 115°C. Soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 3₩ (Oxidizer). Soluble in water; solubility = 135 g/100 mL (trihydrate).

Potential Exposure: Cupric nitrate is used as an insecticide, in paint, varnish, enamel, and wood preservatives. Metal compounds are often used in "hot" operations in the workplace. These may include, but are not limited to, welding, brazing, soldering, plating, cutting, and metallizing. At the high temperatures reached in these operations, metals often form metal fumes which have different health effects and exposure standards than the original metal compound and require specialized controls.

Incompatibilities: A strong oxidizer. Aqueous solution is acidic; incompatible with bases. Violent reaction with potassium hexacyanoferrate; ammonia and potassium amide mixtures; acetic anhydrides, cyanides, ethers. Forms explosive materials with nitromethanes, sodium hypobromite, acetylene; chemically active metals, such as potassium, sodium, etc. May ignite on contact with aluminum foil or tin. Risk of spontaneous combustion with combustibles (wood, cloth, etc.), organics, or reducing agents and readily oxidizable materials. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

NIOSH IDLH: 100 mg[Cu]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 2.95 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 295 mg/m^3

Copper and its inorganic compounds

DFG MAK: 0.1 mg/m^3 measured as the inhalable fraction of the aerosol; Peak Limitation Category II(2); Pregnancy Risk Group C.

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: Russia[43] set a MAC of 0.004 mg/L (0.001 as Cu) in water used for fishery purposes. The EPA[6] has set a maximum of 1.0 mg/L in water to protect human health.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye contact can cause irritation and burns. Inhalation can irritate the nose and throat, causing coughing and wheezing. Cupric nitrate may produce fumes that can cause "metal fume fever." Ingestion causes salivation, nausea, vomiting, stomach pain. May cause blood effects if swallowed. High exposure can cause unconsciousness. LD_{50} = (oral-rat) 940 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure can cause copper to deposit in various parts of the body. Large deposits can make the skin and hair a green color. Repeated exposure can cause shrinking of the inner lining of the nose, and may cause runny nose and sores. Excess deposits in the liver can cause liver damage. Metallic taste may also occur. Skin allergy with rash sometimes occurs. If allergy develops, even small future exposures can trigger rash. Repeated exposures can also cause thickening of the skin not caused by allergy.

Points of Attack: Skin, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for copper can measure recent exposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: In case of fume inhalation, treat for pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m*^{3}: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m*^{3}*:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m*^{3}*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m*^{3}: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m*^{3}*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Cupric nitrate must be stored to avoid contact with combustible, organic, or other readily oxidizable materials; and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from acetylene gas. Protect storage containers from physical damage. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Oxidizing solid, n.o.s. require an "OXIDIZER" label. They fall in DOT Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep cupric nitrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Copper nitrate itself is noncombustible, but it will increase the intensity of fire and may ignite combustible materials. Flooding amounts of water may be used to minimize its oxidizing effect on other materials. Caution: when large quantities are involved, application of water may cause scattering of molten material. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Decomposes below 170°C forming nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to water; stir in excess soda ash. Let stand, then neutralize. Decant solution and flush to sewer; landfill sludge.

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Section 307 Toxic Pollutants, 40CFR401.15 (effluent limitations); as copper and compounds.

Reportable Quantity (RQ): 100 lb (45.4 kg).

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as copper compounds, n.o.s.; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

Cited in US State Regulations: California (A,G), New Jersey (G).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cupric oxalate is a bluish-white, odorless powder. Molecular weight = 153.58. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Insoluble in water.

Potential Exposure: Used as a catalyst for organic reactions and in seed treatment as a repellent for birds and rodents.

Incompatibilities: Explosive materials are formed on contact with acetylene gas, ammonia, caustic solutions, sodium hypobromite, nitromethane. Slight heating can cause a weak explosion.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2.42 mg/m^3

PAC-1: 7.25 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 242 mg/m^3

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5.6 μg/L as a 24-h average, never to exceed e [0.94 In (hardness) − 1.23] μg/L. *To protect human health:* 1000 μg/L.[6] Canada: Drinking Water Quality AO ≤ 1.0 mg/L. Mexico, Drinking Water = 1.0 mg/L.

Determination in Water: Total copper may be determined by digestion followed by atomic absorption or colorimetry (using neocuproine) or inductively coupled plasma (ICP) optical emission spectrometry. Dissolved copper may be determined by 0.45 μ filtration followed by the preceding methods.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Powerful irritant. Contact with skin and/or eyes causes severe irritation, burns, and can cause permanent damage. Inhalation irritates the respiratory tract causing coughing and wheezing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. If swallowed, cupric oxalate has a caustic effect on the mouth, esophagus, and stomach; causing salivation, nausea, vomiting, diarrhea, and may cause damage to the kidneys.

Long Term Exposure: Repeated exposure can cause thickening of the skin; greenish color to the skin and hair; shrinking and perforation of the nasal septum with possible bleeding. May cause skin allergy and liver damage.

Points of Attack: Skin, liver.

Medical Surveillance: Liver function tests. Evaluation by a qualified allergist. Wilson's disease is a rare hereditary condition which interferes with the body's ability to get rid of copper. If you have this condition, consult your doctor about copper exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with cupric oxalate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acetylene gas, ammonia, caustic solutions, and nitromethane.

Regulatory Authority and Advisory Bodies

Clean Water Act: Toxic Pollutant (Section 401.15) as copper and compounds.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200). *Note:* All species in the ground water that contain copper are included.

EPCRA (Section 313): Includes any unique chemical substance that contains copper as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cupriethylenediamine is a purple liquid (may contain red or blue sediment), with an ammoniacal odor. Also described as a fishy odor. Molecular weight = 506.91; Boiling point = 100°C. Reacts with water.

Potential Exposure: Cupriethylene diamine is used to dissolve cellulose products to give a cuprammonium-type solution.

Incompatibilities: Violent reaction with water. A powerful reducing agent. Violent reaction with oxidizers, organic materials, and many other substances. Forms unstable peroxides under normal conditions of temperature and storage. Dissolves wood, cotton, and other cellulosic material.

Permissible Exposure Limits in Air

No TEEL available.

Determination in Air: Use NIOSH Analytical Methods (dusts and mist) #7029, #7300, #7301, #7303, #9102 and OSHA Analytical Methods ID-121, ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5.6 μg/L as a 24-h average, never to exceed e [0.94 In (hardness) − 1.23] μg/L. *To protect human health:* 1000 μg/L.[6] Canada: Drinking Water Quality AO ≤ 1.0 mg/L. Mexico, Drinking Water = 1.0 mg/L.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Cupriethylene diamine is a corrosive chemical that can cause severe irritation and burns of the skin and eyes on contact. Exposure to Cupriethylene diamine can irritate the throat and air passages. May cause asthma-like symptoms with wheezing, cough, and tightness in the chest.

Long Term Exposure: Repeated exposure can cause thickening of the skin or a green color to form on the skin and hair. Repeated exposure can cause shrinking (atrophy) of the inner lining of the nose and may cause sores in the nose and watery discharge. Excessive buildup of copper can cause liver damage.

Points of Attack: Skin, lungs, liver.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Urine copper test. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Copper dusts and mists: 5 mg/m*^{3}: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m*^{3}*:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m*^{3}*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m*^{3}: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m*^{3}*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Cupriethylene diamine solution requires a "CORROSIVE, POISONOUS/TOXIC MATERIALS" label.[19] It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cupriethylene diamine may burn but does not readily ignite. Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire, including nitrous oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cyanamide C:1570

Molecular Formula: CH_2N_2
Common Formula: H_2NCN
Synonyms: Amidocyanogen; Carbamonitrile; Carbimide; Carbodiimide; Cyanogenamide; Cyanogen nitride
CAS Registry Number: 420-04-2; *(alt.)* 65931-45-5
RTECS®Number: GS5950000
UN/NA & ERG Number: UN3276 (nitriles, toxic, n.o.s.)/151
EC Number: 206-992-3 [*Annex I Index No.:* 615-013-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA, 1998 Status of Pesticides: Active registration.

European/International Regulations: Hazard Symbol: T; Risk phrases: R21; R25; R36/38; R43; Safety phrases: S1/2; S3; S22; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

As cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or $Ca(CN)_2$. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Description: Cyanamide is a combustible crystalline solid, but it is usually found as a 25% liquid solution. Molecular weight = 42.05; Specific gravity (H_2O:1) = 1.28; Boiling point = decomposes at 260°C; Freezing/Melting point = 45°C; Flash point = 141°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 3. Highly soluble in water; solubility = 78% at 15°C.

Potential Exposure: Compound Description: Agricultural Chemical; Drug; Reproductive Effector. Cyanamide may be melted to give a dimer, dicyandiamide or cyanoguanidine. At higher temperatures it gives the trimer, melamine; a raw material for melamine−formaldehyde resins.

Incompatibilities: Cyanamide may polymerize at temperatures above 122°C, or on evaporation of aqueous solutions. Reacts with acids, strong oxidants, strong reducing agents, and water, causing explosion and toxic hazard. Attacks various metals. Decomposes when heated above 49°C, on contact with acids, bases, 1,2-phenylene diamine salts, and moisture, producing toxic fumes including nitrogen oxides and cyanides.

Permissible Exposure Limits in Air

OSHA PEL: None.
NIOSH REL: 2 mg/m^3 TWA.
ACGIH TLV®[1]: 2 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 7.5 mg/m^3
DFG MAK: 1 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(2) [skin] Danger of skin sensitization; Pregnancy Risk Group C.

Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, [skin], 1999; Belgium: TWA 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3; STEL 4 mg/m^3, [skin], 1999; France: VME 2 mg/m^3, 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Norway: TWA 2 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, [skin], 1993; Switzerland: MAK-W 2 mg/m^3, 1999; United Kingdom: TWA 2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg/m^3. Russia[43] has limits for ambient air in residential areas of 0.01 mg/m^3 on an average daily basis. Several states have set guidelines or standards for Cyanamide in ambient air[60] ranging from 6.7 μg/m^3 (New York) to 20.0 μg/m^3 (Florida and North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 50 μg/m^3 (South Carolina).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cyanamide is caustic and severely irritates the eyes, skin, and respiratory tract; and may affect the liver. Ingestion or inhalation may cause transitory intense redness of the face, headache, vertigo, increased respiration, tachycardia, and hypotensions. The adverse effects of cyanamide are potentiated by the ingestion of alcohol (beer, wine, or liquor) within 1−2 days before or after exposure. Cyanamide is a highly reactive chemical and is a dangerous explosion hazard.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Exposure may cause liver and nervous system damage.

Points of Attack: Liver, skin.

Medical Surveillance: If overexposure occurs or if illness is suspected, the following are recommended: liver function tests. Examination of the nervous system. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential for exposures over 2 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from acids or acid fumes. Cyanamide can be stored in glass containers if it is stabilized with phosphoric, acetic, sulfuric, or boric acid; it attacks iron and steel, copper, and brass.

Sources of ignition, such as smoking and open flames, are prohibited where cyanamide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever cyanamide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nitriles, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Keep cyanamide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be

properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.1
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9

Fire Extinguishing: Cyanamide may burn but does not readily ignite. Poisonous gas is produced in fire, including nitrogen oxides and cyanides. Use dry chemical or CO_2 extinguishers. Containers may explode in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add excess alkaline calcium hypochlorite with agitation. Flush to sewer after 24 h. Cyanamide can also be destroyed in an incinerator equipped with afterburner and scrubber.

Regulatory Authority and Advisory Bodies

Safe Drinking Water Act: Priority List (55 FR 1470).

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents; as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or $Ca(CN)_2$. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin 4/1/90.

Canada, Drinking Water Quality, IMAC = 0.01 mg/L.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; Safety phrases: S2; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyanazine is an off-white to tan crystalline solid. Molecular weight = 240.73; Freezing/Melting point = 167−169°C. Hazard Identification (based on

NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water. Physical properties may be altered by carrier solvents used in commercial formulations.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Natural Product. Those involved in the manufacture, formulation, and application of this herbicide used for preemergence or postemergence weed control in field corn.

Incompatibilities: Cyanazine decomposes in heat producing very toxic fumes and gases of hydrogen cyanide, hydrogen chloride, ethyl chloride, ammonia, acetone, and ethylene. Attacks metals in the presence of heat and moisture.

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

No TEEL available.

Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.

Permissible Concentration in Water: A no-observed-adverse-effect-level of 1 mg/kg/day has been determined by EPA. This has resulted in a drinking water equivalent level of 0.13 mg/L for a 10-kg child and a level of 0.046 mg/L on a long-term basis. This also results in a lifetime health advisory of 0.009 mg/L for an adult. Kansas[61] has set a guideline for cyanazine in drinking water of 42 μg/L. Canada's IMAC is 0.01 mg/L for drinking water.

Determination in Water: High-performance liquid chromatography is applicable to the determination of cyanazine in water according to EPA.

Routes of Entry: Inhalation, passing through the unbroken skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Exposure can irritate the nose, throat, and bronchial tubes. Contact can irritate the skin or eyes. Overexposure can cause weakness, nausea, and difficulty breathing. LD_{50} = (oral-rat) 149 mg/kg (moderately toxic). Toxicological properties may be altered by carrier solvents used in commercial formulations.

Long Term Exposure: Long-term effects are unknown. Related chemicals in the triazin chemical groups can cause liver damage, reduce thyroid function, and/or cause skin allergy. May cause reproductive toxicity in humans.

Medical Surveillance: Liver function tests. Thyroid function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Engineering control must be effective to ensure that exposure to cyanazine does not occur. Where there is potential for exposures to cyanazine, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air-purifying respirators.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air-respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cyanazine you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Triazine pesticides, solid, toxic, require a label of "POISONOUS/TOXIC MATERIALS." Cyanazine falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. If appropriate, moisten to prevent dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cyanazine may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen cyanide, hydrogen chloride, ethyl chloride, ammonia, acetone, and ethylene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.
Cyanide compounds:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.
US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents; as cyanides, soluble salts and complexes, n.o.s.
EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or $Ca(CN)_2$. Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.
Cyanides, soluble salts and compounds:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total; Toxic Pollutant (Section 401.15).
US EPA Hazardous Waste Number (RCRA No.): P030.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 1.2, total dust; 0.86 (amenable); Nonwastewater (mg/kg), 590, total dust; 30 (amenable).
RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 9010 (40).
Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L; Regulated chemical (47 FR 9352).
Reportable Quantity (RQ): 10 lb (4.54 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanides, inorganic, n.o.s.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.
WGK (German Aquatic Hazard Class): 3—Highly water *polluting (potassium cyanide and calcium cyanide)*.

Description: KCN and NaCN are white crystalline solids with a faint almond odor. Sodium cyanide also has a slight odor of hydrocyanic acid when damp. *KCN:* Boiling point = 1625°C; Freezing/Melting point = 634°C. *NaCN:* Boiling point = 1496°C; Freezing/Melting point = 564°C. NFPA 704 M Hazard Identification (KCN and NaCN): Health 3, Flammability 0 [(4) gas], Reactivity 1 [(2) gas]. Soluble in water.

Potential Exposure: *Sodium and potassium cyanides* are used primarily in the extraction of ores, electroplating, metal treatment, and various manufacturing processes. *Iodine cyanide:* Used generally for destroying all lower forms of life; in taxidermy to preserve insects, etc.

Incompatibilities: The aqueous solution of potassium and sodium cyanide are highly corrosive, and strong bases. KCN and NaCN react violently with acids, releasing highly flammable hydrogen cyanide. Potassium and sodium cyanide are incompatible with strong oxidizers (such as acids, acid salts, chlorates, nitrates), organic anhydrides, isocyanates, alkylene oxides, epichlorohydrin, aldehydes, alcohols, glycols, phenols, cresols, caprolactum. Reacts with water, forming hydrogen cyanide. Attacks aluminum, copper, zinc in the presence of moisture. KCN and NaCN absorb moisture from the air forming a corrosive syrup.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
151-50-8 (potassium cyanide)
TEEL-0: 5 mg/m^3
PAC-1: **5.3** mg/m^3
PAC-2: **19** mg/m^3
PAC-3: **40** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
As cyanides
OSHA PEL: 5 mg[CN]/m^3 TWA.
NIOSH REL: 4.7 ppm/5 mg[CN]/m^3 [10 min] Ceiling Concentration.
ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration (1993−1994).
NIOSH IDLH: 25 mg[CN]/m^3.
Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 5 mg/m^3
PAC-3: 25 mg/m^3
Calcium cyanide
TEEL-0: 3.8 mg/m^3
PAC-1: 3.8 mg/m^3
PAC-2: 13 mg/m^3
PAC-3: 28 mg/m^3
DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.
Australia: TWA 5 mg/m^3, [skin], 1993; Austria: MAK 5 mg[CN]/m^3, [skin], 1999; Denmark: TWA 5 mg/m^3, [skin], 1999; France: VME 5 mg[CN]/m^3, [skin], 1999; Poland: TWA 0.3 mg[CN]/m^3, ceiling 10 mg[CN]/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, KZG-W 10 mg/m^3, [skin], 1999; United Kingdom: TWA 5 mg[CN]/m^3, [skin],

2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 mg/m^3 [skin]. Russia[43] has set MAC values of 0.009 mg/m^3 for ambient air in residential areas on a momentary basis and 0.004 mg/m^3 on an average daily basis. Several states have set guidelines or standards for cyanides in ambient air[60] ranging from 16.7 μ/m^3 (New York) to 50.0 μg/m^3 (Florida and North Dakota) to 80.0 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut and South Dakota) to 119.0 μg/m^3 (Nevada) to 125 μg/m^3 (South Carolina) .

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides. See also Method #6010, Hydrogen Cyanide.[18]

Permissible Concentration in Water: In 1976 the EPA criterion was 5.0 μg/L for freshwater and marine aquatic life and wildlife. As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for humans is 8.4 mg/day.[6]

On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L and Germany 50 μg/L as drinking water standards.

Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes.

The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Potassium cyanide can be absorbed through the skin, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Potassium and sodium cyanide are corrosive to the eyes, skin, and the respiratory tract. Contact can cause eye and skin burns; may cause permanent damage to the eyes. Corrosive if swallowed. These substances may affect the central nervous system. Symptoms include headaches, confusion, nausea, pounding heart, weakness, unconsciousness, and death.

Long Term Exposure: Repeated or prolonged contact with potassium or sodium cyanide may cause thyroid gland enlargement. May cause nosebleed and sores in the nose; changes in blood cell count. May cause central nervous system damage with headache, dizziness, confusion, nausea, vomiting, pounding heart, weakness in the arms and legs, unconsciousness, and death. May affect liver and kidney function.

Points of Attack: Liver, kidneys, skin, cardiovascular system, central nervous system, thyroid.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Urine thiocyanate levels. Blood cyanide levels. Complete blood count (CBC). Evaluation of thyroid function. Liver function tests. Kidney function tests. Central nervous system tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep under observation for 24−48 h as symptoms may return.

Note: Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and MUST be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Note to physician: Consider the administration of Ketocyanor (cobalt edetate) in dose of 300−600 mg i.v. initially. If recovery does not occur quickly (in 1–2 min) give a second dose of 300 mg, followed by i.v. glucose 5%. Alternatively, administer sodium nitrite (3%) in an i.v. dose of 10 mL over 3 min.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cyanides you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Protect against physical damage. Store in cool dry place. Separate from other storage and protect from acids and oxidizing materials.

Shipping: Inorganic cyanides require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and in Packing Group I.

Spill Handling: Avoid contact with solids, dusts, or solutions. Wear chemical protective suit with self-contained breathing apparatus. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Do not allow this chemical to enter the environment. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

UN1680 (potassium cyanide) and UN1989 (sodium cyanide) are in the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water:* Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: Cyanides, such as KCN and NaCN, are not combustible themselves but contact with acid releases highly flammable hydrogen cyanide and oxides of nitrogen. Reacts with water-releasing hydrogen cyanide. NO hydrous agents. NO water. NO carbon dioxide. Use dry chemical and foam on surrounding fires. Vapors are heavier than air and may collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Add strong alkaline hypochlorite and react for 24 h. Then flush to sewer with large volumes of water.[22]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration). *Theft hazard* 45 (≥11.67% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

US EPA Hazardous Waste Number (RCRA No.): P031.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanides, inorganic, n.o.s.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

European/International Regulations: Hazard Symbol: F+ , T, N; Risk phrases: R121; R23; R50/53; Safety phrases: S1/2; S9; S16; S23; S33; S45; 63; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyanogen is a colorless, flammable, compressed liquefied gas at room temperature. At deadly levels only, it has a pungent, almond-like odor. Molecular weight = 52.04; Boiling point = −21°C; Relative density (gas) = 1.82; Freezing/Melting point = − 28°C; Vapor pressure = 5.1 atm at 25°C; Relative vapor density (air = 1) = 1.82. Explosive limits: LEL = 6.6%; UEL = 32.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Soluble in water; solubility = 1%.

Note: The irritant properties of cyanogen have been tested using both human male and female subjects, 21−65 years of age. The distinctive bitter almond smell of cyanogen could not be detected at concentrations of 50, 100, and 250 ppm. When exposed to 8 ppm for 6 min or 16 ppm for 6−8 min, immediate eye and nose irritation occurred.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Cyanogen is currently used as an intermediate in organic syntheses; at one time, it was used in poison gas warfare.

Incompatibilities: Explosive reaction with acids, strong oxidizers (e.g., dichlorine oxide, fluorine). Slowly hydrolyzed in water to form hydrogen cyanide, oxalic acid, ammonia.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.13 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 10 ppm/ 20 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/ 21 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **2.0** ppm

PAC-2: **8.3** ppm

PAC-3: **25** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/11 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Group D.

Arab Republic of Egypt: TWA 10 ppm (20 mg/m^3), 1993; Australia: TWA 10 ppm (20 mg/m^3), 1993; Austria: MAK 10 ppm (22 mg/m^3), [skin], 1999; Belgium: TWA 10 ppm (21 mg/m^3), 1993; Denmark: TWA 10 ppm (20 mg/m^3), 1999; Finland: STEL 10 ppm (22 mg/m^3), [skin], 1999; France: VME 2 ppm (4 mg/m^3), VLE 10 ppm (20 mg/m^3), 1999; the Netherlands: MAC-TGG 20 mg/m^3, 2003; Norway: TWA 10 ppm (22 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (22 mg/m^3), KZG-W 50 ppm (110 mg/m^3), [skin], 1999; United Kingdom: TWA 10 ppm (22 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm. Several states have set guidelines or standards for Cyanogen in ambient air[60] ranging from 66.7 μg/m^3 (New York) to 200 μg/m^3 (Florida and North Dakota) to 350 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 476 μ/m^3 (Nevada) to 500 μg/m^3 (South Carolina).

Determination in Air: Use OSHA Analytical Method PV-2104.

Routes of Entry: Inhalation, passing through the skin, and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator (causing tearing). This chemical can be absorbed through the skin, thereby increasing exposure. Irritates eyes, nose, upper respiratory system. Skin contact with the liquid caused frostbite. Vision loss can occur following a high exposure. Cyanogen hydrolyzes to yield one molecule of hydrogen cyanide and one of cyanate; based on this, the toxic effects of $(CN)_2$ are thought to be comparable to HCN. The cyanide ion when released in the body causes a form of asphyxia by inhibiting many enzymes−especially those concerned with cellular respiration. Although the blood is saturated with oxygen, the tissues are not able to use it. Symptoms appear within a few seconds or minutes of ingesting or breathing vapors. Symptoms include cherry-red lips, tachypnea, hypernea, bradycardia, headache, vertigo (an illusion of movement), convulsions, dizziness. The victims experience constriction of the chest, giddiness, confusion, headache, hyperpnea, palpitation, unconsciousness, convulsions, feeble and rapid respiration, and an extremely weak pulse. Death occurs within a few minutes after a large dose.

Long Term Exposure: Enlargement of the thyroid gland. There is some evidence that long-term exposure can cause damage to the nervous system. Victims experience loss of appetite and weight loss.

Points of Attack: Eyes, respiratory system, central nervous system, cardiovascular system.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: serum and urine thiocyanate levels. If symptoms develop or overexposure is suspected, the following may be useful: examination of the thyroid.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is advised for 24−48 h. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

If cyanide poisoning is suspected: Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Lower exposure can cause irritation of the eyes, nose, and throat. If these symptoms are noticed, immediately leave the work area. Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. *Clothing:* Avoid skin contact with cyanogen. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye protection:* Wear air-tight gas-proof goggles, unless full face-piece respiratory protection is worn. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cyanogen you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from heat and light. Cyanogen must be stored to avoid contact with fluorine and oxygen, water or steam, acid or acid fumes, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where cyanogen is handled, used, or stored. Outside storage or storage in an area of noncombustible construction is preferable. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Where cyanogen is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Cyanogen must be labeled: "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3 and there is no Packing Group.[19] It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. Keep cyanogen out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of cyanogen as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 2.2/3.5

Restrict persons not wearing protective equipment from areas of leaks until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty.

Fire Extinguishing: This chemical is a highly flammable gas; it burns with a purple-tinged flame. Poisonous gases, including hydrogen cyanide, are produced in fire. Stop the flow of gas if it can be done safely. *Do not use water.* Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; oxides or nitrogen are removed from the effluent gas by scrubbers and/or thermal devices.

Cyanogen bromide C:1610

Molecular Formula: BrCN

Synonyms: Bromine cyanide; Bromocyan; Bromocyanogen; Bromure de cyanogen (French); Bromuro de cianogeno (Spanish); Campilit; Cyanobromide; Cyanogen monobromide

CAS Registry Number: 506-68-3

RTECS®Number: GT2100000

UN/NA & ERG Number: UN1889/157

EC Number: 208-051-2

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): U246.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
MARINE POLLUTANT (49CFR, Subchapter 172.10).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Canada, Ocean dumping prohibited.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cyanogen Bromide is a colorless or white, volatile, crystalline solid with a penetrating odor. Molecular weight = 105.93; Boiling point = 61−62°C; Freezing/

Melting point = 52°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 3₩. Soluble in water; dangerous reaction.

Potential Exposure: Compound Description: Human Data. Used as an activating reagent for insoluble supports for affinity absorption. In danger are those manufacturing this compound or using it in organic synthesis or as a fumigant; in textile treatment; in gold cyaniding; or as a military poison gas.

Incompatibilities: May be unstable unless dry and pure. Violent reaction with acids, ammonia, amines. The substance decomposes on heating or on contact with water, acids, or acid vapors, producing highly toxic and flammable hydrogen cyanide and corrosive hydrogen bromide.

Permissible Exposure Limits in Air

NIOSH IDLH: 25 mg[CN]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 20.4 mg/m^3

PAC-1: 20.4 mg/m^3

PAC-2: 44 mg/m^3

PAC-3: 102 mg/m^3

As cyanides

OSHA PEL: 5 mg[CN]/m^3/4.7 ppm TWA.

NIOSH REL: 5 mg[CN]/m^3/4.7 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 5 mg[CN]/m^3 [skin] Ceiling Concentration.

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C.

Routes of Entry: Inhalation, ingestion, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Cyanogen bromide's toxic action resembles that of hydrocyanic acid. Cyanogen bromide is corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may result in death. Super toxic; probable oral lethal dose in humans in less than 5 mg/kg or a taste (less than 7 drops) for a 70-kg (150-lb) person. Vapors are highly irritant and very poisonous. High concentrations produce excessive respiration, causing increased uptake of cyanide; then labored breathing, paralysis, unconsciousness, convulsions, and respiratory arrest. Headache, dizziness, nausea, and vomiting may occur with lesser concentrations.

Patients may experience confusion, anxiety, and an initial rise in blood pressure with a decreased heartbeat followed by an increased heartbeat; cyanosis is not a consistent finding, in fact, the patient may be reddish. An odor of bitter almonds on the patient's breath may be present. Individuals with chronic diseases of the kidneys, respiratory tract, skin, or thyroid are at greater risk of developing toxic cyanide effects.

Long Term Exposure: Repeated or prolonged exposure to cyanogen bromide may cause thyroid gland enlargement. Chronic exposure may cause fatigue and weakness.

Points of Attack: Eyes, respiratory system, thyroid gland.

Medical Surveillance: Thyroid gland examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. Do not perform direct mouth-to-mouth resuscitation; use bag/mask apparatus. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. If dried over sodium, pure material may be stored in a desiccator for several months. Impure material decomposes and may explode. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, acids, ammonia, amines, and incompatible materials listed above.

Shipping: DOT label required is "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I. A DOT regulated marine pollutant.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Protective clothing including impervious hand protection should be worn. Wear positive-pressure breathing apparatus. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. If conditions permit, do not extinguish. Cool exposures using unattended monitors (FEMA). If fire must be extinguished, use agent suitable for type of surrounding fire. Material itself does not burn or burns with difficulty. *Do not use water* on material itself. If large quantities of combustibles are involved, use water in flooding quantities as spray and fog. Use water spray to absorb vapors. Keep material out of water sources and sewers. Use water spray to knock down vapors. Vapors are heavier than air and will collect in low areas. Wear full protective clothing. Avoid direct water contact as it will cause cyanogen bromide to decompose, releasing toxic gases. Avoid breathing vapors; keep upwind; wear self-contained breathing apparatus. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be added to strong alkaline solution of calcium hypochlorite, let stand for 24 h and flush to sewer. May also be dissolved in flammable solvent and sprayed into an incinerator equipped with afterburner and scrubber.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cyanogen chloride is a colorless gas or liquid (below 55°F/13°C) with a pungent, irritating odor. Shipped as a liquefied gas. A solid below −6°C. Molecular weight = 61.47; Boiling point = 13.7°C; Freezing/Melting point = −6°C; Vapor pressure = 1010 mmHg at 20°C; Relative vapor density (air = 1) = 2.16; Flash point = 51°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2. Soluble in water (slowly decomposes); solubility = 7%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen; Human Data. Cyanogen chloride is used as a fumigant, metal cleaner; in ore refining; production of synthetic rubber and in chemical synthesis. CK is used as a military poison gas (blood agent). It forms cyanide in the body.

Incompatibilities: CK is incompatible with, or, may react with, most basic and acidic solvents. CK reacts slowly with water or water vapor to form toxic hydrogen cyanide and hydrogen chloride. Cyanogen chloride may polymerize violently if contaminated with chlorine. CK is unstable; it may be stabilized (i.e., inhibited) to prevent polymerization. In crude form CK trimerizes violently if catalyzed by traces of hydrogen chloride or ammonium chloride. Contact with alcohols, acids, acid salts, amines, strong alkalis, olefins, and strong oxidizers may cause fire and explosion. Heat causes decomposition producing toxic and corrosive fumes of hydrogen cyanide, hydrochloric acid, nitrogen oxides. Reacts slowly with water or water vapor, forming hydrogen chloride. Attacks copper, brass, and bronze in the presence of moisture.

Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 0.3 ppm/0.6 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: 0.3 ppm Ceiling Concentration.
Protective Action Criteria (PAC) CK*
TEEL-0: 0.02 ppm
PAC-1: 0.06 ppm
PAC-2: **0.4** ppm
PAC-3: **4** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**. Emergency Response Planning Guidelines (AIHA).
ERPG-1: Not appropriate
ERPG-2: 0.4 ppm
ERPG-3: 4 ppm
DFG MAK: No numerical value established. Data may be available.
Australia: TWA 0.3 ppm (0.6 mg/m^3), 1993; Belgium: STEL 0.3 ppm (0.75 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.3 mg/m^3), 1999; Finland: STEL 0.1 ppm (0.3 mg/m^3) [skin] 1999; France: VLE 0.3 ppm (0.6 mg/m^3), 1999; the Netherlands: MAC 0.6 mg/m^3, 2003; Norway: TWA 0.25 ppm (0.6 mg/m^3), 1999; Switzerland: MAK-W 0.3 ppm (0.8 mg/m^3), 1999; United Kingdom: STEL 0.3 ppm (0.77 mg/m^3), 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.3 ppm. Israel: STEL 0.3 ppm (0.6 mg/m^3). Some states have set guidelines and standards for cyanogen chloride in ambient air[60] ranging from 5.0 μ/m^3 (Virginia) to 6.0 μg/m^3 (North Dakota) to 14.0 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption (liquid), ingestion (liquid), skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Cyanogen chloride is converted to cyanide in the body. A lacrimator. Cyanogen chloride severely irritates the eyes, skin, and respiratory tract. Inhalation can cause weakness, headache, giddiness, dizziness, confusion, nausea, vomiting, irregular heartbeat, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Skin contact with the liquid may cause frostbite and irritation. The toxicity of cyanogen chloride resides very largely on its pharmacokinetic property of yielding readily to hydrocyanic acid *in vivo*. Inhaling small amounts of cyanogen chloride causes dizziness, weakness, congestion of the lungs, hoarseness, conjunctivitis, loss of appetite, weight loss, and mental deterioration. These effects are similar to those found from inhalation of cyanide. Ingestion or inhalation of a lethal dose of cyanogen chloride (LD_{50} = 13 mg/kg). Cyanide or other cyanogenic compounds causes dizziness, rapid respiration, vomiting, flushing, headache, drowsiness, drop in blood pressure, rapid pulse, unconsciousness, convulsions, with death occurring within 4 h.

Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system.

Medical Surveillance: Lung function tests. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1–2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Decontamination: CK is a gas at normal temperature; the liquid will quickly evaporate. When it mixes with water it forms hydrochloric acid. Since the more concentrated the acid, the more dangerous it is; consequently, the acid must be diluted as much as possible. Decontamination must be started quickly before it has time to do much damage. Extra minutes before decontamination can make a big difference. Although CK is a gas, the victim cannot spread the agent to others. But, if the victim is wet, or the victim's clothes are wet, hydrochloric acid may be spread to others outside the hot and warm zones. So, wash a victim thoroughly so that he cannot spread the acid to others. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash–strip–wash–evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available). Subsequently move away from the hot zone in an upwind and uphill direction. *Do not use household or other bleach products* to decontaminate the victim. Wash the victim with warm water and soap. After decontamination, treat the acid burns as you would with burns from a fire. Decontaminate with water or with soap and water. Be sure you have decontaminated the victim as much as you can before they leave the area. If you get any of the acid on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can following the incident.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. NIOSH recommends: **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas- and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Where there is a potential for overexposure*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: *Corrosive, Toxic gas.* Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Provide ventilation along the floor as the vapors are heavier than air. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Cyanogen chloride must be labeled: "CORROSIVE, INHALATION HAZARD; TOXIC GAS." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

CK, when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

CK, when used as a weapon

First: Isolate in all directions (feet/meters) 200/60

Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.5
Night	1.0/1.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 2000/600

Then: Protect persons downwind (miles/kilometers)

Day	2.5/4.0
Night	5.0/8.0

Cyanogen chloride, stabilized

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.5
Night	0.9/1.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400

Then: Protect persons downwind (miles/kilometers)

Day	2.0/3.2
Night	4.3/6.8

Fire Extinguishing: Containers may explode when heated or if they are contaminated with water. Containers may rocket. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Let it burn! Cyanogen chloride will not burn, but getting close to put out a fire surrounding a broken CK container is very dangerous. Use an unattended fire monitor to “knock down” the cyanogen chloride gas, and remain aware that the water that falls to the ground becomes acidic, and may be concentrated and dangerous. Stay away from it! *Containers:* Cyanogen chloride cannot burn, but the container can explode if heated by the surrounding fire, so you should evacuate immediately. If a container of cyanogen chloride is near a fire, use water hoses (use an unmanned fire monitor if possible to reduce the danger to you) to cool the container so it will not explode. Since the container can explode even if you are trying to keep it cool, evacuate the area. Firefighting risks: The cyanogen chloride gas and the hydrochloric acid (HCl) formed when the gas mixes with firefighting water are both dangerous, so one could easily get injured or killed fighting a fire. That is why it is best to let the surrounding fire burn out. However, if there is some reason that you have to put out the fire, do it from a secure, explosion-proof location; use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. Use the firefighting method that is best for what is burning. But first think it through—do you really have to fight this fire? Heat causes decomposition, producing toxic and corrosive fumes of hydrogen cyanide, hydrogen chloride, nitrogen oxides. Cyanogen chloride is a gas that moves downwind and downhill; it is diluted by the wind. It is heavier than air which means that it sticks together longer than if it were lighter than air. Stay upwind from a spill. It will dissolve in water, so spraying water into the cloud from an unmanned fire monitor will help react it with water as well as mix it with the air and get rid of it. But remember the water will be full of HCl. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: React with strong calcium hypochlorite solution for 24 h, then flush to sewer with large volumes of water.

Protective Action Criteria (PAC)

TEEL-0: 29.4 mg/m^3

PAC-1: 29.4 mg/m^3

PAC-2: 147 mg/m^3

PAC-3: 147 mg/m^3

DFG MAK: 2 mg[CN]/m^3, inhalable fraction TWA; Peak Limitation Category II(1) [skin]; Pregnancy Risk Group: C. Skin contact may contribute significantly in overall exposure.

Determination in Air: Use NIOSH Analytical Method #7904, Cyanides.

Routes of Entry: Ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Highly irritating to eyes and skin. Converted to cyanide in the body. Causes convulsions, paralysis, and death from respiratory failure. Poisonous, may be fatal if swallowed or absorbed through skin. Health effects are similar to cyanides and iodides. Upon ingestion, a bitter, acrid, burning taste is sometimes noted. Other symptoms are anxiety, confusion, dizziness, giddiness, rapid and difficult breathing, palpitations, tightness in chest, unconsciousness, violent convulsions, and death.

Long Term Exposure: Long-term contact with iodides can cause weakness, anemia, loss of appetite, loss of weight, and general depression.

Points of Attack: Blood.

Medical Surveillance: EKG, blood cyanide level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: W*here there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cyanogen iodide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Refrigerate at (approx.) 4°C. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This chemical requires a "POISONOUS/TOXIC MATERIALS" label. This material falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: If outside, cover material to protect from wind, rain, or spray. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. This chemical is a combustible solid. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Poisonous gases are produced in fire, including cyanide gas, iodide gas, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R21/22; R50/53; Safety phrases: S2; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyanophos is a yellow to reddish-yellow or amber liquid. Molecular weight = 243.23; Boiling point = 119°C (decomposes); Freezing/Melting point = 14.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide which is used against rice stem borers and houseflies. It is not registered as a pesticide in the United States.

Incompatibilities: Alkaline materials and exposure to light can cause rapid decomposition. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

Protective Action Criteria (PAC)
TEEL-0: 1.25 mg/m^3
PAC-1: 3.5 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Determination in Air: Filter/Bubbler; Potassium hydroxide; Ion-specific electrode; NIOSH Analytical Method (IV) #7904, Cyanides. OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Cyanophos is an organophosphorus insecticide. It is a cholinesterase inhibitor. Death may occur after a large oral dose; with smaller accidental doses, onset of illness may be delayed. The LD_{50} oral (rat) is 25 mg/kg (highly toxic).

Symptoms of organophosphorus pesticide poisoning include headache, giddiness, nervousness, blurred vision, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, pinpoint pupils, tearing, salivation and other excessive respiratory tract secretion, vomiting, cyanosis, papilledema, uncontrollable muscle twitches followed by muscular weakness, convulsions, coma, loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; possible cumulative effect. Cyanophos may damage the nervous system; resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, peripheral nervous system, plasma cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH also Criteria Document 212 *Nitriles*.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Cyanophos is stable to storage for 2 years or more under normal conditions. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Organophosphorus pesticides, liquid, toxic, require a "POISONOUS/TOXIC MATERIALS" label. Cyanophos falls in Hazard Class 6.1.[19,20]

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Dike far ahead of *large spills* for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including nitrogen oxides, phosphorous oxides, cyanide and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Cyanopyridines C:1650

Molecular Formula: $C_6H_4N_2$

Common Formula: C_5H_4N-CN

Synonyms: *2-cyano-isomer:* Picolinic acid nitrile; 2-Pyridinecarbonitrile
3-cyano-isomer: 3-Azabenzonitrile; 3-Cyanopyridine; Nicotinic acid nitrile; Nicotinonitrile; 3-Pyridinecarbonitrile; 3-Pyridinenitrile; 3-Pyridylcarbonitrile
4-cyano-isomer: 4-Azabenzonitrile; Isonicotinonitrile; 4-Pyridine carbonitrile

CAS Registry Number: 100-70-9 (2-cyano-); 100-54-9 (3-cyano-); 100-48-1 (4-cyano-)

RTECS®Number: QT3030000 (3-cyano-)

UN/NA & ERG Number: UN3276 (nitriles, toxic, n.o.s.)/151

EC Number: 202-880-3 (2-cyano-); 202-863-0 (3-cyano-); 202-865-2 (4-cyano-)

Regulatory Authority and Advisory Bodies

As cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents; as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): $X + CN^-$ where $X = H^+$ or any other group where a formal dissociation may occur. For example, KCN or $Ca(CN)_2$. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned.

Description: The cyanopyridines are as follows:

2-cyano-: A white to tan liquid or solid with an almond odor. Boiling point = about 213°C; Freezing/Melting point = 27°C; Flash point = 89°C.

3-cyano-: A colorless liquid or gray crystalline solid. Molecular weight = 104.12; Boiling point = 83–84°C; Freezing/Melting point = 47–49°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

4-cyano-: A beige solid. Freezing/Melting point = 75.8°C.

Potential Exposure: The cyanopyridines are used in the synthesis of organic compounds and as corrosion inhibitors for aluminum.

Incompatibilities: Oxidizing agents, such as perchlorates, peroxides, and permanganates.

Permissible Exposure Limits in Air

NIOSH REL: (nitriles) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

No TEEL available.

Determination in Air: See NIOSH Criteria Document 212 *Nitriles*.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to the nose and throat. *Skin:* May cause irritation. *Eyes:* May cause irritation. Animal data suggest eye damage can result from contact. *Ingestion:* Possible central nervous system damage due to cyanide content.

Long Term Exposure: No information found. The LD_{50} oral-rat for 3-cyanopiridines is 1105 mg/kg (slightly toxic).
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles.*
Respirator Selection: Wear a chemical cartridge respirator with organic vapor or organic vapor/acid gas cartridges, if necessary.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame and separate from oxidizing materials.
Shipping: Nitriles, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS". They fall in Hazard Class 6.1.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Wash area of spill with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).
Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.1
Night 0.1/0.2
Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9
Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cycasin C:1660

Molecular Formula: $C_8H_{16}N_2O_8$
Synonyms: β-D-Glucopyranoside, (methyl-ONN-azoxy) methyl-; Side methylazoxymethanol β-D-glucoside
CAS Registry Number: 14901-08-7
RTECS®Number: LZ5982000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence*, possibly carcinogenic to humans*, Group 2B, 1976.[9]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Hazardous Waste (EPA-RCRA) Hazardous Constituent Waste (EPA).

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cycasin is a crystalline solid. Molecular weight = 252.08; Freezing/Melting point = (decomposes) 154°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0.

Potential Exposure: Cycasin occurs naturally, in the seeds, roots, and leaves of cycad plants which are found in the tropical and subtropical regions of the world. Nuts from the cycads are used to make chips, flour, and starch. Cycasin is not produced or used commercially. The major potential exposure is the ingestion of the foods containing cycasin. It is estimated that about 50−55% of the inhabitants of Guam are potentially exposed (50,000−60,000 persons) to cycasin. Wastewater from the preparation of the cycad nuts contains large amounts of cycasin and represents a potential secondary exposure source.

Permissible Exposure Limits in Air

No TEEL available.

North Dakota[60] has set a guideline for cycasin in ambient air of zero.

Harmful Effects and Symptoms

Cycasin is carcinogenic in 5 animal species, inducing tumors in various organs. Following oral exposure, it is carcinogenic in the rat, hamster, guinea pig, and fish. By this route, the data in the mouse is of borderline significance and the negative experiment in chickens only lasted 68 weeks. It is active in single-dose experiments and following prenatal exposure. The carcinogenicity of its metabolite, methylazoxymethanol, has been demonstrated in the rat and the hamster, and that of a closely related synthetic substance, methylazoxymethanol acetate. In the rat LD_{50} = (oral-rat) 270 mg/kg (moderately toxic).

Short Term Exposure: Poisonous; a neurotoxin. May cause eye damage.

Long Term Exposure: A possible human carcinogen. Laboratory tests on animals suggest this chemical is a teratogen; mutation data have been reported. May cause liver and brain damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cycasin you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." Cycasin is in Hazard Group 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal

environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cycloheptene is a flammable, colorless, oily liquid. Molecular weight = 96.2; Boiling point = 115°C; Flash point = −7°C (also listed at 23°C). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Cycloheptene may be used in organic synthesis.

Incompatibilities: Contact with strong oxidizers may cause a fire or explosion hazard.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Cycloheptene can affect you when breathed in and by passing through your skin. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Contact can irritate the skin.

Long Term Exposure: May cause drying and cracking of the skin.

Points of Attack: Skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Clothing:* Avoid skin contact with cycloheptene. Wear solvent-resistant gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposures to cycloheptene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Cycloheptene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where cycloheptene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of cycloheptene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of cycloheptene. Wherever cycloheptene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Cycloheptene must be labeled "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep cycloheptene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

US EPA Hazardous Waste Number (RCRA No.): U056.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: F, Xn, N; Risk phrases: R11; R38; R65; R67; R50/53; Safety phrases: S2; S9; S16; S25; S33; S60; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Cyclohexane is a colorless liquid with a mild, sweet odor. Odor threshold = 0.16 ppm. Molecular weight = 83.8; Specific gravity (H_2O:1) = 0.78; Boiling point = 81°C; Freezing/Melting point = 7°C; Vapor pressure = 78 mmHg at 20°C; Flash point = −20°C (cc); Autoignition temperature = 260°C. The explosive limits are: LEL = 1.3%; UEL = 8.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Cyclohexane is used as a chemical intermediate; as a solvent for fats, oils, waxes, resins, certain synthetic rubbers; and as an extractant of essential oils in the perfume industry.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers, nitrogen dioxide, and oxygen can cause fire and explosion hazard. Can explode in heat when mixed with dinitrogen tetroxide liquid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.44 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 300 ppm/1050 mg/m^3 TWA.

NIOSH REL: 300 ppm/1050 mg/m^3 TWA.

ACGIH TLV®[1]: 300 ppm/344 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 300 ppm

PAC-1: 300 ppm

PAC-2: 300 ppm

PAC-3: 1300 ppm

DFG MAK: 200 ppm/700 mg/m^3 TWA; Peak Limitation Category II(4); Pregnancy Risk Group D.

NIOSH IDLH: 1300 ppm [LEL].

Australia: TWA 300 ppm (1050 mg/m^3), 1993; Austria: MAK 300 ppm (1050 mg/m^3), 1999; Belgium: TWA 300 ppm (1030 mg/m^3), 1993; Denmark: TWA 200 ppm (690 mg/m^3), 1999; Finland: TWA 300 ppm (1050 mg/m^3); STEL 375 ppm (1315 mg/m^3), 1999; France: VME 300 ppm (1050 mg/m^3), VLE 375 ppm (1300 mg/m^3), 1999; Hungary: TWA 500 mg/m^3; STEL 1000 mg/m^3, 1993; the Netherlands: MAC-TGG 875 mg/m^3, 2003; Norway: TWA 150 ppm (525 mg/m^3), 1999; Poland: MAC (TWA) 300 mg/m^3, MAC (STEL) 1000 mg/m^3, 1999; Russia: TWA 150 ppm; STEL 80 mg/m^3, 1993; Sweden: NGV 300 ppm (1000 mg/m^3), KTV 370 ppm (1300 mg/m^3), 1999; Switzerland: MAK-W 300 ppm (1050 mg/m^3), KZG-W 600 ppm (2100 mg/m^3), 1999; Turkey: TWA 300 ppm (1050 mg/m^3), 1993; United Kingdom: TWA 100 ppm (350 mg/m^3); STEL 300 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 100 ppm. Several states have set guidelines or standards for cyclohexane in ambient air[60] ranging from 1.4 mg/m^3 (Massachusetts) to 10.5−13.0 mg/m^3 (North Dakota) to 17.0 mg/m^3 (Virginia) to 21.0 mg/m^3 (Connecticut, Florida and New York) to 25.0 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1500 for Hydrocarbons, BP 36−126°C; OSHA Analytical Method 7.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes and 0.01 mg/L in water bodies used for fishery purposes.

Determination in Water: No method listed. Octanol−water coefficient: Log $K_{ow} = 3.4$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: High concentrations (300 ppm): irritates eyes, nose, and respiratory tract. Inhalation of high concentration (300 ppm) may cause irritation of the eyes, nose, and throat. Higher concentrations may act as a narcotic resulting in dizziness, nausea, vomiting, or loss of consciousness. Levels of 1800 ppm can cause death. Vapor or liquid may cause skin irritation. This chemical destroys the skin's natural oils. If allowed to remain in contact with skin, may cause cracking, drying, chapping, smarting, and reddening. Ingestion of the liquid may cause aspiration into the lungs and chemical pneumonia. Animal studies suggest a lethal dose between 1 oz and one pint for an adult. Exposure to high levels can cause nausea, dizziness, lightheadedness, and drowsiness. Unconsciousness and death may occur at levels far above the occupational exposure limit. Alcohol synergistically increases the toxic effects of cyclohexane.

Long Term Exposure: Prolonged or repeated exposure may cause skin drying, rash, and dermatitis. May cause damage to the liver, kidneys, brain, heart, and circulatory system.

Points of Attack: Eyes, respiratory system, central nervous system, skin.

Medical Surveillance: Consider possible irritant effects to the skin and respiratory tract in any preplacement or periodic examination, as well as any renal or liver complications. NIOSH lists the following tests: whole blood (chemical/metabolite); expired air: during exposure; urine (chemical/metabolite): last 4 h of 8-h exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): nitrile rubber gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Responder™ suits; **4 h** (at least 4 but $<$ 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves; Teflon™ gloves, suits, boots. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard.

Respirator Selection: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed; shield, hydrocarbon-insoluble rubber or plastic apron.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with cyclohexane you should be trained on its proper handling and storage. Before entering confined space where cyclohexane may be present, check to make sure that an explosive concentration does not exist. Cyclohexane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever cyclohexane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The label required for cyclohexane is “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a highly flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Delisted 1/25/02.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases R20/22-R37/38; Safety phrases: S2; S24/25. WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cyclohexanol is a sticky solid (above 25°C/ 77°F) or colorless, viscous liquid with a faint camphor odor. Odor threshold = 0.07 ppm. Molecular weight = 100.16; Specific gravity (H_2O:1) = 0.96; Boiling point = 161°C; Freezing/Melting point = 24°C; Vapor pressure = mmHg at 25°C; Flash point = 68°C; Autoignition temperature = 300°C. The explosive limits are: LEL = 2.4%; UEL = 12%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slight solubility in water; solubility = 4% at 20°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Hormone, Primary Irritant. Cyclohexanol is used in making plasticizers, dry cleaning, dyebath; and textile finishing formulations; as a solvent for ethyl cellulose and other resins; it is used in soap manufacture; it is used as a raw material for adipic acid manufacture; as a nylon intermediate.

Incompatibilities: Forms explosive mixture in air. Contact with strong oxidizers cause a fire and explosion hazard. Attacks some plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.10 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/200 mg/m^3 TWA.

NIOSH REL: 50 ppm/200 mg/m^3 TWA [skin].

Several states have set guidelines or standards for cyclohexanol in ambient air[60] ranging from 0.476 mg/m^3 (Kansas) to 2.0 mg/m^3 (North Dakota) to 3.3 mg/m^3 (Virginia) to 4.0 mg/m^3 (Connecticut) to 4.76 mg/m^3 (Nevada).

Determination in Air: See NIOSH Analytical Method (IV) #1402, Method #1405, and OSHA Analytical Method 7.

Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/L in water bodies used for domestic purposes.

Determination in Water: No method listed. Octanol–water coefficient: Log K_{ow} = 1.2.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cyclohexanol irritates the eyes, skin, and respiratory tract. May affect the central nervous system. In high concentrations it can cause headache, nausea, vomiting, dizziness, and unconsciousness.

Long Term Exposure: Removes the natural oils from the skin causing drying, cracking, and dermatitis. Prolonged or high exposures can cause liver, kidney, and lung damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests, liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough > 0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Teflon™ gloves, suits, boots; Viton™ gloves, suits; **4 h** (at least 4 but < 8 h of resistance to breakthrough > 0.1 μg/cm^2/min): Neoprene™ rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. When working with powders or dusts, wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 400 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; eye protection required.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with cyclohexanol you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Cyclohexanol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Cyclohexanol is not specifically cited by DOT[19] but the "Alcohols, flammable, toxic, n.o.s." category may be applied. This category requires the label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid or solid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Cyclohexanone C:1700

Molecular Formula: $C_6H_{10}O$

Synonyms: Anon; Anone; Ciclohexanona (Spanish); Cyclohexyl ketone; Hexalin; Hexanon; Hydralin; Hytrol O; Ketohexamethylene; Nadone; NCI-C55005; Oxocyclohexane; Pimelic ketone; Pimelin ketone; Pomelic acetone; Sextone

CAS Registry Number: 108-94-1

RTECS® Number: GW1050000

UN/NA & ERG Number: UN1915/127

EC Number: 203-631-1 [*Annex I Index No.:* 606-010-00-7]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

US EPA Hazardous Waste Number (RCRA No.): U057.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.36; Nonwastewater (mg/L), 0.75 TCLP.

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20; Safety phrases: S2; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cyclohexanone is a water-white to slight yellow liquid with a peppermint-like or acetone-like odor. The odor threshold is 0.12−0.24 ppm in air. Molecular weight = 98.16; Specific gravity = 0.95; Boiling point = 157°C; Freezing/Melting point = − 32.1°C; Flash point = 44°C; Autoignition temperature = 420°C. The explosive limits are: LEL = 1.1% at 100°C; UEL = 9.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. It is used in metal degreasing and as a solvent for lacquers, resins, and insecticides. It is an intermediate in adipic acid manufacture. Also used as an emulsifier.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizing agents or nitric acid may cause a violent reaction. Do not use brass, copper, bronze, or lead fittings. Attacks many coatings and plastic materials.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.02 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/200 mg/m^3 TWA.

NIOSH REL: 25 ppm/100 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 20 ppm TWA; 50 ppm STEL [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 700 ppm.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 50 ppm

PAC-2: 50 ppm

PAC-3: 700 ppm

DFG MAK: [skin] Carcinogen Category 3B.

European OEL: 10 ppm TWA; 20 ppm STEL [skin] (2000).

Australia: TWA 25 ppm (100 mg/m^3), 1993; Austria: MAK 25 ppm (100 mg/m^3), 1999; Belgium: TWA 25 ppm (100 mg/m^3), 1993; Denmark: TWA 25 ppm (100 mg/m^3) [skin] 1999; Finland: TWA 50 ppm (200 mg/m^3); STEL 75 ppm (250 mg/m^3), 1999; France: VME 25 ppm (100 mg/m^3), 1999; Japan: 25 ppm (100 mg/m^3), 1999; Norway: TWA 20 ppm (80 mg/m^3), 1999; the Philippines: TWA 50 ppm (200 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; STEL 160 mg/m^3, 1999; Russia: TWA 25 ppm; STEL 10 mg/m^3, 1993; Sweden: NGV 25 ppm (100 mg/m^3), KTV 50 ppm (200 mg/m^3) [skin] 1999; Switzerland: MAK-W 25 ppm (100 mg/m^3), KZG-W 50 ppm (200 mg/m^3), 1999; Turkey: TWA 50 ppm (200 mg/m^3), 1993; United Kingdom: TWA 25 ppm (102 mg/m^3); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: ACGIH TLV®: [skin]; confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for cyclohexanone in ambient air[60] ranging from 1.0−4.0 mg/m^3 (North Dakota) to 1.6 mg/m^3 (Virginia) to 2.0 mg/m^3 (Connecticut) to 2.38 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1300 (Ketones), Method #2555, and OSHA Analytical Method 1. Also, NIOSH Analytical Method #2549, Volatile organic compounds.

Permissible Concentration in Water: Russia[43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cyclohexanone irritates the eyes, skin, and respiratory tract. Contact can burn the eyes. LD_{50} = (oral-rat) 1535 mg/kg (slightly toxic). Cyclohexanone may affect the central nervous system. Exposure of high concentrations can cause dizziness, lightheadedness, and unconsciousness.

Long Term Exposure: Repeated or prolonged contact with skin may cause drying, cracking, and dermatitis. The following chronic (long-term) health effects can occur at some time after exposure to cyclohexanone and can last for months or years: cyclohexanone may damage the developing fetus. Long-term exposure may cause liver and kidney damage. Long-term exposure may cause clouding of the eye lenses (cataracts).

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater or significant skin contact), the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure is suspected, the following may also be useful: kidney function tests. Examination of the eyes. Interview for brain effects including recent memory, mood, concentration, headaches, malaise, and altered sleep patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline victims should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves; **4 h** (at least 4 but < 8 h of resistance to breakthrough $> 0.1\ \mu g/cm^2/min$): polyvinyl alcohol gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Remove clothing immediately if set or contaminated to avoid flammability hazard.

Respirator Selection: *625 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *700 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Cyclohexanone you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Cyclohexanone must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates), since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area away from heat, sparks, and flames. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Cyclohexanone requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators

recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cyclohexene is a colorless liquid (cyclic alkene) with a sweetish odor. Molecular weight = 82.16; Specific gravity = 0.81; Boiling point = 82.7°C; Freezing/Melting point = −104°C; Vapor pressure = 67 mmHg at 20°C; Flash point = −6°C; Autoignition temperature = 310°C. Explosive limits in air: LEL = 1.2%; UEL = −4.8% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 2. Insoluble in water.

Potential Exposure: May be used as an intermediate in making other chemicals (e.g., adipic acid, maleic acid, hexahydrobenzoic acid), oil extraction and as a catalyst solvent.

Incompatibilities: Forms explosive mixture with air. The substance can form explosive peroxides. The substance may polymerize under certain conditions. Reacts with strong oxidants, causing a fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: 300 ppm/1015 mg/m^3 TWA.

NIOSH REL: 300 ppm/1015 mg/m^3 TWA.

ACGIH TLV®[1]: 300 ppm/1010 mg/m^3 TWA.

NIOSH IDLH: 2000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 300 ppm

PAC-1: 300 ppm

PAC-2: 500 ppm

PAC-3: 2000 ppm

Australia: TWA 300 ppm (1015 mg/m^3), 1993; Austria: MAK 300 ppm (1015 mg/m^3), 1999; Belgium: TWA 300 ppm (1010 mg/m^3), 1993; Denmark: TWA 300 ppm (1015 mg/m^3), 1999; Finland: TWA 300 ppm (1015 mg/m^3), [skin] 375 ppm (1270 mg/m^3), 1999; France: VME 300 ppm (1015 mg/m^3), 1999; the Netherlands: MAC-TGG 1015 mg/m^3, 2003; the Philippines: TWA 300 ppm (1015 mg/m^3), 1993; Poland: MAC (TWA) 300 mg/m^3, MAC [skin] 900 mg/m^3, 1999; Russia [skin] 50 mg/m^3, 1993; Switzerland: MAK-W 300 ppm (1015 mg/m^3), KZG-W 600 ppm (2030 mg/m^3), 1999; Turkey: TWA 300 ppm (1050 mg/m^3), 1993; United Kingdom: TWA 300 ppm (1020 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 300 ppm TWA. Several states have set guidelines or standards for Cyclohexene in ambient air[60] ranging from 10.15 mg/m^3 (North Dakota) to 17.0 mg/m^3 (Virginia) to 20.3 mg/m^3 (Connecticut) to 24.2 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption followed by workup with CS_2, and analysis by gas chromatography. Use NIOSH Analytical Method #1500 for Hydrocarbons, BP 36−126°C; OSHA Analytical Method 7.

Permissible Concentration in Water: Russia[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Cyclohexene irritates the eyes, skin, and respiratory tract. This chemical can be absorbed through the skin, thereby increasing exposure. Swallowing the liquid may cause droplets to enter the lung and cause chemical pneumonia. Overexposure can cause dizziness, lightheadedness, loss of muscle coordination. Higher exposures can cause tremors, collapse, and death. A closely related chemical, cyclopropane, can cause irregular heartbeat, although it is not known if this chemical causes the same effect. High exposure can cause liver and brain damage.

Long Term Exposure: Repeated or high concentrations can cause dry skin and rash, liver and brain damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do NOT induce vomiting.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash. Remove clothing immediately if wet or contaminated to avoid flammability hazard.

Respirator Selection: *Up to 2000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where cyclohexene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of cyclohexene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of cyclohexene. Wherever cyclohexene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." Cyclohexene falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep cyclohexene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Cyclohexenyl trichlorosilane C:1720

Molecular Formula: $C_9H_9Cl_3Si$
Common Formula: $C_6H_9SiCl_3$
Synonyms: Cyclohexene, 4-(trichlorosilyl)-; Trichloro-3-cyclohexenylsilane; 4-(Trichlorosilyl) cyclohexene
CAS Registry Number: 10137-69-6
RTECS®Number: VV2800000
UN/NA & ERG Number: UN1762/156
EC Number: 233-377-7

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyclohexenyl trichlorosilane is a colorless fuming liquid that smells like hydrogen chloride. Molecular weight = 215.59; Boiling point = 94°C; Flash point = 99°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Reacts with water.

Potential Exposure: This material is used to make silicone polymers.

Incompatibilities: Steam and moisture form toxic and corrosive chloride gases, including hydrogen chloride. Attacks metals in the presence of moisture. Some chlorosilanes self-ignite in air. Contact with ammonia can cause a self-igniting compound.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Based on 15 other trichlorosilanes with the same TEELs

TEEL-0: 0.2 ppm
PAC-1: 0.6 ppm
PAC-2: 7.3 ppm
PAC-3: 33 ppm

Determination in Air: No OEL established.

Permissible Concentration in Water: No criteria set ₩ (water reactive).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Cyclohexenyl trichlorosilane can affect you when breathed in. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid (pulmonary edema), a medical emergency. This can cause death. Cyclohexenyl trichlorosilane is a corrosive chemical and contact can cause severe skin and eye burns. Exposure can irritate the eyes, nose, and throat. LD_{50} = (oral-rat) 2830 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure may cause bronchitis with phlegm and shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Cyclohexenyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with Cyclohexenyl trichlorosilane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames, are prohibited where cyclohexenyl trichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Cyclohexenyl trichlorosilane requires a "CORROSIVE" label. This material falls in DOT Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep Cyclohexenyl trichlorosilane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.9/1.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cycloheximide C:1730

Molecular Formula: $C_{15}H_{23}NO_4$

Synonyms: Acti-Aid®; Actidione; Actidione TGF; Actidone; Actispray; 3[2-(3,5-Dimethyl-2-oxocyclohexyl)-2-hydroxyethyl]glutarimide; Glutarimide,3-[2-(3,5-dimethyl-2-oxocyclohexyl)-2-hydroxyethyl]-; Hizarocin®; Kaken®; Naramycin®; Naramycin A®; Neocycloheximide®; NSC-185; 2,6-Piperidinedione, 4-(2-3,5-dimethyl-2-oxocyclohexyl)-2-hydroxyethyl-, (IS)-[1a (S*),3a,5b]-

CAS Registry Number: 66-81-9; 21059-09-6

RTECS®Number: MA4375000

EC Number: 200-636-0 [*Annex I Index No.:* 613-140-00-8]

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program: Positive: *E. coli* polA with S9; Sperm morphology—mouse; Negative: *N. crassa—aneuploidy*; Inconclusive: Carcinogenicity—mouse/rat; Inconclusive: *D. melanogaster*—whole sex chromosome loss; Inconclusive: Mammalian micronucleus; *E. coli* polA without S9.

Banned or Severely Restricted (in agriculture) (Malaysia) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Very Toxic Substance (World Bank).[15]

Reportable Quantity (RQ): 100 lb (45.4 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin 1/1/89.

European/International Regulations *(66-81-9)*: Hazard Symbol: T+, N; Risk phrases: R61;R28; R51/53; R68; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (CAS 66-81-9).

Description: Cycloheximide is a colorless crystalline substance. Molecular weight = 281.39; Freezing/Melting point = 119.5−121°C. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Primary Irritant. Those involved in the manufacture, formulation, or application of this fungicide and pesticide. Used as an antibiotic, plant growth regulator, and protein synthesis inhibitor. Used on oranges for processing and to inhibit growth of many pathogenic plant fungi. Also used as a repellent for rodents and other animal pests; and in cancer therapy.

Incompatibilities: Incompatible with oxidizers, acid anhydrides, strong bases.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.1 mg/m^3
PAC-1: 0.3 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 2 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Exposure can cause excessive salivation, nausea, vomiting, diarrhea, and elevated blood urea nitrogen (BUN). High exposures can also cause imbalance, tremors, seizures, and coma. Extremely toxic (LD_{50} value for rats is only 3.7 mg/kg). The probable oral lethal dose in humans is 5−50 mg/kg, or 7 drops to 1 teaspoonful for a 150-lb person. Signs of skin irritation may appear as much as 6−24 h after exposure.

Long Term Exposure: May cause mutations and damage the developing fetus. May cause liver and kidney damage.

Points of Attack: Reproductive system. Liver and kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h following skin contact.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents, acid hydrides, and strong bases.

Spill Handling: Avoid breathing dusts. Keep upwind. Wear self-contained breathing apparatus. Material is rapidly inactivated at room temperature by dilute alkali. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Wear SCBA and full protective clothing. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incinerator with flue gas scrubbing equipment.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 15,000 lb (6810 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg).

Reportable Quantity (RQ): 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R10; R21/22; R34; R62; Safety phrases: S1/2; S26; S36/37/39; SS45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cyclohexylamine is a colorless to yellow liquid (amines, primary aromatic). It has an unpleasant fishy odor. Molecular weight = 99.20; Specific gravity = 0.87; Boiling point = 134.4°C; Freezing/Melting point = − 17.7°C; Vapor pressure = 11 mmHg at 20°C; Flash point = 31°C; Autoignition temperature = 293°C. Explosive limits: LEL = 1.5%; UEL = 9.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. CHA is used in making dyes, chemicals, dry cleaning chemicals, insecticides, plasticizers, rubber chemicals, and as a chemical intermediate in the production of cyclamate sweeteners. Used in water treatment and as a boiler feedwater additive. It is also used in rubber production to retard degradation.

Incompatibilities: Forms explosive mixture with air. Cyclohexylamine is a strong base: it reacts violently with acid. Contact with strong oxidizers may cause fire and explosion hazard. Incompatible with organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution, lead. Corrosive to copper alloys, zinc, or galvanized steel.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 10 ppm/40 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/41 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 1.8 ppm

PAC-1: **1.8** ppm

PAC-2: **8.6** ppm

PAC-3: **30** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/8.2 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Group C.

Australia: TWA 10 ppm (40 mg/m^3), 1993; Austria: MAK 10 ppm (40 mg/m^3), 1999; Belgium: TWA 10 ppm (41 mg/m^3), 1993; Denmark: TWA 10 ppm (40 mg/m^3), [skin], 1999; Finland: STEL 10 ppm (40 mg/m^3), [skin], 1999; France: VME 10 ppm (40 mg/m^3), [skin], 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, [skin], 2003; Poland: TWA 40 mg/m^3; STEL 80 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: TWA 5 ppm (20 mg/m^3); STEL 10 ppm (40 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (40 mg/m^3), KZG-W 20 ppm (80 mg/m^3), [skin], 1999; United Kingdom: TWA 10 ppm (41 mg/m^3), [skin] 2000; Argentina, Bulgaria, Columbia, Israel; Jordan, South Korea, Mexico; New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for cyclohexylamine in ambient air[60] ranging from 95.238 μg/m^3 (Kansas) to 400 μg/m^3 (North Dakota) to 650 μg/m^3 (Virginia) to 800 μg/m^3 (Connecticut) to 952 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2010, amines, aliphatic, and OSHA Analytical Method PV-2016.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested a permissible concentration based on health effects of 550 μg/L.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Cyclohexylamine is caustic to the skin, eyes, and respiratory tract. Its systemic effects in humans include nausea, vomiting, anxiety, restlessness, drowsiness, lightheadedness, anxiety, apprehension, slurred speech, papillary dilation, severe skin irritation. Cyclohexylamine may also be a skin sensitizer. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

This material is classified as moderately toxic, LD_{50} = (oral-rat) 156 mg/kg—probable oral lethal dose is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150-lb) person. It is considered a nerve poison; and is a weak methemoglobin-forming substance.

Long Term Exposure: Cyclohexylamine causes mutations (genetic changes). Such chemicals may have a cancer risk. Many scientists believe there is no safe level of exposure to a cancer-causing agent. It may damage the developing fetus. It may also damage the testes (male reproductive gland) and reduce the fertility of females. *Other long-term effects:* Exposure may increase blood pressure. Repeated or severe exposures may damage vision and possibly kidneys and liver. Cyclohexylamine may cause a skin allergy. Very low future exposures can cause itching and a skin rash. The Food and Drug Administration banned the use of cyclamates as artificial sweeteners in 1969 because of their metabolic conversion to cyclohexylamine, which was thought to be carcinogenic in rats. There is now no evidence that CHA is a carcinogen, however.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: blood pressure check. If symptoms develop or overexposure is suspected, the following may be useful: eye and vision examination. Kidney and liver function tests. Skin testing with dilute cyclohexylamine may help diagnose allergy, if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved full face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with cyclohexylamine you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect containers from physical damage. Outdoor or detached storage is recommended. Cyclohexylamine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Sources of ignition, such as smoking and open flames, are prohibited where cyclohexylamine is handled, used, or stored. The vapor can form explosive mixtures in the air. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." The Hazard Class is 8 and the Packing Group is II.

Spill Handling: Stay upwind; keep out of low areas. Wear self-contained (positive-pressure if available) breathing apparatus and full protective clothing. Establish forced ventilation to keep levels below explosive limit. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with vermiculite, dry sand, or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Cyclohexyl isocyanate C:1750

Molecular Formula: $C_7H_{11}NO$

Common Formula: $C_6H_{11}NCO$

Synonyms: CHI; Cyclohexane, isocyanato-; Isocyanatocyclohexane; Isocyanic acid, cyclohexyl ester

CAS Registry Number: 3173-53-3

RTECS®Number: NQ8650000

UN/NA & ERG Number: UN2488/155

EC Number: 221-639-3

Regulatory Authority and Advisory Bodies

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Cyclohexyl isocyanate is a clear, flammable liquid. It has a sharp, pungent odor. Molecular weight = 125.19; Specific gravity (H_2O:1): 0.98; Boiling point = 168°C; Flash point = 48°C (cc). Hazard Identification (based on NFPA-704 M Rating System):

Health 2, Flammability 2, Reactivity 0. Soluble in water (reaction).

Potential Exposure: Compound Description: Mutagen. The material is used in the synthesis of agricultural chemicals.

Incompatibilities: Cyclohexyl isocyanate polymerize due to heating above 93°C/200°F and under the influence of various chemicals including organometallic compounds. Cyclohexyl isocyanate decomposes in fire, forming toxic hydrogen cyanide and nitrogen oxides fumes. Reacts with oxidizers, strong bases, water, alcohol, acids, amines, metal compounds, surface-active materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

Isocyanate-bearing waste (as CNs, n.o.s.)

TEEL-0: 0.004 ppm

PAC-1: 0.0125 ppm

PAC-2: 0.02 ppm

PAC-3: **0.10** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator (causes tearing). Exposure can severely irritate and may burn the skin, eyes, nose, throat, and lungs. Very high levels may lead to a buildup of fluid in the lungs (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Repeated or prolonged inhalation exposure may cause lung damage and/or asthma. A suspected carcinogen.

Points of Attack: Lungs, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber gloves have been recommended by the manufacturer as protection against this substance. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to cyclohexyl isocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with cyclohexyl isocyanate you should be trained on its proper handling and storage. Cyclohexyl isocyanate must be stored to avoid contact with moisture and temperatures above 93°C, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, strong bases, alcohol, metal compounds, or surface-active materials. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Cyclohexyl isocyanate requires a label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1.[19]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they

must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 0.9/1.5

Fire Extinguishing: Cyclohexyl isocyanate may burn but does not readily ignite. Containers may explode in fire. Poisonous gases are produced in fire, including hydrogen cyanide and nitrogen oxides. Use dry chemical, CO_2, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services. (March 2000). *Hazardous Substances Fact Sheet: Cyclohexyl Isocyanate*. Trenton, NJ

Cyclohexyl trichlorosilane C:1760

Molecular Formula: $C_6H_{11}Cl_3Si$
Common Formula: $C_6H_{11}SiCl_3$
Synonyms: Silane, trichlorohexyl-; Trichlorocyclohexylsilane; 1-(Trichlorosilyl)cyclohexane
CAS Registry Number: 98-12-4
RTECS$^{®}$Number: VV2890000
UN/NA & ERG Number: UN1763/156
EC Number: 202-639-2

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyclohexyl trichlorosilane is a colorless to pale yellow liquid. Molecular weight = 217.6; Boiling point = 208°C; Flash point = 91°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1₩. Insoluble in water; reactive.

Potential Exposure: The material is used to make silicone polymers.

Incompatibilities: Contact with water or moisture forms hydrochloric acid. Incompatible with heat, strong oxidizers, strong bases, alcohols, metal compounds. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

No standards or TEEL available for this specific material. See below:

Protective Action Criteria (PAC)

Based on 15 other trichlorosilanes with the same TEELs

TEEL-0: 0.2 ppm
PAC-1: 0.6 ppm
PAC-2: 7.3 ppm
PAC-3: 33 ppm

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Cyclohexyl trichlorosilane can affect you when breathed in. Exposure can irritate the eyes, nose, throat, and lungs, causing coughing, wheezing, and/or shortness of breath. Cyclohexyl trichlorosilane is a corrosive chemical and can cause severe skin and eye burns leading to permanent eye damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 2830 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure may cause bronchitis to develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Cyclohexyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture; and away from combustible materials, such as wood, oil, and paper; and incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Cyclohexyl trichlorosilane requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.9/1.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chloride and hydrogen chloride, are produced in fire. *Do not use water* or hydrous agents. Use dry chemical or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Cyclonite C:1770

Molecular Formula: $C_3H_6N_6O_6$

Synonyms: Cyclotrimethylenetrinitramine; Hexahydro-1,3,5-trinitro-*s*-triazine; Hexogen; Hexolite; Hexotol; HMX; RDX; Trimethylenetrinitramine; 1,3,5-Trinitro-1,3,5-triazacyclohexane; Trinitrotrimethylenetriamine

CAS Registry Number: 121-82-4; 2691-41-0

RTECS$^{®}$Number: XY9450000

UN/NA & ERG Number: UN0072/(RDX, wetted)/112

EC Number: 204-500-1

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade) *(Hexolite, RDX; RDX & HMX mixture, 121-82-4; HMX, 2691-41-0)*.

Carcinogenicity: EPA: Possible Human Carcinogen.

Explosive Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexahydro-1,3,5-trinitro-s-triazine is a white crystalline compound; Boiling point = >260°C; Freezing/Melting point = 203−204°C; Exothermic decomposition = 100°C; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability (explosive), Reactivity (see incompatibilities). Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Those involved in the manufacture of this material and its handling in munitions and solid-propellant manufacture. It is also used as a rat poison; a powerful military explosive; a base charge for detonators; and in plastic explosives.

Incompatibilities: Heat, physical damage, shock, and detonators. Detonates on contact with mercury fulminate. Keep away from other explosives, combustibles, oxidizers (such as chlorates, nitrates, perchlorates, permanganates, peroxides; bromine, chlorine, and fluorine), reducing agents, and aqueous alkaline solutions.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1.5 mg/m^3 TWA; 3 mg/m^3 STEL [skin].

ACGIH TLV$^{®}$[1]: 0.5 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 40 mg/m^3

Australia: TWA 1.5 mg/m^3; STEL 3 mg/m^3, [skin], 1993; Belgium: TWA 1.5 mg/m^3; STEL 3 mg/m^3, [skin], 1993; Denmark: TWA 1.5 mg/m^3, [skin], 1999; Finland: TWA 1.5 mg/m^3; STEL 4.5 mg/m^3, [skin], 1999; France: VME 1.5 mg/m^3, [skin], 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; Norway: TWA 1.5 mg/m^3, 1999; the Philippines: TWA 0.4 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 3 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Switzerland: MAK-W 1.5 mg/m^3, [skin], 1999; United Kingdom: TWA 1.5 mg/m^3; STEL 3 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV$^{®}$: not classifiable as a human carcinogen. Several states have set guidelines or standards for cyclonite in ambient air[60] ranging from 15 μg/m^3 (North Dakota) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (Connecticut) to 36 μg/m^3 (Nevada). This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Irritates the eyes, skin, and respiratory tract. Skin contact causes a burning sensation and rash. Other symptoms include headache, nausea, vomiting, loss of appetite, weakness, confusion, dizziness. LD_{50} = (oral-rat) 100 mg/kg (moderately toxic).

Long Term Exposure: Repeated exposure can cause irritability, sleeplessness, seizures, anorexia, kidney damage. Exposure to high levels can damage the nervous system.

Points of Attack: Eyes, skin, central nervous system.

Medical Surveillance: Examination of the nervous system. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. Neoprene™ gloves and plastic clothing are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use chemical cartridge respirator. *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Explosive. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Detached storage in a secure area is recommended. Store in tightly closed containers in a cool well-ventilated area away from other explosives, combustibles, or strong oxidizers (such as chlorine, bromine, and fluorine). Also keep cyclonite away from shock and heat sources. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: RDX, Wetted must bear the label "EXPLOSIVES 1.1D." It falls in Hazard Class 1.1D.

Spill Handling: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Initial isolation and protective action distances:
Small Spill: 1800 feet/500 m
Large Spill: 2500 feet/800 m
Fire: 1600 m (1 mile)

Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover spill with soda ash, mixed and sprayed with water. Place into bucket of water and allow to stand for 2 h. Do not operate radio transmitters or electronic detonator in spill area. Ventilate area of spill or leak after cleanup is complete. Keep Cyclonite out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cyclonite is a highly dangerous explosion hazard, especially at high temperatures. In case of a fire, immediately evacuate area. An evacuation distance of 1 mile is recommended. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour over soda ash, neutralize and flush to sewer with water. Also HMX may be recovered from solid propellant waste.

New Jersey Department of Health and Senior Services. (January 1999). *Hazardous Substances Fact Sheet: Cyclonite*. Trenton, NJ

Cyclopentadiene C:1780

Molecular Formula: C_5H_6

Synonyms: 1,3-Cyclopentadiene; Pentole; Pyropentylene; R-Pentene

CAS Registry Number: 542-92-7

RTECS®Number: GY1000000

UN/NA & ERG Number: UN1993/128

EC Number: 208-835-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyclopentadiene is a flammable, colorless liquid with a sweet odor, like turpentine. Molecular weight = 66.10; Specific gravity (H_2O:1): 0.8; Boiling point = 42.0°C; Freezing/Melting point = −85°C; Vapor pressure = 400 mmHg at 20°C; Flash point = 25°C (oc); Autoignition temperature = 640°C. Insoluble in water.

Potential Exposure: Compound Description: Human Data. Cyclopentadiene is used as an intermediate in the manufacture of resins, insecticides, fungicides, and other chemicals.

Incompatibilities: Forms explosive mixture with air. Should be stored at −20 to 0°C. Converted (dimerized) to higher boiling dicyclopentadiene upon standing in air and at 32°F/0°C; this conversion may be violent and exothermic; this reaction is accelerated by peroxides or trichloroacetic acid. Reacts violently with potassium hydroxide. Violent reaction with strong oxidizers, strong acids, dinitrogen tetroxide, magnesium. Incompatible with alkaline earth metals, nitrogen oxides. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: 75 ppm/200 mg/m^3 TWA.
NIOSH REL: 75 ppm/200 mg/m^3 TWA.
ACGIH TLV®[1]: 75 ppm/203 mg/m^3 TWA.
No TEEL available.
NIOSH IDLH: 750 ppm.

Australia: TWA 75 ppm (200 mg/m^3), 1993; Austria: MAK 75 ppm (200 mg/m^3), 1999; Belgium: TWA 75 ppm (203 mg/m^3), 1993; Denmark: TWA 75 ppm (200 mg/m^3), 1999; Finland: TWA 75 ppm (200 mg/m^3); STEL 115 ppm (310 mg/m^3), 1999; France: VME 75 ppm (200 mg/m^3), 1999; Hungary: TWA 20 mg/m^3; STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 200 mg/m^3, 2003; Norway: TWA 40 ppm (110 mg/m^3), 1999; the Philippines: TWA 75 ppm (200 mg/m^3), 1993; Poland: TWA 200 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 75 ppm (200 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 75 ppm TWA. Several states have set guidelines or standards for cyclopentadiene in ambient air[60] ranging from 2.0−4.0 mg/m^3 (North Dakota) to 3.3 mg/m^3 (Virginia) to 4.0 mg/m^3 (Connecticut) to 4.76 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2523.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, skin, and respiratory tract. Skin contact causes a burning sensation and rash.

Long Term Exposure: Exposure may damage the liver and kidneys. Exposure can cause a skin allergy to develop. If allergy develops, even low exposures may cause symptoms.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do NOT induce vomiting.

Personal Protective Methods: Wear appropriate clothing to prevent repeated or prolonged skin contact. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard.

Respirator Selection: *Up to 750 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with cyclopentadiene you should be trained on its proper handling and storage. Cyclopentadiene must be stored to avoid contact with strong oxidizing agents because violent reactions occur. Cyclopentadiene must be stored at temperatures below 0°C or it may undergo an explosive chemical reaction. Sources of ignition, such as smoking and open flames, are prohibited where cyclopentadiene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Flammable liquids, n.o.s. require a label of "FLAMMABLE LIQUIDS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, N; Risk phrases: R11; R52/53; Safety phrases: S2; S16; S29; S33; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Cyclopentane is a colorless liquid. Molecular weight = 70.15; Specific gravity = (H_2O:1) = 0.75; Boiling point = 49°C; Freezing/Melting point = − 93.6°C; Vapor pressure = 400 mmHg at 31°C; Relative vapor density (air = 1) = 2.42: Flash point = −37.2°C; Autoignition temperature = 361°C. Explosive limits in air: LEL = 1.1%; UEL = 8.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Cyclopentane is used as a solvent.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Contact with strong oxidizers may cause fire and explosion.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.87 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 600 ppm/1720 mg/m^3 TWA.
ACGIH TLV®[1]: 600 ppm/1720 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 600 ppm
PAC-1: 1800 ppm
PAC-2: 3840 ppm
PAC-3: 15,000 ppm

Australia: TWA 600 ppm (1720 mg/m^3), 1993; Belgium: TWA 600 ppm (1720 mg/m^3), 1993; Denmark: TWA 300 ppm (850 mg/m^3), 1999; France: VME 600 ppm

(1720 mg/m^3), 1999; the Netherlands: MAC-TGG 1720 mg/m^3, 2003; Norway: TWA 300 ppm (850 mg/m^3), 1999; Switzerland: MAK-W 600 ppm (1720 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 600 ppm. Several states have set guidelines or standards for cyclopentane in ambient air[60] ranging from 17.0 mg/m^3 (Connecticut) to 17.2−25.8 mg/m^3 (North Dakota) to 29.0 mg/m^3 (Virginia) to 41.0 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: Vermont[61] has set a guideline for cyclopentane in drinking water of 30.7 mg/L.

Determination in water: No method available. Octanol−water coefficient: Log $K_{ow} = 3.12$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact This chemical can be absorbed through the skin, thereby increasing exposure.

Harmful Effects and Symptoms

Short Term Exposure: Vapors are irritating to eyes, nose, and throat. If inhaled, will cause dizziness, nausea, vomiting, difficult breathing, or loss of consciousness. Ingestion irritates the stomach. Contact with the liquid is irritating to eyes and skin. This chemical can be absorbed through the skin, thereby increasing exposure. This compound is moderately toxic by ingestion and inhalation. Ingestion causes irritation of the stomach, and aspiration produces severe lung irritation and rapidly developing pulmonary edema. Contact with liquid irritates eyes and skin. Cyclopentane is a nervous system depressant. Alcohol consumption synergistically increases the toxic effects of this compound.

Long Term Exposure: Cyclopentane can cause drying and cracking of the skin.

Points of Attack: Eyes, nose, throat, respiratory system, stomach, and nervous system.

Medical Surveillance: Consider possible irritant effects to the skin and respiratory tract in preplacement and periodic examinations as well as any renal or liver complications.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting, guard against aspiration. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is a potential for overexposure:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with cyclopentane you should be trained on its proper handling and storage. Before entering confined space where cyclopentane may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Use only nonsparking tools and equipment, especially when opening and closing containers of cyclopentane. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." The Hazard Class is 3 and the Packing Group is II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a

hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Water may be ineffective because of low flash point. Do not extinguish fire unless flow of chemical can be stopped. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Cyclopropane C:1800

Molecular Formula: C_3H_6

Synonyms: Ciclopropano (Spanish); Cyclopropane, liquified; Trimethylene

CAS Registry Number: 75-19-4

RTECS®Number: GZ0690000

UN/NA & ERG Number: UN1027/115

EC Number: 200-847-8 [*Annex I Index No.:* 601-016-00-6]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Cyclopropane is a gas. Molecular weight = 42.09; Boiling point = −34°C; Freezing/Melting point = −127°C; Flash point = flammable gas. Flammable limits: LEL = 2.4%; UEL = 10.4%; Autoignition temperature = 498°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0.

Potential Exposure: Cyclopropane is used as an anesthetic and to make other chemicals.

Incompatibilities: Forms explosive mixture with air. Heat, flame, or contact with oxidizers can cause fire and explosion hazard. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 200 ppm
PAC-1: 600 ppm
PAC-2: 4000 ppm
PAC-3: 60,000 ppm

Determination in Air: Charcoal adsorption followed by workup with CS_2, and analysis by gas chromatography. Use NIOSH Analytical Method #1500 for hydrocarbons.

Harmful Effects and Symptoms

Short Term Exposure: Cyclopropane can affect you when breathed in. Cyclopropane is used as a surgical anesthetic. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels can cause coma and death. Liquid can cause frostbite. May affect the nervous system; and cause heart-rate disorders.

Medical Surveillance: EKG, examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: *Clothing:* Avoid skin contact with Cyclopropane. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissue. *Eye protection:* Wear gas-proof goggles, unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles when working with liquid, unless full face-piece respiratory protection is worn.

Respirator Selection: Where there is potential for exposure to cyclopropane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with cyclopropane you should be trained on its proper handling and storage. Before entering confined space where this gas may be present, check to make sure that an explosive concentration does not exist. Cyclopropane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and oxygen, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Outside or detached storage is recommended. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Cyclopropane, liquefied, requires a “FLAMMABLE GAS” label. It falls in Hazard Class 2.1 and there is no Packing Group.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Cyclopropane is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services. (March 1999). *Hazardous Substances Fact Sheet: Cyclopropane*. Trenton, NJ

Cyclosarin (Agent GF, WMD) C:1795

Molecular Formula: $C_7H_{14}FO_2P$; $CH_3PO(F)OC_6H_{11}$

Synonyms: CMPF; Cyclohexyl methylphosphonofluoridate; *O*-Cyclohexyl-methylphosphonofluoridate; Cyclohexyl sarin; Cyclosarin; Cyclosin; GF; Methyl cyclohexylfluorophosphonate; Phosphonofluoridic acid, methyl-, cyclohexyl ester

CAS Registry Number: 329-99-7; 1445-76-7

RTECS®Number: Not established

UN/NA & ERG Number: UN2810/153

EC Number: Not established

Regulatory Authority and Advisory Bodies

Report any release of WMD to National Response Center 1-800-424-8802.

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g (*1445-76-7).*

While not a mandated "Federally listed" waste, GF is more toxic than most RCRA listed chemicals. However, GF is a "listed" hazardous waste in some states where it may have been stockpiled by the military.

Description: Cyclosarin (GF) is a liquid nerve agent/organophosphate containing fluoride. GF is a colorless liquid. The odor is variously described as nondescript, sweet, fruit-like. Odor threshold is about 12 mg/m^3. Molecular weight = 180.2 g/mol; Specific gravity = 1.133 g/mL at 20°C; Boiling point = 239°C; Freezing point = −30°C; Liquid density = 1.1327 at20°C; Vapor density (air = 1) = 6.2; Vapor pressure = 0.44 mmHg at 25°C; Volatility = 581 mg/m^3 at 25°C; Flash point = 94°C. Practically insoluble in water; solubility = 0.37% at 20°C.

History of the agent: Cyclosarin (GF) is believed to have been synthesized about the time of World War II by the Germans. Following the war, in the early 1950s, both the United States and Great Britain undertook a systematic study of potential nerve agents including GF. Some sources in the United States suggest that interest in GF was stimulated by work undertaken in an "iron curtain country." However, for various reasons related to its lower toxicity and relatively high cost, it was never manufactured. Iraq is believed to have produced large quantities of cyclosarin for use as a chemical weapon. Iraq fielded artillery projectiles filled with cyclosarin (GF) and sarin (GB). Animal tests did not find GF−GB mixtures to have any special effects as the toxicity range was approximately intermediate between the two agents.

Potential Exposure: A quick-acting and lethal cholinesterase inhibitor and casualty agent. Females appear to be more susceptible to nerve agent effects. Small percentages of general population have genetic traits that may increase susceptibility.

Incompatibilities: Fairly stable. Cyclosarin (GF) is hydrolyzed by water; rapidly hydrolyzed in the presence of heat and alkalies; by dilute solution of aqueous sodium hydroxide. Contact with alkaline conditions produces isopropyl alcohol and polymer substances. Contact with acid conditions produce hydrogen fluoride; alkaline conditions produce isopropyl alcohol and polymers. When heated to decomposition or on contact with steam, it emits very toxic fumes of fluorides and phosphorus oxides. Reasonably stable when stored in steel at normal temperatures; slightly corrosive to steel when heated.

Persistence of Chemical Agent: Cyclosarin has intermediate persistence [as persistent as Tabun (Agent GA)]. GF evaporates about 20 times more slowly than water. Heavily splashed liquid persists 1 or 2 days under average weather conditions.[AFM 3−9] Approximately 20 times more persistent than sarin (GB).[AFM 3−9] Following (for reference and calculation) are persistence rates for sarin (GB): Summer: 10 min to 24 h; Winter: 2 h to 3 days.

Permissible Exposure Limits in Air: Conversion factor: 1 ppm = 7.4 mg/m^3°C = 0.56 × (°F − 32).

IDLH: 0.05 mg/m^3[US Army].

STEL: 5.0×10^{-5} mg/m^3.

Worker Population Limit (WPL) = 3.0×10^{-5} mg/m^3 (8-h TWA).

General Population Limit (GPL) = 1.0×10^{-6} mg/m^3 (24-h TWA lifetime chronic value).

Protective Action Criteria (PAC)*

TEEL-0: 0.0000600 ppm

PAC-1: **0.00020** ppm

PAC-2: **0.0024** ppm

PAC-3: **0.018** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Acute Exposure Guideline Levels (AEGLs)

Level 1: potential discomfort; nondisabling; reversible.

10 min—0.00049 ppm; 30 min—0.00028 ppm; 1 h—0.0002 ppm; 4 h—0.0001 ppm; 8 h—0.00050 ppm.

Level 2: Irreversible or other serious, long-lasting effects; impaired ability to escape; potential delayed recovery.

10 min—0.0062 ppm; 30 min—0.0035 ppm; 1 h—0.0024 ppm; 4 h—0.0013 ppm; 8 h—0.00091 ppm.

Level 3: Life threatening; possible death.

10 min—0.053 ppm; 30 min—0.027 ppm; 1 h—0.018 ppm; 4 h—0.0098 ppm; 8 h—0.0071 ppm.

Determination in Air: Air sampling is a good indicator of other pathways (e.g., off-gassing from soil) and is useful in risk analysis since it has health-based exposure limits. Onsite and downwind sampling should be conducted within 6 in. above potentially contaminated surfaces/soil to assess any off-gassing hazard as well as at breathing zone level (e.g., 5 feet) to assess potential public health inhalation exposures. Appropriate solid phase sorbent medium (e.g., tubes, PUF samplers) and SUMMA canisters can be used for sample collection and subsequent laboratory analysis.

Permissible Concentration in Water: Unknown.

Determination in Water: G-agents are unlikely to persist in water. If analysis is performed, standard EPA volatile water sampling methods should be used. Contact pollution control authorities and advise shutting water intakes. Although G-agent contamination of large water sources is unlikely, there are military screening levels to determine if smaller, contained water supplies (e.g., water buffalo, tank truck) have been contaminated. Acceptable levels for troops drinking 5−15 L/day of a contaminated supply for 7 days are 4−12 μg/L. This level is a reasonable value to use for the general population since their consumption rate is considerably less.[NRT]

Determination in Soil: Industrial Exposure Scenario = 5.2−8.2 mg/kg; Residential Exposure Scenario = 0.22−0.31 mg/kg.[NRT]

Routes of Entry: Enters the body primarily through the respiratory tract, but is highly toxic through the skin and digestive tract. *Inhalation* (a primary exposure route; inhalation of very small concentrations can produce effects), *Skin* [especially toxic from contact with liquid agent; usually moderate to severe localized effects (e.g., sweating) and systemic effects. Effects can also result from absorption of vapors through skin]. *Eyes* [the most sensitive target organs of nerve agent exposure: miosis (reduction in pupil size) will typically be the first sign of exposure]. *Ingestion* (overall systemic effects).[NRT]

Harmful Effects and Symptoms

Cyclosarin (Agent GF) is a quick-acting chemical warfare nerve agent/nerve gas. Both the liquid and the vapor can kill you. Small amounts can injure in seconds, and can quickly lead to death. *Note:* Sarin is 26 times more deadly than cyanide gas and 20 times more deadly than Potassium cyanide. A single drop, if vaporized, can kill every person in an enclosed room![USCG]

Short Term Exposure: A strong cholinesterase inhibitor. Eye/skin toxicity: Very high; Rate of action: Very rapid. Physiological action: Cessation of breath—death may follow. Detoxification rate: Low.[ANSER] LD_{50} = (subcutaneous-rat) 0.225 mg/kg. Median lethal dose (mg-min/m^3): 2500 by skin (vapor) or 350 (liquid); 35 inhaled. Median incapacitating dose: 25 inhaled. LD_{50} = (subcutaneous, mice) reported from 16 μg/kg to 400 μg/kg (compared to Sarin: LD_{50} = (mice) 200 μg/kg). (*Note*: Sarin: *A single drop on the skin can cause death. Death may occur within 15 min after fatal dose is absorbed*). See also Sarin (Agent GB) at S:0130.

Long Term Exposure: May cause neuropsychiatric effects (as long as a year or more following acute manifestation) and possible EEG changes. Both are documented as acute manifestations of nerve agent poisoning; mild neuropsychiatric changes occur after even low-dose nerve agent exposure. The duration of the neuropsychiatric effects after nerve agent exposure is less well documented, but available information suggests that these effects persist for several weeks or possibly several months. Studies of EEG changes following organophosphate nerve agent exposure found differences between the exposed and control populations but suggested no relationship between their findings and alterations in brain function.[MACBW]

Points of Attack: Skin, eyes, lungs.

Medical Surveillance: Annual physical and respiratory function examinations and a baseline cholinesterase.[NRT]

Decontamination: *Important*: The rapid physical removal of a chemical agent is essential. If one does not have the equipment and/or training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Nerve gasses stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. If time is available, decontaminate outer personal protection equipment (PPE) with a dilute household bleach solution†. Use warm soapy water instead of dilute bleach for decon of bare skin. Use caution to avoid hypothermia in children and the elderly. *Patients exposed to liquid:* All visible droplets should be blotted (not wiped) away using an absorbent material (e.g., paper towels, facial tissues, etc.); if available, towelettes moistened with a neutralizing solution should be used. Absorbent powders may also be used for removal of droplets (in the absence of standard absorbents, field expedients such as flour may be useful). GF should be decontaminated by washing in available clean water at least 3 times. Skin decontamination may be unnecessary if the exposure was to GF vapor only. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Wash off the diluted bleach solution after 15 min. Hair should be thoroughly cleaned using soap and water, with care being taken to prevent wash water from getting into the victim's eyes, open wounds, or mouth. Remember that the water used to decontaminate victims is dangerous. Be sure to decontaminate the victims as much as possible before releasing them from the decon area to prevent them from spreading the nerve gas. Rinse the eyes, mucous membranes, or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction. *Patients exposed to nerve agent by vapor (only)*: should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; take care to prevent wash water from getting into the victim's eyes, open wounds, or mouth. *Surface decontamination* (nonporous surfaces, vehicles, etc.): Use hypochlorite bleach slurries or dilute alkalis. *Confined spaces*: Use steam and ammonia.

†The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach (sodium hypochlorite [NaOCl] or calcium hypochlorite [$Ca(OCl)_2$]); (2) "DS2 solution" (2% NaOH; 70% diethylene triamine; 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia.

†Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

First Aid: The immediate treatment for nerve agent intoxication is intravenous injection of 2 mg atropine sulfate (intramuscular injection should be considered if the patient is hypoxic and ventilation cannot be initiated, as there is a risk of ventricular fibrillation). This should be followed by additional injections of atropine at 10−15-min intervals, continuing until bradycardia has been reversed (e.g., until the heart rate is at 90 beats/minute). If breathing has stopped, a mechanical respirator should be used to ventilate the patient. *Do not attempt mouth-to-mouth resuscitation.* If possible, oxygen or oxygen-enriched air should be used for ventilation. If possible, monitor cardiac activity.

Notes for physician and medical personnel: Oximes (pralidoxime salts, obidoxime) may be of use in restoring acetylcholinesterase activity. Obidoxime may be used to treat GF intoxication; however, it may cause liver damage. Animal studies indicate that the oxime Hi-6 may be significantly superior to other oximes in the treatment of GF intoxication, but it is not widely available. Therefore pralidoxime salts should be used, with a slow intravenous infusion of 500 mg to 1 g being given initially. Diazepam may be administered to control convulsions. It also has value in controlling the victim's fear. An initial dose of 5 mg may be followed by additional doses at 15-min intervals up to a total of 15 mg.[CDC]

Other effective antidote: National Response Team (NRT) lists atropine and (if more severe) 2-PAM Chloride injections; atropine eye drops.[NRT]

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. *Outer suit*: Tychem F, Butyl rubber, LV, Responder, TK, Tyvek®-F, or Reflector decontamination suits. *Gloves*: Butyl rubber gloves, M-3 and M-4 Norton, or Chemical Protective Set. See: *http://www2.dupont.com/Personal_Protection/en_US/assets/downloads/tychem/permguide82004.pdf*. Although resistant to liquid chemical agents, impermeable protective clothing may be penetrated after a few hours of exposure to heavy concentration of agent. Consequently, liquid contamination on the clothing must be neutralized or removed as soon as possible. Contact lenses should NOT be worn when working with this chemical.

Medical personnel treating casualties should avoid direct (skin-to-skin) contact; protective gear including breathing protection should be worn when treating casualties prior to decontamination. *Latex gloves are not adequate protection*. Casualties should be decontaminated as rapidly as possible (see the section on decontamination). Remove casualties from exposure as rapidly as possible. *Casualties must not be moved into clean treatment areas where unmasked/ungloved personnel are working until decontamination is complete.* During decontamination operations there should also be PPE/respiratory measures to minimize potential exposures to associated chlorine vapors.

Respirator Selection: *When the types of inhalation hazards and their concentrations are unknown or anticipated to be high*, hazard evaluation responders must use NIOSH- or European Standard EN 149-approved chemical, biological, radiological, and nuclear (CBRN) self-contained breathing apparatus (SCBA) respirators. The CBRN APR full-face respirator provides a lower level of protection than the SCBA and its use is generally allowed once conditions are understood and exposures are determined to be at lower levels. Once the level of danger is established and where there is potential for exposure to the chemical, use a NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full-face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full-face-piece operated in pressure-demand or other positive-pressure mode. The M40 Series (which replaced the M17A1 protective mask) mask provides respiratory protection against all known military toxic chemical agents, but it cannot be used in an oxygen-deficient environment and is *not approved for civilian use*. It does not afford protection against industrial toxics, such as ammonia and carbon monoxide.

Storage: Reasonably stable in steel at normal temperatures. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone A] require a shipping label of "POISONOUS/TOXIC MATERIALS." Inhalation Hazard. Passenger aircraft/rail: "FORBIDDEN"; Cargo aircraft only: "FORBIDDEN". It falls in DOT Hazard Class 6.1. The packaging and shipping of samples are subject to strict regulations established by the Department of Transportation (DOT), Centers for Disease Control and Prevention (CDC), United States Postal Service (USPS), Occupational Safety and Health Administration (OSHA), and International Air Transport Association (IATA).

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Spills must be contained by covering with vermiculite, diatomaceous earth, clay, fine sand, sponges, and paper or cloth towels. This containment is followed by treatment with copious amounts of aqueous sodium hydroxide solution (a minimum 10 wt. %). Scoop up all material and place in a fully removable head drum with a high-density polyethylene liner. The decontamination solution must be treated with excess bleach to destroy the CN formed during hydrolysis. Cover the contents with additional bleach before affixing the drum head. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations. Dispose of the material per IAW waste disposal methods provided below. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 10 wt. % sodium hydroxide is not available then the following decontaminants may be used instead and are listed in order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], sodium carbonate, and Supertropical Bleach Slurry (STB). Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

GF, when used as a weapon

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.7

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 800/240
Then: Protect persons downwind (miles/kilometers)
Day 1.4/2.3
Night 3.2/5.2

Fire: If tank, rail car, or tank truck is involved in fire, isolate for at least 800 m (½ mile) in all directions; also, consider initial evacuation for 800 m (½ mile) in all directions.

Fire Extinguishing: When heated to decomposition it emits toxic fumes of phosphorus oxides and fluorine. When heated, vapors may form explosive mixtures with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Water, fog, foam, CO_2; Avoid using extinguishing methods that will cause splashing or spreading of the GA. Poisonous gases, including hydrogen cyanide, oxides of nitrogen, oxides of phosphorus, carbon monoxide, and hydrogen cyanide, may be produced in fire. Respiratory protection is required. Positive-pressure, full face-piece, NIOSH-approved self-contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief or chemical accident/incident (CAI) operations officer. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing. Complete protection required; have decontaminants available (bleach, alkali) and atropine. Bleaching powder (chlorinated line) destroys tabun but gives rise to cyanogen chloride. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Grossly liquid-contaminated materials should be decontaminated and containerized and labeled in accordance with DOT and EPA requirements as a hazwaste. Wastewater solution from decon should be analyzed to ensure no residual agent is present. The National Response Plan, ESF-3 designates United States Army Corps of Engineers (USACE) as the primary agency to manage contaminated debris. USACE and the Department of Defense (DOD) typically use safety procedures prior to transport that include “head space” (off gas) monitoring around containers prior to shipment to ensure no leakage/off-gassing. Typically waste will be transported in accordance with state requirements to a designated disposal facility, such as an RCRA-permitted hazardous waste facility (typically an incinerator). Wastewater solution from the decontamination process will be analyzed to ensure no residual agent is present. It is likely that the solution will not contain residual agents and therefore not need to be classified as a hazardous waste but sampling must be used to verify. Chlorinated wastewater may need to be treated/neutralized prior to disposal.[NRT] US munitions stockpiles of G-agent are/have undergone destruction/disposal in the states of Utah, Oregon, Arkansas, Alabama, and

Kentucky. State/local plans to address potential releases from US Army properties are in place at these sites.

Because most references are considered "secondary" sources, comparisons among multiple sources helped to verify information. When conflicting information was found between listed references, a determination was made as to what was more correct and up-to-date, based on publication date and level of peer-review.

Cyhexatin C:1810

Molecular Formula: $C_{18}H_{34}O_4Sn$

Common Formula: $(C_6H_{11}O)_3SnOH$

Synonyms: Plictran®; Tricyclohexylhydroxystannane and ENT 27395-X; Tricyclohexyltin hydroxide

CAS Registry Number: 13121-70-5

RTECS®Number: WH8750000

UN/NA & ERG Number: UN2786 (Organotin pesticides, solid, toxic)

EC Number: 236-049-1 [*Annex I Index No.:* 050-002-00-0]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), listed as "severe pollutant."

California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin 1/1/89.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as tin compounds; Canada, CEPA Prohibited Export Substance List.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/21/22; R50/53; Safety phrases: S2; R13; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Cyhexatin is a colorless to white, nearly odorless, crystalline powder. Molecular weight = 385.16; Boiling point = 227°C (decomposes); Freezing/Melting point = 195−198°C. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Organometallic, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as an agricultural chemical and pesticide. Those involved in the manufacture, formulation, and application of this acaricide (miticide).

Incompatibilities: Keep away from strong oxidizers, ultraviolet light, some organic compounds (e.g., chloroform, acetone, xylene).

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Sn]/m^3/0.32 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: 0.1 mg/m^3 (as Sn) [skin] (measured as the, inhalable fraction); Pregnancy Risk Group D.

NIOSH IDLH: 80 mg/m^3 [25 mg[Sn]/m^3].

Australia: TWA 0.1 mg[Sn]/m^3, [skin], 1993; TWA 5 mg/m^3, 1993; Austria: MAK 0.1 mg[Sn]/m^3, [skin], 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 0.1 mg [Sn]/m^3, [skin], 1999; TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Hungary: STEL 0.1 mg[Sn]/m^3, [skin], 1993; Norway: TWA 0.1 mg[Sn]/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; the Philippines: TWA 0.1 mg[Sn]/m^3, 1993; Russia: STEL 0.02 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.1 mg[Sn]/m^3, KZG-W 0.2 mg[Sn]/m^3, [skin], 1999; Thailand: TWA 0.1 mg [Sn]/m^3, 1993; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for cyhexatin in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

NIOSH IDLH is 80 mg/m^3 [25 mg/m^3 (as Sn)].

Determination in Air: Filter/XAD-2® (tube); CH_3COOH/CH_3CN; High-pressure liquid chromatography/graphite furnace atomic absorption spectrometry; NIOSH Analytical Method (IV) #5504, Organotin.

Permissible Concentration in Water: No criteria set. Fish Tox (ppb): 0.083480 MATC; EXTRA HIGH; FISH STV (Sediment Toxicity Value): INTERMEDIATE.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory system. Symptoms of exposure include headache, vertigo (an illusion of movement), sore throat, cough, abdominal pain, vomiting, skin burns, pruritus. Cyhexatin is moderate in acute oral toxicity to animals. This is in contrast to alkyl tin compounds with smaller (methyl and ethyl) radicals which are highly toxic. A diet including 6 mg/kg of body weight of cyhexatin for 2 years showed no effect in rats. LD_{50} = (oral-rat) 180 mg/kg (moderately toxic).

Long Term Exposure: This chemical has been shown to cause liver and kidney damage in animals. Human Toxicity: 5.250 ppb; HIGH.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: Complete Blood Count (RBC Hemolysis), electrocardiogram, especially on workers over 40 years, glaucoma, liver function tests, urine (chemical/metabolite). For organotins, preplacement and periodic examinations should include the skin, eyes, blood, central nervous system, liver and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 3.2 mg/m³:* Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 8 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 16 mg/m³:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 80 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area away from oxidizers.

Shipping: Organotin pesticides, solid, toxic, require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: 2,4-Dichlorophenoxyacetic acid is a white to yellow crystalline powder with a slight phenolic odor. Molecular weight = 221.04; Specific gravity (H_2O:1) = 1.57; Boiling point = decomposes below BP at 158°C; Freezing/Melting point = 138°C; Vapor pressure = 53 Pa at 160°C; 8×10^{-6} mmHg[EPA]; 0.4 mmHg at 160°C.[NIOSH] Slightly soluble in water; solubility = 0.05%. The taste and odor threshold in water is 3.13 mg/L.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. 2,4-Dichlorophenoxyacetic acid was introduced as a plant growth-regulator in 1942. It is registered in the United States as a herbicide for control of broadleaf plants and as a plant growth regulator. Thus, workers engaged in manufacture, formulation, or application are affected, as may be citizens in areas of application. The Vietnam war era defoliant, Agent Orange, was a mixture of 2,4-D and 2,4,5-T.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00004-7

Incompatibilities: A weak acid, incompatible with bases. Decomposes in sunlight or heat, forming hydrogen chloride and phosgene. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

OSHA PEL: 10 mg/m^3 TWA.

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 100 mg/m^3

2,4-D, including salts and esters

DFG MAK: 1 mg/m^3, inhalable fraction TWA; Peak limitation Category II(8) [skin]; Pregnancy Risk Group C.

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 10 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, [skin], 1993; France: VME 10 mg/m^3, 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 10 mg/m^3, 2003; the Philippines: TWA 10 mg/m^3, 1993; Poland: MAC (TWA) 7 mg/m^3, MAC (STEL) 20 mg/m^3, 1999; Switzerland: MAK-W 10 mg/m^3, KZG-W 50 mg/m^3, 1999; Thailand: TWA 10 mg/m^3, 1993; Turkey: TWA 10 mg/m^3, 1993; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] set a MAC of 0.02 mg/m^3 in ambient air in residential areas on a momentary basis and 0.01 mg/m^3 on a daily average basis for the sodium salt of 2,4-D. Several states have set guidelines or standards for 2,4-D in ambient air[60] ranging from 100 μ/m^3 (North Dakota) to 105 μg/m^3 (Pennsylvania) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Collection on a glass fiber filter and analysis by HPLC with UV detection. Use NIOSH Analytical Method #5001.[18]

Permissible Concentration in Water: The United States[35] has set a MPC in bottled water intended for human consumption of 0.1 mg/L. Mexico[35] has set levels in ambient water of 0.1 mg/L in estuaries and 0.01 mg/L in coastal waters.

Russia[43] has set a MAC of 1.0 mg/L in water bodies used for drinking purposes for the sodium salt and 0.62 mg/L in water bodies used for fishery purposes. A no-observed-adverse-effect-level (NOAEL) of 1 mg/kg/day has been determined,[47] which results in the calculation of a lifetime health advisory of 0.070 mg/L. This level has been proposed by EPA[62] as a maximum level in drinking water. Drinking water levels for Canada and Mexico are 0.1 mg/L. States which have set guidelines for 2,4-D in drinking water[61] include Minnesota at 70 μg/L and Maine at 100 μg/L.

Determination in Water: Fish Tox = 4247.00420 ppb MATC (VERY LOW). Octanol−water coefficient: Log K_{ow} = 2.81

Routes of Entry: Inhalation, skin absorption, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of the mouth, nose and throat, headache, nausea, vomiting, and diarrhea at levels above 10 mg/m^3. Nerve damage, which may be delayed, may include swelling of legs and feet, muscle twitch, and stupor. Severe exposures may result in death. *Skin:* Dust or liquid left in contact with the skin for several hours may be absorbed. This may result in severe delayed symptoms as listed above. These symptoms may last for months or years. *Eyes:* Irritation may occur. *Ingestion:* The oral dose required to produce symptoms is about 1/12 oz (1/2 teaspoon). Increasing amounts may result in increasingly severe symptoms as listed above. Death has resulted from as little as 1/5 oz. Survival for more than 48 h is usually followed by complete recovery, although symptoms may last for several months.

Long Term Exposure: Workers exposed to 2,4-D in the manufacturing process over a 5−10-year period at levels above 10 mg/m^3 complained of weakness, rapid fatigue, headache, and vertigo. Liver damage, low blood pressure, and slowed heartbeat were also found. Based on animal tests, 2,4-D may affect human reproduction. Human Tox = 70.00000 ppb MCL (Low).

Points of Attack: Skin, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination of the nervous system. NIOSH lists the following tests: blood plasma, urine (chemical/metabolite) 24-h collection.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): natural rubber gloves, Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *100 mg/m^3:* [Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-D, you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area. Keep away from oxidizers, heat, and sunlight. A regulated, marked area should be established where this chemical is stored in compliance with OSHA Standard 1910.1045.

Shipping: Phenoxy pesticides, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." 2,4-D falls in DOT Hazard Class 6.1 and Packing Group III. A DOT-regulated marine pollutant.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 2,4-Dichlorophenoxyacetic acid ester may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride, carbon monoxide, and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration of phenoxys is effective in 1 s at 982°C, using a straight combustion process or at 482°C using catalytic combustion. Over 99% decomposition was reported when small amounts of 2,4-D were burned in a polyethylene bag. See "Reference"[22] for additional detail. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dacarbazine D:0110

Molecular Formula: $C_6H_{10}N_6O$
Synonyms: Deticene; DIC; (Dimethyltriazeno)imidazole-carboxamide; 4-(3,3-Dimethyl-1-triazeno)imidazole-5-carboxamide; 4-(5)-(3,3-Dimethyl-1-triazeno)imidazole-5(4)-carboxa mide; 4-(Dimethyltriazeno)imidazole-5-carboxamide; 5-(3,3-Dimethyl-1-triazeno)imidazole-4-carboxamide; 5-(3,3-Dimet hyltriazeno)imidazole-4-carboxamide; 5-(Dimethyltriazeno) imidazole-4-carboxamide; 5-(3,3-Dimethyl-1-triazenyl)-1H-imidazole-4-carboxamide; DTIC; DTIC-Dome; NCI-C047 17; NSC-45388
CAS Registry Number: 4342-03-4
RTECS® Number: NI3950000
UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151
EC Number: 224-396-1
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human Limited Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (ipr); clear evidence: mouse, rat; NTP: Reasonably anticipated to be a human carcinogen.
California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin 1/29/99.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Dacarbazine is an ivory-colored crystalline solid. Molecular weight = 182.22; Freezing/Melting point = reported at 205°C.
Potential Exposure: Dacarbazine is used in cancer chemotherapy, as an antineoplastic agent in the treatment of certain skin cancers, and occasionally in the therapy of other neoplastic diseases which have become resistant to alternative treatment.
Health professionals who handle this drug (for example, pharmacists, nurses, and physicians) may possibly be exposed during drug preparation, administration, or cleanup; however, the risks can be avoided through use of appropriate containment equipment and work practices.[10] People receiving dacarbazine in treatment are also exposed.
Incompatibilities: Strong oxidizers. Explosive decomposition reported at 250–255°C.
Permissible Exposure Limits in Air
No standards or TEEL available.
Harmful Effects and Symptoms
Long Term Exposure: There is sufficient evidence that dacarbazine is carcinogenic in experimental animals. Rats given dacarbazine orally or intraperitoneally developed tumors of the breast, thymus, spleen, and brain in a minimum of 18 weeks after initial exposure. Intraperitoneal administration of dacarbazine to mice produced tumors in the lung, blood-producing tissue, and uterus.
First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20–30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dacarbazine you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place and protect from light. A regulated, marked area should be established where this chemical is stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicines, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Daminozide D:0120

Molecular Formula: $C_6H_{12}N_2O_3$

Common Formula: $(CH_3)_2NNHCOCH_2CH_2COOH$

Synonyms: Alar®; Alar®-85; Aminozide®; B-9; B995; Bernsteinsaeure-2,2-dimethylhydrazid (German); B-Nine; Butanedioic acid mono(2,2-dimethylhydrazide); Dimas*; N*-Di methyl amino-β-carbamyl propionic acid*; N*-(Dimethylam ino)succinamic acid*; n*-Dimethylamino-succinamidsaeure (German); DMASA; DMSA; Kylar; NCI-C03827; SADH; Succinic acid 2,2-dimethylhydrazide; Succinic-1,1-dimethyl hydrazide

CAS Registry Number: 1596-84-5

RTECS® Number: WM9625000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 216-485-9 [*Annex I Index No.:* 607-171-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); clear evidence: mouse, rat.[9]

California Proposition 65 Chemical: Cancer 1/1/90; methylhydrazine and its salts 7/1/92.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R40; Safety phrases: S2; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Daminozide is a colorless crystalline solid. Molecular weight = 160.22; Freezing/Melting point = 157−164°C; Vapor pressure = 1×10^{-8} mmHg at 20°C.

Potential Exposure: Daminozide is a plant growth regulator used on certain fruits (especially apples) to improve the balance between growth and fruit production and to improve fruit quality and synchronize maturity. US sales were halted in 1989 because of health considerations.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set. Fish Tox = 31007.43129000 pbbMATC, Very Low.

Harmful Effects and Symptoms

The acute oral LD_{50} for rats is 8400 mg/kg (insignificantly toxic). However, daminozide metabolizes to diamethylhydrazine which is a proven carcinogen in animal tests. It has a low dermal irritation potential and it is neither teratogenic nor mutagenic.[55] It is not an acute toxicant to fish or wildlife. Human Tox = 40.22989 ppb CHCL (Chronic Human Carcinogen Level) (INTERMEDIATE).

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with daminozide you should be trained on its proper handling and storage. Store in a cool, dry place, or in a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Daminozide may be classified as Toxic solids, organic, n.o.s., requiring a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Daunomycin D:0130

Molecular Formula: $C_{27}H_{29}NO_{10}$

Synonyms: 13,057 R.P.; Acetyladriamycin; Cerubidin; Daunamycin; Daunomicina (Spanish); Daunorubicin; Daunorubicine; DM; FI6339; Leukaemmycin C; 5,12-Naphthacenedione, 8-Acetyl-10-(3-amino-2,3,6-trideoxy-α-L-lyxohexopyranosyl)oxy-7,8,9,10-tetrahydro-6,8,11-trihydroxy-1-methoxy-, (8-*cis*)-; NCI-C04693; NSC-82151; RP 13057; Rubidomycin; Rubidomycine; Rubomycin C; Rubomycin C-1; Streptomyces

CAS Registry Number: 20830-81-3

RTECS® Number: HB7875000

UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 244-069-7

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, 1987, *possibly carcinogenic to humans*, Group 2B; NCI: Carcinogenesis Studies (ipr); clear evidence: rat, no evidence, mouse, 1977.

US EPA Hazardous Waste Number (RCRA No.): U059.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Daunomycin is a thin red, needle-shaped material. Molecular weight = 527.6; Freezing/Melting point = 190°C (decomposes). Soluble in water.

Potential Exposure: An antibiotic. It is used as a medicine for treating cancer.

Permissible Exposure Limits in Air

No standards or TEEL set.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if swallowed.

Long Term Exposure: It may cause cancer in humans and may be teratogenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with daunomycin you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Medicines, solid, toxic, n.o.s. require a label of “POISONOUS/TOXIC MATERIALS.” They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Banned or Severely Restricted (many countries) (UN).[13]

Persistent Organic Pollutants (UN).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15).

US EPA Hazardous Waste Number (RCRA No.): U061.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.0039; Nonwastewater (mg/kg), 0.087.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.1); 8270 (10).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

California Proposition 65 Chemical: Cancer 10/1/87 (DDT); Developmental/Reproductive toxin (female) 5/15/98 (*p,p′*-DDT).

Canada, Drinking Water Quality, 0.03 mg/L MAC.

Mexico, Drinking Water Criteria, 0.001 mg/L.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

List of Stockholm Convention POPs: Annex B (Restriction).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R25; R40; R48/25; R50/53; Safety phrases: S1/2; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: DDT is a waxy solid or slightly off-white powder of indefinite melting point with a weak, chemical odor. Molecular weight = 354.58; Boiling point = 260°C; Freezing/Melting point = 107−109°C; Flash point = 72−75°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Poor solubility in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. DDT is a low-cost broad-spectrum insecticide. However, following an extensive review of health and environmental hazards of the use of DDT, US EPA decided to ban further use of DDT in December 1972. This decision was based on several properties of DDT that had been well evidenced[1]: DDT and its metabolites are toxicants with long-term persistence in soil and water[2]; it is widely dispersed by erosion, runoff and volatization[3]; and the low water solubility and high lipophilicity of DDT result in concentrated accumulation of DDT in the fat of wildlife and humans which may be hazardous.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard. Incompatible with salts of iron or aluminum, and bases. Do not store in iron containers.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA; Suspected occupational carcinogen. Reduce exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 1 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1 mg/m^3 TWA measured as the inhalable fraction [skin]; Peak Limitation Category II (8).

Arab Republic of Egypt: TWA 1 mg/m^3, 1993; Australia: TWA 1 mg/m^3, 1993; Austria: MAK 1 mg/m^3, [skin], 1999; Belgium: TWA 1 mg/m^3, 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3, [skin], 1999; France: VME 1 mg/m^3, continuous; carcinogen, 1999; India: TWA 1 mg/m^3, 1993; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Norway: TWA 1 mg/m^3, 1999; the Philippines: TWA 1 mg/m^3, [skin], 1993; Poland: MAC (TWA) 0.1 mg/m^3; STEL 0.8 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, 1993; Switzerland: MAK-W 1 mg/m^3, [skin], 1999; Thailand: TWA 1 mg/m^3, 1993; Turkey: TWA 1 mg/m^3, [skin], 1993; United Kingdom: TWA 1 mg/m^3; STEL 3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[43] set a MAC of 0.005 mg/m^3 for ambient air in residential areas on a momentary basis and 0.001 mg/m^3 on a daily average basis. Several states have set guidelines or standards for DDT in ambient air[60] ranging from 1.8 μg/m^3 (Pennsylvania) to 2.38 μg/m^3 (Kansas) to 5.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (North Dakota) to 16.0 μg/m^3 (Virginia) to 24 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #S-274.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0010 μg/L as a 24-h average; never to exceed 1.1 μg/L. *To protect saltwater aquatic life:* 0.0010 μg/L as a 24-h average; never to exceed 0.13 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is imposed by a level of 0.24 ng/L (0.00024 μg/L). Various states have set guidelines and standards for DDT in drinking water[61] ranging from guidelines of 0.42 μg/L (Kansas) to 0.83 μg/L (Maine) to 1.0 μg/L (Minnesota) and a standard of 50 μg/L (Illinois). Russia set a MAC of 0.1 mg/L in water used for domestic purposes and zero in surface water for fishing.[35]

Canada has set a water quality MAC of 0.03 mg/L. Mexico[35] has set a MPC of 0.001 mg/L in drinking water supply; of 0.006 mg/L in estuaries and 0.6 μg/L in coastal waters.

Determination in Water: Gas chromatography (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 6.36$.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Can cause irritation. 500−4200 mg/m^3 has produced dizziness. *Skin:* Can cause irritation in very high concentrations. DDT can be absorbed through the skin if dissolved in vegetable oils or other solvents. *Eyes:* Can cause irritation. *Ingestion:* 1/30−1/4 oz has caused nausea, vomiting, headache, and convulsions. Other symptoms include weakness, restlessness, dizziness, a lack of coordination, numbness of face and extremities, abdominal pain, diarrhea, tremors, and death. Symptoms may be delayed from 30 min to 3 h. Estimated lethal dose is between 1 teaspoon and 1 oz. Can cause a prickling or tingling sensation in the mouth, tongue, lower face, nausea, vomiting, confusion, a sense of apprehension, weakness, loss of muscle control, tremors, paresthesia tongue, lips, face, dizziness, confusion, malaise (vague feeling of discomfort), headache, fatigue, convulsions, paresis hands. High exposures can cause convulsions and death.

Long Term Exposure: DDT may cause liver and kidney damage. Prolonged or repeated exposure can cause irritation of the eyes, skin, and throat. Occupational exposure to DDT has been associated with changes in genetic material. DDT levels build up and stay in the body for long periods of time. Exposure to DDT and aldrin may increase retention of DDT in the body. DDT causes cancer in laboratory animals. Whether it causes cancer in humans is unknown.

Points of Attack: Eyes, skin, central nervous system, kidneys, liver, peripheral nervous system. Cancer site in animals: liver, lung, and lymphatic system.

Medical Surveillance: Serum DDT level. Urine *dichlorodiphenyl acetic acid* level. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: (No longer manufactured). Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Any barrier will prevent contamination from the dry chemical. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DDT you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong bases, and heat. Should not be stored in iron containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: For organochlorine pesticides, solid, toxic, n.o.s. This chemical requires a shipping label of “POISONOUS/TOXIC MATERIALS.” DDT falls in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not dry sweep. Use vacuum (use special HEPA vacuum, NOT a standard shop-vacuum) or a wet method to reduce dust during cleanup. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including toxic chlorides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration has been successfully used on a large scale for several years; huge incinerator equipments with scrubbers to catch HCl, a combustion product, are in use at several facilities, such as Hooker Chemical, Dow Chemical, and other producers of chlorinated hydrocarbon products. One incinerator operates at 900−1400°C with air and steam added which precludes formation of Cl_2. A few companies also constructed incinerator−scrubber combinations of smaller size, e.g., a system built by Garver-Davis, Inc., of Cleveland, Ohio, for the Canadian government, can handle 200−500 lb DDT per day as a kerosene solution. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Decaborane D:0150

Molecular Formula: $B_{10}H_{14}$

Synonyms: Boron hydride; Decaborane; Decaborano (Spanish); Decarboron tetradecahydride

CAS Registry Number: 17702-41-9; *(alt.)* 1304-02-5

RTECS® Number: HD1400000

UN/NA & ERG Number: UN1868/134

EC Number: 241-711-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Decaborane is a colorless solid with a bitter odor. The odor threshold is 0.06 ppm. Molecular weight = 122.24; Specific gravity (H_2O:1) = 0.94; Boiling point = 212.7°C; Freezing/Melting point = 99.4°C; Flash point = 80°C (cc); Vapor pressure = 0.2 mmHg at 25°C; Autoignition temperature = 149°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Very slightly soluble in cold water; slowly hydrolyzes. Reacts with hot water.

Potential Exposure: Decaborane is used as a catalyst in olefin polymerization, in rocket propellants, in gasoline additives, and as a vulcanizing agent for rubber.

Incompatibilities: May ignite SPONTANEOUSLY on exposure to air. Decomposes slowly in hot water. Incompatible with oxidizers, oxygenated solvents, dimethyl sulfoxide (reaction may be violent). Carbon tetrachloride, ethers, halocarbons, halogenated compounds form shock-sensitive mixtures. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 0.05 ppm/0.3 mg/m^3 TWA [skin].

NIOSH REL: 0.05 ppm/0.3 mg/m^3 TWA; 0.15 ppm/0.9 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.05 ppm/0.25 mg/m^3 TWA; 0.15 ppm/0.75 mg/m^3 [skin] STEL.

NIOSH IDLH: 15 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.3 mg/m^3

PAC-1: 0.75 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 15 mg/m^3

DFG MAK: 0.05 ppm/0.25 mg/m^3, Peal Limitation Category II(2) [skin].

Australia: TWA 005 ppm (0.3 mg/m^3); STEL 0.15 ppm, [skin], 1993; Austria: MAK 0.05 ppm (0.3 mg/m^3), [skin], 1999; Belgium: TWA 0.05 ppm (0.25 mg/m^3); STEL 0.15 ppm, [skin], 1993; Denmark: TWA 0.05 ppm (0.3 mg/m^3), [skin], 1999; Finland: TWA 0.05 ppm (0.25 mg/m^3); STEL 0.15 ppm, [skin], 1999; France: VME 0.05 ppm (0.3 mg/m^3), [skin], 1999; Hungary: TWA 0.3 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.3 mg/m^3, 2003; Norway: TWA 0.05 ppm

(0.3 mg/m^3), 1999; the Philippines: TWA 0.05 ppm (0.3 mg/m^3), [skin], 1993; Switzerland: MAK-W 0.05 ppm (0.25 mg/m^3), KZG-W 0.1 ppm, [skin], 1999; Turkey: TWA 0.05 ppm (0.3 mg/m^3), [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.15 ppm/ 0.75 mg/m^3 [skin]. Several states have set guidelines or standards for decaborane in ambient air[60] ranging from 3-9 μg/m^3 (North Dakota) to 5 μg/m^3 (Virginia) to 6 μ/m^3 (Connecticut) and 7 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Vapor exposure may cause clouding of the eyes with loss of vision. Contact can cause severe eye burns and may also irritate the skin. Signs and symptoms of acute exposure to decaborane may include tightness in the chest, dyspnea (shortness of breath), cough, and wheezing. Nausea and pulmonary edema may also occur. Neurological effects of acute exposure include dizziness, headache, weakness, a lack of coordination, muscle spasms, tremor, and seizures. Exposure to decaborane may irritate or burn the skin, eyes, and mucous membranes. Exposure can cause restlessness, headaches, dizziness, and nausea. High concentrations can cause muscle twitching, convulsions, unconsciousness, and death. High or repeated exposures may damage the liver and kidneys. Decaborane can be absorbed through the skin, thereby increasing exposure.

Long Term Exposure: May cause damage to the central nervous system, liver, and kidneys.

Points of Attack: Central nervous system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following is recommended: examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Any barrier will prevent contamination from the dry chemical. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/ clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 3 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 7.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 15 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* PD: PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with decaborane you should be trained on its proper handling and storage. Decaborane must be stored to avoid contact with oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, or halogenated compounds, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and water. Heat can cause an explosion. Contact with water can slowly produce flammable hydrogen gas. Detached storage is preferable. Sources of ignition, such as smoking and open flames, are prohibited where decaborane is handled, used, or stored.

Shipping: Decaborane must be labeled: "FLAMMABLE SOLID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. For small quantities, sweep into paper or other suitable material, place in appropriate container, and burn in safe place (such as fume hood). Large quantities may be reclaimed. If reclamation is not practical, dissolve in flammable solvent (such as alcohol) and atomize in suitable combustion chamber.

Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: cover with water, sand or earth; shovel into metal container and keep material under water. *Large spills*: dike for later disposal and cover with wet sand or water. Clean up only under supervision of an expert. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. The solid can self-ignite in oxygen, and mixtures with oxidizing materials can be explosive. Use dry chemical or CO_2 extinguishers. Avoid halogenated extinguishing agents, as they can react violently. Poisonous gases are produced in fire, including hydrogen and boron oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full facepieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DBDPO is a white to off-white powder. Molecular weight = 959.9. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: It is used as a fire retardant for thermoplastics and man-made fibers.

Incompatibilities: Contact with strong oxidizers may cause a fire and explosion hazard. Ethers have a tendency to form unstable and explosive peroxides.

Permissible Exposure Limits in Air

AIHA WEEL of 5 mg/m^3 TWA.

No TEEL available.

Routes of Entry: Inhalation, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. DBDPO irritates the eyes, skin, and respiratory tract.

Long Term Exposure: This chemical can accumulate in the body and may cause liver damage. Thyroid enlargement (goiter) may occur. There is limited evidence that this chemical causes cancer in animals; it may cause liver cancer NTP: some closely related polybrominated biphenyl compounds have been shown to damage the developing fetus.

Points of Attack: Liver, thyroid.

Medical Surveillance: Liver and thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with DPDPO you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer this chemical from drums or other storage containers to process containers. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. Label required: "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Do not dry sweep. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA, FIFRA 1998 Status of Pesticides: Canceled (mixture).

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

For Demeton and Demeton-S:

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

uropean/International Regulations (*O-; 298-03-3* & *mixture 8065-48-3*): Hazard Symbol: T+, N; Risk phrases: R27/28; R50; Safety phrases: S1/2; 28; S36/37; S45; S60; S61; (*S; 126-75-0*): Hazard Symbol: T+, N; Risk phrases: R27/28; Safety phrases: S1/2; S28; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Demeton is a light brown liquid with an odor of sulfur compounds; Freezing/Melting point ≤ -13°C. Molecular weight = 516.92; Boiling point = 134°C at 2 mmHg at 20°C; Flash point = 45°C; Explosive limits: LEL = 1%; UEL = 5.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description (mixture): Agricultural Chemical; Mutagen; Reproductive Effector; Human Data; Drug. Those involved in the manufacture, formulation, and application of this systemic insecticide and acaricide.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers, strong bases, soluble mercury, other pesticides, and water.

Permissible Exposure Limits in Air

8065-48-3

OSHA PEL: 0.1 mg/m^3 TWA [skin].

NIOSH REL: 0.1 mg/m^3 TWA [skin].

8065-48-3

ACGIH TLV®[1]: 0.01 mg/m^3 TWA, inhalable fraction and vapor [skin]; BEI$_A$: Acetylcholinesterase-inhibiting pesticides; methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.

919-86-8

ACGIH TLV®[1]: 0.01 mg/m^3 TWA, inhalable fraction and vapor [skin] sensitizer; BEI$_A$: Acetylcholinesterase-inhibiting pesticides; methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.

NIOSH IDLH: 10 mg/m^3.

Protective Action Criteria (PAC) *mixture*

TEEL-0: 0.1 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 10 mg/m^3

Protective Action Criteria (PAC) *demeton-S*

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 200 mg/m^3

DFG MAK: [skin]; BAT information, as acetylcholine esterase inhibitors.

Australia: TWA 0.01 ppm (0.1 mg/m^3), [skin], 1993; Austria: MAK 0.01 ppm (0.1 mg/m^3), [skin], 1999; Belgium: TWA 0.01 ppm (0.11 mg/m^3), [skin], 1993; Finland: STEL 0.1 ppm (0.3 mg/m^3), [skin], 1999; France: VME 0.01 ppm (0.1 mg/m^3), [skin], 1999; India: TWA 0.01 ppm (0.1 mg/m^3), [skin], 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; the Philippines: TWA 0.1 mg/m^3, [skin], 1993; Russia: STEL 0.02 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.01 ppm (0.1 mg/m^3), [skin], 1999; Thailand: TWA 0.1 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 mg/m^3 [skin]. States which have set guidelines or standards for Demeton in ambient air[60] include North Dakota at 1.0 μg/m^3 and Connecticut and Nevada at 2.0 μ/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #5514.

Permissible Concentration in Water: A MAC of 0.01 mg/L in water bodies used for domestic purposes has been set in the former USSR.[35,43]

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Demeton can be absorbed through the skin, thereby increasing exposure. Demeton may cause effects on the nervous system by cholinesterase-inhibiting effect, causing convulsions, respiratory failure, and possible death. High exposure (above OEL) may result in unconsciousness and death. Acute exposure to Demeton may produce the following symptoms of exposure: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is a cholinesterase inhibitor. It is readily absorbed through the skin and is extremely toxic. Probable human lethal oral dose is 5−50 mg/kg or 7 drops to 1 teaspoonful for a 150-lb. person. Acute dose is believed to be 12−20 mg by oral route. The effects may be delayed. Medical observation is indicated.

Long Term Exposure: May cause mutations. May damage the developing fetus. May damage the nervous system causing sensation of "pins and needles" in the hands and feet. May cause depression, irritability, and personality changes. Cumulative effect is possible. Demeton may affect cholinesterase, causing significant depression of blood cholinesterase.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m^3*: Sa (APF = 10) (any supplied-air respirator). *2.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with demeton you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases, water, soluble mercury, and other pesticides. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, flammable, flash point not $<23°C$ require a "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID" label. It falls in Packing Group II and Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur oxides and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The thiono- and thiolo-isomers of this mixture are 50% hydrolyzed in 0.75 and 0.85 min, respectively at 20°C and pH 13. At pH 9 and 70°C, the half life of Demeton is 1.25 h, but at pH $1-5$ it is over 11 h. Sand and rushed limestone may be added together with a flammable solvent; the resultant mixture may be burned in a furnace with afterburner and alkaline scrubber.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Restricted in many countries) (UN).[35]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Demeton-methyl is a colorless to pale yellow oily liquid with an unpleasant odor. It is a mixture of Demeton-S and Demeton-O and may be formulated in a flammable organic solvent that may alter the physical properties shown here. Molecular weight = 230.30. Specific gravity (H_2O:1) = 1.2; Boiling point = decomposes below 100°C.

Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.03−0.3% at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector. An organophosphate insecticide. Those engaged in the manufacture, formulation, and application of the insecticide and acaricide on agricultural and horticultural crops.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA [skin] inhalable fraction and vapors (2006); BEI: methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.

Not TEEL available.

DFG MAK: 0.5 ppm/4.8 mg/m^3 TWA; Peak Limitation Category II(2) [skin].

Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: MAK 0.05 ppm (0.5 mg/m^3), [skin], 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; France: VME 0.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, [skin], 2003; Russia: STEL 0.1 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.05 ppm (0.5 mg/m^3), [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg/m^3 [skin].

Determination in Air: None listed. Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: No criteria set. Octanol−water coefficient: Log K_{ow} = 1.32.

Routes of Entry: Inhalation, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Methyl demeton can be fatal by skin contact even if there is no feeling of irritation. Exposure can cause rapid, fatal organophosphate poisoning. Acute exposure to this chemical may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness, vomiting, diarrhea, abdominal pain, loss of coordination, seizures, coma, and death. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Eye contact may cause irritation.

Long Term Exposure: May cause mutations. In animal studies this chemical causes a decrease in fertility and is toxic to the animal fetus. See also “Demeton” entry.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning. Contact local poison control center for additional guidance.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: None listed by NIOSH for Methyl demeton. *Herewith, for reference only, is the requirement for (8065-48-3) Demeton: 1 mg/m^3*: Sa (APF = 10) (any supplied-air respirator). *2.5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *5 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m*^{3}: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. See "Demeton" for guidance.

Shipping: This may depend on the carrier solvent and its flammability. For organophosphorus pesticides, liquid, toxic, the required label is "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including oxides of phosphorus and sulfur, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis or incineration.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R38; Safety phrases: S2; S26 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Sesone or Crag® pesticide is a colorless, odorless, crystalline solid. It is a noncombustible solid, but commercial products may be formulated using flammable organic solvents, which can change the physical properties shown here. Molecular weight = 309.13; Freezing/Melting point = 245°C (decomposes); Vapor pressure = 0.1 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water; solubility = 26% at 25°C.

Potential Exposure: Compound Description: Primary Irritant. Used as corrosion inhibitor, pharmaceutical intermediate, and emulsifier. Those involved in manufacture, formulation, and application of this herbicide as well as citizens in the area of application.

Incompatibilities: Strong oxidizers, acids.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3 TWA, total dust; 5 mg/m^3 TWA, respirable fraction.

ACGIH TLV®[1]: 10 mg/m^3 TWA; Not Suspected as a Human carcinogen, as Sesone.

NIOSH IDLH: 500 mg/m^3.

No TEEL available.

The Netherlands: MAC-TGG 7.4 mg/m^3, 2003; Russia: STEL 5 mg/m^3 [skin] 1993; United Kingdom: TWA 2 ppm (7.4 mg/m^3); STEL 6 ppm (22 mg/m^3), 2000. Several states have set guidelines or standards for sesone in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #S-356 (II-5).

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. High levels of exposure may cause central nervous system effects, convulsions. May affect the kidneys and liver.

Long Term Exposure: May cause liver and kidney damage.

Points of Attack: Eyes, skin, central nervous system, liver, kidneys.

Medical Surveillance: Liver function. Kidney function. Tests of nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator (N, R, or P filters). *100 mg/m^3*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100, or Sa (APF = 10) (any supplied-air respirator). *250 mg/m^3*: PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or Sa:Cf (APF = 25) (any powered, air-purifying respirator with a dust and mist filter). *500 mg/m^3*: 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter)* or SaF (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode)*; PaprTHie (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaT: Cf (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.) *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and acids. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Phenoxy pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until clean up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after clean up is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Sesone is hydrolyzed by alkali to $NaHSO_4$ and apparently dichlorophenoxyethanol. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Diacetone alcohol D:0200

Molecular Formula: $C_6H_{12}O_2$

Common Formula: $(CH_3)_2C(OH)CH_2COCH_3$

Synonyms: Acetonyldimethylcarbinol; Diacetonalkohol (German); Diacetone-alcool (French); Diacetone, 4-hydroxy-4-methyl-2-pentatone, 2-methyl-2-pentanol-4-one; Diketone alcohol; Dimethylacetonylcarbinol; 4-Hydroxy-2-keto-4-methylpentane; 4-Hydroxyl-2-keto-4-methylpentane; 4-Hydroxy-4-methyl-pentan-2-on (German); 4-Hydroxy-4-methyl-2-pentanone; 4-Hydroxy-4-methylpentan-2-one; 4-Methyl-4-hydroxy-2-pentanone; 2-Methyl-2-pentanol-4-one; 2-Pentanone, 4-hydroxy-4-methyl-; tyranton

CAS Registry Number: 123-42-2

RTECS® Number: SA9100000

UN/NA & ERG Number: UN1148/129

EC Number: 204-626-7 [*Annex I Index No.:* 603-016-00-1]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R36; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diacetone alcohol is a colorless liquid with a mild, minty odor. Odor threshold = 0.28 ppm. Molecular weight = 116.16; Specific gravity (H_2O:1) = 0.94; Boiling point = 168°C; Freezing/Melting point = −43.8°C; Vapor pressure = 1 mmHg at 20°C; Flash point = 64°C; 58°C (acetone free); 64°C (commercial grade). Explosive limits: LEL = 1.8%; UEL = 6.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. It is used as a solvent for pigments, cellulose esters, oils, and fats. It is used in hydraulic brake fluids and in antifreeze formulations.

Incompatibilities: Strong oxidizers, strong alkalis.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.75 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/240 mg/m^3 TWA.

NIOSH REL: 50 ppm/240 mg/m^3 TWA.

ACGIH TLV®[1]: 50 ppm/238 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 50 ppm

PAC-2: 50 ppm

PAC-3: 1800 ppm

DFG MAK: 20 ppm/96 mg/m^3 TWA; Peak Limitation Category I(2) [skin] Pregnancy Risk Group D.

NIOSH IDLH: 1800 ppm [LEL].

Australia: TWA 50 ppm (240 mg/m^3), 1993; Austria: MAK 50 ppm (240 mg/m^3), 1999; Belgium: TWA 50 ppm (238 mg/m^3), 1993; Finland: TWA 50 ppm (240 mg/m^3); STEL 75 ppm (360 mg/m^3), 1999; France: VME 50 ppm (240 mg/m^3), 1999; the Netherlands: MAC-TGG 120 mg/m^3, 2003; Norway: TWA 25 ppm (120 mg/m^3), 1999; Russia: STEL 100 mg/m^3, 1993; Sweden: NGV 25 ppm (120 mg/m^3), KTV 20 ppm (240 mg/m^3), 1999; Switzerland: MAK-W 50 ppm (240 mg/m^3), 1999; Turkey: TWA 50 ppm (240 mg/m^3), 1993; United Kingdom: TWA 50 ppm (241 mg/m^3); STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for diacetone alcohol in ambient air[60] ranging from 0.03 mg/m^3 (Nevada) to 2.4−3.6 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 4.8 mg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method #1402, Method #1405, or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye contact can cause corneal tissue damage. Contact can irritate the skin, causing a burning sensation. It can cause you to become dizzy, lightheaded, and to pass out.

Long Term Exposure: Repeated contact may lead to skin rash. Exposure may damage the liver, kidneys, and the blood cells. Although there is no evidence involving this chemical, many similar solvents can cause nerve and brain damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Complete blood count. NIOSH lists: expired air; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Noeprene rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *1800 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diacetone alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) or strong alkalis (such as sodium hydroxide or potassium hydroxide) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where diacetone alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of diacetone alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Shipping: Diacetone alcohol must be labeled: "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Malaysia, Germany).[13]

Very Toxic Substance (World Bank).[15]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant, as Dialifos.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T + , N; Risk phrases R24; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Dialifor is a crystalline solid. The commercial product may also be available as a colorless oil. Molecular weight = 393.86; Freezing/Melting point (solid) = 68°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide.

Incompatibilities: Strong bases. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 5 mg/m^3

Determination in Air: No method available.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 4.7.

Routes of Entry: Inhalation, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This material is highly toxic (the LD$_{50}$ for rats is 5 mg/kg). This material can cause serious symptoms, and in extreme cases, death by respiratory arrest. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous

system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dialifor you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." Dialifor falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including phosphorus, sulfur, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis or incineration. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Diallate D:0220

Molecular Formula: $C_{10}H_{17}Cl_2NOS$

Common Formula: $[(CH_3)_2CH]_2NCOSCH_2CCl{=}CHCl$

Synonyms: Avadex; Bis(1-methylethyl)carbamothioic acid, *S*-(2,3-dichloro-2-propenyl) ester; Carbamothioic acid, bis (1-methylethyl) *S*-(2,3-dichloro-2-propenyl) ester; CP 15,336; DATC; 2,3-DCDT; Diallat (German); Di-allate; Diallate carbamate herbicide; *S*-(2,3-Dichloroallyl) diisopropylthiocarbamate; *S*-2,3-Dichloroallyl di-isopropyl(thiocarbamate); *S*-2,3-Dichloroallyl diisopropylthiocarbamate; *S*-2,3-Dichloroallyldiisopropyl thiocarbamate; Dichloroallyldiisopropyl thiocarbamate; 2,3-Dichloroallyl *N,N*-Diisopropylthiolcarbamate; 2,3-Dichloro-2-propene-1-thiol, isopropylcarbamate; *S*-(2,3-Dichloro-2-propenyl)bis(1-methylethyl) carbamothioate; Diisopropylthiocarbamic acid, -(2,3-dichloroallyl) ester; Di-isopropylthiolocarbamate des-(2,3-dichloro allyle) (French); 2-Propene-1-thiol, 2,3-dichloro-, diisopropylcarbamate

CAS Registry Number: 2303-16-4

RTECS® Number: EX8225000

UN/NA & ERG Number: UN2992 (Carbamate pesticides, liquid, toxic)/151

EC Number: 218-961-1 [*Annex I Index No.:* 006-019-00-0]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animals Sufficient Evidence; Human No Adequate Data, Group 3, 1998.

US EPA Hazardous Waste Number (RCRA No.): U062.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R40; R50/53; Safety phrases: S2; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diallate is a brown liquid. Molecular weight = 270.21; Boiling point = 150°C at 9 mmHg; Freezing/Melting point = 25−30°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 14 mg/L at 25°C.

Potential Exposure: Those involved in the manufacture, formulation, and application of this thiolcarbamate re-emergence herbicide.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: Russia[43] set a MAC of 0.03 mg/L in water used for domestic purposes.[35,43]

Routes of Entry: Inhalation, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can irritate and possibly cause burns. Inhalation caused irritation of the respiratory tract with chest tightness and/or difficulty breathing. Higher levels can affect the nervous system. Nausea, vomiting, diarrhea, abdominal pain, reduced muscle coordination, blurred vision, muscle twitching, convulsions, coma, and possible death.

Long Term Exposure: High or repeated exposures can cause liver and kidney damage. There is limited evidence that diallate causes liver cancer in animals.

Points of Attack: Skin, eyes, nervous system.

Medical Surveillance: Lung function tests. Kidney and liver function tests. Examination of the nervous system. Interview exposed person for brain effects, including memory, mood, concentration, headaches, malaise, and altered sleep patterns.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diallate you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalies. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pesticides, solid, toxic, n.o.s. must bear a "POISONOUS/TOXIC MATERIALS" label. They fall in DOT Hazard Class 6.1 and diallate falls in Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including sulfur oxides, nitrogen oxides, and chlorides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land burial is acceptable for small quantities. Larger quantities can be incinerated.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

615-05-4

Carcinogenicity: IARC: Human No Evidence, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1998.

39156-41-7 (sulfate)

Carcinogenicity: NTP: Reasonably anticipated to be a human carcinogen.

Banned or Severely Restricted (Sweden).[35]

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 10/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol (*includes sulfate*): T, N; Risk phrases: R45; R22; R68; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class) (*615-05-4*): 3—Highly water polluting.

Description: 2,4-Diaminoanisole is a needle-like solid. Molecular weight = 138.19; Freezing/Melting point 67−68°C. The sulfate is an off-white to violet powder. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0 (includes sulfate). Soluble in water.

Potential Exposure: The principal use of 2,4-diamino-anisole (and its salts such as the sulfate) as a component of oxidation (permanent) hair and fur dye formulations. Human exposure to 2,4-diaminoanisole sulfate may possibly occur through skin absorption at chemical and dye production facilities, as well as through dermal contact in persons using hair dyes containing the chemical.

Incompatibilities: Sulfates react violently with aluminum and magnesium.

Permissible Exposure Limits in Air

NIOSH (*2,4-Diaminoanisole and its salts*): Potential human carcinogen; Reduce exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A.

No standards or TEEL available.

DFG MAK: [skin] Carcinogen Category 2.

This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Contact may cause irritation and possible eye damage. High exposures to the sulfate can cause poisoning with trembling, diarrhea, trouble breathing, and even death.

Long Term Exposure: The sulfate can cause both skin and lung allergies to develop. There is sufficient evidence for the carcinogenicity of 2,4-diaminoanisole sulfate in experimental animals. In rats, dietary administration of the technical grade 2,4-diaminoanisole sulfate increased the incidence of cancers of the skin and the associated glands and of thyroid cancers in each sex. In mice, dietary administration of 2,4-diaminoanisole sulfate induced thyroid tumors in each sex. Female rats exposed to technical-grade 2,4-diaminoanisole sulfate in the feed developed tumors of the thyroid, mammary, clitoral, and pituitary glands.

Points of Attack: Skin, eyes, lungs.

Medical Surveillance: Evaluation by a qualified allergist. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Gloves are usually worn by hairdressers when applying hair dyes. Beyond that, NIOSH recommends minimization of exposure. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DAA sulfate you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from aluminum and magnesium.

Shipping: Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s. or Toxic solids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Carcinogenicity: IARC: Human No Adequate Data, animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1998; NTP (*101-77-9 & 13552-44-8*): 11th Report on Carcinogens, 2002: Reasonably anticipated to be a human carcinogen; OSHA: Potential human carcinogen; NIOSH: Potential occupational carcinogen.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1050).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations (*101-77-9*): Hazard Symbol: T, N; Risk phrases: R45-R39/23/24/25; R43; R48/20/21/22; R68; R51/53; Safety phrases: S53; S45; S61.

European/International Regulations: not listed in Annex I (*dichloride salt*).

WGK (German Aquatic Hazard Class) (*101-77-9*): 3—Highly water polluting.

Description: 4,4′-Diaminodiphenylmethane is a pale yellow crystalline solid (turns light brown on contact with air) with a faint amine-like odor. Molecular weight = 198.29; Boiling point = 398°C; Freezing/Melting point = 92°C; Vapor pressure = 2×10^{-7} mmHg at 25°C; Flash point = 221°C (cc). Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Used as an intermediate and as a curing agent. Approximately 99% of the DDM produced is consumed in its crude form (occasionally containing not more than 50% DDM and ply-DDM) at its production site by reaction with phosgene in the preparation of isocyanates and polyisocyanates. These isocyanates and polyisocyanates are employed in the manufacture of rigid polyurethane foams which find application as thermal insulation. Polyisocyanates are also used in the preparation of the semiflexible polyurethane foams used for automotive safety cushioning. DDM is also used as an epoxy hardening agent, a raw material in the production of polyurethane elastomers, in the rubber industry as a curative for Neoprene™ and as an antifrosting agent (antioxidant) in footwear, a raw material in the production of Quana® nylon, and as a raw material in the preparation of poly(amide-imide) resins (used in magnet wire enamels).

Incompatibilities: A weak base. Strong oxidizers may cause a fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: 0.010 ppm TWA; 0.100 ppm STEL. Potential human carcinogen. See 29CFR1910.1050.

NIOSH REL: Limit exposure to lowest feasible concentration. NIOSH considers this chemical to be a potential occupational carcinogen as defined by the OSHA carcinogen policy [29 CFR 1990]. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.1 ppm/0.81 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.01 ppm

PAC-1: 0.1 ppm

PAC-2: 0.6 ppm

PAC-3: 5 ppm

DFG MAK: [skin]; danger of skin sensitization; Carcinogen Category 2; BLW information available.

Australia: TWA 0.1 ppm (0.8 mg/m^3), [skin], 1993; Austria: carcinogen, 1999; Belgium: TWA 0.1 ppm (0.81 mg/m^3), [skin], carcinogen, 1993; Denmark: TWA 0.1 ppm (0.8 mg/m^3), 1999; Japan: 0.4 mg/m^3, [skin], 2B carcinogen, 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Norway: TWA 0.1 ppm (0.8 mg/m^3), 1999; United Kingdom: LTEL 0.1 ppm (0.8 mg/m^3); STEL 0.5 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for MDA in ambient air[60] ranging from zero (North Dakota) to 0.4 μg/m^3 (Kansas) to 0.8 μ/m^3 (Virginia) to 2.67 μg/m^3 (New York) to 4.0 μg/m^3 (South Carolina) to 8.0 μg/m^3 (Connecticut) to 19.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #ID-57; or, special filter; potassium hydroxide/methanol; high-pressure liquid chromatography/ultraviolet/electrochemical detection; NIOSH Analytical Method (IV) #5029.

Determination in Water: No criteria set. Octanol−water coefficient: Log K_{ow} = 1.6.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. A single large exposure or repeated smaller exposures can cause serious liver disease (toxic hepatitis) with symptoms of fever, upper abdominal pain, jaundice, dark urine, fatigue, and loss of appetite.

Long Term Exposure: 4,4′-Methylene dianiline can cause liver damage and may damage the kidneys. Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Causes thyroid and bladder cancer in animals; a possible carcinogen in humans.

Points of Attack: Liver, kidneys, skin. In animals: bladder cancer.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* Any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode; or, any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive pressure breathing apparatus. *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical is an animal carcinogen and Suspected Human Carcinogen. It requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including aniline and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Diatomaceous earth D:0260

Molecular Formula: O_2Si

Common Formula: SiO_2

Synonyms: Amorphous silica; Diatomaceous silica; Diatomite, uncalcined; Precipitated amorphous silica; Silica, amorphous diatomaceous earth; Silicon dioxide (amorphous)

CAS Registry Number: 61790-53-2; 7631-86-9 (silica, amorphous, hydrated); *(alt.)* 12750-99-1; *(alt.)* 29847-98-1; *(alt.)* 37337-67-0; *(alt.)* 54511-18-1; *(alt.)* 56748-40-4;*(alt.)* 67016-73-3

RTECS® Number: HL8600000; VV7311000 (natural)

UN/NA & ERG Number: No citation

EC Number: 231-545-4 (silicon dioxide)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997; NIOSH (*Silica, amorphous silica, fused*): Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Diatomaceous earth is a transparent to gray, odorless amorphous powder. Molecular weight = 60.78; Specific gravity (H_2O:1) = 2.20; Boiling point = 2230°C; Freezing/Melting point = 1710°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen. Diatomaceous earth is used as a filtering agent and as a filler in construction materials, pesticides, paints, and varnishes. The calcined version (which has been heat-treated) is the most dangerous and contains crystallized silica and should be handled as silica. See also other entries on silica.

Incompatibilities: High temperatures causes the formation of crystalline silica. Incompatible with fluorine, oxygen difluoride, chlorine difluoride.

Permissible Exposure Limits in Air

Diatomaceous earth, uncalcined and Silica, amorphous precipitated and gel

OSHA PEL: *either one of the methods:* 20 mppcf [millions of particles per cubic foot of air, based on impinger samples counted by light-field techniques] *or* 80 mg/m^3 divided by the value "%SiO_2," TWA.

NIOSH REL: 6 mg/m^3 TWA.

ACGIH TLV®[1]: Withdrawn for the following: *silica amorphous, precipitated and gel; silica fume; silica fused; diatomaceous earth, calcined.*

NIOSH IDLH: 3000 mg/m^3.

Protective Action Criteria (PAC)

Diatomaceous earth; (silica-amorphous diatomaceous)

TEEL-0: 6 mg/m^3

PAC-1: 18 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK (*diatomaceous earth, uncalcined)*: 4 mg/m^3, inhalable fraction; Pregnancy Risk Group C.

Austria: MAK 4 mg/m^3, 1999; Norway: TWA 1.5 mg/m^3 (respirable dust), 1999; Switzerland: MAK-W 4 mg/m^3, 1999; Thailand: TWA 80 mg/m^3, 1993; United Kingdom: TWA 6 mg/m^3,, total dust, 2000; TWA 1.2 mg/m^3, (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 3 mg/m^3 (respirable fraction, for particulate matter containing no asbestos and <1% crystalline silica). Russia[43] set a MAC of 2 mg/m^3 in work-place air.

Determination in Air: Filter; Low-temperature ashing; X-ray diffraction spectrometry; NIOSH Analytical Method (IV) #7501.[58]

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Unknown at this time.

Long Term Exposure: Exposure can cause permanent scarring of the lungs, especially if diatomaceous earth has been calcined (heat-treated). Symptoms include shortness of breath and cough. This can begin anywhere from months to years after exposure. The name of this disease is silicosis. With heavy exposure, individuals may become respiratory cripples. This can be fatal.

Points of Attack: Lungs.

Medical Surveillance: Before first exposure to calcined diatomaceous earth and at regular times after, the following are recommended: Medical examination of the lungs. Lung function tests. Chest X-ray (every 2−5 years).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *30 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *60 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *150 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *300 mg/m^3:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *3000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or

SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This material is not singled out by DOT[19] in its Performance-Oriented Packaging Standards.

Spill Handling: Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Diazepam D:0270

Molecular Formula: $C_{16}H_{13}ClN_2O$

Synonyms: Alboral; Aliseum; Amiprol; Ansiolin; Ansiolisina; Apaurin; Apozepam; Assival; Atensine; Atilen; 2H-1,4-Benzodiazepin-2-one,7-chloro-1,3-dihydro-1-methyl-5-phenyl-bialzepam; Calmocitene; Calmpose; Cercine; Ceregulart; 7-Chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one; 7-Chloro-1-methyl-5-3H-1,4-benzodiazepin-2(1H)-one; 7-Chloro-1-methyl-2-oxo-5-phenyl-3H-1,4-benzodiazepine; 7-Chloro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one; 7-Chloro-1-methyl-5-phenyl-3H-1,4-benzodiazepin-2(1H)-one; 7-Chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one; Condition; DAP; Diacepan; Diapam; Diazemuls; Diazepam; Diazetard; Dienpax; Dipam; Dipezona; Domalium; Duksen; Duxen; E-Pam; Eridan; Faustan; Freudal; Frustan; Gihitan; Horizon; Kabivitrum; Kiatrium; LA-III; Lembrol; Levium; Liberetas; Methyl diazepinone; 1-Methyl-5-phenyl-7-chloro-1,3-dihydro-2H-1,4-benzodiazepin-2-one; Morosan; Noan; NSC-77518; Pacitran; Paranten; Paxate; Paxel; Plidan; Quetinil; Quiatril; Quievita; Relaminal; Relanium; Relax; Renborin; RO 5-2807; S.A.R.L.; Saromet; Sedipam; Seduksen; Seduxen; Serenack; Serenamin; Serenzin; Setonil; Sibazon; Sonacon; Stesolid; Stesolin; Tensopam; Tranimul; Tranqdyn; Tranquirit; Umbrium; Unisedil; Usempax AP; Valeo; Valitran; Valium; Valium R; Vatran; Velium; Vival; Vivol; WY-3467; Zipan

CAS Registry Number: 439-14-5

RTECS® Number: DF1575000

UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 207-122-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

California Proposition 65 Developmental/Reproductive toxin 1/1/92.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diazepam is a yellow crystalline powder. Molecular weight = 284.75; Freezing/Melting point = 125−126°C. Insoluble in water.

Potential Exposure: Those involved in the manufacture, packaging, or consumption of this widely used tranquilizing drug.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: When used as a medial drug, diazepam can cause drowsiness and difficulty with coordination, concentration, and balance. It may also cause irritability, anxiety, weakness, headaches, upset stomach, and joint pains. Less common side effects include jaundice, skin rashes, or a drop in the white blood cell count. These effects might also occur from work-place exposure due to breathing in dust during packaging or manufacture. LD_{50} = (oral-rat) 352 mg/kg (moderately toxic).

Long Term Exposure: Diazepam is a probable teratogen and may be a mutagen. Handle with extreme caution. Sudden discontinuing of the exposure following high exposure for at least 3 months may cause shakiness, irritability, and possibly convulsions.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for diazepam level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to diazepam, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diazepam you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. If you are required to work in a sterile environment, you require specific training.

Shipping: As Medicine, solid, toxic, n.o.s., diazepam requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire, including chlorine and oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 206-373-8 [*Annex I Index No.:* 015-040-00-4]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

US EPA Gene-Tox Program, Negative: Carcinogenicity—mouse/rat; Histidine reversion—Ames test; Negative: *In vitro* UDS—human fibroblast; TRP reversion; Negative: *S. cerevisiae*—homozygosis; Inconclusive: *B. subtilis* rec assay; *E. coli* polA without S9.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

Canada, Drinking Water Quality, 0.02 mg/L MAC.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; Safety phrases: S2; S24/25; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Diazinon is a combustible, colorless, oily liquid with a faint amine odor. Technical grade is pale to dark brown. Commercial formulations may use carrier solvents which can change the physical properties listed here. Molecular weight = 304.38; Boiling point = decomposes below BP at 120°C; 83−84°C at 0.002 mmHg; Flash point = 82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.004%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Producers, formulators, and applicators of this nonsystemic pesticide and acaricide. Diazinon is used in the United States on a wide variety of agricultural crops, ornamentals, domestic animals, lawns and gardens, and household pests.

Incompatibilities: Hydrolyzes slowly in water and dilute acid. Reacts with strong acids and alkalis with possible formation of highly toxic tetraethyl thiopyrophosphates. Incompatible with copper-containing compounds. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.01 mg/m^3 TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; TLV-BEI$_A$ issued (2000), Acetylcholinesterase-inhibiting pesticides.

No TEEL available.

DFG MAK: 0.1 mg/m^3 (measured as the inhalable fraction); Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C.

Australia: TWA 0.1 mg/m^3, [skin], 1993; Austria: MAK 0.1 mg/m^3, [skin], 1999; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Finland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; Hungary: STEL 0.1 mg/m^3, [skin], 1993; India: TWA 0.1 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Norway: TWA 0.1 mg/m^3, 1999; Russia: STEL 0.2 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for diazinon in ambient air[60] ranging from 1.0 μ/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides. See also OSHA Analytical Method 62.[58]

Permissible Concentration in Water: Canada set a MAC of 0.02 mg/L. Russia set a MAC of 0.3 mg/L in water bodies for domestic purposes. The US EPA has determined a NOAEL of 0.05 mg/kg/day which gives a long-term health advisory of 0.0175 mg/L and a lifetime health advisory of 0.00063 mg/L. Several states have set guidelines for Diazinon in drinking water[61] ranging from 4 μg/L (Maine) to 14 μg/L (California and Kansas).

Determination in Water: By Methylene chloride extraction followed by gas chromatography. Octanol−water coefficient: Log K_{ow} = 3.12.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Diazinon can affect you when breathed in and quickly enters the body by passing through the skin. May cause skin and eye irritation. Exposure can cause organophosphate poisoning with headache, sweating, nausea and vomiting, diarrhea, muscle twitching, and possible death. It is a moderately toxic organophosphate chemical. LD_{50} = (oral-rat) 66 mg/kg (moderately toxic).

Long Term Exposure: Diazinon may damage the developing fetus. Exposure can cause severe organophosphate poisoning with headache, sweating, nausea and vomiting, diarrhea, loss of coordination, and death. Diazinon may affect the liver.

Points of Attack: Eyes, respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver function tests. Examination of the nervous system. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3} use a NIOSH/MSHA- or European Standard EN149-approved respirator with a pesticide cartridge. The prefilter should be a high-efficiency particulate filter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator.

Where there is potential for high exposures, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from water, and oxidizers, such as peroxides, nitrates, permanganates, chlorates, and perchlorates.

Shipping: Organophosphorus pesticides, liquid, toxic n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and diazinon in Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Collect for reclamation or absorb in vermiculate, dry sand, earth or a similar material. Dispose by absorbing in vermiculite, dry sand, earth or a similar material, and depositing in an approved facility. *Do not use water*, as toxic gases may be produced. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Diazinon decomposes on heating above 120°C producing toxic fumes including phosphorous oxides and sulfur oxides. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Diazinon is hydrolyzed in acid media about 12 times as rapidly as parathion and at about the same rate as parathion in alkaline media. In excess water this compound yields diethylthiophosphoric acid and 2-isopropyl-4-methyl-6-hydroxypyrimidine. With insufficient water, highly toxic tetraethyl monothiopyrophosphate is formed. Therefore, incineration would be a preferable ultimate disposal method with caustic scrubbing of the incinerator effluent.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R 45; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diazomethane is a flammable, yellow gas, or a liquid under pressure. Molecular weight = 42.05; Boiling point = −22.7°C; Freezing/Melting point = −145°C; Autoignition temperature = 100°C (explodes). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Decomposes in water; reaction.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Diazomethane is a powerful methylating agent for acidic compounds, such as carboxylic acids, phenols, and enols. It is used in pesticide manufacture and pharmaceutical manufacture.

Incompatibilities: Heat (at about or above 100°C), shock, friction, concussion, sunlight, or other intense illuminations may cause explosions. Contact with alkali metals, drying agents, such as calcium sulfate, or rough edges (such as ground glass) may cause explosions.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.72 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.2 ppm/0.4 mg/m^3 TWA.

NIOSH REL: 0.2 ppm/0.4 mg/m^3 TWA.

ACGIH TLV®[1]: 0.2 ppm/0.34 mg/m^3 TWA; Suspected Human Carcinogen.

NIOSH IDLH: 2 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.2 ppm

PAC-1: 0.6 ppm

PAC-2: 2 ppm

PAC-3: 2 ppm

DFG MAK: Carcinogen Category 2.

Australia: TWA 0.2 ppm (0.4 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Finland: TWA 0.2 ppm (0.4 mg/m^3), 1999; France: VME 0.2 ppm (0.4 mg/m^3), 1993; Hungary: carcinogen, 1993; India: STEL 0.4 mg/m^3 [skin] 1993; Norway: TWA 0.2 ppm (0.4 mg/m^3), 1999; Russia: TWA 0.2 ppm (0.4 mg/m^3), 1993; Switzerland: MAK-W 0.2 ppm (0.35 mg/m^3), carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Several states have set guidelines or standards for diazomethane in ambient air[60] ranging from 1.3 μg/m^3 (New York) to 2.0 μ/m^3 (South Carolina) to 4.0 μg/m^3 (Florida and North Dakota) to 7.0 μg/m^3 (Virginia) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada).

Determination in Air: See NIOSH Analytical Method (IV) #2515.[18]

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5.5 μg/L, based on health effects.

Routes of Entry: Inhalation, ingestion, skin and eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Cough, shortness of breath, headaches, flushed skin, fever, chest pain, pulmonary edema, pneumonitis, asthma, eye irritation. It is extremely toxic. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause severe lung damage with symptoms of coughing, chest pain, shortness of breath, fever, and fatigue. Exposure to the gas or liquid can cause severe skin burns and eye damage. Contact with the liquid can cause frostbite.

Long Term Exposure: Repeated exposures, even at low levels, may cause an asthma-like lung allergy. This chemical is a possible human carcinogen.

Points of Attack: Respiratory system, lungs, eyes, skin.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal at first if the person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy. Consider chest X-ray after acute overexposure. NIOSH lists the following tests: blood gas analysis, chest X-ray, electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Frostbite: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any possibility of contact. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2 ppm:* Sa (APF = 10) (any supplied-air respirator)* or SCBA (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Diazomethane must be stored to avoid contact with alkali metals, such as lithium, sodium, or potassium, or drying agents, such as calcium sulfate, since violent reactions occur. Safety barriers or shields should be used to protect workers from accidental explosions. Sources of ignition, such as smoking and open flames, are prohibited where diazomethane is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more diazomethane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of diazomethane. Wherever diazomethane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Diazomethane is not specifically covered in DOT's Performance-Oriented Packaging Standards.[19]

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. If in liquid form, allow to vaporize or absorb the spilled chemical by using a sponge and water. Decompose chemically with a 10% ceric ammonium nitrate solution. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable and explosive gas. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical or sand to extinguish fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Decompose chemically with ceric ammonium nitrate under constant agitation and cooling.[24]

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

List of Stockholm Convention POPs: Annex C (Unintentional production and release) as polychlorinated dibenzofurans (PCDFs).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dibenz(a,h)anthracene is a colorless, crystalline solid. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 278.36; Boiling point = 524°C; Freezing/Melting point = 267−270°C. Hazard Identification (based on

NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Dibenz(a,h)anthracene is a chemical substance formed during the incomplete burning of fossil fuel, garbage, or any organic matter and is found in smoke in general; it condenses on dust particles and is distributed into water and soil and on crops. DB(a,h)A is a polycyclic aromatic hydrocarbon (PAH) and is also a component of coal tar pitch, which is used in industry as a binder for electrodes, and creosote is used to preserve wood. PAHs are also found in limited amounts in bituminous materials and asphalt used in industry and for paving.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Dibenz(a,h)anthracene falls in the category of coal tar pitch volatiles.

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 15 mg/m^3

DFG MAK: [skin] Carcinogenic Category 2; Germ Cell Mutation Category 3A.

France: carcinogen, 1993; Norway: TWA 0.04 mg/m^3, 1999; Poland: TWA 0.004 mg/m^3, 1999.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: Under the priority toxic pollutant criteria, the recommended level for the protection of human health is zero. Various levels have been set forth for various lifetime cancer risks.[6] Kansas has set a guideline for BDA in drinking water of 0.029 μg/L.[61]

Determination in Water: Extraction with methylene chloride may be followed by measurement by gas chromatography coupled with mass spectrometry.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Long Term Exposure: DB(a,h)A is a toxic chemical and is a probable carcinogen in humans. It has caused cancer in laboratory animals when it is ingested or applied to their skin. Because DB(a,h)A causes cancer in animals, it is likely that humans exposed in the same manner would develop cancer as well. DB(a,h)A may affect the skin, resulting in photosensitization.

Points of Attack: Respiratory system, skin, bladder, kidneys.

Medical Surveillance: NIOSH lists: complete blood count; chest X-ray; pulmonary function tests: forced vital capacity; forced expiratory volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. See the entry on "Coal Tar Pitch Volatiles." A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The "Acridine" standard may be used for this chemical. The required label is "POISONOUS/TOXIC MATERIALS." It would fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See the entry on: "Coal Tar Pitch Volatiles." Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, CEPA Toxic Substances.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dibenzofuran is a white crystalline powder. Molecular weight = 168.20; Boiling point = 285°C−288°C; Freezing/Melting point = 85−87°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Very slightly soluble in water.

Potential Exposure: This material is used as an insecticide and in organic synthesis to make other chemicals. It is derived from coal tar creosote.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

132-64-9

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Dibenzofuran can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin and respiratory tract. Poisonous if ingested. See also entry on "Coal Tar."

Long Term Exposure: Repeated contact may cause skin growths, rashes, and changes in skin color. Exposure to sunlight may make rash worse.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. Environmentally hazardous solid, n.o.s. requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Dibenzyldichlorosilane D:0320

Molecular Formula: $C_{14}H_{14}Cl_2Si$

Common Formula: $(C_6H_5CH_2)_2SiCl_2$

Synonyms: Dichlorobis(phenylmethyl)silane

CAS Registry Number: 18414-36-3

RTECS® Number: VV2977000

UN/NA & ERG Number: UN2434/156

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, *based on other chlorosilanes listed.*

WGK (German Aquatic Hazard Class): No value assigned.

Description: A colorless, corrosive liquid. Hazard Vapor pressure = <1. Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Reacts with water.

Potential Exposure: This material is used as an intermediate in the production of silicone polymers.

Incompatibilities: Combustible materials. Contact with water, steam, or moisture produces corrosive hydrogen chloride gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Based on six other dichlorosilanes (for reference only)

TEEL-0: 0.3 ppm

PAC-1: 0.9 ppm

PAC-2: 11 ppm

PAC-3: 47 ppm

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: The health effects are not well known at this time. However, closely related chemicals cause irritation of the eyes, nose, throat, and lungs. Dibenzyl dichlorosilane is a corrosive chemical and can cause severe eye and skin burns. This substance can give off corrosive hydrogen chloride gas on contact with water, steam, or moisture. It is possible that higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Although it is not known if this chemical causes lung problems, similar corrosive or highly irritating substances may affect the lungs.

Points of Attack: Skin, lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Dibenzyldichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials and any form of moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Dibenzyldichlorosilane requires a "CORROSIVE" label.[19] It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Fire Extinguishing: Dibenzyldichlorosilane may burn but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 2500 lb (1135 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diborane is a compressed, colorless, flammable gas with a nauseating, sickly-sweet odor. The odor threshold = 2.5 ppm. Molecular weight = 27.67; Specific gravity (air = 1) = 0.96; Boiling point = −92.5°C; Freezing/Melting point = −165.5°C; Vapor pressure = 39.5 atm at 17°C; Relative vapor density (air = 1) = 0.97; Flash point = −90°C (flammable gas); Autoignition temperature = 40−50°C. Explosive limits: LEL = 0.8%; UEL = 88%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 3. Reacts with water forming hydrogen gas and boric acid.

Potential Exposure: Compound Description: Mutagen. Diborane is used as the source of boron in the semiconductor industry, as a catalyst for olefin polymerization, a rubber vulcanizer, a reducing agent, a flame-speed accelerator, a chemical intermediate for other boron hydrides, as a doping agent, in rocket propellants, and in the conversion of olefins to trialkyl boranes and primary alcohols.

Incompatibilities: A strong reducing agent. Unstable above 8°C. The presence of contaminants may lower the autoignition temperature; ignition may take place at, or below, room temperature. Diborane can polymerize forming liquid pentaborane. It ignites spontaneously in moist air; and on contact with water, hydrolyzes exothermically forming hydrogen and boric acid. Contact with halogenated compounds (including fire extinguishers) may cause fire and explosion. Contact with aluminum, lithium, and other active metals forms hydrides which may ignite spontaneously. Incompatible with aluminum, carbon tetrachloride, nitric acid, nitrogen trifluoride, and many other chemicals. Reacts with oxidized surfaces. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.13 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.1 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.1 ppm/0.11 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 ppm

PAC-1: 0.15 ppm

PAC-2: **1.0** ppm

PAC-3: **3.7** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: No numerical value established. Data may be available.

NIOSH IDLH: 15 ppm.

Australia: TWA 0.1 ppm (0.1 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.1 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.11 mg/m^3), 1993; Finland: TWA 0.1 ppm (0.1 mg/m^3); STEL 0.3 ppm (0.3 mg/m^3), 1999; France: VME 0.1 ppm (0.1 mg/m^3), 1999; Japan: 0.01 ppm (0.012 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; the Philippines: TWA 0.1 ppm (0.1 mg/m^3), 1993; Russia: STEL 0.1 mg/m^3, 1993; Switzerland: MAK-W 0.1 ppm (0.1 mg/m^3), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.1 mg/m^3), 1993; United Kingdom: TWA 0.1 ppm (0.12 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm. Several states have set guidelines or standards for diborane in ambient air[60] ranging from 30 μg/m^3 (North Dakota) to 50 μg/m^3 (Virginia) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Method (IV) #6006.

Permissible Concentration in Water: No criteria set. (Diborane reacts on contact with water as noted above.)

Routes of Entry: Inhalation, skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Diborane is the least toxic of the boron hydrides. In acute poisoning, the symptoms are similar to "metal fume fever": tightness, heaviness and burning in chest, coughing, shortness of breath, chills, fever, pericardial pain, nausea, shivering, and drowsiness. Signs appear soon after exposure or after a latent period of up to 24 h and persist for 1−3 days or more. Pneumonia may develop later. Reversible liver and kidney changes were seen in rats exposed to very high gas levels. This has not been noted in humans. Subacute poisoning is characterized by pulmonary irritation symptoms, and if this is prolonged, central nervous system symptoms, such as headaches, dizziness, vertigo, chills, fatigue, muscular weakness, and only infrequent transient tremors, appear. Convulsions do not occur. NIOSH lists symptoms as chest tightness, precordial pain, shortness of breath, nonproductive cough; nausea, headache, lightheadedness, vertigo (an illusion of movement), chills, fever, fatigue, weakness, tremor, muscle fasciculation. In animals: liver, kidney damage, pulmonary edema, hemorrhage.

Long Term Exposure: Prolonged exposure may cause lung damage. Chronic exposure leads to wheezing, dyspnea, tightness, dry cough, rales, and hyperventilation which persist for several years.

Points of Attack: Respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure has occurred, the following may be useful: liver and kidney function tests. Examination of the nervous system. NIOSH lists the following tests: chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 1 ppm*: Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 ppm:* SCBAF (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SaF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaT: Cf (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 15 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diborane must be stored to avoid contact with air, active metals, such as aluminum and lithium;

halogenated compounds, such as chlorine; and oxidizing agents, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, since violent reactions occur. Containers should be dry, clean, and free of oxygen. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. Containers are usually stored in "dry ice" or are refrigerated in some other way. Diborane can ignite spontaneously in moist air at room temperature. Use dry nitrogen purge in any transfer. Sources of ignition, such as smoking and open flames, are prohibited where diborane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of diborane. Wherever diborane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Diborane must be labeled: "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3 and Packing Group I. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If possible, dilute the leak with an inert gas and exhaust through a fume hood. If source is a cylinder and the leak cannot be stopped in place, specially trained personnel may be able to remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Diborane and diborane, compressed

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.8/1.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 2.7/4.3

Fire Extinguishing: Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. This chemical is a highly flammable and reactive gas; it will ignite without warning in moist air at room temperature. Poisonous gases are produced in fire, including boron and hydrogen at higher temperatures and hydrogen and boron hydrides at lower temperatures. Approach fire with extreme caution; consider letting it burn. Do not extinguish fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Stop the flow of gas and use water spray to protect personnel during the shut-off. Use water from an unmanned source to keep fire-exposed containers cool. Diborane may react violently with halogenated extinguishing agents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

Dibromobenzene D:0340

Molecular Formula: $C_6H_4Br_2$
Synonyms: Benzene dibromide; Benzene, dibromo-; *o*-Dibromobenzene
CAS Registry Number: 26249-12-7
RTECS® Number: CZ1780000
UN/NA & ERG Number: UN2514/130
EC Number: 247-544-7
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Dibromobenzene is a heavy colorless liquid with a pleasant aromatic odor. Molecular weight = 235.94; Boiling point = 225.5°C; Freezing/Melting point = 7°C; Flash point = 47°C. Insoluble in water.
Potential Exposure: Dibromobenzene is used as a solvent for oils and in organic synthesis.
Incompatibilities: Strong oxidizers.
Permissible Exposure Limits in Air
No TEEL available.
Russia[43] set a MAC value of 0.2 mg/m^3 for ambient air in residential areas on a momentary basis.
Routes of Entry: Inhalation, passing through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Exposure can irritate the eyes, nose, and throat. High levels can cause you to feel dizzy, lightheaded, and to pass out. Contact can irritate the eyes and skin.
Long Term Exposure: Similar chemicals can cause liver damage.
Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to dibromobenzene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with dibromobenzene you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where dibromobenzene is used, handled, or stored, in a manner that could create a potential fire or explosion hazard.
Shipping: Dibromobenzene requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many

directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with flue gas scrubbing.

California Proposition 65 Chemical: delisted as a cancer agent 10/29/99.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dibromochloromethane is a clear colorless liquid. Molecular weight = 208.29; Boiling point = 119−120°C; Freezing/Melting point = −22°C. Also reported as ≤20°C.

Potential Exposure: Dibromochloromethane is used as a chemical intermediate in the manufacture of fire extinguishing agents, aerosol propellants, refrigerants, and pesticides. Dibromochloromethane has been detected in drinking water in the United States. It is believed to be formed by the haloform reaction that may occur during water chlorination. Dibromochloromethane can be removed from drinking water via treatment with activated carbon. There is a potential for dibromochloromethane to accumulate in the aquatic environment because of its resistance to degradation. Volatilization is likely to be an important means of environmental transport.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 150 mg/m^3

Permissible Concentration in Water: The Maximum Contaminant Level (MCL) for total trihalomethanes (including dibromochloromethane) in drinking water has been set by the US EPA at 0.10 mg/L (44 RF 68624). Illinois has set a guideline for CDBN in drinking water[61] of 1.0 μg/L.

Harmful Effects and Symptoms

Short Term Exposure: Very little toxicity information is available. It is, however, an irritant and narcotic. Symptoms include dizziness, headache, liver and kidney damage.

Long Term Exposure: May cause liver and kidney damage. Dibromochloromethane gave positive results in mutagenicity tests with *Salmonella typhimurium* TA 100. LD_{50} = (oral-rat) 848 mg/kg (slightly toxic).

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: Liver and kidney function tests.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves (nitrile gloves may provide protection[52]) and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers under an inert atmosphere, away from light, in a refrigerator. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including chlorine and bromine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be destroyed by high-temperature incinerator equipped with an HCl scrubber.

California Proposition 65 Chemical: Cancer 7/1/87; reproductive, male 2/27/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; B3 combustible liquid; D1A Very toxic material causing immediate and serious toxic effects; D2A Very toxic material causing other toxic effects.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DBCP is an amber to brown liquid (a solid below 6°C/43°F) with a strong, pungent odor. It has an odor and taste threshold at 0.01 mg/L in water. Molecular weight = 236.35; Specific gravity (H_2O:1): 2.1; Boiling point = 196°C (decomposes); Freezing/Melting point = 6.1°C; Vapor pressure = 0.8 mmHg at 20°C; Flash point = 77°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.1%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. DBCP has been used in agriculture as a fumigant for control of nematodes since 1955, being supplied for such use in the forms of liquid concentrate, emulsifiable concentrate, powder, granules, and solid material. A rebuttable presumption against registration for pesticide uses was issued by US EPA on September 22, 1977, on the basis of oncogenicity and reproductive effects. Then, as of November 3, 1977, the EPA in a further action, suspended all registrations of end-use products, subject to various specific restrictions.

Incompatibilities: Reacts with oxidizers and chemically active metals (i.e., aluminum, magnesium, and tin alloys). Attacks some rubber materials and coatings. Corrosive to metals.

Permissible Exposure Limits in Air

OSHA PEL: [1910.1044] TWA 0.001 ppm.

NIOSH REL: Carcinogen; Limit exposure to lowest feasible concentration.

Protective Action Criteria (PAC)

TEEL-0: 0.001 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 2.

Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000. Argentina: TWA of 0.25 mg/m^3; STEL 0.75 mg/m^3. Sweden set no limits; it simply stated that DBCP is a carcinogenic substance and should be avoided. Russia[43] set a MAC of 0.0004 mg/m^3 for ambient air in residential areas on a momentary basis and 0.00003 mg/m^3 on a daily average basis. Several states have set guidelines or standards for DBCP in ambient air[60] ranging from zero (North Dakota) to 0.05 μg/m^3 (Connecticut) to 1.0 μg/m^3 (Pennsylvania).

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes. The US EPA[47] has set both a 1-day health advisory of 0.2 mg/L and a 10-day health advisory of 0.02 mg/L for a 10-kg child. Longer-term health advisories could not be calculated because of the carcinogenicity of DBCP. EPA has recently proposed[62] a maximum drinking water level of 0.0002 mg/L (0.2 μg/L). Several states have set guidelines for DBCP in drinking water[61] ranging from 0.025 μg/L (Arizona) to 0.25 μg/L (Minnesota) to 0.5 μg/L (Wisconsin) to 1.0 μg/L (California).

Determination in Water: By purge-and-trap gas chromatography.[47] Octanol−water coefficient: Log $K_{ow} = 2.96$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include severe local irritation to eyes, skin, and mucous membranes. Nausea and vomiting may occur after ingestion. Exposure to DBCP can cause headache, nausea, vomiting, weakness, lightheadedness, unconsciousness, and possible death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: The possible effects on the health of employees chronically exposed to repeated or lower exposures of DBCP may include sterility, diminished renal function, degeneration, and cirrhosis of the liver. DBCP is a probable carcinogen in humans. It has been shown to cause stomach, breast, tongue, and nasal cavity cancer in animals. May damage the testes and decrease fertility in males and females. Repeated exposure can damage the eyes, causing clouding of lens or cornea, open sores on the skin, and liver and kidney damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys, spleen, reproductive system, digestive system.

Medical Surveillance: Medical surveillance shall be made available to employees as outlined below:

Comprehensive preplacement or initial medical and work histories with emphasis on reproductive experience and menstrual history. Comprehensive physical examination with emphasis on the genito-urinary tract including testicle size and consistency in males. Semen analysis to include sperm count, motility, and morphology. Other tests, such as serum testosterone, serum follicle stimulating hormone (FSH), and serum luteinizing hormone (LH) may be carried out if, in the opinion of the responsible physician, they are indicated. In addition, screening tests of the renal and hepatic systems may be considered. A judgment of the worker's ability to use positive-pressure respirators. Employees shall be counseled by the physician to ensure that each employee is aware that DBCP has been implicated in the production of effects on the reproductive system including sterility in male workers. In addition, they should be made aware that cancer was produced in some animals. While the relevancy of these findings is not yet clearly defined, they do indicate that both employees and employers should do everything possible to minimize exposure to DBCP. Periodic examinations containing the elements of the preplacement or initial examination shall be made available at least on an annual basis. Examinations of current employees shall be made available as soon as practicable after the promulgation of standards for DBCP. Medical surveillance shall be made available to any worker suspected of having been exposed to DBCP. Pertinent medical records shall be maintained for all employees subject to exposure to DBCP in the workplace. Such records shall be maintained for 30 years and shall be available to medical representatives of the US Government, the employer, and the employee. *NIOSH mandated tests:* blood serum: follicle stimulating hormone, luteinizing hormone, total estrogen (females); genito-urinary tract: testicle size, sperm count. NIOSH also lists the following tests: blood serum: follicle stimulating hormone, luteinizing hormone serum, multiphasic analysis, testosterone; complete blood count; pulmonary function tests; sperm count; thyroid function test/thyroid profile; urinalysis (routine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20−30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Contact local poison control center for advice about inducing vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Note: Protective clothing shall be resistant to the penetration and to the chemical action of dibromochloropropane. Additional protection, including gloves, bib-type aprons, boots, and overshoes, shall be provided for, and worn by, each employee during any operation that may cause direct contact with liquid dibromochloropropane. Supplied-air hoods or suits resistant to penetration of dibromochloropropane shall be worn when entering confined spaces, such as pits or storage tanks. In situations where heat stress is likely to occur, supplied-air suits, preferably cooled, are recommended. The employer shall ensure that all personal protective clothing is inspected regularly for defects and is maintained in a clean and satisfactory condition by the employee.

Respirator Selection: Engineering controls shall be used wherever airborne dibromochloropropane concentrations needed to be kept below the recommended occupational exposure limit. Compliance with this limit may be achieved by the use of respirators under the following conditions only: during the time necessary to install or test the required engineering controls; for nonroutine operations, such as emergency maintenance or repair activities; during emergencies when air concentrations of dibromochloropropane may exceed the recommended occupational exposure limit. When a respirator is permitted, NIOSH recommends the following: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DBCP you should be trained on its proper handling and storage. Store in a refrigerator. Protect from alkalis and reactive metals. Protection from light is recommended for long-term storage. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: DBCP requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Use incinerator equipped with afterburner and scrubber.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Positive: *In vitro* SCE—nonhuman; Positive/dose response: *In vitro* cytogenetics—nonhuman.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dibutylamine is a colorless liquid with an odor of ammonia. Molecular weight = 129.28; Boiling point = 159−161°C; Freezing/Melting point = −61.9 to −59°C; Flash point = 42−47°C; Autoignition temperature = 260°C. Explosive Limits: LEL = 1.1%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen, Primary Irritant. Used as a corrosion inhibitor and intermediate for emulsifiers, rubber products, dyes, and as insecticides.

Incompatibilities: Forms explosive mixture with air. Aqueous solution is a strong base. Incompatible with acids, acid chlorides, acid anhydrides, halogens, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution, strong oxidizers, reactive organic compounds. Attacks copper alloys, zinc, tin, tin alloys, galvanized steel. Also, carbon dioxide is listed as incompatible by the state of New Jersey.

Permissible Exposure Limits in Air
AIHA WEEL: 5 ppm/26.5 mg/m^3, Ceiling [skin].
Protective Action Criteria (PAC)
TEEL-0: 0.25 ppm
PAC-1: 0.75 ppm
PAC-2: 50 ppm
PAC-3: 50 ppm

Routes of Entry: Inhalation, through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is corrosive. This chemical can be absorbed through the skin, thereby increasing exposure. Skin or eye contact can cause severe irritation and burns. Inhalation can cause irritation of the respiratory tract and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation; bronchitis may develop with coughing, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with dibutylamine you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Di-*n*-butylamine requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, hydrocarbons, amines, and carbon monoxide, are produced in fire. Use dry chemical, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 203-057-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-Di-*n*-butylaminoethanol is a colorless to yellowish liquid. Faint amine-like odor. Molecular weight = 173.33; Boiling point = 224−232°C; Freezing/Melting point = <−69°C; Flash point = 96°C; Autoignition temperature = 240°C. Explosive Limits: LEL = 0.9%; UEL = 5.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Solubility in water = 11.6 g/L at 25°C.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2 ppm/14 mg/m^3 TWA [skin].

ACGIH: 0.5 ppm/3.5 mg/m^3 TWA [skin]; TLV-BEI$_A$ issued; Acetylcholinesterase-inhibiting pesticides.

No TEEL available.

Australia: STEL of 4 ppm (28 mg/m^3). Several states have set guidelines or standards for dibutylaminoethanol in ambient air[60] ranging from 0.14 mg/m^3 (North Dakota) to 0.23 mg/m^3 (Virginia) to 0.28 mg/m^3 (Connecticut) to 0.333 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2007, aminoethanol compounds.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may burn the eyes and irritate the skin. The vapor can irritate the nose, throat, and bronchial tubes. LD_{50} = (oral-rat) 1070 mg/kg (slightly toxic).

Long Term Exposure: High or repeated exposure may damage the liver and kidneys. Related chemicals can cause lung allergy (asthma) or skin allergy, with rash. They can also cause a fluid buildup in the lungs with high exposures, which is a medical emergency. It is not known whether 2-*n*-dibutylaminoethanol has these effects.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Lung function tests. These may be normal if the person is not having an attack at the time of the test. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof

chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with DBAE you should be trained on its proper handling and storage. 2-*N*-Dibutylaminoethanol must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions may occur. Sources of ignition, such as smoking and open flames, are prohibited where 2-*n*-dibutylaminoethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Dibutylaminoethanol must be labeled "CORROSIVE." It falls into DOT/UN Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 204-881-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat.

Listed in the TSCA inventory.

US EPA Gene-Tox Program, Positive: *D. melanogaster*—whole sex chromosome loss; Negative: Histidine reversion—Ames test; Mouse-specific locus; Negative: *D. melanogaster* sex-linked lethal; Inconclusive: *D. melanogaster*—reciprocal translocation; Inconclusive: Mammalian micronucleus; Sperm morphology—mouse.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Listed by the following states: CA, NJ, PA, MA, MN.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (D2B, D2A); listed on Canada's DSL List.

European/International Regulations; Hazard Symbol: Xn; Risk phrases: R22: Harmful if swallowed; R36; R37; R38; Safety phrases: S24; S25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: BHT is a white to pale yellow crystalline solid or powder. Molecular weight = 220.39; Boiling point = 265°C; Freezing/Melting point = 70°C; Vapor pressure = .01 mmHg at 20°C; Flash point = 127°C (cc). Hazard Identification (based on NFPA-704 M Rating

System): Health 2, Flammability 1, Reactivity 0. Insoluble in water; solubility = 0.00004%.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. DBPC is used as a food and feed additive, flavor, and packaging material and as an antioxidant in human foods and animal feeds. It is also used as an antioxidant to stabilize petroleum fuels, rubber, and vinyl plastics.

Incompatibilities: Contact with oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 2 mg/m^3 TWA (intermittent, vapor, and aerosol); Not Classifiable as a Human carcinogen, as butylated hydroxytoluene (BHT) (2001).

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 400 mg/m^3

DFG MAK: 20 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(2); Carcinogen Category 4; Pregnancy Risk Group C.

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 10 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, [skin], 1999; France: VME 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Switzerland: MAK-W 10 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use NIOSH II-1,[1] P&CAM Method #226 and OSHA Analytical Method PV-2108.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 5.1.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. This compound has an acute oral LD_{50} for rats of 890 mg/kg which is classified as slightly toxic.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. BHT may cause liver damage. BHT may damage the developing fetus. Repeated exposure to high levels may affect the liver. BHT may cause changes in behavior and learning ability and reduce the blood's ability to clot, but this is not known for sure at this time. In animals: decreased growth rate, increased liver weight.

Points of Attack: Eyes, skin, liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with DBPC you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents (such as peroxides, permanganates, chlorates, perchlorates, and nitrates).

Shipping: No information available. BHT may be treated as Toxic solids, organic, n.o.s. This shipping name requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazards Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be

properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: DBPC is a combustible solid but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Water or foam may cause frothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dibutyl phosphate is a pale amber to brown, odorless liquid. Molecular weight = 210.24; Specific gravity (H_2O:1) = 1.06; Boiling point = (decomposes) 135−138°C; Freezing/Melting point = −13°C; Vapor pressure ≈1 mmHg at 20°C; Flash point = 188°C (oc); Autoignition temperature = 420°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: This material is used as a catalyst in organic synthesis.

Incompatibilities: Dibutyl phosphate is a medium strong acid. Reacts with strong oxidizers. Attacks many metals forming flammable and explosive hydrogen gas. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 1 ppm/5 mg/m^3 TWA.

NIOSH REL: 1 ppm/5 mg/m^3 TWA; 2 ppm/10 mg/m^3 STEL.

ACGIH TLV®[1]: 1 ppm TWA inhalable fraction and vapor; 2 ppm STEL inhalable fraction and vapor [skin].

NIOSH IDLH: 30 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 2 ppm

PAC-2: 6 ppm

PAC-3: 30 ppm

DFG MAK: Germ Cell Mutation Category 3A.

Australia: TWA 1 ppm (5 mg/m^3); STEL 2 ppm, 1993; Belgium: TWA 1 ppm (8.8 mg/m^3); STEL 2 ppm (17 mg/m^3), 1993; Finland: TWA 1 ppm (8 mg/m^3); STEL 3 ppm (24 mg/m^3), [skin], 1999; France: VME 1 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Philippines: TWA 1 ppm (5 mg/m^3), 1993; Switzerland: MAK-W 1 ppm (8.5 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietman: ACGIH TLV®: STEL 2 ppm. Some states have set guidelines or standards for dibutyl phosphate in ambient air[60] ranging from 50−100 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5017.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.6−1.4.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate and burn the eyes. Inhalation can irritate the respiratory tract causing coughing, wheezing, and shortness of breath. Skin contact irritates the skin causing rash or burning sensation.

Long Term Exposure: Can cause drying and cracking of skin. Can cause lung irritation.

Points of Attack: Respiratory system, skin, eyes.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. NIOSH lists the following tests: whole blood (chemical/metabolite); breath; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Viton™ gloves, suits. **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode. *Up to 30 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Dibutyl phosphate must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, and bromine, since violent reactions occur.

Shipping: Acids, liquid, n.o.s. must carry a "CORROSIVE" label. They fall in DOT Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dibutyl phosphate is a combustible liquid. Poisonous gases, including oxides of phosphorus, carbon monoxide, phosphine, and phosphoric acid are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

DFG MAK: 0.05 ppm/0.58 mg/m^3; Peak Limitation Category I(1) Pregnancy Risk Group: C.

Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; France: VME 5 mg/m^3, 1999; Hungary: TWA 2 mg/m^3; STEL 4 mg/m^3 [skin] 1993; India: TWA 5 mg/m^3, 1993; Japan: 5 mg/m^3, 1999; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, 1993; Sweden: NGV 3 mg/m^3, KTV 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3. Russia has set a limit of 0.1 mg/m^3 for ambient air on a once daily basis; the Czech Republic[35] has set ambient air limits at 0.8 mg/m^3 on a daily average basis and 2.4 mg/m^3 on a half-hour exposure basis.

Determination in Air: Use NIOSH Analytical Method (IV) #5020.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 940 μg/L on an acute basis and 3 μg/L on a chronic basis for all phthalate esters. On a chronic basis, as low as 2944 μg/L. *To protect human health:* 34,000 μg/L.[6] Several states have set guidelines for DBP in drinking water[61] ranging from 770 μg/L in Kansas to 2200 μg/L in Maine. Russia[43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes.

Determination in Water: Gas chromatography (EPA Method 606) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 4.7.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Highly corrosive. The substance irritates the eyes, skin, nasal passages, and upper respiratory system. May cause skin allergy, stomach irritation, light sensitivity.

Long Term Exposure: Unknown at this time. However, this chemical may cause lung problems. Di-*n*-butyl phthalate may also damage the developing fetus and testes (male reproductive glands).

Points of Attack: Eyes, respiratory system, gastrointestinal system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends butyl rubber; Neoprene™, nitrile rubber, and viton as good to excellent protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m³:* Any air-purifying full-face-piece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100. *125 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m³:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *4000 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Di-*n*-butyl phthalate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, or chlorine dioxide), strong alkalis (such as sodium hydroxide, potassium hydroxide, and lithium hydroxide), and strong acids (such as sulfuric acid, hydrochloric acid, and nitric acid) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where di-*n*-butyl phthalate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phthalic anhydride, are produced in fire. Use dry chemicals or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location,

use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be absorbed on vermiculite, sand, or earth and disposed of in a sanitary landfill. Alternatively, it may be incinerated.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Safe Drinking Water Act: Priority List (55 FR 1470).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, Drinking Water Quality, 0.12 mg/L MAC.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dicamba is a white or brown nonflammable, colorless, odorless solid. Molecular weight = 221.04; Specific gravity (H_2O:1) = 1.57; Boiling point = 195°C (decomposes below BP); Freezing/Melting point = 114−116°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Those involved in manufacture, formulation, and application of this postemergence herbicide. Used to control allual and perennial broad leaf weeds in corn, sorghum, small grain pastures, and noncroplands.

Incompatibilities: Incompatible with sulfuric acid, bases, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Dicamba decomposes in heat, producing toxic and corrosive fumes including hydrogen chloride.

Permissible Exposure Limits in Air

No TEEL available.

Russia: STEL 1 mg/m^3, [skin], 1993. Although no US exposure limits have been established, this chemical can be absorbed through the skin, thereby increasing exposure.

Permissible Concentration in Water: A no-adverse-effect level in drinking water has been calculated by NSA/NRC[46] at 0.009 mg/L. States which have set guidelines for dicamba in drinking water[61] include Maine at 9.0 μg/L and Wisconsin at 12.5 μg/L. Canada’s MAC in drinking water is 0.12 mg/L.

Determination in Water: A detection limit of 1 ppb for dicamba by electron-capture gas chromatography has been reported by NAS/NRC.[46] Octanol−water coefficient: Log K_{ow} = 2.2.

Routes of Entry: Ingestion, inhalation, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Dicamba irritates the eyes, skin, and respiratory tract. Exposure can cause nausea, vomiting, loss of appetite and weight, muscle weakness, and exhaustion. The acute toxicity of dicamba is relatively low. Dicamba produced no adverse effect when fed to rats at up to 19.3 and 25 mg/kg/day in subchronic and chronic studies. The no-adverse-effect dose in dogs was 1.25 mg/kg/day in a 2-year feeding study. Based on these data, an ADI was calculated at 0.0012 mg/kg/day. LD_{50} = (oral-rat) 1037 mg/kg (slightly toxic).

Long Term Exposure: May affect the liver.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dicamba you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above, heat, and water.

Shipping: Benzoic derivative pesticides, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including chlorine and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Land disposal or incineration are disposal options.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Dichloroacetic acid D:0430

Molecular Formula: $C_2H_2C_{l2}O_2$
Synonyms: Acetic acid, bichloro-; Acetic acid, dichloro-; Bichloroacetic acid; DCA; Dichlorethanoic acid
CAS Registry Number: 79-43-6
RTECS® Number: AG6125000
UN/NA & ERG Number: UN1764/153
EC Number: 201-207-0 [*Annex I Index No.*: 607-066-00-5]
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Data*, not classifiable as carcinogenic to humans*, Group 2B, 1995; EPA: Likely to produce cancer in humans.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
California Proposition 65 Chemical: Cancer 5/1/96; male 8/7/09.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: DCA is a corrosive, combustible, colorless liquid with a pungent odor. Molecular weight = 128.94; Specific gravity (H_2O:1) = 1.56; Boiling point = 193.8°C; Freezing/Melting point = 9.7−13.5°C; Vapor pressure = 1 mmHg at 44°C; Flash point = 110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Highly corrosive. Soluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Used as starting material for the production of glyoxylic, dialkyloxy acids, and sulfonamides. Also used as a fungicide, a medication, and a chemical intermediate in pharmaceuticals.
Incompatibilities: DCA is a medium strong acid, incompatible with nonoxidizing mineral acids, organic acids, bases, acrylates, aldehydes, alcohols, alkylene oxides, ammonia, aliphatic amines, alkanolamines, aromatic amines, amides, glycols, isocyanates, ketones. Attacks metals generating flammable hydrogen gas. Attacks some plastics, rubber, and coatings.
Permissible Exposure Limits in Air
ACGIH TLV®[1]: 0.5 ppm/2.64 mg/m^3 [skin]; confirmed animal carcinogen with unknown relevance to humans.
Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 10 ppm
PAC-2: 75 ppm
PAC-3: 200 ppm
DFG MAK: Germ Cell Mutation Category 3A.
Russia: STEL 4 mg/m^3, 1993.
Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = <1.0.
Routes of Entry: Inhalation, ingestion.
Harmful Effects and Symptoms
Short Term Exposure: Corrosive. Destructive to the eyes, skin, and tissues of the respiratory tract; causes severe irritation and burns. Eye contact may cause permanent damage. Higher exposures can cause chemical pneumonitis and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms can include burning sensation, coughing, wheezing, laryngitis, shortness of breath, headache, nausea, and vomiting.
Long Term Exposure: May cause damage to the developing fetus. May affect the liver and kidneys. May damage the nervous system causing numbness, "pins and needles," and/or weakness in the hands and feet. Repeated exposure may cause lung irritation, bronchitis. There is limited evidence that DCA causes liver cancer in animals.
Points of Attack: Lungs, liver, kidneys, nervous system.
Medical Surveillance: Liver and kidney function tests. Lung function tests. Examination of the nervous system. Consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved

respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with DCA you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: DCA must be labeled "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid, but does not readily ignite. Poisonous gases, including phosgene, hydrogen chloride, carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: [*Annex I Index No.:* 602-069-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1999.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DCA is a volatile oil. It has a disagreeable, sweetish odor. A gas above 32°C/90°F. Molecular weight = 94.92; Boiling point = 32°C (explodes); Freezing/Melting point = −50°C to −66°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. DCA is not produced commercially. DCA is a possible decomposition product of trichloroethylene or trichloroethane. Also in closed circuit anesthesia with trichloroethylene, heat and moisture produced by soda-lime absorption of CO_2 may produce dichloroacetylene along with phosgene and CO.

Incompatibilities: Heat or shock may cause explosion. Violent reaction with oxidizers and strong acids (forms poisonous gases of phosgene and hydrogen chloride).

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 ppm/0.4 mg/m^3 Ceiling Concentration; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.1 ppm/0.39 mg/m^3 Ceiling Concentration; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 1.5 ppm
PAC-2: 10 ppm
PAC-3: 40 ppm

DFG MAK: Carcinogen Category 2.

Australia: TWA 0.1 ppm (0.4 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: STEL 0.1 ppm (0.39 mg/m^3), 1993; Finland: TWA 0.1 ppm (0.4 mg/m^3); STEL 0.3 ppm (1.2 mg/m^3), 1993; the Netherlands: MAC-continuous 0.4 mg/m^3, 2003; Norway: TWA 0.1 ppm (0.4 mg/m^3), 1999; United Kingdom: STEL 0.1 ppm (0.39 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea: New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.1 ppm. Several states have set guidelines or standards for dichloroacetylene in ambient air[60] ranging from 3.2 μg/m^3 (Virginia) to 4.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada).

Determination in Air: The NIOSH pocket guide lists no methods. However, see NIOSH Analytical Method 1003, hydrocarbons, halogenated.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Inhalation can irritate the respiratory tract with coughing, wheezing, and/or shortness of breath. Exposure can cause headache, loss of appetite, extreme nausea, vomiting, involvement of the trigeminal nerve and facial muscles causing paralysis of the face, and development of facial herpes. Higher exposure may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death.

Long Term Exposure: There is limited evidence that DCA causes kidney cancer in animals. Dichloroacetylene can cause nervous system damage leading to weakness and behavioral changes and may affect the kidneys. May cause lung irritation and the development of bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Central nervous system; lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Avoid skin contact. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Eye Protection: Wear splash-proof chemical goggles when working with liquid, unless full face-piece respiratory protection is worn. Wear gas-proof goggles, unless full face-piece respiratory protection is worn.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DCA you should be trained on its proper handling and storage. Dichloroacetylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Keep dichloroacetylene away from strong acids (such as hydrochloric, sulfuric, and nitric) because poisonous gases may be given off, including phosgene and hydrogen chloride. Store in tightly closed containers in a cool, well-ventilated area away from heat, potassium, sodium, and aluminum powders. Sources of ignition, such as smoking and open flames are prohibited where dichloroacetylene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of dichloroacetylene. Wherever dichloroacetylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dichloroacetylene is cited by DOT[19] as "FORBIDDEN."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichloroacetylene is a combustible liquid; becomes a gas above 32°C/90°F. It will explode before it reaches a temperature that is hot enough to burn. Poisonous gas is produced in fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Dichlorobenzalkonium chloride D:0450

Molecular Formula: C_8H_{17} to $C_{18}H_{37}$

Common Formula: $C_9H_{11}Cl_2N \cdot Cl$

Synonyms: Alkyl(C_6H_{18})dimethyl-3,4-dichlorobenzylammonium chloride; Alkyl(C_8H_{17} to $C_{18}H_{37}$) dimethyl-3,4-dichlorobenzyl ammonium chloride; Dichlorobenzalkonium chloride; Tetrosan®

CAS Registry Number: 8023-53-8

RTECS® Number: BO3200000

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: Dropped from listing in 1988.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichlorobenzalkonium chloride is a colorless, crystalline solid. Specific gravity (H_2O:1) = 0.89; Melting point = 33—34°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as an antiseptic, germicide, algicide, sterilizer, and deodorant.

Incompatibilities: Chlorides may be incompatible with acids, acid fumes. Esters may be incompatible with moisture and nitrates.

Permissible Exposure Limits in Air

No standard or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause vomiting, diarrhea, and abdominal pain. Ingestion causes burning pain in the mouth, throat, and abdomen with spitting of blood; drooling, vomiting; burns and ulcers in the mouth, throat, pharynx, and esophagus; shock, restlessness, confusion, weakness, apprehension; muscle weakness; difficulty in breathing; depression; bluing of the skin; and death from shock or asphyxiation. Ten percent (10%) concentrated aqueous solutions are irritating to the skin and concentrations as low as 0.1−0.5% are irritating to the eyes and mucous membranes. Concentrations ranging from 2% to 17.5% have caused dermal necrosis. Ingestion can cause corrosion of upper intestinal tract. Swelling of throat and lungs with fluid (edema) also can occur. Death can occur due to paralysis of respiratory muscles or circulatory collapse. The oral LD_{50} (oral-rat) = 730 mg/kg (slightly toxic).

Long Term Exposure: May cause liver and kidney damage. Repeated contact may cause allergic contact dermatitis to skin and allergic reaction in the lungs.

Points of Attack: Liver, kidneys, lungs, skin.

Medical Surveillance: Liver and kidney function tests. Lung function tests. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If concentrated (10% or greater) solution is ingested, patient should swallow a large quantity of milk, egg whites, or gelatin solution. If breathing is difficult, give oxygen.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, acid fumes, moisture, and nitrates.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides, ammonia, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Mexico, Drinking Water, 0.4 mg/L.

WGK (German Aquatic Hazard Class): 2—Water polluting (*all isomers*).

Description: There are three isomeric forms of dichlorobenzene (DCB):

m-DCB is a flammable liquid and vapor. Molecular weight = 147.00; Boiling point = 172°C; Flash point = 63°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

o-DCB is a colorless to pale yellow liquid with a pleasant, aromatic odor. Odor threshold = 0.30 ppm. Molecular weight = 147.00; Boiling point = 180°C; Freezing/Melting point = −17°C; Flash point = 60°C; 66°C (cc); Autoignition temperature: 648°C. Explosive limits: LEL = 2.2%; UEL = 9.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

p-DCB is a colorless or white solid with a mothball-like odor. Odor threshold = 0.18 ppm. Molecular weight = 147.00; Boiling point = 174°C; Freezing/Melting point = 53°C; Vapor pressure = 13 mmHg at 20°C; Flash point = 66°C. Insoluble in water. Explosive limits: LEL = 2.5%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: (*m*-isomer) Tumorigen, Mutagen, (*o*-isomer) Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant; (*p*-isomer) Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. The major uses of *o*-DCB are as a process solvent in the manufacturing of toluene diisocyanate and as an intermediate in the synthesis of dyestuffs, herbicides, and degreasers. *p*-Dichlorbenzene is used primarily as a moth repellant, a mildew control agent, space deodorant, and in insecticides, which accounts for 90% of the total production of this isomer. Information is not available concerning the production and use of *m*-DCB. However, it may occur as a contaminant of *o*- or *p*-DCB formulations. Both *o*- and *p*-isomers are produced almost entirely as by-products during the production of monochlorobenzene.

Incompatibilities: For *o*-DCB and *m*-DCB: acid fumes, chlorides, strong oxidizers, hot aluminum, or aluminum alloys. For *p*-DCB: strong oxidizers; although incompatibilities for this chemical may also include other materials listed for *o*-DCB.

Russia[43] gives a MAC of 0.035 mg/m^3 for ambient air in residential areas on a once daily basis for *p*-DCB.[35]
Several states have set guidelines or standards for chlorobenzenes in ambient air[60] as follows:

State	***o*-DCB- (mg/m^3)**	***p*-DCB (mg/m^3)**
Connecticut	0	9.0
Indiana	1.5	–
Massachusetts	0.082	0.0042
Nevada	7.14	10.7
New York	1.0	–
North Carolina	–	67.5
North Dakota	3.0	6.75
South Carolina	–	4.5
Virginia	2.5	7.5

Determination in Air: Use NIOSH Analytical Method 1003 or OSHA Analytical Method 7.
Permissible Concentration in Water: *To protect freshwater aquatic life:* 1120 μg/L on an acute toxicity basis and 763 μg/L on a chronic basis. *To protect saltwater aquatic life:* 1970 μg/L on an acute toxicity basis. *To protect human health:* 400 μg/L for all isomers.[6] Russia[43] established a MAC of 0.002 mg/L for water bodies used for domestic purposes.[35,43] The US EPA[48] has derived lifetime health advisories for *o*- and *m*-DCB as 0.62 mg/L (620 μg/L) and for *p*-DCB of 0.075 mg/L (75 μg/L). EPA[62] has recently proposed a maximum level for *o*-DCB of 0.6 mg/L in drinking water. See also "Regulatory" section for drinking water criteria for Mexico and Canada. Several states have set guidelines and standards for chlorobenzenes in drinking water[61] as follows:

State	o-DCB (μg/L)	m-DCB (μg/L)	p-DCB- (μg/L)
Arizona	620	–	750
California	130	130	0.3–0.5
Kansas	620	620	–
Maine	85	–	27
Minnesota	620	–	750
New Jersey	600	600	6
Vermont	620	–	–
Wisconsin	1250	1250	5

Determination in Water: Gas chromatography (EPA Methods 601, 602, 612) or gas chromatography plus mass spectrometry (EPA Method 625). Gas-chromatographic methods have been developed for *p*-PDB with a sensitivity of 380 pg/cm peak high, and *p*-PDB concentrations as low as 1.0 ppb in water have been analyzed according to NAS/NRC. Octanol–water coefficient: Log K_{ow} (*p*-) = 3.37.
Routes of Entry: *o*-DCB: inhalation, skin absorption; ingestion; skin and/or eye contact. *p*-DCB: inhalation, ingestion, eye and skin contact.
Harmful Effects and Symptoms
Human exposure to dichlorobenzene is reported to cause hemolytic anemia and liver necrosis, and 1,4-dichlorobenzene has been found in human adipose tissue. In addition, the dichlorobenzenes are toxic to nonhuman mammals, birds, and aquatic organisms and impart an offensive taste and odor to water. The dichlorobenzenes are metabolized by mammals, including humans, to various dichlorophenols; some are as toxic as the dichlorobenzenes.
Exposure can damage blood cells. Contact can cause irritation of the skin and eyes. Prolonged contact can cause severe burns. It may damage the liver, kidneys, and lungs. Exposure can cause headache, dizziness, swelling of the eyes, hands and feet, and nausea. Higher levels can cause severe liver damage and death. Persons with preexisting pathology (hepatic, renal, central nervous system, blood) or metabolic disorders, who are taking certain drugs (hormones or otherwise metabolically active), or who are otherwise exposed to DCBs or related (chemically or biologically) chemicals by such means as occupation, or domestic use or abuse (e.g., pica or "sniffing") of DCB products, might well be considered at increased risk from exposure to DCBs.
Short Term Exposure: *o-DCB:* Can be absorbed through the skin, thereby increasing exposure. Irritates the eyes, skin, and respiratory tract. Prolonged skin contact may

cause blisters. May affect the central nervous system. Exposure can cause headache and nausea. Higher exposure can cause dizziness, lightheadedness, and unconsciousness.

m-DCB: Can be absorbed through the skin, thereby increasing exposure. Symptoms are similar to *o*-DCB, and *m*-DCB may damage the red blood cells leading to low blood count.

p-DCB: Can be absorbed through the skin, thereby increasing exposure. Exposure can cause headache, dizziness, nausea, swelling of the hands and feet. Contact with the dust can irritate and burn the eyes and skin. Skin allergy may develop.

Long Term Exposure: *o-DCB:* Repeated or prolonged contact may cause skin sensitization and allergy. Long-term exposure may cause damage to the blood cells, liver, kidneys, and lungs.

m-DCB: Repeated or prolonged contact may cause skin sensitization and allergy. May affect the liver and kidneys.

p-DCB: May be carcinogenic to humans; it causes kidney and liver cancer in animals. There is a suggested association between this chemical and leukemia. There is evidence that *p*-DCB can damage the developing animal fetus. Repeated exposure can damage the nervous system, may cause skin allergy, and damage the lungs, liver, and kidneys. *p*-DCG may affect the blood and cause hemolytic anemia.

Points of Attack: *o*-DCB and *m*-DCB: liver, kidneys, skin, eyes. *p*-DCB: liver, respiratory system, eyes, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: liver, kidney, and lung function tests. Complete blood count. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests: (*o*-isomer) urine (chemical/metabolite), (*p*-isomer) expired air, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Viton™ gloves, suits; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof (*o*-DCB or *o*-DCB) or dust-proof (*p*-DCB) chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *For o-DCB: 2000 ppm:* CcrFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

p-DCB: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red (*o*-DCB): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Color Code—Blue (*m*-DCB): Health Hazard/Poison: Store in a secure poison location.

Color Code—Green (*p-DCB*): General storage may be used. Prior to working with any DCB you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dichlorobenzene must be stored to avoid contact with strong oxidizers, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, hot aluminum or aluminum alloys since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and direct light. Sources of ignition, such as smoking and open flames, are prohibited where dichlorobenzene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where *p*-DCB is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: *o*-DCB: Requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

m-DCB: Toxic, liquids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1 and Packing Group III.

Based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. Under this classification, it requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

p-DCB: May be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: *p-DCB:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

o-DCB and m-DCB: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *p-DCB:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

o-DCB and p-DCB: These chemicals are combustible liquids. Poisonous gases are produced in fire, including hydrogen chloride and chlorine. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (20).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations (*91-94-1*): Hazard Symbol: T, N; Risk phrases: R45; R21; R43; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class) (*91-94-1*): 3—Highly water polluting.

Dyhydrochloride and sulfate:

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1007).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

European/International Regulations (*3,3′-dichlorobenzidine salts*): Hazard Symbol: T, N; Risk phrases: R45; R21; R43; R50/53; Safety phrases: S53; S45; S60; S61.

Description: 3,3′-Dichlorobenzidine is a gray or purple crystalline solid. Molecular weight = 253.14; Boiling point = 368°C; Freezing/Melting point = 132.8°C; Autoignition temperature = 350°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.07% at 15°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. The major uses of dichlorobenzidine are in the manufacture of pigments for printing ink, textiles, plastics, and crayons and as a curing agent for solid urethane plastics. There are no substitutes for many of its uses. Additional groups that may be at risk include workers in the printing or graphic arts professions handling the 3,3′-DCB-based azo pigments. 3,3′-DCB may be present as an impurity in the pigments, and there is some evidence that 3,3′-DCB may be metabolically liberated from the azo pigment.

Incompatibilities: Keep away from strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical are to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements. See Appendix B of the *NIOSH Pocket Guide*.

NIOSH REL (*3,3′-Dichlorobenzidine and its salts*): A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

Note: OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine (and dyes based on them) may present a cancer risk to workers and should be handled with caution and exposure minimized.

ACGIH TLV®[1]: [skin] confirmed animal carcinogen with unknown relevance to humans; exposure to carcinogens must be kept to a minimum.

Protective Action Criteria (PAC)

91-94-1

TEEL-0: 0.2 ppm

PAC-1: 0.6 ppm

PAC-2: 4 ppm

PAC-3: 150 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, [skin], Carcinogen 1993; 0.1 mg/m^3, carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for dichlorobenzidine in ambient air[60] ranging from zero (North Dakota, Pennsylvania, Virginia) to 0.002 μg/m^3 (Rhode Island) to 0.10 μg/m^3 (New York) to 0.15 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method #5509,[18] OSHA Analytical Method ID-65.

Permissible Concentration in Water: *To protect freshwater and saltwater aquatic life*: no criteria developed due to insufficient data. *To protect human health:* preferably zero. An additional life-time cancer risk of 1 in 100,000 results at a level of 0.103 μg/L.[6] States which have set guidelines for dichlorobenzidine in drinking water[61] include Kansas and Minnesota: both at 0.21 μg/L.

Determination in Water: Chloroform extraction followed by concentration and high-performance liquid chromatography (EPA Method 605) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin allergic sensitization, dermatitis, headache, dizziness, caustic burns, frequent urination, dysuria, hematuria (blood in the urine); gastrointestinal upset, upper respiratory infection.

Long Term Exposure: 3,3′-Dichlorobenzidine was shown to be a potent carcinogen in rats and mice in feeding and injection experiments, but no bladder tumors were produced. LD_{50} = (oral-rat) 5250 mg/kg (insignificantly toxic).

Points of Attack: Bladder, liver, lung, skin, gastrointestinal tract.

Medical Surveillance: Preplacement and periodic examinations should include history of exposure to other carcinogens, smoking, alcohol, medication, and family history. The skin, lung, kidney, bladder, and liver should be evaluated; sputum or urinary cytology may be helpful. Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Full body protective clothing and gloves should be used by those employed in handling operations. Full-face supplied-air respirators of continuous-flow or pressure-demand type should also be used. On exit from a regulated area, employees should shower and change into street clothes, leaving their protective clothing and equipment at the point of exit to be placed in impervious containers at the end of the work shift for decontamination or disposal. Effective methods should be used to clean and decontaminate gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: 3,3′-Dichlorobenzidine is an animal carcinogen and Suspected Human Carcinogen. It requires a shipping label of "POISONOUS/TOXIC MATERIALS". 3,3′-Dichlorobenzidine falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s for primary combustion; 1204°C, 1.0 s for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. Nitrogen oxides may be abated through the use of thermal or catalytic devices.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

1,4-Dichloro-2-butene D:0480

Molecular Formula: $C_4H_6Cl_2$

Synonyms: *cis-isomer:* 2-Butene, 1,4-dichloro-; 1,4-DCB; DCB; 1,4-Dichloro-2-butene; 1,4-Dichlorobutene-2; 1,4-

Dicloro-2-butano (Spanish) *trans-isomer:* AI3-52332; 2-Butene, 1,4-dichloro-, (*E*)-; 2-Butene, 1,4-dichloro-, *trans*-; 2-Butylene dichloride; (*E*)-1,4-Dichloro-2-butene; (*E*)-1,4-Dichlorobutene; *trans*-1,4-Dichloro-2-butene; *trans*-1,4-Dichlorobutene; *trans*-2,3-Dichlorobut-2-ene; 1,4-Dichloro-*trans*-2-butene; 1,4-Dichlorobutene-2, (*E*)-; 1,4-Dichlorobutene-2, *trans*-

CAS Registry Number: 764-41-0 (*cis*-); 110-57-6 (*trans*-); 11069-19-5 (mixed isomers)

RTECS® Number: EM4900000 (*cis*-)/132; EM4903000 (*trans*-); EM4730000 (mixed isomers)

UN/NA & ERG Number: UN2920/132

EC Number: 212-121-8 [*Annex I Index No.:* 602-073-00-X]; 203-779-7 (*trans*-)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (*1,4-isomer*): Animal Inadequate Evidence; Human No Data*, not classifiable as carcinogenic to humans*, Group 3.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U074.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (1,4-Dichloro-2-butene and Dichlorobutene).

trans-isomer:

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8240 (5).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): EHS, 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations (*cis*-): Hazard Symbol: T + , N; Risk phrases: R45; R24/25; R26; R34; R50/53; Safety phrases: S53; S45; S60; S61.

European/International Regulations (*trans*-): not listed in Annex 1.

WGK (German Aquatic Hazard Class) (*cis*-): 3—Highly water polluting.

Description: The 1,4-dichloro-2-butenes are colorless liquids. Some have a distinct odor.

(*cis*-isomer): Molecular weight = 125; Boiling point = 153°C; Freezing/Melting point = −48°C. Explosive limits: LEL = 1.5%; UEL = 4.0%. Reacts slowly with water.

(*trans*-isomer): This material has a sweet, pungent odor. Boiling point = 155.5°C; Freezing/Melting point = 1−3°C; Flash point = 53°C. The explosive limits for the *trans*-isomer are LEL = 1.5%; UEL = 4%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water. The *trans-isomer*, only, appears on the EHS list.

Potential Exposure: DC occurs as a by-product in chloroprene manufacture and may be used as a chemical intermediate.

Incompatibilities: (*cis*-isomer): Reacts slowly with water forming hydrogen chloride. Attacks metals and may form other, more dangerous materials; attacks some plastics.

Permissible Exposure Limits in Air

764-41-0

ACGIH TLV®[1]: 0.005 ppm/0.025 mg/m^3 TWA [skin] Suspected Human Carcinogen.

Protective Action Criteria (PAC)

cis-isomer (Dichloro-2-butene, 1,4-)

TEEL-0: 0.005 ppm

PAC-1: 0.6 ppm

PAC-2: 4 ppm

PAC-3: 50 ppm

trans-isomer

TEEL-0: 0.04 ppm

PAC-1: 0.125 ppm

PAC-2: 0.861 ppm

PAC-3: 7.5 ppm

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutagen Category 3A.

Russia[43] set a MAC of 1.0 mg/m^3 in work-place air for 1,3-dichloro-2-butene but set no value for 1,4-dichloro-2-butene.

Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/L for 1,3-dichloro-2-butene in water bodies used for domestic purposes but has no value for 1,4-dichloro-2-butene.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include respiratory distress and burns to skin and eyes. Inhalation of vapor irritates nose and throat. Contact with eyes causes intense irritation and tears. Contact of liquid with skin causes severe blistering. Ingestion causes severe irritation of mouth and stomach. Liquid and vapors from the material are highly corrosive and may damage skin, eyes, lungs, and internal organs.

Long Term Exposure: The material is a carcinogen according to DFG[3] and ACGIH. Corrosive substances may affect the lungs.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions,

including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and Saranex™ are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red (*cis*-isomer): Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Corrosive liquids, flammable, n.o.s. must be labeled: "CORROSIVE, FLAMMABLE LIQUID." It falls in Hazard Class 8.

The code "D" identifies proper shipping names [Dichlorobutene] which are appropriate for describing materials for domestic transportation but may be inappropriate for international transportation under the provisions of international regulations (e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stay upwind; keep out of low areas. Shut off ignition sources. Do not touch spilled material. Use water spray to reduce vapors, but do not get water inside containers. For *small spills*, absorb with sand or other noncombustible absorbent material. For *large spills*, dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: The material will burn, though it may require some effort to ignite. Fire produces irritating and poisonous gases. When heated to decomposition, it emits toxic fumes of chlorine-containing compounds. For small fires, use dry chemical, carbon dioxide, spray, or foam. For large fires, use water spray, fog, or foam. Wear positive-pressure breathing apparatus and full protective clothing. Move containers from fire area if you can do so without risk. Spray containers with cooling water until well after fire is out. Isolate for one-half mile in all directions if tank car or truck is involved in a fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with hydrochloric acid scrubbing. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dichlorodifluoroethylene D:0490

Molecular Formula: $C_2Cl_2F_2$

Common Formula: CFCl=CFCl

Synonyms: Dichlorodifluoroethene; Ethene, dichlorofluoro-; Diclorodifluoroetileno (Spanish) to index

CAS Registry Number: 27156-03-2

RTECS® Number: KV9460000

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichlorodifluoroethylene is a colorless gas or liquid. Molecular weight = 132.93; Boiling point = 21.1°C. ₩ Reacts with water.

Potential Exposure: Those involved in the manufacture of this compound or its use in the synthesis of fluorochemicals. Used for chemical research and development purposes.

Incompatibilities: Reacts with moisture, water, steam, forming corrosive and toxic fumes.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Dichlorodifluoroethylene can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. High levels can cause you to become dizzy, light-headed, and pass out. Similar compounds can cause the heart to beat irregularly, or stop, which can cause death.

Long Term Exposure: May cause liver and kidney damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following tests may be useful: liver function tests. Kidney function tests. Holter monitor (a special 24-h EKG to look for irregular heart beat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Dichlorodifluoroethylene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. On contact with water or steam, dichlorodifluoroethylene produces highly toxic and corrosive fumes. Store in tightly closed containers in a cool, dry area.

Shipping: In its Performance-Oriented Packaging Standards,[19] this material is not specifically cited.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. If dichlorodifluoroethylene gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air; repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they

must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichlorodifluoroethylene may burn but does not readily ignite. Poisonous gases are produced in the fire, including highly toxic fumes of fluorides and chlorides. Containers may explode in fire. Use dry chemical or CO_2 extinguishers. Use water spray to keep fire-exposed containers cool. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 1.0.

US EPA Hazardous Waste Number (RCRA No.): U075.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.23; Nonwastewater (mg/kg), 7.2.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8010 (10); 8240 (5).

Safe Drinking Water Act: Priority List (55 FR 1470) (Removed January 1981).

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichlorodifluoromethane is a colorless, nonflammable gas with a characteristic ether-like odor at >20% by volume. Shipped as a compressed gas. Molecular weight = 120.91; Boiling point = −30°C; Freezing/Melting point = −158°C; Vapor pressure = 5.7 atm. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water; solubility = 0.03% at 25°C.

Potential Exposure: Compound Description: Human Data; Hormone. Dichlorodifluoromethane is used as an aerosol propellant, refrigerant, and foaming agent.

Incompatibilities: Chemically active metals: sodium, potassium, calcium, powdered aluminum, zinc, magnesium. Attacks magnesium and its alloys.

Permissible Exposure Limits in Air

OSHA PEL: 1000 ppm/4950 mg/m^3 TWA.

NIOSH REL: 1000 ppm/4950 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/4950 mg/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 15,000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3000 ppm

PAC-2: 10,000 ppm

PAC-3: 15,000 ppm

DFG MAK: 1000 ppm/5000 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Australia: TWA 1000 ppm (4950 mg/m^3), 1993; Austria: MAK 1000 ppm (5000 mg/m^3), 1999; Belgium: TWA 1000 ppm (4950 mg/m^3), 1993; Finland: TWA 1000 ppm (4950 mg/m^3); STEL 1250 ppm (6200 mg/m^3), 1999; France: VME 1000 ppm (4950 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; Japan: 500 ppm (2500 mg/m^3), 1999; the Netherlands: MAC-TGG 5040 mg/m^3, 2003; Norway: TWA 500 ppm (2475 mg/m^3), 1999; the Philippines: TWA 1000 ppm (4950 mg/m^3), 1993; Poland: MAC (TWA) 4000 mg/m^3, MAC (STEL) 6200 mg/m^3, 1999; Russia: TWA 500 ppm; STEL 3000 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (5000 mg/m^3), 1999; Turkey: TWA 1000 ppm (4950 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (5030 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for R-12 in ambient air[60] ranging from 49.5 mg/m^3 (North Dakota) to 82.5 mg/m^3 (Virginia) to 99.0 mg/m^3 (Connecticut) to 118.0 mg/m^3 (Nevada) to 247.0 mg/m^3 (North Carolina). Those values may well be modified in the future because of concern over the effect of chlorofluorocarbons on the depletion of the ozone layer in the atmosphere.

Determination in Air: Use NIOSH Analytical Method (IV) #1018.

Permissible Concentration in Water: Human health protection: preferably zero. Additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L. In January 1981 EPA (46FR2266) removed F-12 from the priority toxic pollutant list.[6] Russia[35,43] set a MAC of 10 mg/L in water used for domestic purposes. Several states have set guidelines for R-12 in drinking water[61] ranging from 1.0 μg/L in Arizona to 160 μg/L (Maine) to 5600 μg/L (Kansas).

Determination in Water: Use EPA Method 601.

Routes of Entry: Inhalation, eye and/or skin contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Exposure can cause you to become dizzy and lightheaded, and to have trouble concentrating. Exposure can cause the heart to beat irregularly (cardiac arrhythmia) or cause heart arrest. This can cause death. Contact with the liquid can cause severe eye and skin burns from frostbite. Breathing the gas can irritate the mouth, nose, and throat. High levels can cause asphyxiation.

Points of Attack: Cardiovascular system, peripheral nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Where cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends Neoprene™ rubber as a good to excellent protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10,000 ppm:* Sa (APF = 10) (any supplied-air respirator). *15,000 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat. Dichlorodifluoromethane must be stored to avoid contact with chemically active metals (such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium), since violent reactions occur. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: R-12 must be labeled "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. The material itself does not burn. Poisonous gases, including hydrogen chloride, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Because of potential ozone decomposition in the stratosphere, R-12 should be released to the atmosphere only as a last resort.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 204-258-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: DCDMH is a combustible, white powder with a chlorine-like odor. Molecular weight = 197.03; Freezing/Melting point = 130°C; Flash point = 175°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0 Oxidizer, ₩. Water reactive; slightly soluble; solubility = 0.2%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Primary Irritant. It is used as a chlorinating agent, disinfectant, biocide, and laundry bleach. It is also used as a polymerization catalyst in making vinyl chloride and in drug and pesticide synthesis.

Incompatibilities: A strong oxidizer. Contact with water forms poisonous and corrosive gases. Mixtures with xylene may explode. Not compatible with moisture (especially hot water, steam), strong acids, easily oxidized materials (such as ammonia salts, sulfides, etc.), reducing agents, strong bases, ammonium salts, sulfides.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA.

NIOSH REL: 0.2 mg/m^3 TWA; 0.4 mg/m^3 STEL.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA; 0.4 mg/m^3 STEL.

NIOSH IDLH: 5 mg/m^3.

No TEEL available.

Australia: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, 1993; Belgium: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, 1993; Finland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, 1999; France: VME 0.2 mg/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, 2003; the Philippines: TWA 0.2 mg/m^3, 1993; Switzerland: MAK-W 0.2 mg/m^3, 1999; United Kingdom: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.4 mg/m^3. Several states have set guidelines or standards for this material in ambient air[60] ranging from 2.0−4.0 μg/m^3 (North Dakota) to 3.2 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: No method established.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of skin, eyes, mucous membrane, and respiratory system. LD$_{50}$ = (oral-rat) 542 mg/kg (slightly toxic). Higher levels can irritate the lungs, causing a buildup of fluid (pulmonary edema). This can cause death.

Long Term Exposure: Can irritate the lungs, causing bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Eyes, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2 mg/m^3*: Sa (APF = 10) (any supplied-air respirator). *Up to 5 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. 1,3-Dichloro-5,5-dimethyl-hydantoin must be stored to avoid contact with strong acids (such as sulfuric acid, nitric acid, or hydrochloric acid) and easily oxidized materials (such as ammonium salts and sulfides) since violent reactions occur and poisonous gases can be produced. Store in tightly closed containers in a cool, well-ventilated area away from water or steam. 1,3-Dichloro-5,5-dimethyl-hydantoin decomposes with formation of poisonous gases at 201−210°C. If 1,3-dichloro-5,5-dimethyl-hydantoin contacts water or steam, it decomposes at lower temperatures and produces poisonous gases, including chlorine. Sources of ignition, such as smoking and open flames, are prohibited where 1,3-dichloro-5,5-dimethyl-hydantoin is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical or carbon dioxide. *Do not use water*. Poisonous gases are produced in fire, including chlorine, phosgene, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (815.5°C/816°C, 0.5 s for primary combustion; 104.4°C/220°F, 1.0 s for secondary combustion). The formation of elemental chlorine can be prevented by injection of steam or methane into the combustion process. Any nitrogen oxides may be abated by the use of thermal or catalytic devices.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,1-Didichloroethane is a colorless, oily liquid with a chloroform-like odor. Odor threshold = 50−1350 ppm. Molecular weight = 98.96; Specific gravity (H_2O:1) = 1.2; Boiling point = 57.2°C; Freezing/Melting point = −96.6°C; Vapor pressure = 182 mmHg at 20°C; Flash point = −16.6°C (cc); Autoignition temperature = 458°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Explosive limits: LEL = 5.4%; UEL = 11.4%. Slightly soluble in water; solubility = 0.6%.

Potential Exposure: It is used as a solvent, cleaning and degreasing agent, as well as in organic synthesis as an intermediate.

Incompatibilities: Forms explosive mixture with air. Reacts violently with strong oxidizers, alkali metals, earth-alkali metals, powdered metals, causing fire and explosion hazard. Contact with strong caustic will produce flammable and toxic acetaldehyde gas. Attacks aluminum, iron. Attacks some plastics (including polyethylene) and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.05 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/400 mg/m^3 TWA.

NIOSH REL: 100 ppm/400 mg/m^3 TWA, potential animal carcinogen, as chloroethanes; See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 100 ppm/405 mg/m^3 TWA, not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 750 ppm

PAC-2: 3000 ppm

PAC-3: 3000 ppm

DFG MAK: 100 ppm/410 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

NIOSH IDLH: 3000 ppm.

Australia: TWA 200 ppm (810 mg/m^3); STEL 250 ppm, 1993; Austria: MAK 100 ppm (400 mg/m^3), 1999; Belgium: TWA 200 ppm (810 mg/m^3); STEL 250 ppm (1010 mg/m^3), 1993; Finland: TWA 100 ppm (400 mg/m^3); STEL 250 ppm (1000 mg/m^3), 1999; France: VME 200 ppm (810 mg/m^3), 1999; Japan: 100 ppm (400 mg/m^3), 1999; the Netherlands: MAC-TGG 400 mg/m^3, 2003; the Philippines: TWA 100 ppm (400 mg/m^3), 1993; Poland: TWA 50 mg/m^3, 1999; Russia: TWA 100 ppm, 1993; Switzerland: MAK-W 100 ppm (400 mg/m^3), KZG-W 200 ppm (800 mg/m^3), 1999; Thailand: TWA 50 ppm; STEL 100 ppm, 1993; Turkey: TWA 100 ppm (400 mg/m^3), 1993; United Kingdom: TWA 200 ppm (823 mg/m^3); STEL 400 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for ethylidene chloride in ambient air[60] ranging from 8.0 mg/m^3 (Connecticut) to 8.1−10.1 mg/m^3 (North Dakota) to 13.5 mg/m^3 (Virginia) to 19.3 mg/m^3 (Nevada).

Determination in Air: Charcoal tube; CS_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV)#1003, Halogenated hydrocarbons or OSHA Analytical Method 7.

Permissible Concentration in Water: No criteria set for aquatic life or human health due to insufficient data.[6] Several states have set guidelines or standards for ethylidene chloride in drinking water[61] ranging from 1.0 μg/L (Illinois) to 20.0 μg/L (California) to 25 μg/L (New Mexico) to 70.0 μg/L (Vermont) to 850 μg/L (Wisconsin).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 1.79$.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical may affect the central nervous system. Exposure can cause drowsiness, unconsciousness, and death. High exposures may damage the liver or kidneys. Contact can cause eye and skin irritation with eye burns. Long-term exposure can cause thickening and cracking of skin. 1,1-Dichloroethane is a highly flammable liquid and a dangerous fire hazard. Never use near combustion sources. Do not use 1,1-dichloroethane where welding is being done because deadly phosgene gas can be formed.

Long Term Exposure: It may damage the developing fetus. The liquid destroys the skin's natural oils. May affect the kidneys and liver. A chloroethane, this chemical may be a potential occupational carcinogen. Prolonged skin contact can cause thickening and cracking of the skin and mild burns. Although not adequately evaluated, similar petroleum-based chemicals can cause brain or other nerve damage.

Points of Attack: Skin, liver, kidneys, lungs, central nervous system.

Medical Surveillance: If overexposure or illness is suspected, consider liver and kidney function tests. Interview for brain effects, including recent memory, mood, concentration, headaches, malaise, altered sleep patterns. Consider autonomic and peripheral nervous system evaluation. Positive and borderline cases should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear solvent-resistant protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Tychem 10000® suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* Sa (APF = 10) (any supplied-air respirator). *2500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *3000 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,1-Dichloroethane must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and fluorine, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where 1,1-dichloroethane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers used in the transfer of 5 gallons or more of 1,1-dichloroethane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,1-dichloroethane.

Shipping: This material requires a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous and corrosive fumes, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichloroethyl acetate is a water-white liquid. Molecular weight = 155.32; Boiling point = 58−65°C at 13 mmHg; Flash point = 152°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Contact with strong oxidizing acids may cause an exothermic reaction strong enough to ignite reaction products. May explode on contact with nitrates and heat. Reacts with caustic solutions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.35 ppm

PAC-1: 1 ppm

PAC-2: 1.71 ppm

PAC-3: 6 ppm

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: EPA states that the material is toxic by inhalation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and nitrates. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: There is no label requirement, Hazard category, or Packing group.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Ventilate area of spill or leak. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Safe Drinking Water Act: MCL, 0.07 mg/L; MCLG, 0.07 mg/L; Regulated chemical (47 FR 9352).

European/International Regulations: Hazard Symbol: F, Xn, N; Risk phrases: R11; R20; R52/53; Safety phrases: S2; S7; S16; S29; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*all isomers*).

Description: 1,2-Dichloroethylene exists as three isomers: *sym*-, *cis*- 60%, and *trans*- 40%. There are variations in toxicity between these three forms. At room temperature, these chemicals are colorless liquids with a slightly acrid, ethereal odor. The odor threshold in air is 17 ppm.

sym-isomer: Molecular weight = 96.94; Boiling point = 48−55°C. Specific gravity (H_2O:1) = 1.27 at 25°C; Flash point = 2°C (cc); Autoignition temperature = 460°C. Explosive Limits: LEL = 9.7%; UEL = 12.8%. Poor solubility in water; solubility = 0.4%.

cis-isomer*:* Boiling point = 60.3°C; Freezing/Melting point = −82°C; Flash point = 6°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2.

trans-isomer*:* Boiling point = 47.5°C; Freezing/Melting point = −49°C; Flash point = 2−4°C. The explosive limits are LEL = 5.6% or 9.7%[52]; UEL = 12.8%. Slightly soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2.

Potential Exposure: Compound Description: Mutagen. Primary Irritant. 1,2-Dichloroethylene is used as a solvent for waxes, resins, and acetylcellulose. It is also used in the extraction of rubber, as a refrigerant, in the manufacture of pharmaceuticals and artificial pearls, and in the extraction of oils and fats from fish and meat.

Incompatibilities: Forms explosive mixture with air. Keep away from strong oxidizers. Gradual decomposition results in hydrochloric acid formation in the presence of ultraviolet light or upon contact with hot metal or other hot surfaces. Reacts with strong oxidizers, strong bases, potassium hydroxide, difluoromethylene, dihypofluoride, nitrogen tetroxide (explosive), or copper (and its alloys) producing toxic chloroacetylene which is spontaneously flammable on contact with air. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.97 mg/m^3 (*sym*-dichloroethylene) at 25°C & 1 atm.

OSHA PEL: 200 ppm/790 mg/m^3 TWA.

NIOSH REL: 200 ppm/790 mg/m^3 TWA.

ACGIH TLV®[1]: 200 ppm/793 mg/m^3 TWA, all isomers.

NIOSH IDLH: 1000 ppm *(sym*-dichloroethylene).

Protective Action Criteria (PAC)*

sym-isomer (540-59-0)

TEEL-0: 200 ppm

PAC-1: 200 ppm

PAC-2: 200 ppm

PAC-3: 1000 ppm

cis-isomer

TEEL-0: 140 ppm

PAC-1: **140** ppm

PAC-2: **500** ppm

PAC-3: **850** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

trans-isomer

TEEL-0: 200 ppm

PAC-1: **280** ppm

PAC-2: **1000** ppm

PAC-3: **1700** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 200 ppm/800 mg/m^3; Peal Limitation Category II(2) (*sym-*).

Australia: TWA 200 ppm (790 mg/m^3), 1993; Austria: MAK 200 ppm (790 mg/m^3), 1999; Belgium: TWA 200 ppm (793 mg/m^3), 1993; Denmark: TWA 200 ppm (790 mg/m^3), 1999; Finland: TWA 200 ppm (790 mg/m^3); STEL 250 ppm (990 mg/m^3), 1999; Hungary: TWA 80 mg/m^3; STEL 160 mg/m^3, 1993; Japan: 150 ppm (590 mg/m^3), 1999; the Netherlands: MAC-TGG 790 mg/m^3, 2003; Norway: TWA 100 ppm (395 mg/m^3), 1999; the Philippines: TWA 200 ppm (790 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, 1999; Russia: TWA 150 ppm, 1993; Switzerland: MAK-W 200 ppm (790 mg/m^3), KZG-W 400 ppm (1580 mg/m^3), 1999; Turkey: TWA 200 ppm (790 mg/m^3), 1993; United Kingdom: TWA 200 ppm (806 mg/m^3); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 200 ppm. Several States have set guidelines or standards for *sym*-dichloroethylene in ambient air[60] ranging from 0.110 mg/m^3 (Massachusetts) to 13.0 mg/m^3 (Virginia) to 15.8 mg/m^3 (Connecticut) to 18.8 mg/m^3 (Nevada).

Determination in Air: Charcoal absorption workup with CS_2, analysis by gas chromatography. Use NIOSH Analytical Method #1003 for hydrocarbons, halogenated or OSHA Analytical Method 7.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 11,600 μg/L on an acute toxicity basis for dichloroethylenes in general. *To protect saltwater aquatic life:* 224,000 μg/L on an acute toxicity basis for dichloroethylenes as a class. To protect human health—no criteria developed due to insufficient data.[6] A long-term health advisory for *cis*-1,2-DCE has been determined by EPA[48] as 3.5 mg/L and a lifetime health advisory as 0.07 mg/L. Maximum levels in drinking water have been set by EPA[62] at 0.07 mg/L for the *cis*-isomer and 0.10 mg/L for the *trans*-isomer. Several states have set guidelines or standards for the dichloroethylenes in drinking water[61] as follows:

State	***cis-* (μg/L)**	***trans-* (μg/L)**	***sym-* (μg/L)**
Arizona	–	–	70
California	16	16	–
Kansas	70	70	–
Maine	400	270	–
Minnesota	70	70	–
New Jersey	–	–	10
Vermont	–	–	70
Wisconsin	100	100	–

Determination in Water: *trans*-1,2-dichloroethylene may be determined by inert gas purge followed by gas chromatography with halide-specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol–water coefficient: Log $K_{ow} = 1.96$.

Routes of Entry: Inhalation of the vapor, ingestion, skin and eye contact.

Short Term Exposure: This liquid can act as a primary irritant producing dermatitis and irritation of mucous membranes. 1,2-DCE irritates the eyes, skin, and respiratory tract. Skin contact can cause a burning sensation and rash. 1,2-Dichloroethylene acts principally as a narcotic, causing central nervous system depression. Symptoms of acute exposure include dizziness, nausea, frequent vomiting, and central nervous system intoxication, similar to that caused by alcohol. High levels can cause unconsciousness. LD_{50} = (oral-rat) 770 mg/kg (slightly toxic).

Long Term Exposure: Destroys skin's natural oils. Repeated exposure may damage the liver and kidneys. Renal effects, when they do occur, are transient.

Points of Attack: Respiratory system, eyes, central nervous system.

Medical Surveillance: Consider possible irritant effects on skin or respiratory tract as well as liver, and renal function as preplacement or periodic examinations. Expired air analysis may be useful in detecting exposure. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade® coated suits; CPF3® suits; Responder™ suits; Trychem 10000® suits. **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials for the *cis-* and *trans-*isomers. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,2-DCE you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2-Dichloroethylene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 1,2-dichloroethylene is used, handled, or stored. Metal containers involving the transfer of 5 gallons or more of 1,2-dichloroethylene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of 1,2-dichloroethylene. Wherever 1,2-dichloroethylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dichloroethylene must carry a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,2-DCE is a flammable liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Dichloroethyl ether is a clear, colorless liquid with a pungent, fruity odor. It is also described as having a chlorinated solvent-like odor. Molecular weight = 143.02; Boiling point = 176−178°C; Flash point = 55°C[17]; Autoignition temperature = 369°C; Explosive limits: LEL = 2.7%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Insoluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary Irritant. Dichloroethyl ether is used as a soil fumigant, an insecticide, and an acaricide, and in the manufacture of paint, varnish, lacquer, soap, and finish removers. It is also used as a solvent for cellulose esters, naphthalenes, oils, fats, waxes, greases, pectin, tar, and gum, in dry cleaning and in textile scouring.
Incompatibilities: Contact with moisture caused decomposition producing hydrochloric acid. Can form peroxides. Forms explosive mixture with air. Contact with strong oxidizers may cause fire and explosion hazard. Attacks some plastics, rubber, and coatings. Attacks metals in the presence of moisture.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 5.85 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 15 ppm/90 mg/m^3 Ceiling Concentration [skin].
NIOSH REL: 5 ppm/30 mg/m^3 TWA; 10 ppm/60 mg/m^3 STEL [skin]; See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 5 ppm/29 mg/m^3 TWA; 10 ppm/58 mg/m^3 STEL [skin], not classifiable as a human carcinogen.
NIOSH IDLH: 100 ppm.
Protective Action Criteria (PAC)
TEEL-0: 5 ppm
PAC-1: 10 ppm
PAC-2: 2.5 ppm
PAC-3: 100 ppm
DFG MAK: 10 ppm/59 mg/m^3 TWA; Peak Limitation Category I(1) [skin].
Australia: TWA 5 ppm (30 mg/m^3); STEL 10 ppm, [skin], 1993; Austria: MAK 5 ppm (30 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (29 mg/m^3); STEL 10 ppm (58 mg/m^3), [skin], 1993; Finland: TWA 5 ppm (30 mg/m^3); STEL 10 ppm (60 mg/m^3), [skin], 1999; France: VME 5 ppm (30 mg/m^3), [skin], 1999; Japan: 15 ppm (88 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 30 mg/m^3, 2003; the Philippines: TWA 15 ppm (90 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 60 mg/m^3,

Several states have set guidelines or standards for BCEE in ambient air[60] ranging from 0.0714 mg/m^3 (Kansas) to 0.3−0.6 mg/m^3 (North Dakota) to 0.5 mg/m^3 (Virginia) to 0.6 mg/m^3 (Connecticut) to 0.714 mg/m^3 (Nevada) to 0.72 mg/m^3 (Pennsylvania).

Determination in Air: Charcoal tube; CS_2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1004 or OSHA Analytical Method 7.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 238,000 μg/L for chloroalkyl ethers in general. No criteria developed for protection of saltwater aquatic life due to insufficient data. For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.3 μg/L.[6] Several states have set guidelines for BCEE in drinking water[61] ranging from 0.31 μg/L (Minnesota) to 4.2 μg/L (Kansas) to 8.3 μg/L (Maine) to 10.0 μg/L (Arizona).

Determination in Water: CH_2Cl_2 extraction followed by gas chromatography with halogen; specific detector (EPA Method 611) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: BCEE can be absorbed through the skin, thereby increasing exposure. Exposure irritates the eyes, skin, and respiratory tract. Skin and eye contact may cause burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. At concentrations above 500 ppm, coughing, retching, and vomiting may occur; as well as profuse tearing. There can be irritation at lower concentrations. This material is very toxic; the probable oral lethal dose is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb person. It can be a central nervous system depressant in high concentrations. It is extremely irritating to the eyes, nose, and respiratory passages. It can penetrate the skin to cause serious and even fatal poisoning. Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin.

Long Term Exposure: BCEE may damage the liver and kidneys. Can irritate the lungs; repeated exposures may cause bronchitis.

Points of Attack: Respiratory system, skin, eyes, liver and kidneys. This chemical causes liver cancer in animals and may be a potential human carcinogen.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: liver, kidney, and lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Tychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with BCEE you should be trained on its proper handling and storage.

Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Bis (2-chloroethyl) ether must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and chlorine dioxide, since violent reactions occur, and moisture. Store in tightly closed containers in a cool, dry, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where bis (2-chloroethyl) ether is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dichloroethyl ether must carry a "POISONOUS/ TOXIC MATERIALS, FLAMMABLE LIQUID" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb spills in vermiculite, dry sand, earth, or similar material. Keep material out of water sources and sewers. Build dikes to contain flow as necessary. Use water spray to knock down vapors. *Spill or leak:* shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dichloromethylphenyl-silane D:0560

Molecular Formula: $C_7H_8Cl_2Si$

Common Formula: $C_6H_5SiCl_2CH_3$

Synonyms: Dichloromethylphenylsilane; Methylphenyldichlorosilane; Phenylmethyldichlorosilane; Silane, dichloromethylphenyl-

CAS Registry Number: 149-74-6

RTECS$^{®}$ Number: VV3530000

UN/NA & ERG Number: UN2437/156

EC Number: 205-746-2

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dichloromethylphenyl-silane is a flammable, colorless liquid. Molecular weight = 191.14; Boiling point = 205°C; Freezing/Melting point: −52.7°C; Flash point = 82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts with water.

Potential Exposure: Used in the manufacture of silicones and as a chemical intermediate for silicone fluids, resins, and elastomers.

Incompatibilities: Forms explosive mixture with air. Contact with moisture causes decomposition, forming HCl, and explosive hydrogen. Contact with ammonia may form a self-igniting material. Reacts strongly with oxidizing materials. Attacks some metals in the presence of moisture.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The chemical is toxic and a corrosive irritant. Contact with the skin or eyes causes burns and permanent damage. Inhalation may cause irritation. Higher exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause lung irritation and bronchitis.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with methylphenyldichlorosilane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture, oxidizers, and ammonia. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Methylphenyldichlorosilane requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Fire Extinguishing: Dichloromethylphenyl-silane is a combustible liquid. Poisonous gases, including silicon oxides and hydrogen chloride, are produced in fire. *Do not use water*. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dichlorofluoro-methane is a heavy, colorless gas or liquid (below 9°C) with a slight ether-like odor. Molecular weight = 102.92; Boiling point = 9°C; Freezing/Melting point = −135°C; Relative vapor density (air = 1) = 3.57; Vapor pressure = 1.6 atm at 25°C; Autoignition temperature = 522°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Poor solubility in water; solubility = 0.7% at 30°C.

Potential Exposure: Compound Description: Reproductive Effector. This material is used as a refrigerant and a propellant gas.

Incompatibilities: Reacts violently with chemically active metals: sodium, potassium, calcium, powdered aluminum, zinc, magnesium, alkali, alkaline earth. Reacts with acids or acid fumes producing highly toxic chlorine and fluorine fumes. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 1000 ppm/4200 mg/m^3 TWA.
NIOSH REL: 10 ppm/40 mg/m^3 TWA.
ACGIH TLV®[1]: 10 ppm/42 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 10 ppm
PAC-1: 1500 ppm
PAC-2: 5000 ppm
PAC-3: 5000 ppm
DFG MAK: 10 ppm/43 mg/m^3 TWA; Peak Limitation Category II(2).
NIOSH IDLH: 5000 ppm.

Australia: TWA 10 ppm (40 mg/m^3), 1993; Austria: MAK 10 ppm (45 mg/m^3), 1999; Belgium: TWA 10 ppm (42 mg/m^3), 1993; Denmark: TWA 10 ppm (40 mg/m^3), 1999; Finland: TWA 10 ppm (40 mg/m^3); STEL 20 ppm (80 mg/m^3), 1999; France: VME 10 ppm (40 mg/m^3), 1999; Hungary: STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 43 mg/m^3, 2003; Norway: TWA 10 ppm (42 mg/m^3), 1999; the Philippines: TWA 1000 ppm (4200 mg/m^3), 1993; Poland: MAC (TWA) 40 mg/m^3, MAC (STEL) 200 mg/m^3, 1999; Switzerland: MAK-W 10 ppm (40 mg/m^3), KZG-W 20 ppm (80 mg/m^3), 1999; Turkey: TWA 1000 ppm (4200 mg/m^3), 1993; United Kingdom: TWA 10 ppm (43 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm. Several states have set guidelines or standards for R-21 in ambient air[60] ranging from 0.4 mg/m^3 (North Dakota) to 0.5 mg/m^3 (North Carolina) to 0.65 mg/m^3 (Virginia) to 0.8 mg/m^3 (Connecticut) to 0.952 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2516.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 1.55.

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with the liquid may cause frostbite. This chemical affects the central nervous system at high concentrations. High exposure could cause asphyxia and/or cardiac arrhythmia (irregular heartbeat). This might lead to cardiac arrest.

Long Term Exposure: May damage the developing fetus. May damage the liver. May cause irregular heartbeat.

Points of Attack: Respiratory system, lungs, cardiovascular system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. EKG, liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm*: Sa (APF = 10) (any supplied-air respirator). *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *500 ppm*: SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *5000 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with dichloromonofluoro-methane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chemically active metals, acids, acid fumes, alkali and alkaline earth metals, since violent reaction occur. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Dichloromonofluoro-methane must be labeled "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine, fluorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition

sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Because of recent discovery of potential ozone decomposition in the stratosphere, this material should be released to the atmosphere only as a last resort.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; Safety phrases: S1/2; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1,1-Dichloro-1-nitroethane is a colorless liquid with an unpleasant odor; causes tears. Molecular weight = 143.96; Boiling point = 124°C; Vapor pressure = 15 mmHg at 20°C; Flash point = 58°C; 76°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 3. Poor solubility in water; solubility = 0.3%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. This material is used as a fumigant insecticide. Therefore, those engaged in the manufacture, formulation, and application of this material may be exposed.

Incompatibilities: Strong oxidizers. Corrosive to iron in the presence of moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.89 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/60 mg/m^3 Ceiling Concentration.

NIOSH REL: 2 ppm/10 mg/m^3 TWA.

ACGIH TLV®[1]: 2 ppm/12 mg/m^3 TWA.

No TEEL available.

DFG MAK: No numerical value established. Data may be available.

Australia: TWA 2 ppm (10 mg/m^3), 1993; Austria: MAK 2 ppm (12 mg/m^3), 1999; Belgium: TWA 2 ppm (12 mg/m^3), 1993; Finland: TWA 10 ppm (60 mg/m^3), STEL 20 ppm (120 mg/m^3), 1999; France: VME 2 ppm (10 mg/m^3), 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; the Philippines: TWA 10 ppm (60 mg/m^3), 1993; Poland: MAC (TWA) 30 mg/m^3, MAC (STEL) 60 mg/m^3, 1999; Switzerland: MAK-W 2 ppm (12 mg/m^3), 1999; Thailand: TWA 10 ppm (60 mg/m^3), 1993; Turkey: TWA 10 ppm (60 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm. Several states have set guidelines or standards for dichloronitroehtane in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1601 or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: In animals: lung, skin, eye irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 410 mg/kg (moderately toxic).

Long Term Exposure: This chemical causes liver, heart, kidney, and blood vessel damage in animals.

Points of Attack: Lungs.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 20 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 25 ppm:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: 1,1-Dichloro-1-nitroethane requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Water may be used to blanket fire since liquid is heavier than water (sp. gr. = 1.4). Apply water gently to the surface of the liquid.[17] Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s for primary combustion; 1204°C, 1.0 s for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. Nitrogen oxides may be abated through the use of thermal or catalytic devices.

2,4-Dichlorophenol D:0590

Molecular Formula: $C_6H_4Cl_2O$

Common Formula: $Cl_2C_6H_3OH$

Synonyms: 2,4-DCP; 1,3-Dichloro-4-hydroxybenzene; 4,6-Dichlorophenol; 2,4-Diclorofenol (Spanish); Phenol, 2,4-dichloro-

CAS Registry Number: 120-83-2

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, Drinking Water, ≤0.0003 mg/L MAC, National Pollutant Release Inventory (NPRI).

Mexico Drinking water, 0.03 mg/L.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R22; R24; R34; R51/53; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 2,4-DCP is a colorless crystalline solid with a characteristic odor. Molecular weight = 163.00; Boiling point = 210°C; Freezing/Melting point = 45.0°C; Flash point = 113°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. 2,4-Dichlorophenol is a commercially produced substituted phenol used in the manufacture of industrial and agricultural products and in synthesis of pharmaceuticals. As an intermediate in the chemical industry, 2,4-DCP is utilized as the feedstock for the manufacture of 2,4-dichlorophenoxyacetic acid (2,4-D) and 2,4-D derivatives (germicides, soil sterilants, etc.); certain methyl compounds are used in mothproofing, antiseptics, and seed disinfectants. 2,4-DCP is also reacted with benzene sulfonyl chloride to produce miticides or further chlorinated to pentachlorophenol, a wood preservative. It is thus a widely used pesticide intermediate. The only group expected to be at risk for high exposure to 2,4-DCP is industrial workers involved in the manufacturing or handling of 2,4-DCP and 2,4-D.

Incompatibilities: Violent reaction with strong oxidizers. Contact with acids or acid fumes causes decomposition releasing poisonous chlorine gas. Incompatible with caustics, acid anhydrides, acid chlorides. Quickly corrodes aluminum, slowly corrodes zinc, tin, brass, bronze, copper, and its alloys. May accumulate static electrical charges and may cause ignition of its vapors.

Permissible Exposure Limits in Air

AIHA WEEL: 1 ppm TWA [skin]; Absorbed rapidly through the skin in molten or heated liquid form in amounts that have caused rapid death in humans.

Protective Action Criteria (PAC)
TEEL-0: 0.2 ppm
PAC-1: 0.2 ppm
PAC-2: 2 ppm
PAC-3: 20 ppm

Michigan[60] has set a guideline for 2,4-dichlorophenol in ambient air of 77.0 μg/m^3.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 2020 μg/L on an acute toxicity basis and 365 μg/L on a chronic toxicity basis. *To protect saltwater aquatic life:* no criteria because of insufficient data. *To protect human health:* 0.3 μg/L based on organoleptic effects and 3090 μg/L based on toxicity data.[6] Canada, Drinking Water, ≤0.0003 mg/L MAC. Mexico Drinking Water, 0.03 mg/L. Russia[35,43] set a MAC of 2 μg/L in water bodies used for domestic purposes. This applies to all dichlorophenols isomers. Two states have set guidelines for 2,4-dichlophenol in drinking water: Maine at 200 μg/L and Kansas at 700 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion, through the skin.

Harmful Effects and Symptoms

Although a paucity of aquatic toxicity data exists, 2,4-DCP appears to be less toxic than the higher chlorinated phenols. 2,4-DCP's toxicity to certain microorganisms and plant life has been demonstrated and its tumor-promoting potential in mice has been reported. In addition, it has been demonstrated that 2,4-DCP can produce objectionable odors when present in water at extremely low levels. These findings, in conjunction with potential 2,4-DCP pollution by waste sources from commercial processes or the inadvertent production of 2,4-DCP due to chlorination of waters containing phenol, led to the conclusion that 2,4-DCP represents a potential threat to aquatic and terrestrial life, including humans. 2,4-DCP can irritate tissue and mucous membranes. LD_{50} = (oral-rat) 580 mg/kg (slightly toxic).

Short Term Exposure: 2,4-DCP can be absorbed through the skin, thereby increasing exposure. Skin or eye contact can cause irritation and burns. Inhalation can cause respiratory irritation, coughing, and wheezing. A suspected carcinogen.

Long Term Exposure: May cause liver and kidney damage. May affect the nervous system causing headache, dizziness, nausea, vomiting, weakness, and possible coma. Several other chlorophenols are carcinogenic, although 2,4-DCP has not been identified specifically as a carcinogen.

Points of Attack: Nervous system, liver, and kidneys.

Medical Surveillance: Examination of the nervous system. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DCP you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers, acid, acid fumes, acid chlorides, acid anhydrides, caustics. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorophenols, solid require a "POISONOUS/TOXIC MATERIALS" label. 2,4-DCP falls in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Dry chemical or CO_2 are preferred extinguishers. Water or foam may cause frothing. Poisonous gases are produced in fire, including corrosive hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent and incinerate in a furnace equipped with afterburner and scrubber.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Developmental/Reproductive toxin 4/27/99.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; R38; R41; Safety phrases: S2; S26; 36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 2,4-DP is a combustible, colorless to yellowish to tan crystalline solid with a faint phenolic odor; Molecular weight = 235.07; Freezing/Melting point = 117−118°C. Soluble in water; solubility = 350 mg/L at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. May be applied as a liquid formulated with a flammable carrier, which can alter the physical properties listed here.

Potential Exposure: A phenoxy herbicide.

Incompatibilities: Contact with oxidizers may cause a fire and explosion hazard. The aqueous solution is a weak acid. Attacks many metals in presence of moisture.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Water: No method listed. Octanol−water coefficient: Log $K_{ow} = 5.9$

Routes of Entry: Inhalation and passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause headache, fatigue, muscle twitching, fever, nausea, vomiting, diarrhea, stomach pain, poor appetite, and convulsions.

Long Term Exposure: There is limited evidence that related phenoxy herbicide compounds cause cancer. May cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 2,4-DP you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers and bases. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically transfer material from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Phenoxy pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: *Solid material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid formulations containing organic solvents: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Solid material:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including phosgene, hydrogen chloride, and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid formulations containing organic solvents: This chemical is a combustible liquid. Poisonous gases, including phosgene, hydrogen chloride, and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Reference

New Jersey Department of Health and Senior Services. (October 2006). *Hazardous Substances Fact Sheet: 2-(2,4-Dichlorophenoxy) Propionic Acid.* Trenton NJ

Dichlorophenyl isocyanates D:0620

Molecular Formula: $C_7H_3C_{12}NO$ (102-36-3)

Synonyms: *102-36-3:* Benzene, 1,2-dichloro-4-isocyanato-; 3,4-Dichlorfenylisokyanat; 1,2-Dichloro-4-phenyl isocyanate; 3,4-Dichlorophenyl isocyanate; Dichlorophenyl isocyanate

Other dichlorophenyl isocyanates: Benzene, 2,4-dichloro-1-isocyanato-; 1,2-Dichloro-3-phenyl isocyanate; 1,3-Dichloro-2-phenyl isocyanate; 1,4-Dichloro-2-phenyl isocyanate; 2,4-Dichloro-1-phenyl isocyanate; Dichlorophenyl isocyanate

CAS Registry Number: *General group:* 102-36-3; 41195-90-8; 39920-37-1; 5392-82-5; 2612-57-9; 34893-92-0

RTECS® Number: NQ8755000 (General group); NQ8760000 (102-36-3)

UN/NA & ERG Number: UN2250/156

EC Number: 203-026-2 (CAS: 102-36-3); 255-253-1 (CAS: 41195-90-8); 254-699-4 (CAS: 39920-37-1); 226-396-7 (CAS: 5392-82-5); 220-040-4 (CAS: 2612-57-9); 252-276-9 (CAS: 34893-92-0)

Regulatory Authority and Advisory Bodies

Isocyanic Acid, 3,4-Dichlorophenyl Ester (102-36-3).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%, all isomers.

WGK (German Aquatic Hazard Class): 2—Water polluting (CAS: 102-36-3).

Description: The dichlorophenyl isocyanates are combustible, crystalline (sugar- or sand-like) solids. In general, they are white to yellow in color, but the 1,4-dichloro-2-phenyl isomer is white to light green. Their flash points are generally >113°C but that of the 1,3-dichloro-2-phenyl isomer is reported as 77°C. These chemicals are insoluble in water, and some may be reactive. *1,2-dichloro-4-isomer* (CAS 102-36-3) is the isomer of regulatory focus: Freezing/Melting point = 42−43°C. Molecular weight = 188.01; Boiling point = 243°C; Freezing/Melting point = 42°C. Reacts with water.

Potential Exposure: Those materials used as chemical intermediates.

Incompatibilities: Water (forms carbon dioxide), alcohols and glycols, acids, ammonia, strong bases, carboxylic acids, amines, caprolactum solution, and metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 14 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: Impinger; Reagent; High-pressure liquid chromatography/Fluorescence/Electrochemical detection; NIOSH Analytical Method (IV) #5522, Isocyanates. See also Method #5521.

Permissible Concentration in Water: No criteria set. Reacts with water, forming carbon dioxide.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, nose, throat, air passages, and lungs, causing coughing, shortness of breath, and tightness in the chest.

Long Term Exposure: Dichlorophenyl isocyanates may cause an asthma-like allergy. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dichlorophenyl isocyanates, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with these chemicals you should be trained on its proper handling and storage. Store to avoid contact with alcohols, strong bases (such as potassium hydroxide and sodium hydroxide), carboxylic acids, amines, and metals since violent reactions occur. Store in tightly closed containers in a dry, cool, well-ventilated area away from moisture and temperatures above 40°C.

Shipping: Dichlorophenyl isocyanates must carry a "POISONOUS/TOXIC MATERIALS" label. They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are combustible solids. Use dry chemical, carbon dioxide, or water spray extinguishers. Poisonous gases are produced in fire, including hydrogen cyanide, oxides of nitrogen, and hydrogen chloride gas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Combustion in an incinerator equipped with afterburner and fume scrubber.

Dichlorophenyl trichloro-silane D:0630

Molecular Formula: $C_6H_3Cl_5Si$
Common Formula: $Cl_2C_6H_3SiCl_3$
Synonyms: Silane, trichloro(dichlorophenyl)-; Trichloro (dichlorophenyl)silane
CAS Registry Number: 27137-85-5
RTECS® Number: VV3540000
UN/NA & ERG Number: UN1766/156
EC Number: 248-254-3
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Dichlorophenyl trichloro-silane is a straw-colored liquid. Molecular weight = 280.43; Boiling point = 258.6°C; Vapor pressure = <1 mmHg at 18°C; Flash point = 141°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Decomposes in water.
Potential Exposure: This material is used in silicone polymer manufacture.
Incompatibilities: Water, combustible materials.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.2 ppm
PAC-1: **0.6** ppm
PAC-2: **7.3** ppm
PAC-3: **33** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
Russia[43] set a MAC of 1.0 mg/m^3 in work-place air.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. This substance is a corrosive chemical and contact can cause severe skin and eye burns. Exposure can irritate the eyes, nose, and throat.
Long Term Exposure: Repeated exposure may affect the lungs.
Points of Attack: Lungs.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to Dichlorophenyl trichloro-silane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure demand or other positive-pressure mode.
Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Dichlorophenyl trichloro-silane should be stored to avoid contact with moisture or with combustible materials, such as wood, paper, and oil.
Shipping: This chemical requires a shipping label of "CORROSIVE". It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Fire Extinguishing: Dichlorophenyl trichloro-silane may burn but does not readily ignite. Poisonous gas is produced in fire. Use dry chemical, CO_2, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, National Pollution Release Inventory (NPRI).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Dichloropropane is a colorless stable liquid. Sweet, chloroform-like odor. The odor threshold in air is 0.25 ppm. Molecular weight = 112.99; Specific gravity (H_2O:1) = 1.16; Boiling point = 96°C; Freezing/Melting point = − 100°C; Vapor pressure = 40 mmHg at 20°C; Flash point = 16°C (cc); Autoignition temperature = 557°C. Explosive limits: LEL = 3.4%; UEL = 14.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Very slightly soluble in water; solubility = 0.3% at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Dichloropropane is used as a chemical intermediate in perchloroethylene and carbon tetrachloride synthesis, and as a lead scavenger for antiknock fluids. It is also used as a solvent for fats, oils, waxes, gums, and resins, and in solvent mixtures for cellulose esters and ethers. Other applications include the use of dichloropropane; as a fumigant, alone and in combination with dichloropropane, as a scouring compound; and a metal degreasing agent. It is also used as an insecticidal fumigant.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges and may cause ignition of its vapors. Contact with strong oxidizers, powdered aluminum may cause fire and explosion hazard. Strong acids can cause decomposition and the formation of hydrogen chloride vapors. Reacts with strong bases, *o*-dichlorobenzene, 1,2-dichloroethane. Corrosive to aluminum and its alloys. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.62 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 75 ppm/350 mg/m^3 TWA.

NIOSH REL: Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/46 mg/m^3 TWA, sensitizer, not classifiable as a human carcinogen.

78-87-5

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 200 ppm

PAC-2: 400 ppm

PAC-3: 400 ppm

DFG MAK: Carcinogen Category 3B.

NIOSH IDLH: [Ca] 400 ppm.

Australia: TWA 75 ppm (350 mg/m^3); STEL 110 ppm, 1993; Austria: MAK 75 ppm (350 mg/m^3), 1999; Belgium: TWA 75 ppm (347 mg/m^3); STEL 110 ppm (509 mg/m^3), 1993; Denmark: TWA 75 ppm (350 mg/m^3), 1999; Finland: TWA 75 ppm (350 mg/m^3); STEL 115 ppm (530 mg/m^3), 1999; France: VME 75 ppm (350 mg/m^3), 1999; Hungary: TWA 50 mg/m^3; STEL 100 mg/m^3 [skin] 1993; the Netherlands: MAC-TGG 350 mg/m^3, 2003; Norway: TWA 40 ppm (185 mg/m^3), 1999; the Philippines: TWA 75 ppm (350 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, MAC (STEL) 400 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Switzerland: MAK-W 75 ppm (350 mg/m^3), KZG-W 375 ppm (1750 mg/m^3), 1999; Turkey: TWA 74 ppm (350 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 110 ppm. Russia[35, 43] set a MAC of 0.18 mg/m^3 in ambient air in residential areas on a daily average basis. Several states have set guidelines or standards for propylene dichloride in ambient air[60] ranging from 5.1 μg/m^3 (Massachusetts) to 13.89 μg/m^3 (Kansas) to 3500−5100 μg/m^3 (North Dakota) to 5800 μg/m^3 (Virginia) to 7000 μg/m^3 (Connecticut) to 8330 μg/m^3 (Nevada).

26638-19-7

TEEL-0: 5 ppm

PAC-1: 15 ppm

PAC-2: 100 ppm

PAC-3: 350 ppm

Determination in Air: Use NIOSH Analytical Method (IV) #1013 or OSHA Analytical Method 7.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 23,000 μg/L on an acute toxicity basis and 5700 μg/L on a chronic basis. *To protect saltwater aquatic life:* 10,300 μg/L on an acute toxicity basis and 3040 μg/L on a chronic basis. *To protect human health:* no value set because of insufficient data.[6] EPA[62] has recently proposed a limit of 0.005 mg/L (5 μg/L) in drinking water. Several states have set guidelines for propylene dichloride in drinking water[61] ranging from 1 μg/L (Arizona, Massachusetts) to 6 μg/L (Kansas and Minnesota) to 10 μg/L (California and Connecticut). Russia[35,43] set a MAC of 0.4 mg/L in water bodies used for domestic purposes. The US EPA[47] has derived a no-observed-adverse-effects-level (NOAEL) of 8.8 mg/kg/day which gives a 10-day health advisory of 0.09 mg/L for a 10-kg child.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = about 2.

Routes of Entry: Inhalation of vapor, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: 1,2-Dichloropropane irritates the eyes, skin, and respiratory tract. It may affect the nervous system. High concentration exposure can result in lightheadedness, dizziness, and unconsciousness. Propylene dichloride may cause dermatitis and defatting of the skin. More severe irritation may occur if it is confined against the skin by clothing. Undiluted, it is moderately irritating to the eyes, but does not cause permanent injury. The vapor can irritate the nose, throat, eyes, and air passages. Repeated or prolonged skin contact can cause rash.

Long Term Exposure: Repeated exposure can cause skin drying and dermatitis. There is limited evidence that this chemical causes cancer in animals. It may cause liver cancer. In animal experiments, acute exposure to propylene dichloride produced central nervous system narcosis, fatty degeneration of the liver and kidneys. High or repeated exposure can damage the liver, kidneys, and brain. Early symptoms include headaches, nausea, personality changes. Based on animal tests this chemical may affect reproduction and may cause malformations in the human fetus.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, central nervous system. *Cancer site:* (in animals) liver and mammary gland.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Evaluate the skin condition.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ is among the recommended protective materials for all dichloropropane isomers. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At *any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,2-dichloropropane you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2-dichloropropane must be stored to avoid contact with aluminum since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), *o*-dichlorobenzene, and 1,2-dichloroethane. Sources of ignition, such as smoking and open flames, are prohibited where 1,2-dichloropropane, is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of 1,2-dichloropropane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,2-dichloropropane. Wherever 1,2-dichloropropane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Propylene dichloride must be labeled: "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, CO_2, or foam extinguishers. Water may be ineffective, except to blanket fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN2750 (1,3-Dichloropropanol-2)/153

EC Number: 247-787-9 (dichloropropanol); 202-491-9 [*Annex I Index No.:* 602-064-00-0] (dichloro-2-propanol, 1,3-); 210-470-0 (2,3-dichloropropan-1-ol)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (chlorophenols) Human Limited Evidence, Animal Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1973; DFG: (96-23-1) Category 2 Hazardous Constituent Waste (EPA-RCRA), as dichloropropanols.

California Proposition 65 Chemical (*96-23-1*): Cancer: 10/8/10.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, 1,3-Dichloro-2-propanol.

WGK (German Aquatic Hazard Class): No value assigned.

Description: There are 4 isomers of dichloropropanols 1,3-dichloro-2-propanol (96-23-1), and "dichloropropanols" (26545-73-3) are citations in environmental regulations: $C_3H_6OCl_2$ is a colorless viscous liquid with a chloroform-like odor. Slightly soluble in water. *1,3-Dichloro-2-propanol*: Boiling point = 174°C; Flash point = 74°C; Freezing/Melting point = −4°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water. *2,3-Dichloro-1-propanol*: Boiling point = 182°C. *3,3-Dichloro-1-propanol*: Boiling point = 82−83°C. *1,1-Dichloro-2-propanol*: Boiling point = 146−148°C.

Potential Exposure: It is used as a solvent for hard resins and nitrocellulose, in the manufacture of photographic chemicals and lacquer, as a cement for celluloid, and as a binder of water colors. It occurs in effluents from glycerol and halohydrin production plants.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Dichloro-2-propanol, 1,3-

TEEL-0: 6 ppm

PAC-1: 0.2 ppm

PAC-2: 50 ppm

PAC-3: 50 ppm

DFG MAK: [skin] Carcinogen Category 2.

Harmful Effects and Symptoms

Short Term Exposure: *2,3-dichloro-1-propanol*[52]: Irritation of the eyes, skin, and mucous membranes; dyspnea, coughing, nausea, vomiting, diarrhea, abdominal pain; gastrointestinal hemorrhage; toxic hepatitis; jaundice, hemolytic anemia; decreased urinary output from nephritis and renal failure; somnolence, cerebral hemorrhage; central nervous system depression, and coma. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *1,3-dichloro-2-propanol*[52]*:* Irritation of skin, eyes, and respiratory system; inhalation may cause headache, vertigo, nausea, vomiting; may also cause coma and liver damage.

Long Term Exposure: Causes cancer in animals; may be a potential human carcinogen. May cause liver, kidney, and/or lung damage.

Points of Attack: Central nervous system, liver, kidneys, lungs.

Medical Surveillance: Kidney function tests. Liver function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with 1,3-dichloro-2-propanol you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a refrigerator under inert atmosphere away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: 1,3-Dichloropropanol-2 requires a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine and phosgene, are produced in fire. Use alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling

streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations (*Z; 10061-01-5*): Hazard Symbol: T, N; Risk phrases: R10; R20; R24/25; R36/37/38; R43; R65; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61.

Description: 1,3-Dichloropropene is a colorless to straw-colored liquid with a sharp, sweet, irritating, chloroform-like odor. Molecular weight = 110.97; Specific gravity (H_2O:1) = 1.21; Boiling point = 107.7°C; 103−110°C (mixed *cis-* and *trans*-isomers); Freezing/Melting point = −83.8°C; Vapor pressure = 29 mmHg at 20°C; Flash point = 35°C. The explosive limits are LEL = 5.3%; UEL = 14.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.2%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. Used as a soil fumigant prior to planting crops, such as cotton, sugar beet, potatoes; used in combinations with dichloropropanes as a soil fumigant. Workers engaged in manufacture, formulation, and application of this soil fumigant and nematocide.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers. May accumulate static electrical charges, and may cause ignition of its vapors. Incompatible with strong acids, oxidizers, aluminum or magnesium compounds, aliphatic amines, alkanolamines, alkaline materials, halogens, or corrosives.

Note: Epichlorohydrin may be added as a stabilizer.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 ppm/5 mg/m^3 TWA [skin]; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 1 ppm/4.5 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans (2003).

Protective Action Criteria (PAC)

dichloropropene, 2,3-

TEEL-0: 0.2 ppm

PAC-1: 0.6 ppm

PAC-2: 4 ppm

PAC-3: 75 ppm

DFG MAK (*cis- and trans-isomers*): [skin] danger of skin sensitization; Carcinogen Category 2

Australia: TWA 1 ppm (5 mg/m^3), [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (4.5 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (5 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Norway: TWA 1 ppm (5 mg/m^3), 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: 1 ppm (5 mg/m^3), [skin], carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for 1,3-dichloropropene in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No method listed.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 6060 μg/L on an acute toxicity basis and 244 μg/L on a chronic basis. *To protect saltwater aquatic life:* 790 μg/L on an acute toxicity basis. *To protect human health:* 87.0 μg/L.[6] Russia[35,43] set a MAC of 0.4 mg/L in water bodies used for domestic purposes. Mexico's drinking water criteria is 0.09 mg/L. A no-observed-adverse-effects level (NOAEL) of 3.0 mg/kg/day has been determined by the EPA (see Health Advisory reference below). This results in a drinking water level on a lifetime basis of 0.011 mg/L (11.0 μg/L). Several states have set guidelines for 1,3-dichloropopene in drinking water[61] ranging from 10 μg/L (Connecticut) to 87 μg/L (Arizona and Kansas) to 89 μg/L (Vermont).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Fish Tox = 137.01437000 ppb MATC (LOW).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This chemical can be absorbed through the skin, thereby increasing exposure. Exposure can cause headaches, chest pain, and dizziness. High levels can cause you to pass out. Contact can severely burn the eyes and skin, with permanent damage. High exposures can damage the kidneys, liver, and lungs.

Long Term Exposure: There is evidence that 1,3-dichloropropene causes cancer in animals and humans. May damage the kidneys, liver, and lungs. May cause chronic headache and personality changes. Human Tox = 2.86885 ppb CHCL (Chronic Human Carcinogen Level) (HIGH).

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. *Cancer site:* (in animals) bladder, liver, lung, and stomach.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver function tests, lung function tests, and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; Viton™ gloves, suits; Responder™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 1,3-dichloropropene you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,3-Dichloropropene must be stored to avoid contact with aluminum or magnesium compounds, substances containing fluorine, chlorine, bromine or iodine, and alkaline or corrosive materials, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Separate outside storage is preferred. Sources of ignition, such as smoking and open flames are prohibited where 1,3-dichloropropene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of 1,3-dichloropropene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,3-dichloropropene. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dichloropropene must be labeled "FLAMMABLE LIQUID." They fall in DOT Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 200-923-0 [*Annex I Index No.*: 607-162-00-7]
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.
US EPA, FIFRA 1998 Status of Pesticides: Canceled.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Safe Drinking Water Act: MCL, 0.2 mg/L; MCLG, 0.2 mg/L.
Reportable Quantity (RQ): 5000 lb (2270 kg).
European/International Regulations: Hazard Symbol: Xi,N; Risk phrases: R38-R41; R52/53; Safety phrases: S2; S26; S39; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: 2,2-Dichloropropionic acid is a colorless liquid with an acrid odor or a white to tan powder below 8°C. The sodium salt, a white powder, is often used. Molecular weight = 142.97; Boiling point = 190°C; Freezing/Melting point = 7.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water (slowly reactive); solubility = 50%.
Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Those involved in the manufacture, formulation, and application of the herbicide. Used against quack grass, bermuda grass, johnson grass, cattails, rushes, etc.
Incompatibilities: *Metals:* Highly corrosive to aluminum and copper alloys. Reacts slowly in water to form hydrochloric and pyruvic acids.
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 1 ppm/6 mg/m^3 TWA.
ACGIH TLV®[1]: 5 mg/m^3 TWA intermittent; not classifiable as a human carcinogen.
No TEEL available.
DFG MAK: No numerical value established. Data may be available; suspended 2004.
Austria: MAK 1 ppm (6 mg/m^3), 1999; Denmark: TWA 1 ppm (6 mg/m^3), 1999; France: VME 1 ppm (6 mg/m^3), 1999; the Netherlands: MAC-TGG 6 mg/m^3, 2003; Switzerland: MAK-W 1 ppm (5 mg/m^3), 1999. Russia[35,43] set a MAC of 10 mg/m^3 in work-place air and a value of 0.03 mg/m^3 for ambient air in residential areas.[35]
Determination in Air: No method available.
Permissible Concentration in Water: The no-observed-adverse-effects-level (NOAEL) for the acid is 8 mg/kg/day according to the EPA Health Advisory. This gives a lifetime drinking water equivalent level of 2.8 mg/L.
Determination in Water: By gas chromatography. See Health Advisory referenced below for details.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: 2,2-Dichloropropionic acid is a corrosive chemical and can cause irritation and burn the skin and eyes, causing permanent damage. Exposure may cause symptoms of throat pain, loss of appetite, nausea and sweating, lassitude (weakness, exhaustion), diarrhea, vomiting, slowing of pulse, central nervous system depressant/depression. 2,2-Dichloropropionic acid can affect you when breathed in. Exposure can irritate the upper respiratory tract. 2,2-Dichloropropionic acid may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash.
Long Term Exposure: May cause liver and kidney damage. May cause skin allergy.
Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract, central nervous system.
Medical Surveillance: If overexposure or illness is suspected, consider lung function tests. Kidney and liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.
Personal Protective Methods: Wear acid-resistant protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/

manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquids or dust-proof goggles and face shield when working with powders or dusts unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals and moisture.

Shipping: Acids, liquid, n.o.s. must carry a "CORROSIVE" label. They fall in DOT Hazard Class 8 and Packing Group II.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Powder: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a unit with efficient gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

CAS Registry Number: 76-14-2; 1320-37-2 (1,2-dichlorotetrafluoroethane)

RTECS® Number: KI1101000

UN/NA & ERG Number: UN1958/126

EC Number: 200-937-7 (CAS: 76-14-2); 215-300-9 (CAS: 1320-37-2)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 1.0.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (CAS: 76-14-2).

Description: CFC 114 is a colorless gas with a faint, ether-like odor at high concentrations. A liquid below 3.3°C/38°F. Shipped as a liquefied compressed gas. Molecular weight = 170.92; Boiling point = 3°C; Freezing/Melting point = −94°C; Vapor pressure = 1.9 atm at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.1%.

Potential Exposure: This material is used as a refrigerant and also as a propellant gas.

Incompatibilities: Keep away from welding and hot metals; decomposes, forming hydrogen chloride and hydrogen fluoride. Reacts with acids and acid fumes forming highly toxic chloride gases. Keep away from chemically active metals: sodium, potassium, calcium, powdered aluminum, zinc, and magnesium. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.99 mg/m^3 at 25°C & 1 atm.

OSHA PEL 1000 ppm/7000 mg/m^3 TWA.

NIOSH REL: 1000 ppm/7000 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/6990 mg/m^3 TWA, not classifiable as a human carcinogen.

76-14-2

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 1500 ppm

PAC-2: 10,000 ppm

PAC-3: 15,000 ppm

DFG MAK: 1000 ppm/7100 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group D.

NIOSH IDLH: 15,000 ppm.

Australia: TWA 1000 ppm (7000 mg/m^3), 1993; Austria: MAK 1000 ppm (7000 mg/m^3), 1999; Belgium: TWA 1000 ppm (6990 mg/m^3), 1993; Denmark: TWA 500 ppm (3500 mg/m^3), 1999; Finland: TWA 1000 ppm (7000 mg/m^3); STEL 1250 ppm (8750 mg/m^3), 1999; France: VME 1000 ppm (7000 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, 1993; the Netherlands: MAC-TGG 7130 mg/m^3, 2003; Norway: TWA 500 ppm (3500 mg/m^3), 1999; the Philippines: TWA 1000 ppm (7000 mg/m^3), 1993; Poland: MAC (TWA) 5000 mg/m^3, MAC (STEL) 8750 mg/m^3, 1999; Russia: STEL 3000 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (7000 mg/m^3), 1999; Turkey: TWA 1000 ppm (7000 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (7110 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for R-114 in ambient air[60] ranging from 70 mg/m^3 (North Dakota) to 115 mg/m^3 (Virginia) to 140 mg/m^3 (Connecticut) to 167 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1018.

Determination in Water: No method cited. Octanol−water coefficient: Log K_{ow} = 2.8.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Dichlorotetrafluoro-ethane can affect you when breathed in. Irritates the eyes and upper respiratory tract. Inhalation of vapors can cause you to become dizzy and lightheaded, drowsy, and pass out. It can cause the heart to beat irregularly or stop, which can cause death. Contact with the liquid can cause frostbite, burning of eyes and skin.

Long Term Exposure: Can irritate the lungs and cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Respiratory system, cardiovascular system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24 h EKG to look for irregular heart rhythms).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with the liquid, wear gas-proof goggles and face shield when working with the gas unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10,000 ppm:* Sa (APF = 10) (any supplied-air respirator). *15,000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with CFC 114 you should be trained on its proper handling and storage. Dichlorotetrafluoro-ethane must be stored to avoid contact with acids, acid fumes, chemically active metals, such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This chemical requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2; there is no Packing Group.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If the liquid is spilled or leaked, allow it to vaporize. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dichlorotetrafluoro-ethane is a nonflammable liquid or gas. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire, including hydrogen chloride, phosgene, and hydrogen fluoride. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with combustible fuel. Use flue gas scrubber.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Dichlorvos is a colorless to amber liquid with a mild aromatic odor. Molecular weight = 220.98; Boiling point = 140°C under 20 mmHg at 20°C; Flash point ≥ 79°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Organometallic, Mutagen; Reproductive Effector. Those involved in manufacture, formulation, and application of this fumigant insecticide in household, public health, and agricultural uses. Used as an insecticide and as an anthelmintic for swine and dogs.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas. Corrosive to iron, mild steel, some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.04 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 mg/m^3 TWA [skin].

NIOSH REL: 1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.9 mg/m^3 TWA measured as inhalable fraction and vapor; [skin, sensitization]; not classifiable as a human carcinogen; BEI$_A$ issued; Acetylcholinesterase inhibiting pesticides.

NIOSH IDLH: 100 mg/m^3.

Determination in Air: Use NIOSH P&CAM Method #295 (II-5) or OSHA Analytical Method 62.

Permissible Concentration in Water: Russia set a MAC of 1.0 mg/L in water bodies used for domestic purposes and in water for fishing of zero.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 1.47.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Symptoms of exposure include sweating, twitching, contracted pupils, respiratory distress (tightness in the chest and wheezing), salivation (drooling), lacrimation (tearing), nausea, vomiting, abdominal cramps, diarrhea, involuntary defecation and urination, slurred speech, coma, apnea (cessation of breathing), and death. Dichlorvos is a very toxic compound with a probable lethal oral dose in humans between 50 and 500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150-lb) person. However, brief exposure (30−60 min) to vapor concentrations as high as 6.9 mg/L did not result in clinical signs or depressed serum cholinesterase levels. Toxic changes are typical of organophosphate insecticide poisoning with progression to respiratory distress, respiratory paralysis, and death if there is no clinical intervention.

Short Term Exposure: Dichlorvos irritates the eyes and skin. Symptoms include miosis, aching eyes, rhinorrhea (discharge of thin nasal mucous), headache, chest tightness, wheezing, laryngeal spasm, salivation, cyanosis, anorexia, nausea, vomiting, diarrhea, sweating, muscle fasiculation, paralysis, giddiness, ataxia, convulsions, low blood pressure, cardiac irregular/irregularities. The substance may cause effects on the central nervous system. Cholinesterase inhibitor. High levels of exposure may result in death.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Cholinesterase inhibitor; cumulative effect is possible: see "Short Term Exposure." This substance may be carcinogenic to humans; it has been shown to cause cancer of the pancreas in animals. There is limited evidence that Dichlorvos is a teratogen in animals, and may cause birth defects or damage the fetus in humans.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, central nervous system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. NIOSH lists the following tests: blood serum; cholinesterase: whole blood (chemical/metabolite); cholinesterase: blood plasma, red blood cells/count; cholinesterase: blood serum, red blood cells/count; urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h following overexposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: 10 mg/*m*^{3}: Sa (APF = 10) (any supplied-air respirator). *25 mg/m*^{3}: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *50 mg/m*^{3}: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m*^{3}: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dichlorvos you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids; strong alkalis. Dichlorvos will attack some forms of mild iron, plastics, rubber, and coatings.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a "POISON, FLAMMABLE LIQUID" label. Dichlorvos falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leaks if you can do it without risk. Reduce vapors with water spray. Take up *small spills* with sand or other noncombustible absorbent material for later disposal in canisters. Dike *large spills* far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen chloride and phosphoric acid, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Use self-contained breathing apparatus with a full face-piece operated on pressure-demand or other positive-pressure mode. Prevent skin contact with protective clothing. Isolate area and deny entry. Fight fire from maximum distance. Dike fire control water for future disposal. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Fifty percent hydrolysis is obtained in pure water in 25 min at 70°C and in 61.5 days at 20°C. A buffered solution yields 50% hydrolysis (37.5°C) in 301 min at pH 8, 462 min at pH 7, 620 min at pH 5.4. Hydrolysis yields no toxic residues. Incineration in a furnace equipped with an afterburner and alkaline scrubber is recommended as is alkaline hydrolysis followed by soil burial.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat; IARC: Human, No Adequate Data, 1983; Animal, Limited Evidence, 1983, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA, FIFRA 1998 Status of Pesticides: Supported.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R21/22; R38; R43; R50/53; Safety phrases: S2; S36/37; 60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dicofol is a white or brown waxy solid. Molecular weight = 370.48; Flash point = 120°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those involved in manufacture, formulation and application of this organochlorine pesticide. Used as acaricide (miticide) in agricultural and nonagricultural applications.

Incompatibilities: Incompatible with alkaline pesticides, strong acids, acid fumes, aliphatic amines, isocyanates, and steel.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, skin absorption, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Dicofol can be absorbed through the skin, thereby increasing exposure. It irritates the skin and the respiratory tract. Exposure can cause headache, nausea, vomiting, and poor appetite. Dicofol may affect the central nervous system causing numbness and weakness in the hands and feet, muscle twitching, seizures, unconsciousness, and death.

Long Term Exposure: May affect the liver and kidneys. May cause personality changes with depression, anxiety, and irritability. May decrease fertility in females. Prolonged or repeated skin contact may cause dermatitis. There is limited evidence that Dicofol causes liver cancer in animals.

Points of Attack: Skin, nervous system, liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Dermatological examination.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. For liquid solutions containing Dicofol wear indirect-vent, impact, and splash-resistant goggles. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dicofol you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline pesticides, strong acids, acid fumes, and steel. Where possible, automatically transfer material from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Organochlorine pesticides, solid, toxic, n.o.s. require a “POISONOUS/TOXIC MATERIALS” label.

They fall in DOT Hazard Class 6.1 and Dicofol in Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Molecular Formula: $C_8H_{16}NO_5P$

Synonyms: Bidirl; Bidrin; Bidrin (Shell); Bidrin-R; C-709; C-709 (Ciba-Geigy); Carbicrin; Carbicron; Carbomicron; Ciba 709; Crotonamide, 3-hydroxy-*N*,*N*-dimethyl-, *cis*-, dimethyl phosphate; Crotonamide, 3-hydroxy-*N*,*N*-dimethyl-, dimethylphosphate, (*E*)-; Crotonamide, 3-hydroxy-*N*,*N*-dimethyl-, dimethylphosphate, *cis*-; Diapadrin; Dicroptophos; Didrin; 3-(Dimethoxyphosphinyloxy)-*N*,*N*-dimethyl[e]crotonamide; 3-(Dimethoxyphosphinyloxy)-*N*,*N*-dimethyl-*cis*-crotonamide; 3-(Dimethoxyphosphinyloxy)-*N*,*N*-dimethylisocrotonamide; 3-(Dimethylamino)-1-methyl-3-oxo-1-propenyl dimethyl phosphate; (*E*)-2-Dimethylcarbamoyl-1-methylvinyl dimethylphosphate; *cis*-2-Dimethylcarbamoyl-1-methylvinyl dimethylphosphate; *O,O*-Dimethyl-*O*-(2-dimethyl-carbamoyl-1-methylvinyl)phosphat (German); *O,O*-Dimethyl *O*-(1,4-dimethyl-3-oxo-4-azapent-1-enyl) phosphate; *O,O*-Dimethyl *O*-(*N*,*N*-dimethylcarbamoyl-1-methylvinyl) phosphate; Dimethyl phosphate ester with 3-hydroxy-*N*,*N*-dimethyl-*cis*-crotonamide; Dimethyl phosphate of 3-hydroxy-*N*,*N*-dimethyl-*cis*-crotonamide; Ektafos; Ektofos; ENT 24,482; 3-Hydroxy-*N*,*N*-dimethyl-(*E*)-crotonamide dimethyl phosphate; 3-Hydroxy-*N*,*N*-dimethyl-*cis*-crotonamide dimethyl phosphate; 3-Hydroxydimethyl crotonamide dimethyl phosphate; Karbicron; Phosphatede dimethyle et de 2-dimethylcarbamoyl 1-methyl vinyle (French); Phosphoric acid, 3-(dimethylamino)-1-methyl-3-oxo-1-propenyl dimethyl ester, (*E*)-; Phosphoric acid, dimethyl ester, ester with (*E*)-3-hydroxy-*N*,*N*-dimethylcrotonamide; Phosphoric acid, dimethyl ester, ester with *cis*-3-hydroxy-*N*,*N*-dimethylcrotonamide; SD 3562; Shell SD-3562

CAS Registry Number: 141-66-2

RTECS® Number: TC3850000

UN/NA & ERG Number: UN3018 (organophosphorus pesticides, liquid, toxic)/152

EC Number:205-494-3 [*Annex I Index No.:* 015-073-00-4]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Supported.

US EPA Gene-Tox Program, Positive: *S. cerevisiae* gene conversion.

Banned or Severely Restricted (Germany and Malaysia) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dicrotophos is an amber liquid with a mild ester odor. Molecular weight = 237.22; Boiling point = 400°C (Decomposes below boiling point at 75°C after storage for 31 days); Flash point ≥94°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. Those involved in the manufacture, formulation and application of this organophosphate. Used to control the coffee borer and certain economically important pests of cotton.

Incompatibilities: Attacks some metals: Corrosive to cast iron, mild steel; brass, and stainless steel. Decomposes after prolonged storage but is stable when stored in glass or polyethylene containers with temperatures up to 40°C. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.70 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.25 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI: methemoglobin in blood; 1.5% of hemoglobin, during or end-of-shift as methemoglobin inducers.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 0.9 mg/m^3

PAC-3: 40 mg/m^3

Australia: TWA 0.25 mg/m^3, [skin], 1993; Belgium: TWA 0.25 mg/m^3, [skin], 1993; Denmark: TWA 0.25 mg/m^3, [skin], 1999; Finland: TWA 0.25 mg/m^3, 1999; France: VME 0.25 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.25 mg/m^3, [skin], 2003; Switzerland: MAK-W 0.25 mg/m^3, [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for dicrotophos in ambient air[60] ranging from 2.5 μg/m^3 (North Dakota) to 4.0 μg/m^3 (Virginia) to 5.0 μg/m^3 (Connecticut) to 6.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Dicrotophos may affect the nervous system, causing convulsions, respiratory failure. Dicrotophos is a cholinesterase inhibitor which can penetrate the skin. Effects may be cumulative. It is extremely toxic. Probable human oral lethal dose is 5−50 mg/kg, 7 drops to 1 teaspoonful for a 70-kg (150-lb) person. Closely related in toxicity to azodrin. Acute exposure to dicrotophos may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. The effects may be delayed.

Long Term Exposure: Dicrotophos is a cholinesterase inhibitor; cumulative effect is possible. May damage the nervous system causing numbness, "pins and needles" sensation, and/or weakness of the hands and feet. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended; effect may be delayed.

Note to physician: 1,1′-Trimethylenebis(4-formylpyridinium bromide) dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof

chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, metals, strong bases, and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove all ignition sources. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Poisonous gases, including nitrogen oxides, phosphorus oxides, carbon monoxide, are produced in fire. Fire and runoff from fire control water may produce irritating or poisonous gases. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dicrotophos decomposes after 7 days at 90°C and 31 days at 75°C. Hydrolysis is 50% complete in aqueous solutions at 38°C after 50 days at pH 9.1 (100 days are required at pH 1.1). Alkaline hydrolysis (NaOH) yields $(CH_3)_2NH$. Incineration is also recommended as a disposal method.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

RTECS® Number: HY4025000

UN/NA & ERG Number: UN2565/153

EC Number: 202-980-7 [*Annex I Index No.:* 612-066-00-3]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human, No Adequate Data, 1980; Animal, Limited Evidence, 1980, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: C, N; Risk phrases: R22; R34; R50/53; Safety phrases: S1/2; S26; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dicyclohexylamine is a combustible, colorless liquid with a faint amine odor. Molecular weight = 181.36; Boiling point = 256°C; Flash point ≥99°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Dicyclohexylamine salts of fatty acids and sulfuric acid have soap and detergent properties useful to the printing and textile industries. Metal complexes of Di-Cha are used as catalysts in the paint, varnish, and ink industries. Several vapor-phase corrosion inhibitors are solid Di-Cha derivatives. These compounds are slightly volatile at normal temperatures and are used to protect packaged or stored ferrous metals from atmospheric corrosion. Dicyclohexylamine is also used for a number of other purposes: plasticizers, insecticidal formulations; antioxidant in lubricating oils, fuels, and rubber; and as an extractant.

Incompatibilities: Contact with strong oxidizers can cause fire and explosion hazard.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin] No numerical value established.

Russia: STEL1 mg/m^3, [skin], 1993. Russia[43] set a MAC of 0.008 mg/m^3 for ambient air in residential areas on a momentary basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the skin and eyes; may cause burns and permanent damage. Dicyclohexylamine is somewhat more toxic that cyclohexylamine. Poisoning symptoms and death appear earlier in rabbits injected with 0.5 g/kg Di-Cha (as opposed to Cha). Doses of 0.25 g/kg are just sublethal, causing convulsions and reversible paralysis. Dicyclohexylamine is a skin irritant. LD_{50} = (oral-rat) 373 mg/kg (moderately toxic). Symptoms of exposure include severe irritation of the eyes, skin, and mucous membranes. Also, nausea, vomiting, weakness, and irritation of the gastrointestinal tract.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at lest 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with Di-Cha you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Protection from air is recommended for long-term storage.

Shipping: Dicyclohexylamine requires a "CORROSIVE" label. If falls in DOT Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or

federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

EC Number: 221-515-9 [*Annex I Index No.*: 007-009-00-9]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: Xn; Risk phrases R20/22; Safety phrases: S2; S15; S41 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dicyclohexylamine nitrite is a flammable white powder which has some volatility at room temperature and higher. Molecular weight = 228.38; Melting point = 181°C; Flash point = 185°C. Partly soluble in water.

Potential Exposure: It is used as a vapor-phase corrosion inhibitor whereby it vaporizes either from the solid state or from solution, and offers protection against atmospheric rusting. Wrapping paper, plastic wraps, and other materials may be impregnated with dichan to protect metal parts during packaging and storage.

Incompatibilities: Highly flammable and a strong oxidizer. Contact with reducing materials (nitrides, hydrides, sulfides, etc.) or easily oxidized materials may cause fire and explosion hazard.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: No numerical value established. Data may be available.

Russia[43] set a MAC of 0.5 mg/m^3 in work-place air and a MAC of 0.02 mg/m^3 in ambient air in residential areas.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: $LD_{50} =$ (oral-rat) 284 mg/kg (moderately toxic). It decreases blood pressure.

Long Term Exposure: Prolonged exposure to dicyclohexylamine nitrite vapor is reported to lead to changes in the CNS, erythrocytes, and methemoglobinemia; and to disturb the functional state of the liver and kidneys of human workers.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: Blood pressure. Complete blood count. Liver and kidney function tests.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere for long-term storage.

Shipping: Dicyclohexylammonium nitrite requires a "FLAMMABLE SOLID" label. It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and nitrous acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

RTECS Number: FF2160000

UN/NA & ERG Number: UN2928 (toxic solid, corrosive, organic, n.o.s)/154

EC Number: 208-704-1 [*Annex I Index No.:* 615-019-00-5]

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory.

SARA 311/312 codes: Acute.

Canada: WHMIS Classification D1A; D2B; on DSL list.

European/International Regulations: Hazard Symbol: T, Xn, Xi; Risk phrases: R22; R24; R41; R43; Safety phrases: S1/2; S24; S26; S37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *N,N′*-Dicyclohexylcarbodiimide (DCC) is a white crystalline solid. Odor is sweet and heavy. Molecular weight = 206.33; Freezing/Melting point = 34-35°C; Boiling Point = 122−124°C at 6.0 mmHg; Flash point = 110°C to >113°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3; Flammability 1; Reactivity 1₩. Insoluble in water; water reactive.

Potential Exposure: Laboratory reagent.

Incompatibilities: Dust may for explosive mixture with air. Reacts with steam and water. *N,N′*-Dicyclohexylcarbodiimide is an imide: contact with strong oxidizers may cause fire and explosions. Incompatible with acids, strong bases, strong reducing agents (may form flammable gasses), azo and diazo compounds (may form toxic gases), chlorinated hydrocarbons, nitro compounds. Contact with mixture of acetic acid + dinitrogen trioxide may cause explosion. The combustion of amide compounds generates nitrogen oxides (NOx). In the presence of moisture, may attack metals and plastics.

Permissible Exposure Limits in Air:
Protective Action Criteria (PAC)
TEEL-0: 0.0035 mg/m^3
PAC-1: 0.01 mg/m^3
PAC-2: 0.06 mg/m^3
PAC-3: 100 mg/m^3

Determination in Air: No NIOSH or OSHA method available.

Permissible Concentration in Water: No data available.

Determination in Water: Data not available.

Routes of Entry: Ingestion, inhalation, or absorbed through the skin. Causes burns by all exposure routes.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Highly toxic by inhalation. Severe overexposure can result in death. Harmful if inhaled, swallowed, or absorbed through skin. May cause allergic skin reaction and allergic reaction to the respiratory tract. Depending on the intensity and duration of exposure, this chemical can cause severe destruction of tissues of the mucous membranes and upper respiratory tract. Causes burns to any internal or external area of contact. Symptoms of exposure to this compound may include severe skin and eye irritation, irritation of the mucous membranes and upper respiratory tract, burning feeling, laryngitis, coughing and wheezing, shortness of breath, headache, nausea, and vomiting. Inhalation of this chemical can be fatal, resulting from inflammation, bronchial pneumonia, edema of the larynx, bronchi, and pulmonary tract. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. LD_{50} = (oral-rat) 400 mg/kg.

Long Term Exposure: The chronic properties of this material have not been fully investigated. May cause skin and respiratory allergies. Repeated exposure to a highly toxic material may result in general deterioration of health and possible organ damage.

Points of Attack: Skin, respiratory tract.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin or respiratory tract allergy.

First Aid: *Eyes*: Check the victim for contact lenses and remove. Flush victim's eyes with water or normal saline solution for 20−30 min, lifting lower and upper eyelids occasionally. Remove contaminated clothing and shoes. Get medical attention immediately. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water and wash for at least 15 min. Remove and isolate all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician. Transport the victim to a hospital for treatment. *Inhalation*: Remove victim to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately. *Ingestion*: *Do not induce vomiting*. If the victim is conscious and not convulsing, give large amount of water to dilute the chemical. Never give anything by mouth to an unconscious person. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician. In all cases get medical attention immediately. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body.

Personal Protective Methods: Maintain eyewash fountain and quick-drench facilities in work area. Unless full facepiece respiratory protection is worn, wear splash-proof protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Wear Tyvek-type disposable protective clothing or other impervious protective clothing, gloves, lab coat, apron, or coveralls, as appropriate, to prevent skin contact. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA- or European Standard EN 149-approved respirator; or an approved half-face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas and SO_2) with a dust/mist filter. Splash-proof safety goggles should be worn while handling this chemical. Alternatively, a full-face respirator, equipped as above, may be used to provide simultaneous eye and respiratory protection. For emergencies or instances where the exposure levels are not known, use a full-face positive-pressure, air-supplied respirator. WARNING: Air-purifying respirators do not protect workers in oxygen-deficient atmospheres.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Keep DCC in a tightly closed container in a cool, dry, ventilated area away from sources of incompatible materials, heat, direct sunlight, moisture, or ignition; best stored under an inert atmosphere at refrigerated temperatures. Containers of DCC may be hazardous when empty since they retain product residues (dust, solids); observe all warnings and precautions listed for the product. Shelf life when stored under ideal conditions: >4 years.

Shipping: This material requires a label of "TOXIC SOLID." Hazard Class 6.1, 8. Packing Group II. May be shipped in 100-g packages.

Spill Handling: Wear appropriate personal protective equipment. Remove all sources of ignition. Ventilate area of leak or spill. *Small spills and leakage*: If a spill occurs while you are handling this chemical, *remove all sources of ignition.* Clean up spills in a manner that does not disperse dust into the air. Reduce airborne dust and prevent scattering by moistening the solid spill material with 60−70% ethanol and using nonsparking tools and equipment, transfer the dampened material to a suitable container. Use absorbent paper dampened with 60−70% ethanol to pick up any remaining material. Seal the absorbent paper, and any of your clothes, which may be contaminated, in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the Safety Officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: In the event of a fire, wear full protective clothing and use a NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus (SCBA) with full face-piece operated in the pressure-demand or other positive-pressure mode. Burning may produce carbon monoxide, carbon dioxide, nitrogen oxides. Fires involving this material can be controlled with a dry chemical, carbon dioxide, or Halon extinguisher. When heated to decomposition it emits toxic fumes of carbon monoxide, carbon dioxide, and Nox.

Disposal Method Suggested: Whatever cannot be saved for recovery or recycling should be managed in an appropriate and approved waste facility. Although not a listed RCRA hazardous waste, this material may exhibit one or more characteristics of a hazardous waste and require appropriate analysis to determine specific disposal requirements. Processing, use, or contamination of this product may change the waste management options. State and local disposal regulations may differ from federal disposal regulations. Dispose of container and unused contents in accordance with federal, state, and local requirements.

Dicyclopentadiene D:0740

Molecular Formula: $C_{10}H_{12}$

Synonyms: Bicyclopentadiene; Biscyclopentadiene; 1,3-Cyclopentadiene, dimer; DCPD; Diciclopentadieno (Spanish); 4,7-Methano-1H-indene; 4,7-Methano-1H-indene, 3a,4,7,7a-tetrahydro-; 3a,4,7,7a-Tetrahydro-4,7-methanoindene

CAS Registry Number: 77-73-6

RTECS® Number: PC1050000

UN/NA & ERG Number: UN2048/130

EC Number: 201-052-9 [*Annex I Index No.:* 601-044-00-9]

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: Histidine reversion—Ames test; *S. cerevisiae*—homozygosis.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xn, N; R11; R20/22; R36/37/38; R51/53; Safety phrases: S2; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Cyclopentadiene is a crystalline solid or a liquid (above 32°C) with a disagreeable, camphor-like odor. The odor threshold is 0.011 (detectable); 0.020 ppm (recognizable). Molecular weight = 132.22; Boiling point = decomposes at 172.2°C; Freezing/Melting point = 32°C; Vapor pressure = 1.4 mmHg at 20°C; Flash point = 32°C; Autoignition temperature = 503°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 1. Explosive limits: LEL = 0.8; UEL = 6.3. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Hormone, Primary Irritant. This compound is used in the manufacture of cyclopentadiene as a pesticide intermediate; in the production of ferrocene compounds; in paints, varnishes, and resin manufacture; in production of elastomers, resin systems, and polymers.

Incompatibilities: Forms explosive mixture with air above flash point. Depolymerizes at boiling point and forms two molecules of cyclopentadiene unless inhibited and maintained under inert atmosphere to prevent polymerization. Violent reaction with strong oxidizers, strong acids, strong bases. Can accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.41 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 5 ppm/30 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/27 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.01 ppm

PAC-1: 0.01 ppm

PAC-2: 5 ppm

PAC-3: 75 ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.5 ppm/2.7 mg/m^3 TWA; Peak Limitation Category II(1); Pregnancy Risk Group D.

Australia: TWA 5 ppm (30 mg/m^3), 1993; Austria: MAK 0.5 ppm (3 mg/m^3), 1999; Belgium: TWA 5 ppm (27 mg/m^3), 1993; Denmark: TWA 5 ppm (30 mg/m^3), 1999; Finland: TWA 5 ppm (30 mg/m^3); STEL 10 ppm (54 mg/m^3) [skin] 1999; France: VME 5 ppm (30 mg/m^3), 1999; Norway: TWA 5 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 3 mg/m^3, 2003; Switzerland: MAK-W 0.5 ppm (3 mg/m^3), KZG-W 1 ppm (6 mg/m^3), 1999; United Kingdom: TWA 5 ppm (27 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm. Several states have set guidelines or standards for dicyclopentadiene in ambient air[60] ranging from 0.3 mg/m^3 (North Dakota) to 0.5 mg/m^3 (Virginia) to 0.6 mg/m^3 (Connecticut) to 0.714 mg/m^3 (Nevada).

Determination in Air: See OSHA Analytical Method PV-2098.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Dicyclopentadiene irritates the skin and eyes. Human subjects reported an odor threshold at 0.003 ppm, slight eye or throat irritation at 1−5 ppm. May cause headache, loss of balance and coordination, and even convulsions. Increased urinary frequency has been reported in exposed workers.

Long Term Exposure: May affect the liver, kidneys, nervous system, and gastrointestinal tract. May cause lung irritation with possible cough and shortness of breath. Animal experiments produced leukocytosis and kidney lesions.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: Lung and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles when working with powders or dusts and splash-proof goggles when working with liquids unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator with a combination cartridge offering protection against organic vapors as well as against dust, fume, and mist. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect dicyclopentadiene, or in the case of a full-face-piece respirator if you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing materials, strong acids, and strong bases. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Dicyclopentadiene must carry a "FLAMMABLE LIQUID" label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: *Powders and dusts:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Dieldrin is a colorless to light tan solid with a mild chemical odor. The odor threshold in water is 0.04 mg/L. Molecular weight = 380.90; Boiling point = (decomposes); Freezing/Melting point = 176.1°C; Vapor pressure = 8×10^{-7} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Aldrin belongs to the group of cyclodiene insecticides. They are a subgroup of the chlorinated cyclic hydrocarbon insecticides which include DDT, BHC, etc. They were manufactured in the United States by Shell Chemical Co. until the US EPA prohibited their manufacture in 1974 under the Federal Insecticide, Fungicide, and Rodenticide Act. The primary use of the chemicals in the past was for control of corn pests although they were also used by the citrus industry.

Dieldrin's persistence in the environment is due to its extremely low volatility (i.e., a vapor pressure of 1.78×10^{-7} mmHg at 20°C) and low solubility in water (186 μg/L at 25−29°C). In addition, dieldrin is extremely apolar, resulting in a high affinity for fat which accounts for its retention in animal fats, plant waxes, and other such organic matter in the environment. The fat solubility of dieldrin results in the progressive accumulation in the food chain which may result in a concentration in an organism which would exceed the lethal limit for a consumer.

Incompatibilities: Incompatible with strong acids: concentrated mineral acids; acid catalysts; phenols; strong oxidizers; active metals like sodium, potassium, magnesium, and zinc. Keep away from copper, iron, and their salts.

Permissible Exposure Limits in Air

OSHA PEL: 0.25 mg/m^3 TWA[skin].

NIOSH REL: 0.25 mg/m^3 TWA[skin]; Potential occupational carcinogen; limit exposure to lowest feasible level. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.25 mg/m^3 TWA measured as inhalable fraction and vapor [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 50 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.25 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 50 mg/m^3

DFG MAK: 0.25 mg/m^3, measured as the, inhalable fraction; [skin] Peak Limitation Category II(8).

Australia: TWA 0.25 mg/m^3, [skin], 1993; Austria: MAK 0.25 mg/m^3, [skin], 1999; Belgium: TWA 0.25 mg/m^3, [skin], 1993; Denmark 0.25 mg/m^3, [skin], 1999; Finland: TWA 0.25 mg/m^3; STEL 0.75 mg/m^3, [skin], carcinogen, 1999; France: VME 0.25 mg/m^3, [skin], continuous carcinogen, 1999; India: TWA 0.25 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.25 mg/m^3, [skin], 2003; Norway: TWA 0.25 mg/m^3, 1999; the Philippines: TWA 0.25 mg/m^3, [skin], 1993; Poland: MAC (TWA) 0.5 mg/m^3; STEL 1.5 mg/m^3, 1999; Russia: STEL 0.01 mg/m^3, 1993; Switzerland: MAK-W 0.25 mg/m^3, [skin], 1999; Thailand: TWA 0.25 mg/m^3, 1993; Turkey: TWA 0.25 mg/m^3, [skin], 1993; United Kingdom: TWA 0.25 mg/m^3; STEL 0.75 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for dieldrin in ambient air[60] ranging from 0.035 μg/m^3 (Pennsylvania) to 0.595 μg/m^3 (Kansas) to 2.5 μg/m^3 (North Dakota) to 4.0 μg/m^3 (Virginia) to 5.0 μg/m^3 (Connecticut) to 6.0 μg/m^3 (Nevada).

Determination in Air: Filter; Isooctane; Gas chromatography/Electrochemical detection; NIOSH II(3), Method #S283.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0019 μg/L as a 24-h average, never to exceed 2.5 μg/L. *To protect saltwater aquatic life:* 0.0019 μg/L as a 24-h average never to exceed 0.71 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 0.71 ng/L (0.00071 μg/L).[6]

Mexico[35] has set a MAC value of 0.0000007 mg/L for dieldrin in water used for drinking water supply; of 0.003 mg/L in estuaries and 0.03 μg/L in estuaries. WHO[35] has set a limit of 0.03 μg/L in drinking water. A NOAEL (no-observed-adverse-effects-level) of 0.005 mg/kg/day has been calculated by EPA which results in the calculation of a drinking water equivalent of 1.75 μg/L. No lifetime health advisory could be calculated in view of the cancer risk. Several states have set standards or guidelines for dieldrin in drinking water[61] ranging from 0.01 μg/L (Minnesota) to 0.019 μg/L (Kansas) to 0.05 μg/L (California) to 1.0 μg/L (Illinois).

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{\text{ow}} = 6.2$.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

During the past decade, considerable information has been generated concerning the toxicity and potential carcinogenicity of the two organochlorine pesticides, aldrin and dieldrin. These two pesticides are usually considered together since Aldrin is readily epoxidized to dieldrin in the environment. Both are acutely toxic to most forms of life including arthropods, mollusks, invertebrates, amphibians, reptiles, fish, birds, and mammals. Dieldrin is extremely persistent in the environment. By means of bioaccumulation it is concentrated many times as it moves up the food chain.

Short Term Exposure: *Inhalation:* May cause nausea, drowsiness, loss of appetite, visual disturbances, and insomnia. Sprays of 1−2.5% have caused giddiness, headache, muscle twitching, convulsions, and loss of consciousness. *Skin:* Can be absorbed to cause or increase the severity of symptoms as listed under ingestion. Contact may cause skin rash. *Eyes:* May cause irritation, redness, and affect vision. *Ingestion:* Can cause headache, nausea, irritability, insomnia, high blood pressure, vision problems, loss of coordination, profuse sweating, dizziness, frothing at the mouth, convulsions, and loss of consciousness. Death may occur from as little as 1/20 oz (1.4 g). Some symptoms may be delayed up to 12 h. Exposure to dieldrin may affect the central nervous system, resulting in convulsions.

Long Term Exposure: May cause liver damage. Dieldrin accumulates in the human body. Dieldrin has caused cancer in laboratory animals. It is considered a suspect occupational carcinogen. May damage the developing fetus. May reduce fertility in males and females. Dieldrin concentrates in breast milk, and therefore, may be transferred to breast-feeding infants. Repeated higher exposure can cause tremors, muscle twitching and seizures (convulsions), and may lead to coma and death. Convulsions are somewhat delayed and may occur weeks or months following exposure. Repeated exposure may cause personality changes of depression, anxiety, or irritability.

Points of Attack: Central nervous system, liver, kidneys, skin. *Cancer site* (in animals): lung, liver, thyroid, and adrenal gland.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Blood dieldrin level. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. EEG. Blood dieldrin levels (normal = less than 1 mg/100 mL; level should not exceed 15 mg/100 mL). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 12 h after overexposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At *any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dieldrin you should be trained on its proper handling and storage. Dieldrin must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates); strong acids (such as hydrochloric, sulfuric, and nitric); chemically active metals (such as potassium, sodium, magnesium, and zinc) since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dieldrin, an organochlorine pesticide, solid toxic, must carry a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dieldrin is a noncombustible solid. Commercial solutions may contain flammable or combustible liquids. Use dry chemical, carbon dioxide, water spray, alcohol or polymer foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s minimum for primary combustion; 1760°C, 1.0 s for secondary combustion) with adequate scrubbing and ash disposal facilities.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R46; R25/26; R34; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diepoxybutane is a flammable, colorless liquid. Molecular weight = 86.09; Boiling point = 57°C at 25°C; Freezing/Melting point = 19°C; also reported at 2−4°C; Flash point = 44.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Mixes with water.

Potential Exposure: DEB is primarily used in research and experimental work; as a curing agent for polymers; as a crosskicking agent for textile fabrics; and in preventing microbial spoilage in substances. DEB is also used commercially as mixed stereoisomers and as individual isomers in the preparation of erythritol and other pharmaceuticals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.04 ppm

PAC-1: 0.125 ppm

PAC-2: 0.995 ppm

PAC-3: 10 ppm

DFG MAK: Germ Cell Mutation Category 2.

North Dakota[60] has set a guideline of zero in ambient air.

Routes of Entry: Human exposure to DEB is principally through inhalation and skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Eye and skin contact can cause severe irritation. Accidental minor exposure caused swelling of the eyelids, upper respiratory tract irritation, and painful eye irritation 6 h after exposure. Contact may cause skin sensitization. Inhalation may cause respiratory tract irritation. Poison if ingested or inhaled.

Long Term Exposure: May cause skin allergies. There is sufficient evidence for the carcinogenicity of diepoxybutane in experimental animals. Two forms of 1,2:3,4-diepoxybutane (DL- and *meso*-) were carcinogenic in mice by skin application. Both compounds produced squamous-cell skin carcinomas. The DL-racemate also produced local sarcomas in mice and rats by subcutaneous injection.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diepoxybutane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic liquids, flammable, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb the material on carbon, clay, bentonite, or sawdust. For spills on water bodies, isolate the contaminated water and add dilute HCl or acetic acid to detoxify, then treat the water by biological treatment. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling

streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Detoxify by HCl or acetic acid treatment followed by secure landfill disposal, landfarming, or biological treatment. Incineration is another alternative. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human, Inadequate Data; Animal, Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 2000 NCI: Carcinogenesis Studies (dermal); clear evidence: mouse; no evidence: rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R38; R41; R48/22; Safety phrases: S2; S26; S36/37/39; R46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diethanolamine is a colorless crystalline solid or a syrupy, white liquid (above 28°C) with a mild, ammonia-like odor. Odor threshold = 0.27 ppm. Molecular weight = 105.16; Boiling point = 269°C (decomposes); Freezing/Melting point = 28°C; Vapor pressure = very low; below 0.01 mmHg at 20°C; Flash point = 137.4°C (oc); Autoignition temperature = 662°C. Explosive limits: LEL = 1.6%; UEL = 9.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Highly soluble in water; solubility = 95%.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Primary Irritant. Used as a detergent; and as an intermediate for making fatty alkanolamides; morpholine, plasticizers, and resins; as an absorbent for acid gases.

Incompatibilities: The aqueous solution is a medium strong base. Violent reaction with strong acids; oxidizers, acid anhydrides; halides. Incompatible with isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, aldehydes. Reacts with CO_2 in the air. Hygroscopic (i.e., absorbs moisture from the air). Corrosive to copper, zinc, aluminum and their alloy; and galvanized iron.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.30 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 3 ppm/15 mg/m^3 TWA.

ACGIH TLV®[1]: 0.2 mg/m^3/1 mg/m^3 TWA measured as inhalable fraction and vapor [skin].

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 300 mg/m^3

DFG MAK: 1 mg/m^3; measured as the inhalable fraction TWA; Peak Limitation Category I(1) [skin] danger of skin sensitization; Carcinogen Category 3B; Pregnancy Risk Group C.

Australia: TWA 3 ppm (15 mg/m^3), 1993; Austria: MAK 3 ppm (13 mg/m^3), 1999; Belgium: TWA 3 ppm (13 mg/m^3), 1993; Denmark: TWA 3 ppm (15 mg/m^3), 1999; France: VME 3 ppm (15 mg/m^3), 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Norway: TWA 3 ppm (15 mg/m^3), 1999; Russia: STEL 5 mg/m^3 [skin] 1993; Switzerland: MAK-W 0.1 mg/m^3, 1999; Switzerland: TWA 3 ppm (13 mg/m^3), 1993; United Kingdom: TWA 3 ppm (13 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam American Conference of Governmental Industrial Hygienists (ACGIH) Threshold Limit Value: TWA 2 mg/m^3 (skin).

Determination in Air: Use NIOSH Analytical Method (IV) #3509, aminoethanol Compounds II or OSHA Analytical Method PV-2018.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = below -1.0.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator. Irritates the eyes, skin, nose, and throat. Contact can cause severe irritation and burns of the skin and eyes. Inhalation can cause headache, nausea and vomiting, coughing, wheezing, and/or shortness of breath.

Long Term Exposure: Diethanolamine may affect the kidneys and liver. Prolonged or repeated skin exposure may cause a skin allergy and rash.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Liver and kidney function tests. Lung function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; neoprene rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Viton™ gloves, suits; CPF3, Responder™ suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): natural rubber gloves; Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield when working with the liquid or solid material unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with diethanolamine you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Ethanolamine or Ethanolamine solutions require a shipping label of "CORROSIVE." They fall in Hazard Class 8 and Packing Group III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Dry material:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. *Liquid:* This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Diethoxypropene D:0780

Molecular Formula: $C_7H_{14}O_2$

Common Formula: $(C_2H_5O)_2CHCH{=}CH_2$

Synonyms: Acrolein acetal; Acrylaldehyde diethyl; 3,3-Diethoxy-1-propene; 3,3-Diethoxypropene; Propenal diethyl acetal; 1-Propene, 3,3-diethoxy-

CAS Registry Number: 3054-95-3

RTECS® Number: AS1370000

UN/NA & ERG Number: UN1993/128

EC Number: 221-276-0

Regulatory Authority and Advisory Bodies

US EPA, TSCA, use is restricted to research and development only.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 3,3-Diethoxypropene is a colorless flammable liquid; Molecular weight = 130.21; Boiling point = 123.5°C; Flash point = 4.4°C. Hazard Identification (based on HMIS Rating System scale: 0−4): Health 1, Flammability 3, Reactivity 1. Water solubility = not determined.

Potential Exposure: Used by technically qualified individuals only; in organic synthesis. US EPA under TSCA restricts use of this chemical to R&D only.

Incompatibilities: Forms explosive mixture with air. Contact with acids and strong oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Irritating to the eyes, skin, and respiratory tract.

Long Term Exposure: There is little information about the long-term health effects of diethoxypropene known at this time. It may be a mutagen based on tests with bacteria.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids and strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where diethoxypropene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of diethoxypropene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of diethoxypropene. Wherever diethoxypropene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: 3,3-Diethoxypropene must bear a “FLAMMABLE LIQUID” label. It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Diethylamine D:0790

Molecular Formula: $C_4H_{11}N$

Common Formula: $(C_2H_5)_2NH$

Synonyms: 2-Aminopentane; DEN; Diaethyamin (German); Diethamine; *N*,*N*-Diethylamine; Dietilamina (Spanish); *n*-Ethyl ethanamine

CAS Registry Number: 109-89-7

RTECS*® *Number: HZ8750000

UN/NA & ERG Number: UN1154/132

EC Number: 203-716-3 [*Annex I Index No.:* 612-003-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: Section 311 Hazardous Substances/RQ 100 lb (45.4 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R20/21/22; R35; Safety phrases: S1/2; S3; S16; S26; S29; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DEA, a secondary aliphatic amines compound, is a colorless, flammable liquid with a fishy ammonia-like odor. The odor threshold is 0.14 ppm. Molecular weight = 73.16; Boiling point = 55.6°C; Freezing/Melting point = −50°C; Vapor pressure = 192 mmHg at 20°C; Flash point = −23°C; Autoignition temperature = 312°C. Explosive limits: LEL = 1.8%; UEL = 10.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Diethylamine (DEA) is used in the manufacture of the following chemicals: diethyldithiocarbamate and thiurams (rubber processing accelerators); diethylaminoethanol (medicinal intermediate); diethylaminopropylamine (epoxy curing agent); *N*,*N*-diethyl-*m*-toluamide and other pesticides; and 2-diethylaminoethylmethacrylate. It is used in the manufacture of several drugs.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Violent reaction with strong oxidizers, strong acids, cellulose nitrate. Incompatible with organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, mercury, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc, and alloys.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.99 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/75 mg/m^3 TWA.

NIOSH REL: 10 ppm/30 mg/m^3 TWA; 25 ppm/75 mg/m^3 STEL.

ACGIH TLV®[1]: 5 ppm TWA; 15 ppmSTEL; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 15 ppm

PAC-2: 75 ppm

PAC-3: 200 ppm

DFG MAK: 5 ppm/15 mg/m^3 TWA; Peak Limitation Category I(2), a momentary value of 10 mL/m^3/30 mg/m^3 should not be exceeded; Pregnancy Risk Group D.

NIOSH IDLH: 200 ppm.

Australia: TWA 10 ppm (30 mg/m^3); STEL 25 ppm, 1993; Austria: MAK 10 ppm (30 mg/m^3), 1999; Belgium: TWA 10 ppm (30 mg/m^3); STEL 25 ppm, 1993; Finland: STEL 10 ppm (30 mg/m^3), [skin], 1999; France: VLE 10 ppm (30 mg/m^3), 1999; Hungary: TWA 30 mg/m^3; STEL 60 mg/m^3, 1993; Japan: 10 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 15 mg/m^3, [skin], 2003; Norway: TWA 10 ppm (30 mg/m^3), 1999; the Philippines: TWA 25 ppm (75 mg/m^3), 1993; Russia: TWA 10 ppm; STEL 30 mg/m^3, [skin], 1993; Sweden: NGV 10 ppm (30 mg/m^3), KTV 15 ppm (45 mg/m^3), [skin], 1999; Switzerland: MAK-W 10 ppm (30 mg/m^3), KZG-W 20 ppm (60 mg/m^3), 1999; Turkey: TWA 25 ppm (75 mg/m^3), 1993; United Kingdom: TWA 10 ppm (30 mg/m^3); STEL 25 ppm (76 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm [skin]. Several states have set guidelines or standards for Diethylamine in ambient air[60] ranging from 4.1 μg/m^3 (Massachusetts) to 300−750 μg/m^3 (North Dakota) to 500 μg/m^3 (Virginia) to 600 μg/m^3 (Connecticut) to 715 μ/m^3 (Nevada).

Determination in Air: Adsorption on silica, workup with H_2SO_4 in CH_3OH (Methanol); Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #2010 or OSHA Analytical Method 41.

Permissible Concentration in Water: Russia[43] set a MAC of 2 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: It is irritant and corrosive to eyes, skin, mucous membranes, and the respiratory tract. Dyspnea (difficult breathing) results in inhalation and it may be fatal.[24] Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. DEA can be absorbed through the skin, thereby increasing exposure. LD_{50} = (oral-rat) 540 mg/kg (slightly toxic).

Long Term Exposure: Repeated exposure may affect the liver and kidneys and result in swelling of the eyes, impaired vision, and the appearance of "circles" or halos around lights. Repeated exposures may cause bronchitis to develop with coughing, phlegm, and/or shortness of breath. In animals; myocardial degeneration.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Consider chest X-ray following acute overexposure. Consider vision tests, especially if symptoms have been noted. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Use butyl rubber gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *200 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] orCcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern organic vapor and acid gas cartridge(s)] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with DEA you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Keep containers well closed. Protect against direct sunlight. Store in a cool place. Protect containers against physical damage. Outdoors or detached storage is preferred. In case of indoor storage, store in a standard combustible liquid storage room or cabinet. Good ventilation. Separate from oxidizing materials, strong acids, cellulose nitrate, and other incompatible materials listed above.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Spread sodium bisulfate and sprinkle water upon a spill,[24] then flush to sewer. Alternatively, absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, foam, or carbon dioxide fire extinguishing agent. Water may be ineffective, but use water spray to keep fire-exposed containers cool; to disperse the vapor; to flush spills away from exposures; to dilute spills to nonflammable mixtures and thus to prevent the spread of fires. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R20/21/22; R34; Safety phrases: S1/2; S25; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DEAE, an aminoethanol compound, is a colorless liquid with a weak ammoniacal odor. The odor perception limit in air is 0.011 ppm; the odor recognition level is 0.04 ppm.[41] Molecular weight = 117.22; Specific gravity (H_2O:1) = 0.89; Boiling point = 162.8°C; Freezing/Melting point = −70°C; Vapor pressure = 1 mmHg at 20°C; Flash point = 52.2°C; Autoignition temperature = 250°C. Explosive limits: LEL = 6.7; UEL = 11.7. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. This compound is used as an anticorrosive additive; as a chemical intermediate for the production of emulsifiers, detergents, solubilizers, cosmetics, and textile finishing agents. It is also used in drug manufacture.

Incompatibilities: Forms explosive mixture with air. Violent reaction with oxidizers, strong acids, acid chlorides, and isocyanates. Attacks light metals and copper. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

OSHA PEL/NIOSH REL: 10 ppm/50 mg/m^3 TWA [skin].

NIOSH REL: 10 ppm/50 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 2 ppm/9.6 mg/m^3 TWA [skin].

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)

TEEL-0: 2 ppm

PAC-1: 3 ppm

PAC-2: 20 ppm

PAC-3: 100 ppm

DFG MAK: 5 ppm/24 mg/m^3 TWA; Peak Limitation Category I(1) [skin]; Pregnancy Risk Group C.

Australia: TWA 10 ppm (50 mg/m^3), [skin], 1993; Austria: MAK 10 ppm (50 mg/m^3), [skin], 1999; Belgium: TWA 10 ppm (48 mg/m^3), [skin], 1993; Denmark: TWA 10 ppm (50 mg/m^3), [skin], 1999; Finland: STEL 10 ppm (50 mg/m^3), [skin], 1999; France: VME 10 ppm (50 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 9.6 mg/m^3, [skin], 2003; the Philippines: TWA 10 ppm (50 mg/m^3), [skin], 1993; Poland: TWA 50 mg/m^3, 1999; Russia: STEL 5 mg/m^3, [skin], 1993; Switzerland: MAK-W 10 ppm (50 mg/m^3), [skin], 1999; United Kingdom: TWA 10 ppm (49 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm [skin]. Several states have set guidelines or standards for diethylaminoethanol in ambient air[60] ranging from 0.5 mg/m^3 (North Dakota) to 0.8 mg/m^3 (Virginia) to 1.0 mg/m^3 (Connecticut) to 1.19 mg/m^3 (Nevada).

Determination in Air: Adsorption on silica gel; Methanol/Water; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #2007, aminoethanol Compounds I.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = <0.5.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Diethylaminoethanol can affect you when breathed in by passing through your skin. Contact can cause very severe burns of the eyes, leading to permanent damage. It can also irritate the skin, causing a rash and burning sensation upon contact. Breathing the vapor may irritate the lungs, causing coughing and/or shortness of breath. Inhalation of vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms include nausea, vomiting; eye, skin, and respiratory irritation. LD_{50} = (oral-rat) 1300 mg/kg (slightly toxic).

Long Term Exposure: Diethylaminoethanol can cause a skin allergy to develop and may affect the nervous system. May cause lung irritation.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl alcohol gloves; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with DEAE you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diethylaminoethanol must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where diethylaminoethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Diethylaminoethanol must carry a "CORROSIVE, FLAMMABLE LIQUID" label. It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

***N,N*-Diethylaniline D:0810**

Molecular Formula: $C_{10}H_{15}N$

Common Formula: $C_6H_5N(C_2H_5)_2$

Synonyms: Benzenamine, *N,N*-diethyl-; DEA; Diaethyanilin (German); *N,N*-Diethylaminobenzene; Diethylaniline; *N,N*-Diethylbenzenamine; Diethylphenylamine; *N,N*-Dietilanilina (Spanish)

CAS Registry Number: 91-66-7

RTECS® Number: BX3400000

UN/NA & ERG Number: UN2432/153

EC Number: 202-088-8 [*Annex I Index No.:* 612-054-00-8]

Regulatory Authority and Advisory Bodies

Reportable Quantity (RQ): 1 lb (0.454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R51/53; Safety phrases: S1/2; S28; S37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diethyl aniline is a colorless to yellow liquid. Molecular weight = 149.26; Boiling point = 216°C; Flash point = 85°C; Autoignition temperature = 630°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Diethyl aniline is used in organic synthesis and as a diestuff intermediate.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers, halogens. Incompatible with acids, organic anhydrides, isocyanates, aldehydes.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 20 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

DEA can be absorbed through the skin, thereby increasing exposure.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure by skin contact or breathing can interfere with the ability of the blood to carry oxygen (a condition called methemoglobinemia). This can cause headaches, dizziness, a bluish color to the skin and lips, trouble breathing, and even collapse and death. Repeated exposures can cause a low red blood count (anemia). Very high single or repeated high exposures to diethyl aniline can damage the liver.

Long Term Exposure: May cause anemia and liver damage.

Points of Attack: Blood, liver.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: liver function tests. Complete blood count (CBC). If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to diethyl aniline, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DEA you should be trained on its proper handling and storage. Diethyl aniline must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric) and direct sunlight.

Shipping: *N,N*-Diethylaniline must be labeled: "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of

spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Diethylcarbamazine citrate D:0820

Molecular Formula: $C_{10}H_{21}N_3O{-}C_6H_8O_7$

Synonyms: Banocide; Caricide; Caritrol; Dicarocide; Diethylcarbamazane citrate; Diethylcarbamazine citrate; Diethylcarbamazine hydrogen citrate; 1-Diethylcarbamoyl-4-methylpiperazine dihydrogen citrate; *N,N*-Diethyl-4-methyl-1-piperazine carboxamide citrate; *N,N*-diethyl-4-methyl-1-piperazinecarboxamide dihydrogen citrate; *N,N*-Diethyl-4-methyl-1-piperazinecarboxamide 2-hydroxy-1,2,3-propanetricarboxylate; Ditrazin; Ditrazin citrate; Ditrazine; Ditrazine citrate; Ethodryl citrate; Franocide; Franozan; Hetrazan; Loxuran; 1-Methyl-4-diethylcarbamoylpiperazine citrate

CAS Registry Number: 1642-54-2

RTECS® Number: TL1225000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 216-696-6

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diethylcarbamazine citrate is an odorless, white crystalline powder; Molecular weight = 391.48; Freezing/Melting point = 135−143°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used against filariasis in humans and animals. Especially popular in veterinary medicine (anthelmintic).

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if inhaled. Symptoms of exposure include nausea, vomiting, headache, weakness, and (as seen in dogs) muscle tremors and convulsions. May be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. The average adult man may tolerate a single dose of 1.5 g without ill effects.

Long Term Exposure: May have reproductive effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: For emergency situations, wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash, or a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Medicine, solid, toxic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Diethylcarbamoyl chloride D:0830

Molecular Formula: $C_5H_{10}ClNO$
Common Formula: $(C_2H_5)_2NCOCl$

Synonyms: Caricide®; Diethylcarbamic chloride; Diethylcarbamidoyl chloride; *N*,*N*-Diethylcarbamoyl chloride; Diethylcarbamyl chloride; Hetrazan®
CAS Registry Number: 88-10-8
RTECS® Number: FD4025000
UN/NA & ERG Number: UN3123 (Toxic liquids, water-reactive, n.o.s.)/139
EC Number: 201-798-5 [*Annex I Index No.*: 607-229-00-0]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: Xn; Risk phrases R20/22; R36/37/38; R40; Safety phrases: S2; S26-36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diethylcarbamoyl chloride is a colorless liquid. Molecular weight = 135.61; Boiling point = 186−190°C; Melting point = −44; Flash point = 163−172°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 2. Soluble in water (reactive).

Potential Exposure: Diethylcarbamazine citrate, a carbamate anthelmintic (working agent), used in the synthesis of pharmaceuticals.

Incompatibilities: Will react with water or steam to produce toxic and corrosive fumes.

Permissible Exposure Limits in Air

No standards or TEEL available.

DFG MAK: Carcinogen Category 3B.

Harmful Effects and Symptoms

Long Term Exposure: A study has shown DECC to be mutagenic in two *E. coli* strains (WP2 and WP2S from Witkin). However, DECC was not as mutagenic as its close analog, dimethylcarbamoyl chloride (DMCC). A suspected carcinogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic liquids, water-reactive, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS, DANGEROUS WHEN WET." They fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides and chlorides, are produced in fire. Use dry chemical, carbon dioxide extinguishers. Reacts with water, forming corrosive and toxic fumes. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reference

New Jersey Department of Health and Senior Services. (September 2000). *Hazardous Substances Fact Sheet: Diethylcarbamoyl Chloride*. Trenton, NJ

Diethyl chlorophosphate D:0840

Molecular Formula: $C_4H_{10}ClO_3P$

Common Formula: $P(OC_2H_5)_2OCl$

Synonyms: Chlorophosphoric acid diethyl ester; Clorofosfato de dietilo (Spanish); Diethoxyphosphorous oxychloride; Phosphorochloridic acid, diethyl ester

CAS Registry Number: 814-49-3

RTECS® Number: TD1400000

UN/NA & ERG Number: UN3278 (organophosphorus compound, toxic n.o.s.)/151

EC Number: 212-396-4

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diethyl chlorophosphate is a combustible, clear liquid with an unpleasant odor. Molecular weight = 172.76; Boiling point = 60°C at 2.0 mmHg; 81°C at 6.0 mmHg. Freezing/Melting point = 0°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 2₩. Reacts with water.

Potential Exposure: This material may be used as an intermediate in the manufacture of pesticides and chemical warfare agents.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas. Strong oxidizers, bases.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 8 mg/m^3

PAC-3: 8 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Poison; can be absorbed through the skin. Diethyl chlorophosphate may severely irritate or burn the skin, eyes, or mucous membranes. This material is a cholinesterase inhibitor. It has high oral and very high dermal toxicity. It is a skin irritant. It is also toxic by inhalation. Acute exposure to diethyl chlorophosphate may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may either decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may be observed although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Diethyl chlorophosphate may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give conscious victims water or milk. Promote excretion by administering saline cathartic or sorbitol. Do not make an unconscious person vomit.

Personal Protective Methods: For emergency situations, wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape (SCBA) and a fully encapsulating, chemical-resistant suit.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus compound, toxic n.o.s. requires a label of “POISONOUS/TOXIC MATERIALS.” These materials fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Do not touch spilled material. Do not breathe vapors. Stay upwind; keep out of low areas. Remove all ignition sources. Ventilate area of spill or leak. This material is a combustible liquid. For a spill or leak of a combustible liquid, shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.4
Night	0.8/1.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200

Then: Protect persons downwind (miles/kilometers)

Day	1.6/2.6
Night	2.8/4.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides and chlorides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Cool containers that are exposed to flames with water from the side until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Stay upwind; keep out of low areas. Wear self-contained (positive-pressure if available) breathing apparatus and full protective clothing. Isolate for 1/2 mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 203-865-4 [*Annex I Index No.:* 612-058-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R21/22; R34-43; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diethylene triamine is a flammable, thick yellow liquid with an ammoniacal odor. The odor threshold is 100 ppm.[41] Molecular weight = 103.20; Specific gravity = (H_2O:1) = 0.96; Boiling point = 207°C; Freezing/Melting point = −38.9°C; Vapor pressure = 0.4 mmHg at 20°C; Flash point = 97.8°C; Autoignition temperature = 358°C. Explosive limits: LEL = 2%; UEL = 6.7%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. This material is used in textile finishes, fungicides, corrosion inhibitors, adhesives, asphalt additives, as a solvent for sulfur, acid gases, resins, and dyes.

Incompatibilities: Forms explosive mixture with air. Ignites spontaneously on contact with cellulose nitrate. Contact with silver, cobalt, or chromium compounds may cause explosions. Incompatible with acids, halogenated organics, organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, mercury, phenols, cresols, caprolactum solution, strong oxidizers. Attacks aluminum, copper, copper alloys, lead, tin, zinc and alloys.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.22 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 1 ppm/4 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 1 ppm/4.2 mg/m^3 TWA [skin].
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 1 ppm
PAC-2: 1.25 ppm
PAC-3: 1.5 ppm
DFG MAK: [skin] Danger of skin sensitization.

Australia: TWA 1 ppm (4 mg/m^3), [skin], 1993; Austria: MAK 1 ppm (4 mg/m^3), 1999; Belgium: TWA 1 ppm (4.2 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (4 mg/m^3), [skin], 1999; France: VME 1 ppm (4 mg/m^3), 1999; Hungary: STEL 4 mg/m^3, [skin], 1993; Netherlands: MAC-TGG 4 mg/m^3, 2003; Norway: TWA 1 ppm (4 mg/m^3), 1999; the Switzerland: MAK-W 1 ppm (4 mg/m^3), [skin], 1999; United Kingdom: TWA 1 ppm (4.3 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm [skin]. Several states have set guidelines or standards for diethylene triamine in ambient air[60] ranging from 40.0 μg/m^3 (North Dakota) to 65 μg/m^3 (Virginia) to 80.0 μg/m^3 (Connecticut) to 95 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2540, OSHA Analytical Method 60.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes.

Determination in Water: No tests listed. Octanol–water coefficient: Log $K_{ow} = -1.27$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Diethylene triamine can affect you when breathed in and by passing through your skin. Exposure can severely irritate the eyes, skin, and respiratory system. Diethylene triamine is a corrosive liquid and contact can irritate the skin and may irritate and burn the eyes. Skin sensitization, dermatitis, and pulmonary sensitization and irritation, possibly leading to bronchial asthma. Also, conjunctivitis, keratitis; nausea, vomiting; eye, skin necrosis; cough, dyspnea (breathing difficulty). LD_{50} = (oral-rat) 1080 mg/kg (slightly toxic).

Long Term Exposure: Diethylene triamine can cause both skin and lung allergies to develop. Once allergy develops, further low exposures can trigger allergic effects.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Skin testing with diluted diethylene triamine may help diagnose allergy if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; neoprene rubber gloves, suits, and boots; Viton™ gloves, suits; Trychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from acids, halogenated organics, and oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates). Protect containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This material requires a "CORROSIVE" label. It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Diethylene triamine may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in admixture with flammable solvent in furnace equipped with afterburner and scrubber.[22]

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Di(2-ethylhexyl)phthalate is a colorless oily liquid with almost no odor. Molecular weight = 390.56; Specific gravity (H$_2$O:1) = 0.99; Boiling point = 385°C; Freezing/Melting point = −50°C; Vapor pressure = <0.01% mmHg at 20°C; Flash point = 195°C; Autoignition temperature = 348°C. Explosive limits: LEL = 0.1%; UEL − 0.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.00003% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Di (2-ethylhexyl)phthalate (DEHP) is commercially produced by the reaction of 2-ethylhexyl alcohol and phthalic anhydride. It is used as a plasticizer for polyvinyl chloride (PVC), plastic resins, di-electrical fluid component in capacitors; in the manufacture of organic pump fluids. Two groups are at risk in regard to phthalic acid esters. These are workers in the industrial environment in which the phthalates are manufactured or used and patients receiving chronic transfusion of blood and blood products stored in PVC blood bags.

Incompatibilities: Nitrates, strong oxidizers, strong acids, strong alkalis.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA; 10 mg/m^3 STEL, potential carcinogen, reduce to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 5 mg/m^3 TWA, confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 10 mg/m^3 TWA; Peak Limitation Category II (8); Carcinogen Category 4; Pregnancy Risk Group C.

Australia: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; Denmark: TWA 3 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3, [skin], 1999; France: VME 5 mg/m^3, 1999; Hungary: TWA 5 mg/m^3; STEL 10 mg/m^3, [skin], 1993; Japan: 5 mg/m^3, 1999; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 5 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993; Sweden: NGV 3 mg/m^3, KTV 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for bis (2-ethylhexyl)phthalate in ambient air[60] ranging from 0.5 μg/m^3 (Rhode Island) to 0.68 μg/m^3 (Massachusetts) to 16.0 μg/m^3 (New York) to 25.0 μg/m^3 (North Carolina) to 80.0 μg/m^3 (Virginia) to 100 μ/m^3 (Connecticut) to 119 μg/m^3 (Nevada) to 120 μg/m^3 (Pennsylvania).

Determination in Air: Collection on a filter, workup with CS$_2$; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #5020, di(2-Ethylhexyl) Phthalate.

Permissible Concentration in Water: *For freshwater and saltwater aquatic life*, no criteria have been set due to lack of data. *For protection of human health*, the ambient water criterion is 15 mg/L (15,000 μg/L).[6] A no-adverse-effect-level in drinking water has been calculated by NAS/NRC to be 4.2 mg/L. An acceptable daily intake (ADI) value of 0.6 μg/kg/day has been calculated by NAS/NRC.

Determination in Water: Gas chromatography (EPA Method 606) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 5.0$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: DEHP irritates the eyes, skin, and respiratory tract, and may affect the gastrointestinal tract. Symptoms also include irritation of the mucous membranes, nausea, diarrhea.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The very low levels of DEHP to which humans are normally exposed have not been shown to cause adverse health effects. But DEHP causes cancer in rats and mice. It is also known to produce liver damage and male reproductive system damage; affect reproduction; and produce birth defects in laboratory animals. However, none of these effects have been documented in humans. This complicates estimating which kinds of health effects and exposure levels will actually affect humans. However, it is prudent to regard the animal data as indicating some degree of concern for harmful human effects (a potential occupational carcinogen) until research can more reasonably conclude that no harm can occur.

Points of Attack: Eyes, respiratory system, central nervous system, liver, reproductive system, gastrointestinal tract. Cancer site [in animals]: liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Examination of the nervous system. Any evaluation should include a careful history of past and present symptoms.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with DEHP you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Bis (2-ethylhexyl)phthalate must be stored to avoid contact with oxidizing materials, such as permanganates, nitrates, peroxides, chlorates, and perchlorates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where bis (2-ethylhexyl) phthalate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. It may burn but does not easily ignite. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Diethyl ketone D:0870

Molecular Formula: $C_5H_{10}O$

Common Formula: $C_2H_5COC_2H_5$

Synonyms: DEK; Diethylcetone (French); Dimethylacetone; Ethyl ketone; Ethyl propionyl; Metacetone; Methacetone; 3-Pentanone; Pentanone-3; 3-Pentanone dimethyl acetone; Propione

CAS Registry Number: 96-22-0

RTECS® Number: SA8050000

UN/NA & ERG Number: UN1156/127

EC Number: 202-490-3 [*Annex I Index No.:* 606-006-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F , Xi; Risk phrases: R11; R37; Safety phrases: S2; S9; S16; S25; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diethyl ketone is a colorless liquid with an acetone-like odor (smells like nail-polish remover). Odor threshold 2.8 ppm. Molecular weight = 86.15; Specific gravity (H_2O:1) = 0,81 at 25°C; Boiling point = 101.6°C; Freezing/Melting point = −42°C; Vapor pressure = 35 mmHg at 25°C; Flash point = 12.8°C (oc); Autoignition temperature = 452°C. Explosive limits: LEL = 1.6%; UEL = 6.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Moderately soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen, Primary Irritant. This compound is used as a solvent; in organic synthesis and making medicines.

Incompatibilities: Violent reaction with oxidizers, causing fire and explosion hazard. Forms explosive mixture with air. Incompatible with strong acids, aliphatic amines. Attacks many plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 200 ppm/705 mg/m^3 TWA.

ACGIH TLV®[1]: 200 ppm/705 mg/m^3 TWA; 300 ppm/1057 mg/m^3 STEL.

Protective Action Criteria (PAC)

TEEL-0: 200 ppm

PAC-1: 300 ppm

PAC-2: 300 ppm

PAC-3: 750 ppm

Australia: TWA 200 ppm (705 mg/m^3), 1993; Belgium: TWA 200 ppm (705 mg/m^3), 1993; Denmark: TWA 200 ppm (700 mg/m^3), 1999; France: VME 200 ppm (705 mg/m^3), 1999; the Netherlands: MAC-TGG 705 mg/m^3, 2003; Norway: TWA 100 ppm (350 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (705 mg/m^3), 1999; United Kingdom: TWA 200 ppm (716 mg/m^3); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 300 ppm. Several states have set guidelines or standards for diethyl ketone in ambient air[60] ranging from 7.05 mg/m^3 (North Dakota) to 12.0 mg/m^3 (Virginia) to 14.1 mg/m^3 (Connecticut) to 16.8 mg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: No tests listed. Octanol–water coefficient: Log K_{ow} = (estimated) 0.99.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: DEK can be absorbed through the skin, thereby increasing exposure. DEK irritates the eyes, skin, and respiratory tract. Higher exposures can cause dizziness, lightheadedness, and unconsciousness. This material is slightly toxic. LD_{50} = (oral-rat) 2140 mg/kg.

Long Term Exposure: Removes the skin's natural oils. Some, but not all, ketones can cause nerve damage.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Interview for brain effects, including memory, mood, concentration, headaches, altered sleep patterns.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 200 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect diethyl ketone, or in the case of a full-face-piece respirator if you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with DEK you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diethyl ketone must be stored to avoid contact with oxidizing materials (such as peroxides, perchlorates, chlorates, permanganates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Sources of ignition, such as smoking and open flames, are prohibited where diethyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of diethyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of diethyl ketone. Wherever diethyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition

sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

O,O-Diethyl-*S*-methyl phosphorodithioate D:0880

Molecular Formula: $C_5H_{13}O_2PS_2$

Synonyms: Phosphorodithioc acid, *O,O*-diethyl *S*-methyl ester

CAS Registry Number: 3288-58-2

RTECS® Number: TD9670000

UN/NA & ERG Number: UN2783 (organophosphorus pesticides, solid, toxic)/152

UN/NA & ERG Number: None assigned.

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): U087.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA Land Ban Waste Restrictions.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

Reportable Quantity (RQ): 5000 lb (2270 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: *O,O*-Diethyl-*S*-methyl phosphorodithioate is an organophosphate and the methyl derivative of *O,O*-diethyl dithiophosphoric acid. The compound has partly insecticidal, acaricidal, and fungicidal activity and is useful as an intermediate for organic synthesis.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Many organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: There is no available information on the possible carcinogenic, mutagenic, teratogenic, or adverse reproductive effects of *O,O*-diethyl-S-methyl phosphorodithioate. It, like other organophosphate compounds, is expected to produce cholinesterase inhibition in humans. There are no available data on the aquatic toxicity of this compound. The oral LD_{50} mouse is 156 mg/kg (moderately toxic).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof goggles and face shield if working with the liquid or dust-proof chemical goggles and face shield if working with dry material unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents.

Shipping: Organophosphorus pesticides, liquid, toxic n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Diethyl-*p*-phenylene-diamine D:0890

Molecular Formula: $C_{10}H_{16}N_2$

Common Formula: $C_6H_4NH_2N(C_2H_5)_2$

Synonyms: *p*-Aminodiethylaniline; 4-Amino-*N*,*N*-diethylaniline; *p*-(Diethylamino)aniline; 4-(Diethylamino)aniline; Diethylaminoaniline; *N*,*N*′-Diethyl-*p*-fenylendiamin; *N*,*N*′-Diethyl-*p*-phenylenediamine; Diethyl-*p*-phenylenediamine; *N*,*N*-Diethyl-*p*-phosphoric acid; DPD

CAS Registry Number: 93-05-0

RTECS® Number: SS9275000

UN/NA & ERG Number: UN1673 (phenylenediamines)/153

EC Number: 202-214-1[*Annex I Index No.:* 612-080-00-X]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: Dropped from listing in 1988.

European/International Regulations: Hazard Symbol: T; Risk phrases: R 25-R34; Safety phrases: S1/2; S26; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: DPD is a clear liquid. Molecular weight = 164-28; Boiling point = 260−262°C; Flash point $\geq$110°C.[52]

Potential Exposure: Used as a dye intermediate and in color photography. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

DFG MAK: Danger of skin sensitization (*p*-phenylenediamine compounds used as rubber components).

Harmful Effects and Symptoms

Short Term Exposure: DPD is poisonous and a skin irritant. The lowest toxic dermal dose reported in humans is 73 μg/kg. The LD_{50} low-oral-cat is 300 mg/kg and the LD_{50} low-dermal-rabbit is 5 mg/kg.

Long Term Exposure: May cause allergic dermatitis.

Points of Attack: Skin.

Medical Surveillance: Examination by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DPD you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Phenylenediamines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1; National Pollutant Release Inventory (NPRI).

Mexico, Drinking Water Criteria, Wastewater.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diethyl phthalate is a water-white odorless liquid. Molecular weight = 222.26; Specific gravity (H_2O:1) = 1.12; Boiling point = 296°C; Melting point = −44.5°C; Flash point = 161°C (cc); Autoignition temperature = 457°C. Explosive limits: LEL = 0.7% at 186°C; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.1% at 25°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. This material is used as a plasticizer, dye carrier, and wetting agent; as a solvent for cellulose esters; as a vehicle in pesticidal sprays; as a fixative and solvent in perfumery; as an alcohol denaturant; and as a plasticizer in solid rocket propellants.

Incompatibilities: Violent reaction with strong acids, strong oxidizers, including permanganates, water. Attacks some forms of plastic.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 3 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3 [skin] 1999; France: VME 5 mg/m^3, 1999; Japan: 5 mg/m^3, 1999; Norway: TWA 3 mg/m^3, 1999; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 15 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, 1993; Sweden: NGV 3 mg/m^3, KTV 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3. 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for diethyl phthalate in ambient air[60] ranging from 16.7 μg/m^3 (New York) to 25.0 μg/m^3 (South Carolina) to 50.0 μg/m^3 (Connecticut and Florida) to 50−100 μg/m^3 (North Dakota) to 80.0 μg/m^3 (Virginia) to 119 μg/m^3 (Nevada).

Determination in Air: Collection by OSHA versatile sampler-Tenax; Toluene; Gas chromatography/Flame ionization detection; OSHA Analytical Method #104.

Permissible Concentration in Water: Data are insufficient to draft criterion for the protection of either freshwater or marine organisms. The recommended water quality criterion level for protection of human health is 350 mg/L (350,000 μg/L).[6] Kansas has set guideline for drinking water of 350 mg/L.[61] The Mexican drinking water criteria is 350.0 mg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method #606) or gas chromatography plus mass spectrometry (EPA Method #625). Octanol−water coefficient: Log $K_{ow} = 2.47$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation: Levels above 500 mg/m^3 may cause irritation. Exposure to heated vapors may cause irritation of the nose and throat, dizziness, and nausea. Sensitive individuals may develop an allergic reaction similar to asthma. *Skin:* Can be absorbed. May cause irritation and allergy. *Eyes:* Contact can cause irritation and damage to the cornea. *Ingestion:* Animal studies suggest that about 2.5 liquid ounces may cause death in a 150-lb adult. Symptoms include headache, dizziness, nausea, lacrimation (discharge of tears), possible polyneuropathy, vestibular dysfunction, pain, numbness, weakness, spasms in arms and legs.

Long Term Exposure: Prolonged inhalation may cause irritation of the nose, throat, and respiratory system. Repeated exposure may cause disturbed sleep, with pain, numbness, or weakness in the arms and legs. In animals: reproductive effects.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following are recommended: medical exam of the nervous system. Complete blood count and differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure *over 5 mg/m^3*, use an NIOSH/MSHA- or European Standard EN 149-approved full-face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full face-piece powered air-purifying respirators. If while wearing a filter, cartridge or canister respirator, you can smell, taste, or otherwise detect diethyl phthalate, or in the case of a full-face-piece respirator if you experience eye irritation, leave the area immediately.

Storage: Color Code—Green: General storage may be used. Prior to working with DEP you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and oxidizing agents (such as permanganates, nitrates, chlorates, perchlorates, and peroxides). Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. However, ignition is difficult. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Water or foam may cause frothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence, animal Sufficient Evidence*, carcinogenic to humans*, Group 1, 1998.[9]; NTP: Known to be a human carcinogen.

Banned or Severely Restricted (many countries) (UN).[13]

US EPA Hazardous Waste Number (RCRA No.): U089.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 2/27/87; Developmental/Reproductive toxin 7/1/87.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DES is a white, odorless, crystalline powder or plates. Molecular weight = 268.35; Freezing/Melting point = 172°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solubility = 13,000 mg/L.

Potential Exposure: DES had been used extensively as a growth promoter for cattle and sheep and is used in veterinary medicine to treat estrogen-deficiency disorders. It has been used in humans to prevent spontaneous abortions; to treat symptoms associated with menopause, menstrual disorders, postpartum breast engorgement, primary ovarian failure, breast cancer, and prostate cancers in males. In 1979, the DFA revoked all use of DES in food-producing animals. The Court of Appeals upheld the Commissioner's decision to revoke the use of DES in all food-producing animals on November 24, 1980; the motion to reconsider was denied on December 24, 1980.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.025 mg/m^3
PAC-1: 0.075 mg/m^3
PAC-2: 0.6 mg/m^3
PAC-3: 15 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Nausea, headache, vomiting, local irritation of eyes, skin, and mucous membranes.

Long Term Exposure: A Confirmed Human Carcinogen. May affect the glands. A possible teratogen. May cause vaginal bleeding. In men, it may cause impotence, breast enlargement, and other feminizing effects.

Points of Attack: Cancer sites: skin, liver, and lung; uterine and other reproductive system in the female newborn of exposed women. Glandular system.

First Aid: *Skin Contact*[52]*:* Flood areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately, breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—Green: General storage may be used. Prior to working with DES you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Banned or Severely Restricted (Sweden) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; National Pollutant Release Inventory (NPRI).

European/International Regulations: Hazard Symbol: T; Risk phrases: R45;R46; R20/21/22; R34; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Diethyl sulfate is a colorless, oily liquid with a faint peppermint-like or ether-like odor. Turns brown on contact with air. Molecular weight = 154.20; Boiling point = 209°C (decomposes); Freezing/Melting point = −25°C; Flash point = 104°C; Autoignition temperature = 436°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Insoluble in water; slight decomposition.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Used as an industrial chemical; ethylating agent (synthesis of dye and pharmaceuticals); synthesizing agent of ammonium chloride compounds; in making isopropyl alcohol, ethyl alcohol, and other chemicals; dehydrating agent; extractant for gasoline.

Incompatibilities: Vigorous reaction with strong oxidizers or water (forms sulfuric acid). The aqueous solution is a strong acid; incompatible with nonoxidizing mineral acids, organic acids, bases, acrylates, aldehydes, alcohols, alkylene oxides, ammonia, aliphatic amines, alkanolamines, aromatic amines, amides, chlorates, epichlorohydrin, fulminates, glycols, isocyanates, ketones, powdered metals, organic anhydrides, perchlorates, picrates, substituted allyls, phenols, and cresols. DS decomposes when heated, producing diethyl ether and fumes of sulfur oxides. DS is a strong reducing agent; reacts with oxidizing materials. Forms explosive hydrogen gas on contact with iron in the presence of water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.075 ppm
PAC-1: 0.2 ppm
PAC-2: 1.5 ppm
PAC-3: 25 ppm

DFG MAK: Carcinogen Category 2; Germ Cell Mutation Category 2 (2006).

Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.03 ppm (0.2 mg/m^3), carcinogen, 1999; United Kingdom: TWA 0.05 ppm (0.32 mg/m^3), [skin], carcinogen 2000.

Harmful Effects and Symptoms

Short Term Exposure: DS is corrosive to the eyes, skin, and respiratory tract. Inhalation of the aerosol can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. A poison by subcutaneous and inhalation routes. Moderate acute toxicity by ingestion and skin routes. An experimental tumorigen, transplacental brain carcinogen.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. DS is a probable human carcinogen. May cause heritable genetic damage in humans. May cause lung damage.

Points of Attack: Lungs, central nervous system, skin, reproductive system. Cancer sites: lungs and stomach in animals and throat in humans.

Medical Surveillance: Preclude from exposure those individuals with diseases of central nervous system, kidneys, and liver. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Gastric lavage (stomach wash), if swallowed, followed by saline catharsis. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Protect against physical damage. Store in a cool, dry, well-ventilated location away from any area where the fire hazard may be acute. Outside or detached storage is preferred. Separate from other storage. Before entering confined space where DS may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water or foam may cause frothing and sulfuric acid. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent. Scatter the spray of the solvent into the furnace with afterburner and alkali scrubber.

Diethyl zinc D:0930

Molecular Formula: $C_4H_{10}Zn$
Common Formula: $(C_2H_5)_2Zn$
Synonyms: Ethyl zinc; Zinc, diethyl-; Zinc ethide; Zinc ethyl
CAS Registry Number: 557-20-0
RTECS® Number: ZH2070000
UN/NA & ERG Number: UN1366/135
EC Number: 209-161-3 [*Annex I Index No.*: 030-004-00-8]
Regulatory Authority and Advisory Bodies
OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 10,000 lb (4540 kg).
European/International Regulations: Hazard Symbol: F, C, N; Risk phrases: R14; R17; R 34; R50/53; Safety phrases: S1/2; S16; S43; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Diethyl Zinc is a colorless liquid. Molecular weight = 123.51; Boiling point = 124°C; Flash point = Ignites spontaneously in air at room temperature. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3₩ (water reactive). *Do not use water*, foam, or halogenated extinguishing agents. Contact with water causes violent decomposition releasing a flammable gas. It should be used under a dry inert gas, kerosene blanket, or in an evacuated system.
Potential Exposure: Diethyl zinc is used in organic syntheses; as a catalyst in the manufacture of olefin polymers and as a high-energy aircraft and missile fuel.
Incompatibilities: Ignites spontaneously on contact with air or strong oxidizers. Explosive decomposition at 245°F/120°C. Violent reaction with hydrazine, sulfur dioxide, halogens, some alcohols, ozone; possible fire and explosions. Contact with water forms ethane gas.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.3 ppm
PAC-2: 2 ppm
PAC-3: 10 ppm
Harmful Effects and Symptoms
Short Term Exposure: Contact can irritate or burn the eyes and skin.
Long Term Exposure: Unknown at this time.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Because diethyl zinc can ignite spontaneously, protective clothing should be fire-retardant or fire-proof. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to diethyl zinc, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with diethyl zinc you should be trained on its proper handling and storage. Before entering confined space where diethyl zinc may be present, check to make sure that an explosive concentration does not exist. Diethyl zinc must be stored to avoid contact with water, chlorine, hydrazine, and oxidizers since violent reactions occur. Store in sealed tubes or cylinders under a dry, inert gas blanket or in an evacuated system. Shade from radiant heat and protect from rain. Metal containers involving the transfer of 5 gallons or more of diethyl zinc should be grounded and bonded. Wherever diethyl zinc is used, handled, manufactured, or stored, use explosion proof electrical equipment and fittings. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.
Shipping: This compound requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard 4.2 and Packing Group I.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup

is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable and highly reactive liquid. It can ignite spontaneously if it is exposed to air or moisture at room temperature. Poisonous gases, including zinc oxide, are produced in fire. Use dry chemical, soda ash, or lime extinguishers. *Do not use water*, foam, or halogenated extinguishers. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Difluorodibromomethane D:0940

Molecular Formula: CBr_2F_2

Synonyms: Dibromodifluoromethane; Freon® 12B2; Halon® 1202; Methane, dibromofluoro-

CAS Registry Number: 75-61-6

RTECS® Number: PA7525000

UN/NA & ERG Number: UN1941/171

EC Number: 200-885-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Difluorodibromomethane is a colorless heavy liquid or gas (above 24°C/76°F) with a characteristic odor. Molecular weight = 209.83; Boiling point = 24°C; Freezing/Melting point = − 146°C; Vapor pressure = 620 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Insoluble in water.

Potential Exposure: This material is used as a fire-extinguishing agent and in making dyes and pharmaceuticals.

Incompatibilities: Reacts with chemically active metals, such as sodium, potassium, calcium, powdered aluminum, zinc, magnesium. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 8.58 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/860 mg/m^3 TWA.

NIOSH REL: 100 ppm/860 mg/m^3 TWA.

ACGIH TLV®[1]: 100 ppm/858 mg/m^3 TWA.

No TEEL available.

DFG MAK: No numerical value established. Data may be available.

NIOSH IDLH: 2000 ppm.

Australia: TWA 100 ppm (860 mg/m^3), 1993; Austria: MAK 100 ppm (860 mg/m^3), 1999; Belgium: TWA 100 ppm (858 mg/m^3), 1993; Denmark: TWA 100 ppm (860 mg/m^3), 1999; Finland: TWA 100 ppm (860 mg/m^3); STEL 150 ppm (1290 mg/m^3), 1999; France: VME 100 ppm (860 mg/m^3), 1993; the Netherlands: MAC-TGG 860 mg/m^3, 2003; the Philippines: TWA 100 ppm (860 mg/m^3), 1993; Switzerland: MAK-W 100 ppm (860 mg/m^3), KZG-W 200 ppm (1720 mg/m^3), 1999; Turkey: TWA 100 ppm (860 mg/m^3), 1993; United Kingdom: TWA 100 ppm (872 mg/m^3); STEL 150 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 100 ppm. Several states have set guidelines or standards for this compound in ambient air[60] ranging from 8.6 mg/m^3 (North Dakota) to 14.0 mg/m^3 (Virginia) to 17.2 mg/m^3 (Connecticut) to 29.5 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with isopropanol, analysis by gas chromatography. Use NIOSH Analytical Method 1012.[18]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause eye and skin irritation. Inhalation can irritate the nose and throat. High exposures can cause you to become dizzy, lightheaded, and to pass out. Also, high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact with the liquid can cause frostbite.

Long Term Exposure: May cause liver damage. In animals: central nervous system symptoms; liver damage.

Points of Attack: Respiratory system, central nervous system, liver.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: consider chest X-ray following acute overexposure. Liver and lung function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. When working with Difluorodibromomethane gas, wear gas-proof goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *Up to 1000 ppm:* Sa (APF = 10) (any supplied respirator). *Up to 2000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Difluorodibromomethane must be stored to avoid contact with chemically active metals, such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: This compound does not require a shipping label. It falls in Hazard Class 9 and Packing III. The symbol "A" restricts the application of requirements of this subchapter to materials offered or intended for transportation by aircraft, unless the material is a hazardous substance or a hazardous waste.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate area of spill or leak. If the gas is leaking, stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If the liquid is spilled or leaked, allow it to vaporize.

Fire Extinguishing: This chemical is a noncombustible liquid or gas. Poisonous gases, including hydrogen bromide, hydrogen fluoride, carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure

position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Venting to the atmosphere was formerly the preferred method. Now, concern for destruction of the ozone layer has made this method unacceptable. Return to supplier (where possible) or high-temperature incineration must now be used.

Digitoxin D:0950

Molecular Formula: $C_{41}H_{64}O_{13}$

Synonyms: Acedoxin; Asthenthilo; Cardidigin; Cardigin; Carditoxin; Cristapurat; Crystalline digitalin; Crystodigin; (3b,5b)-3-[(*O*-2,6-Dideoxy-β-D-ribohexopyranosyl-(1→4)-*O*-2,6-dideoxy-β-D-ribohexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-14-hydroxycard-20(22)-enolide; Digilong; Digimed; Digimerck; Digisidin; Digitalin; Digitaline (French); Digitaline cristalliseel digitaline nativelle; Digitalinum verum; Digitophyllin; Digitoxigenin-tridigitoxosid (German); Digitoxigenin tridigitoxoside; Digitoxina (Spanish); Ditaven; Glucodigin; Lanatoxin; Monoglycocoard; Myodigin; Purodigin; Purpurid; Tardigal; Tri-digitoxoside (German); Unidigin

CAS Registry Number: 71-63-6

RTECS® Number: IH2275000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-760-5 [*Annex I Index No.:* 614-022-00-9]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/25; R33; Safety phrases: S1/2; R45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Digitoxin is a white crystalline solid; Molecular weight = 765.05; Freezing/Melting point = 256−257°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Natural Product; Reproductive Effector; Primary Irritant. This material is used as a cardiotonic drug. Digitoxin is the most toxic component of digitalis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.0075 mg/m^3

PAC-1: 0.025 mg/m^3

PAC-2: 0.18 mg/m^3

PAC-3: 0.25 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause irritation. Symptoms of exposure include nausea and vomiting. Headache, malaise, fatigue, weakness, drowsiness, and abdominal discomfort are symptomatic of toxicity. Visual disturbances (reduction of visual acuity, illusions of flickering or shimmering lights, abnormal color vision) and emotional disorders (including confusion, disorientation, aphasia, delirium, hallucinations, and rarely, convulsions) are also possible toxic effects. This material is bioactive and capable of causing cardiac arrhythmias and electrolyte imbalances that may be fatal. Death is due to ventricular fibrillation or cardiac arrest. Material has a high toxicity hazard rating; it may cause death or permanent injury after a very short exposure. It is classified as super toxic; an estimated single lethal dose is 3−10 mg. LD_{50} = (oral-rat) 56 mg/kg.

Long Term Exposure: May cause reproductive effects.

Points of Attack: Heart.

Medical Surveillance: EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with digitoxin you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator.

Shipping: This compound can be classed under Medicine, solid, toxic, n.o.s. It requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

PAC-3: 10 ppm

DFG MAK: [skin]; Carcinogen Category 3B.

Australia: TWA 0.1 ppm (0.5 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.6 mg/m^3), Suspected carcinogen, 1999; Belgium: TWA 0.1 ppm (0.53 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.53 mg/m^3), 1999; Finland: STEL 0.2 ppm (1 mg/m^3), [skin], 1999; France: VME 0.1 ppm (0.5 mg/m^3), 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 0.5 ppm (2.8 mg/m^3), 1993; Sweden: TGV 0.2 ppm (1.1 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.5 mg/m^3), KZG-W 0.2 ppm (1.0 mg/m^3), 1999; Thailand: TWA 0.5 ppm (2.8 mg/m^3), 1993; Turkey: TWA 0.5 ppm (2.8 mg/m^3), 1993; United Kingdom: TWA 0.1 ppm (0.53 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The Canadian province of British Columbia: 0.5 ppm/2.8 mg/m^3 Ceiling Concentration. Several states have set guidelines or standards for DFG in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 5−10 μg/m^3 (Connecticut) to 8.0 μg/m^3 (Virginia) to 2380 μg/m^3 (Nevada).

Determination in Air: Adsorption by charcoal tube, analysis by gas liquid chromatography.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Diglycidyl ether can affect you when breathed in and by passing through your skin. Higher levels can cause you to feel dizzy, lightheaded, and to pass out. Death can occur. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. DGE may affect the blood, kidneys, liver, testes. Contact can irritate and burn the eyes and skin, and cause skin allergy. Because this is a mutagen, handle it as a possible carcinogen—with extreme caution. LD_{50} = (oral-rat) 450 mg/kg.

Long Term Exposure: Repeated exposure can damage the liver and kidneys and can lower blood cell count. Diglycidyl ether may damage the lungs and cause clouding of the eyes. Repeated or prolonged contact with skin may cause skin sensitization and dermatitis. Animal tests show that DGE may damage the testes. Designated a potential occupational carcinogen by NIOSH (as glycidyl ethers).

Points of Attack: Eyes, skin, respiratory system, reproductive system. Cancer site in animals: skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: Liver and kidney function tests; lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the eyes and vision. NIOSH lists the following tests: complete blood count; chest X-ray; pulmonary function tests; forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with DGE you should be trained on its proper handling and storage. Diglycidyl ether must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, bromine, nitrates, and permanganates since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where diglycidyl ether is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: DGE requires a "CORROSIVE" label. It falls in Hazard Class 8(6.1) and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid that may explode on heating. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Diglycidyl ether of bisphenol A D:0970

Molecular Formula: $C_{21}H_{24}O_4$

Synonyms: 2,2′-Bis [(*p*-2,3-epoxy propoxy) phenyl] propane; 2,2-Bis[4-(2,3-epoxypropyloxy)phenyl]propane; Bis(4-glycidyloxyphenyl)dimethylamethane; 2,2-Bis(*p*-glycidyloxyphenyl)propane; Bis(4-hydroxyphenyl)dimethylmethane diglycidyl ether; 2,2-Bis(*p*-hydroxyphenyl)propane, diglycidyl ether; 2,2-Bis(4-hydroxyphenyl)propane, diglycidyl ether; D.E. R. 332; Diglycidyl bisphenol A; Diglycidyl ether of 2,2-bis(*p*-hydroxyphenyl)propane; Diglycidyl ether of 2,2-bis(4-hydroxyphenyl)propane; Diglycidyl ether of bisphenol A; Diglycidyl ether of 4,4′-isopropylidenediphenol; *p,p*′-Dihydroxydiphenyldimethylmethane diglycidyl ether; 4,4′-Dihydroxydiphenyldimethylmethane diglycidyl ether; EPI-REZ 508; EPI-REZ 510; Epon 828; Epoxide A; ERL-2774; 4,4′-Isopropylidenediphenol diglycidyl ether; 2,2′-[(1-Methylethylidene)bis(4,1-phenyleneoxymethylene)] bisoxirane

CAS Registry Number: 1675-54-3

RTECS® Number: TX3800000

UN/NA & ERG Number: Not regulated.

EC Number: 216-823-5 [*Annex I Index No.:* 603-073-00-2]

Regulatory Authority and Advisory Bodies

Canada WHMIS Classification D2b Skin sensitizer; DSL listed.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/38; R43; Safety phrases: S2; S28-37/39. WGK (German Aquatic Hazard Class): No value assigned.

Description: Diglycidyl ether of bisphenol A is a colorless to light amber liquid. Slight epoxy odor. Molecular weight = 340.45; Freezing/Melting point = 8−12°C and decomposes in lieu of boiling; Flash point = >251.5°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: Diglycidyl ether of bisphenol A is used as a basic active ingredient of epoxy resins.

Incompatibilities: Easily oxidized in air; presumed to form unstable and explosive peroxides in storage. Incompatible with strong acids; strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 3.5 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 6 mg/m^3

DFG MAK: [skin] Danger of sensitization of the skin; Germ Cell Mutagen Category 3A.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Diglycidyl ether of bisphenol A can affect you when breathed in and by passing through your skin. Skin contact can cause irritation and rash. It may also lead to the development of skin allergy. Once allergy develops even low future exposures can trigger rash. Eye contact causes irritation. The vapors can irritate the eyes, nose, throat, and bronchial tubes, causing nosebleeds, coughing, and tightness in the chest. LD_{50} = (oral-rat) >5000 mg/kg.

Long Term Exposure: There is limited evidence that this chemical causes skin cancer in animals. May cause dermatitis; skin sensitization and allergy.

Points of Attack: Skin, lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to diglycidyl ether of bisphenol A, use a MSHA/NOSH approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard (skin sensitization): Store in a secure location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area away from strong oxidizers, acids, and heat. Recommended storage (and pumping) temperature = 45−50°C.

Shipping: This material is not covered in DOT's Performance-Oriented Packaging Standards.[19] It may, however, be classified as a Combustible Liquid, n.o.s. This class requires no shipping label. It falls in Hazard Class 3 [each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F], and Packing Group III. The symbol "D" identifies proper shipping names which are appropriate for describing materials for domestic transportation but may be inappropriate for international transportation under the provisions of international regulations (e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 244-068-1

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (0.454/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Digoxin is a white crystalline solid. Molecular weight = 781.05; Freezing/Melting point = 230−265°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Compound Description: Natural Product; Reproductive Effector. Digoxin is used as a cardiotonic drug.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.04 mg/m^3

PAC-1: 0.125 mg/m^3

PAC-2: 0.2 mg/m^3

PAC-3: 0.35 mg/m^3

Routes of Entry: Ingestion, inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure refer specifically to digitalis and include nausea and vomiting; headache, fatigue, weakness, drowsiness, and abdominal discomfort are symptomatic of toxicity. Visual disturbances (including blurring, halos, and aberrations of color); emotional disorders (including confusion, disorientation, aphasia, delirium, and hallucinations); and convulsions. Material is a digitalis glycoside. Ingestion can cause death. Material is considered super toxic; probable human oral lethal dose is less than 5 mg/kg, a taste (less than 7 drops) for a 70-kg (150-lb) person.

Persons at risk include those taking drugs for thyroid and renal diseases. Quinidine and diuretics taken concurrently with digoxin can be hazardous. It should be used with extreme care during pregnancy and in nursing mothers.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Avoid light. Store in tightly closed containers in a dark, cool, well-ventilated area away from oxidizers and reducing agents.

Shipping: This compound falls in the DOT ID and ERG Number: UN3249. Medicine, solid, toxic, n.o.s. category and requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Data, *possibly carcinogenic to humans*, Group 2B, 1987.

US EPA Hazardous Waste Number (RCRA No.): U090.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dihydrosafrole is an oily liquid. Molecular weight = 164.22; Boiling point = 228°C; Wiswesser line notation: T56 BO DO CHJ G3.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Primary Irritant. Workers may be exposed to dihydrosafrole during its use as a chemical intermediate in the production of piperonyl butoxide and related insecticidal synergists; and in the production of fragrances for cosmetic products.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Water: By chromatography.

Harmful Effects and Symptoms

Short Term Exposure: Skin contact can cause irritation. An LD_{50} value of 2260 mg/kg has been reported for rats (slightly toxic).

Long Term Exposure: Dihydrosafrole is recognized as a carcinogen in experimental animals by the International Agency for Research on Cancer IARC: and the National Cancer Institute Bioassay Program.

Points of Attack: Liver, spleen.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter front- or back-mounted organic vapor canister having a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The US EPA recommends packaging of product residues and sorbent media in epoxy-lined drums and disposal at an EPA-approved site. The compound may be destroyed by permanganate oxidation, high-temperature incineration with scrubbing equipment, or microwave plasma treatment. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R37; Safety phrases: S2; S24 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diisobutyl ketone is a colorless liquid with a mild, sweet odor. Molecular weight = 142.27; Specific gravity (H_2O:1) = 0.81; Boiling point = 167.8°C; Freezing/Melting point = −42°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 48.8°C (cc); Autoignition temperature = 396°C. The explosive limits are LEL = 0.8%; UEL = 7.1% at 93°C.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.05%.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Diisobutyl ketone is used as a solvent; as a dispersant for resins; and as an intermediate in the synthesis of pharmaceuticals and pesticides.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, aliphatic amines, strong oxidizers. Attacks some forms of plastics, coatings, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.82 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/290 mg/m^3 TWA.

NIOSH REL: 25 ppm/150 mg/m^3 TWA.

ACGIH TLV®[1]: 25 ppm/145 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 50 ppm

PAC-2: 50 ppm

PAC-3: 500 ppm

DFG MAK: No numerical value established. Data may be available.

NIOSH IDLH: 500 ppm

Australia: TWA 25 ppm (150 mg/m^3), 1993; Austria: MAK 50 ppm (290 mg/m^3), 1999; Belgium: TWA 25 ppm (145 mg/m^3), 1993; Denmark: TWA 25 ppm (150 mg/m^3), 1999; Finland: TWA 25 ppm (150 mg/m^3); STEL 40 ppm (225 mg/m^3), 1999; France: VME 25 ppm (150 mg/m^3), 1999; the Netherlands: MAC-TGG 150 mg/m^3, 2003; the Philippines: TWA 50 ppm (290 mg/m^3), 1993; Poland: MAC (TWA) 150 mg/m^3, MAC (STEL) 300 mg/m^3, 1999; Switzerland: MAK-W 25 ppm (150 mg/m^3), 1999; Turkey: TWA 50 ppm (290 mg/m^3), 1993; United Kingdom: TWA 25 ppm (148 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. Several states have set guidelines or standards for diisobutyl ketone in ambient air[60] ranging from 2.5 mg/m^3 (North Dakota and Virginia) to 2.8 mg/m^3 (Connecticut) to 3.57 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1300, NIOSH Analytical Method #2555, and OSHA Analytical Method 7.[18]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: DIBK irritates the eyes, skin, respiratory tract. Exposure to high concentrations could cause headaches, dizziness, unconsciousness.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis, liver, and kidney damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: liver and kidney function tests. NIOSH lists the following tests: pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof goggles and face shield unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with DIBK you should be trained on its proper handling and storage. Before entering confined space where DIBK may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22].

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R20/22; R34; Safety phrases: S2; S16; S26; S36/37/39; R45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diisopropylamine is a colorless liquid with an ammoniacal odor. Molecular weight = 101.22; Boiling point = 83.9°C; Melting point = − 96.1°C; Vapor pressure = 70 mmHg; Flash point = − 6.1°C; Autoignition temperature = 316°C. Explosive limits: LEL = 1.1%; UEL = 7.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Mutagen. This material is used in the preparation of vapor-phase inhibitors and rubber accelerators; as a chemical intermediate in the synthesis of pharmaceuticals and pesticides (diallate, fenamiphos, and triallate, for example).

Incompatibilities: Forms explosive mixture with air. This chemical is a strong base; reacts violently with strong oxidizers, strong acids. Attacks copper, zinc and their alloys, aluminum, and galvanized steel. Attacks some forms of plastics and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 5 ppm/20 mg/m^3 TWA [skin].

NIOSH REL: 5 ppm/20 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/21 mg/m^3 TWA [skin].

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 10 ppm

PAC-2: 75 ppm

PAC-3: 200 ppm

Australia: TWA 5 ppm (20 mg/m^3), [skin], 1993; Belgium: TWA 5 ppm (21 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (20 mg/m^3), [skin], 1999; Finland: STEL 5 ppm (20 mg/m^3), [skin], 1999; France: VME 5 ppm (20 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 20 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (20 mg/m^3), 1999; the Philippines: TWA 5 ppm (20 mg/m^3), [skin], 1993; Russia: STEL 5 mg/m^3, [skin], 1993; Switzerland: MAK-W 5 ppm (20 mg/m^3), [skin], 1999; United Kingdom: TWA 5 ppm (21 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 5 ppm [skin]. Several states have set guidelines or standards for diisopropylamine in ambient air[60] ranging from 200 μg/m^3 (North Dakota) to 350 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 476 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II(4), Method #S141.

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: No tests listed. Octanol–water coefficient: Log $K_{ow} = 1.59$.

Routes of Entry: Inhalation, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator. The vapor is corrosive to the eyes and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This can also cause nausea, vomiting, headaches, eye irritation, and visual disturbance. Contact may cause eye damage, causing cloudy vision. Exposure may cause a skin allergy to develop, so that even very small future exposures will result in itching and skin rash.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy, dermatitis, lung damage, and asthma-like allergy.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time of test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™, Viton™, and nitrile are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *200 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:*

SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with DIPA you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diisopropylamine must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) or oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where diisopropylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of diisopropylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of diisopropylamine.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID, CORROSIVE.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

PAC-1: 310 ppm

PAC-2: 310 ppm

PAC-3: 1400 ppm

DFG MAK: 200 ppm/850 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group: C.

NIOSH IDLH: 1400 ppm [LEL].

Australia: TWA 250 ppm (1050 mg/m^3); STEL 310 ppm, 1993; Austria: MAK 250 ppm (1050 mg/m^3), 1999; Belgium: TWA 250 ppm (1040 mg/m^3); STEL 310 ppm (1300 mg/m^3), 1993; Denmark: TWA 250 ppm (1050 mg/m^3), 1999; France: VME 250 ppm (1050 mg/m^3) 1999; the Netherlands: MAC-TGG 1050 mg/m^3, 2003; Norway: TWA 125 ppm (525 mg/m^3), 1999; Poland: MAC (TWA) 1000 mg/m^3, MAC (STEL) 1300 mg/m^3, 1999; Russia: STEL 100 mg/m^3, 1993; Switzerland: MAK-W 250 ppm (1050 mg/m^3), 1999; Turkey: TWA 500 ppm (2100 mg/m^3), 1993; United Kingdom: TWA 250 ppm (1060 mg/m^3); STEL 310 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 310 ppm.

Several states have set guidelines or standards for diisopropyl ether in ambient air[60] ranging from 10.5−13.2 mg/m^3 (North Dakota) to 17.5 mg/m^3 (Virginia) to 21.0 mg/m^3 (Connecticut) to 25.0 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1618 or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Diisopropyl ether irritates the eyes, skin, and respiratory tract. May affect the central nervous system. Inhaling or breathing diisopropyl ether may cause drowsiness, dizziness, and nausea. Higher levels may cause unconsciousness and even death.

Long Term Exposure: Prolonged or repeated exposures may cause drying and cracking of the skin.

Points of Attack: Respiratory system, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends nitrile rubber, polyvinyl alcohol, and viton materials as providing good to excellent protection in gloves and clothing. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *up to 1400 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with diisopropyl ether you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Diisopropyl ether must be stored to avoid contact with strong oxidizers, such as bromine, chlorine, chlorine dioxide, and nitrates since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, spark, or direct sunlight. Unstable peroxides may form when diisopropyl ether is in contact with the air for a long time. It may then explode by itself or when heated or subjected to shock. Sources of ignition, such as smoking and open flames, are prohibited where diisopropyl ether is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of diisopropyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxide-perforation of a container of the waste from a safe distance followed by open burning.

CAS Registry Number: 115-26-4

RTECS® Number: TD4025000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 204-076-8 [*Annex I Index No.:* 015-061-00-9]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+; Risk phrases: R27/28; Safety phrases: S1/2; S23; S28; S36/37; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dimefox is a clear liquid. Molecular weight = 154.14; Boiling point = 86°C at 15 mmHg. Hazard

Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1. Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this pesticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials, strong acids, halogens.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.2 mg/m^3

PAC-1: 0.6 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. This material is extremely toxic; the probable oral lethal dose (human) is 5−50 mg/kg or 7 drops to 1 teaspoonful for a 150-lb person. Death may occur from respiratory arrest. Hazards of vapor toxicity are high.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Dimefox may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dimefox you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids, halogens. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. Dimefox falls in Hazard Class 6.1 and because it is extremely toxic, in Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides, nitrogen oxides, and fluorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. *Do not* use halogen extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small batches may be mixed with sand and acid added in a pit or trench in clay soil. Larger quantities may be incinerated in a unit with effluent flue gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dimethoate is a white crystalline solid with a camphor-like odor. Molecular weight = 229.27; Boiling point = 117°C; Freezing/Melting point = 52°C. Hazard Identification (based on NFPA-704 M Rating System):

Health 3, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Dimethoate is a contact and systemic organophosphate insecticide effective against a broad range of insects and mites when applied on a wide range of crops. It has not been produced in the United States since 1982.

Incompatibilities: Strong bases (alkalis). Do not store solid above 77−86°F/25−30°C. Liquid solutions must be stored above 45°F/7°C. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 6 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 30 mg/m^3

Russia[35,43] has set air MAC of 0.5 mg/m^3 in work-place air and limits in the ambient air of residential areas of 0.003 mg/m^3 on either a momentary or a daily average basis.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: A MAC of 0.03 mg/L in water bodies used for domestic purposes has been set by the former USSR.[35,43] States which have set guidelines for dimethoate in drinking water include California at 140 μg/L and Wisconsin at 10 μg/L.

Harmful Effects and Symptoms

Short Term Exposure: Acute exposure to dimethoate may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood pressure) is not uncommon. Respiratory effects may include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Dimethoate is very toxic; the probable oral lethal dose in humans is between 50 and 500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150-lb) person. Dimethoate is a cholinesterase inhibitor, meaning it affects the central nervous system. Death is due to respiratory arrest arising from failure of the respiratory center, paralysis of respiratory muscles, intense bronchoconstriction, or all three. Dimethoate is a mutagen. Mutagens may have a cancer risk. All contact with this chemical should be reduced to the lowest possible level.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Animal tests indicate that this chemical possibly causes toxic effects upon human reproduction.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under medical observation. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dimethoate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from heat and strong bases. Do not store *solid* Dimethoate above 25−30°C/77−86°F. However, *liquid* solutions of dimethoate must be stored above 7°C/45°F. Keep away from sources of heat, flames, or spark-generating equipment. Unstable in alkaline solution. Hydrolyzed by aqueous alkali. Stable in aqueous solutions. The compound is stable for 2 years under environmental conditions if stored in undamaged, original containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a “POISONOUS/TOXIC MATERIALS” label. They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides, sulfur oxides, and phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: May be mixed with alkalis and then buried.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: DMOB is a colorless crystalline material which may turn purple on standing in air. Molecular weight = 244.32; Freezing/Melting point = 137−138°C; Flash point = 206°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. DMOB or its dihydrochloride is used principally as a chemical intermediate for the production of azo dyes. About 30% of DMOB is used as a chemical intermediate in the production of *o*-dianisidine diisocyanate (3,3′-dimethoxy-4,4′-diisocyanate-biphenyl) that is used in adhesive systems and also as a component of polyurethane elastomers and resins. DMOB is used as a dye itself for leather, paper, plastics, rubber, and textiles. DMOB has also been used in the detection of metals, thiocyanates, and nitrites.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

NIOSH REL: See *NIOSH Pocket Guide*, Appendix A & C.

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Carcinogen Category 2 (2006).

Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000.

Guidelines or standards for dimethoxybenzidine in ambient air have been set[60] by North Dakota at zero, by New York at 0.2 μg/m^3, and by South Carolina at 0.3 μg/m^3.

Routes of Entry: Human exposure to DMOB is possible through inhalation of dye particles from equipment vent systems and through skin absorption from the finished dye product, textile processing, mixing operations, or packaging process.

Harmful Effects and Symptoms

Short Term Exposure: May cause eye and skin irritation.

Long Term Exposure: There is sufficient evidence for the carcinogenicity of 3,3′-dimethoxybenzidine (*o*-dianisidine) in experimental animals.[1] 3,3′-Dimethoxybenzidine administered by stomach tube was carcinogenic in rats, producing tumors at various sites, including intestinal, skin, and Zymbal's gland carcinomas. The findings in hamsters exposed to *o*-dianisidine in the feed also suggest carcinogenicity. The evidence for the carcinogenicity of *o*-dianisidine in humans in inadequate. Most of the workers exposed to this substance were also exposed to related amines, such as benzidine, which are strongly associated with urinary bladder cancer in humans.

Points of Attack: Bladder, breast, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: exam of the breast, bladder, intestine, skin, stomach, and ovary.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any exposure level, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. 3,3′-Dimethoxybenzidine may react with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Store in tightly closed containers in a cool, well-ventilated area. Avoid exposure to light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, liquid, toxic, n.o.s or Dye intermediates, liquid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and 3,3′-dimethoxybenzidine in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 3,3′-Dimethoxybenzidine may burn but does not readily ignite. Use dry chemical, CO_2, water spray, foam or water spray extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

California Proposition 65 Chemical: Developmental/Reproductive toxin 5/21/10.

European/International Regulations: Hazard Symbol: T; Risk phrases: R61; R20/21; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dimethylacetamide is a colorless, nonvolatile liquid with a faint ammonia-like odor. The odor threshold is 47 ppm. Molecular weight = 87.12; Boiling point = 165°C; Freezing/Melting point = −20°C; Flash point = 70°C (oc); Autoignition temperature = 490°C. The explosive limits are LEL = 1.8% at 100°C and UEL = 11.5% at 160°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Primary Irritant. Dimethylacetamide is used primarily as a solvent for synthetic and natural resins, especially acrylic fibers and spandex. About 15% of dimethylacetamide production is used to make alkyl (C_{12-14}) dimethylamine oxide (a surfactant) and rubber chemicals. Dimethylacetamide is also used as an extraction solvent for butadiene manufacture.

Incompatibilities: Forms explosive mixture with air. Incompatible with nonoxidizing mineral acids, strong acids, ammonia, isocyanates, phenols, cresols, halogenated compounds above 185°F/85°C. Incompatible with carbon tetrachloride and other halogenated compounds when in contact with iron and oxidizers. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 10 ppm/35 mg/m^3 TWA [skin].

NIOSH REL: 10 ppm/35 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 10 ppm/36 mg/m^3 TWA [skin]; BEI: 30 mg[*N*-Methylacetamide]/g creatinine in urine at end-of-shift at end-of-work-week.

NIOSH IDLH: 300 ppm.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 75 ppm

PAC-2: 300 ppm

PAC-3: 300 ppm

DFG MAK: 10 ppm/36 mg/m^3, Peak Limitation Category II (2) [skin]; Pregnancy Risk Group C.

Australia: TWA 10 ppm (35 mg/m^3) [skin] 1993; Austria: MAK 10 ppm (35 mg/m^3) [skin] 1999; Belgium: TWA 10 ppm (36 mg/m^3) [skin] 1993; Denmark: TWA 10 ppm (35 mg/m^3) [skin] 1999; Finland: TWA 10 ppm (35 mg/m^3); STEL 20 ppm (70 mg/m^3) [skin] 1993; France: VME 10 ppm (35 mg/m^3) [skin] 1999; Japan: 10 ppm (36 mg/m^3) [skin] 1999; the Netherlands: MAC-TGG 36 mg/m^3 [skin] 2003; Norway: TWA 10 ppm (35 mg/m^3), 1999; the Philippines: TWA 10 ppm (35 mg/m^3) [skin] 1993; Poland: MAC (TWA) 35 mg/m^3, 1999; Switzerland: MAK-W 10 ppm (35 mg/m^3), KZG-W 20 ppm (70 mg/m^3) [skin] 1999; United Kingdom: TWA 10 ppm (36 mg/m^3); STEL 20 ppm (72 mg/m^3) [skin] 2000 Occupational Exposure Limit; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for DMA in ambient air[60] ranging from 350 μg/m^3 (North Dakota) to 429 μg/m^3 (Nevada) to 600 μg/m^3 (Virginia) to 700 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #2004.

Routes of Entry: Inhalation of vapor and absorption through intact skin, ingestion, and eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, nose, and throat.

Long Term Exposure: Repeated skin contact with the liquid can cause irritation and destroys the skin's natural oils. DMAC may affect the central nervous system and liver. Liver damage with nausea and/or jaundice can occur from skin or breathing exposure at 400 ppm levels. Repeated or high exposures can cause depression, lethargy, hallucinations, and personality changes. There is limited evidence that DMAC damages the developing fetus.

Points of Attack: Skin, liver, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. An examination of the nervous system emphasizing personality changes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves; Barricade® coated suits; CPF3, Responder™ suits; Trychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Saranex™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm:* Sa (APF = 10) (any supplied-air respirator). *250 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *400 ppm*: SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with DMAC you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dimethylacetamide must be stored to avoid contact with carbon tetrachloride and other halogenated compounds when in contact with iron since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This material is not covered in DOT's Performance-Oriented Packaging Standards.[19] It may, however, be classified as a combustible liquid, n.o.s. This class requires no shipping label. It falls in Hazard Class 3 [each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter or has a flash point above 60.5°C/141°F but below 93°C/200°F] and Packing Group III. The symbol "D" identifies proper shipping names which are appropriate for describing materials for domestic transportation but may be inappropriate for international transportation under the provisions of international regulations (e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxide emissions).

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 2500 lb (1135 kg).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

US EPA Hazardous Waste Number (RCRA No.): U092.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F+, Xn; Risk phrases: R; Risk phrases: R12; R20; R37/38; R41; Safety phrases: S2; S16; S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: DMA is a colorless, compressed gas or liquid (below 7°C) with a pungent, fishy, or ammonia-like odor. The odor threshold is 0.34 ppm. Molecular weight = 45.10; Boiling point = 6.8°C; Freezing/Melting point = −92.3°C; Flash point = flammable gas; Autoignition temperature = 401°C. Explosive limits: LEL = 2.8%; UEL = 14.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water; solubility = 24% at 60°C.

Potential Exposure: Compound Description: Mutagen. Primary Irritant. This material is used in leather tanning; as an accelerator in rubber vulcanization; in the manufacture of detergents; in drug synthesis and pesticide manufacture.

Incompatibilities: Dimethylamine is a medium strong base. Reacts violently with strong oxidizers; with mercury causing fire and explosion hazard. Incompatible with acids, organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc and alloys, some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.85 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/18 mg/m^3 TWA.

NIOSH REL: 10 ppm/18 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/9.2 mg/m^3 TWA; 15 ppm/27 mg/m^3 STEL; not classifiable as a human carcinogen.

NIOSH IDLH: 500 ppm.

Temporary Emergency Exposure Limits (DOE).

TEEL-0: 10 ppm

PAC-1: 10 ppm

PAC-2: 66 ppm

PAC-3: 250 ppm

DFG MAK: 2 ppm/3.7 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Australia: TWA 10 ppm (18 mg/m^3), 1993; Austria: MAK 10 ppm (18 mg/m^3), 1999; Belgium: TWA 10 ppm (18 mg/m^3), 1993; Denmark: TWA 10 ppm (18 mg/m^3), 1999; Finland: STEL 10 ppm (18 mg/m^3), [skin], 1999; France: VLE 10 ppm (18 mg/m^3), 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 1.8 mg/m^3, 2003; Norway: TWA 10 ppm (18 mg/m^3), 1999; the Philippines: TWA 10 ppm (18 mg/m^3), 1993; Poland: MAC (TWA) 9 mg/m^3, MAC (STEL) 18 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 1 mg/m^3, [skin], 1993; Switzerland: MAK-W 2 ppm (4 mg/m^3), KZG-W 4 ppm (8 mg/m^3), 1999; United Kingdom: TWA 2 ppm (3.8 mg/m^3); STEL 6 ppm (11 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm. Russia[35,43] set a MAC value of 0.005 mg/m^3 in ambient air in residential areas on either a momentary or a daily average basis. Several states have set guidelines or standards for dimethylamine in ambient air[60] ranging from 42.857 μg/m^3 (Kansas) to 180 μg/m^3 (North Dakota) to 300 μ/m^3 (Virginia) to 360 μg/m^3 (Connecticut) to 429 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2010.

Permissible Concentration in Water: No criterion set but EPA[32] has suggested a permissible ambient goal of 248 μg/L, based on health effects. Russia[35,43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, respiratory tract. Eye or skin contact with the liquid can cause burns and permanent damage. Inhalation of the vapors can cause coughing and/or shortness of breath. Higher levels can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptom include sneezing, coughing and dyspnea, pulmonary edema, conjunctivitis, dermatitis, burns of skin and mucous membranes. LD$_{50}$ = (oral-rat) 698 mg/kg (slightly toxic). Rapid evaporation of the liquid may cause frostbite.

Long Term Exposure: Repeated or prolonged contact with skin may cause irritation, redness, itching, dermatitis. Repeated exposures may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Respiratory system, lungs, skin, eyes.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver function tests. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. If symptoms develop or overexposure has occurred, repeat these tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; neoprene rubber gloves, suits, boots; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid.

Respirator Selection: *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *500 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dimethylamine you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dimethylamine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and mercury because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where dimethylamine is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more of dimethylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of dimethylamine. Wherever dimethylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If in liquid form, allow to vaporize. Keep dimethylamine out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dimethylamine is a flammable gas or liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition

sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DAB is a flaky yellow crystal. Molecular weight = 225.32; Boiling point = (sublimes); Freezing/Melting point = 114−117°C; Vapor pressure = very low (0.0000003 mmHg). Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector DAB is used for coloring polishes and other wax products, polystyrene, petrol, soap, and as a chemical indicator. Human exposure to DAB can occur through either inhalation or skin absorption.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposure of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: Carcinogen; Limit exposure to lowest feasible concentration.

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 75 mg/m^3

Finland: carcinogen, 1993; France: carcinogen, 1993; Sweden: carcinogen, 1993.

States which have set guidelines or standards for this compound in ambient air[60] include North Dakota at zero, New York at 0.03 μg/m^3, and South Carolina at 125.0 μg/m^3.

Determination in Air: G-Chromosorb tube P; 2-Propanol; Gas chromatography/Flame ionization detection; NIOSH II (4) P&CAM Method #284.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This compound can cause irritation of the eyes, skin, and respiratory system. It can cause contact dermatitis.

Long Term Exposure: Enlarged liver, liver and kidney dysfunction, contact dermatitis, cough, wheezing, dyspnea (breathing difficulty), bloody sputum, bronchial secretions, frequent urination, hematuria (blood in the urine), dysuria, and may cause liver or bladder cancer.

Points of Attack: Skin, respiratory system, liver, kidneys, bladder. Cancer site in animals: liver and bladder.

Medical Surveillance: Preplacement and periodic examinations should include a history of exposure to other carcinogens; use of alcohol, smoking, medications, and family history. Special attention should be given to liver size and liver function tests. OSHA Mandated Medical Tests: *Increased Risk:* check for reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and if conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DAB you should be trained on its proper handling and storage. Store in a cool, dry place and protect from exposure to light and air. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." 4-Dimethylaminoazo-benzene falls in Hazard Class 6.1; Packing Group III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. 4-Dimethylaminoazobenzene itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dimethylaminoethanol D:1090

Molecular Formula: $C_4H_{11}N$

Synonyms: Deanol; 2-Dimethylaminoethanol; β-Dimethylaminoethyl alcohol; Dimethylethanolamine; *N*,*N*-Dimethyl-*N*-(2-hydroxyethyl)amine; *N*,*N*-Dimethyl-2-hydroxyethylamine; Ethanol, 2-dimethylamino-

CAS Registry Number: 108-01-0

RTECS® Number: KK6125000

UN/NA & ERG Number: UN2051/132

EC Number: 203-542-8 [*Annex I Index No.:* 603-047-00-0.]

Regulatory Authority and Advisory Bodies

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R36/37/38; R34; Safety phrases: S1/2; S25; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dimethylaminoethanol is a colorless liquid with a pungent odor. Odor threshold: 0.25 ppm. Molecular weight = 89.16; Boiling point = 133°C; Freezing/Melting point = −59°C; Flash point = 41°C (oc); Autoignition temperature = 295°C. Explosive limits: LEL = 1.6%; UEL = 11.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Dimethylaminoethanol is used as a corrosion inhibitor; pharmaceutical intermediate; in making dyestuffs, textiles, pharmaceuticals; emulsifiers in paints and coatings. Also, it has been used as a medication in the treatment of behavioral problems of children.

Incompatibilities: Forms explosive mixture with air. Violent reaction with oxidizers, strong acids, acid chlorides, and isocyanates. Attacks copper and its alloys, galvanized steel, zinc and its alloys.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 12.5 ppm

PAC-1: 35 ppm

PAC-2: 150 ppm

PAC-3: 150 ppm

Russia: STEL 5 mg/m^3, [skin], 1993; United Kingdom: TWA 2 ppm (7.4 mg/m^3); STEL 6 ppm (22 mg/m^3), 2000; the Netherlands: MAC-TGG 7.4 mg/m^3, 2003.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = -0.6$.

Routes of Entry: Inhalation, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause severe irritation and burns to the eyes and skin, with possible permanent damage. Breathing the aerosol can cause lung irritation, coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, muscle tenderness, restlessness, increased irritability, lack of sleep, and weight loss.

Long Term Exposure: Repeated skin contact may cause dermatitis. May cause an asthma-like allergy. May affect the nervous system. Corrosive substances may cause lung irritation and bronchitis.

Points of Attack: Nervous system, skin, lungs.

Medical Surveillance: Examination of the nervous system. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for

pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with dimethylaminoethanol you should be trained on its proper handling and storage. Before entering confined space where it may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, and chemically active metals. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Label of "CORROSIVE, FLAMMABLE LIQUID." It falls in Hazard Class 8. Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol- or polymer-resistant foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human, Inadequate Data; Animal, Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1993; NTP: Carcinogenesis Studies (gavage); some evidence: rat; NCI: Carcinogenesis Studies (gavage); equivocal evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R40; R51/53; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: DMA, an aromatic amine, is a straw-colored liquid with a characteristic amine-like odor. It turns brown on contact with air. Molecular weight = 121.20; Boiling point = 192°C; Freezing/Melting point = 2.2°C; Vapor pressure = 1 mmHg at 20°C; Flash point = 61°C; Autoignition temperature = 371°C. Explosive limits: LEL = 1%; UEL = 7%. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. This material is used as a chemical intermediate in the manufacture of many dyes and rubber chemicals; solvent, emulsifier, and analytical reagent.

Incompatibilities: Forms explosive mixture with air. Contact with strong oxidizers, strong acids, benzoyl peroxide may cause fire and explosion hazard. Contact with hypochlorite bleaches form explosive chloramines. Incompatible with anhydrides, isocyanates, aldehydes.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.96 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/25 mg/m^3 TWA [skin].

NIOSH REL: 5 ppm/25 mg/m^3 TWA; 10 ppm/50 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 5 ppm/25 mg/m^3 TWA: 10 ppm/50 mg/m^3 STEL [skin]; not classifiable as a human carcinogen; BEI$_M$ issued for Methemoglobin inducers.

Protective Action Criteria (PAC)
TEEL-0: 5 ppm
PAC-1: 10 ppm
PAC-2: 10 ppm
PAC-3: 100 ppm

DFG MAK: 5 ppm/25 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B; Pregnancy Risk Group D.

NIOSH IDLH: 100 ppm.

Australia: TWA 5 ppm (25 mg/m^3); STEL 10 ppm, [skin], 1993; Austria: MAK 5 ppm (25 mg/m^3), [skin], Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (25 mg/m^3); STEL 10 ppm (50 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (25 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (25 mg/m^3); STEL 10 ppm (50 mg/m^3), [skin], 1993; France: VME 5 ppm (25 mg/m^3), [skin], 1999; Hungary: TWA 5 mg/m^3; STEL 10 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 5 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (25 mg/m^3), 1999; the Philippines: TWA 5 ppm (25 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 40 mg/m^3, 1999; Russia: STEL 0.2 mg/m^3, [skin], 1993; Sweden: TWA 1 ppm (5 mg/m^3); STEL 2 ppm (10 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (25 mg/m^3), KZG-W 10 ppm (50 mg/m^3), [skin], 1999; United Kingdom: TWA 5 ppm (25 mg/m^3); STEL 10 ppm (50 mg/m^3), [skin], 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 ppm (skin). Several states have set guidelines or standards for *N,N*-dimethylaniline in ambient air[60] ranging from 250−500 μg/m^3 (North Dakota) to 500 μg/m^3 (Connecticut) to 560 μg/m^3 (Nevada).

Determination in Air: Adsorption on charcoal, workup with CS_2, analysis by gas chromatography. Use NIOSH Analytical Method #2002 on Amines, aromatic.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested permissible ambient concentrations of 345 μg/L.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = 2.3$.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Exposure: Contact may irritate or burn the eyes, and may irritate the nose and throat. Dimethylaniline can be absorbed through the skin, thereby increasing exposure. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical pneumonia. May affect the blood, resulting in the formation of methemoglobin. Symptoms include anoxia, cyanosis, weakness, dizziness, ataxia. Symptoms may be delayed.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. While this chemical has not been identified as a reproductive hazard, there is some evidence that women working with aniline, a related compound, have a higher incidence of reproductive cycle disorders and abortions.

Points of Attack: Blood, kidneys, liver, cardiovascular system.

Medical Surveillance: A blood test for methemoglobin level should be done periodically and after any overexposure, or if any symptoms develop. Any evaluation should include a careful history of past and present symptoms. NIOSH lists the following tests: complete blood count, whole blood (chemical/metabolite), methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended; effects may be delayed.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough>0.1 μg/cm^2/min): Tychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 50 ppm*: Sa (APF = 10) (any supplied-air respirator). *Up to 100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dimethylaniline you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dimethylaniline must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids, and benzoyl peroxide, since violent reactions occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Cover and mix with a 9:1 mixture of sand and soda ash and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank

discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a furnace equipped with afterburner and scrubber.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human No Adequate Data, animal No Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as polynuclear aromatic hydrocarbons (PAH).

US EPA Hazardous Waste Number (RCRA No.): U094.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DBA is a greenish-yellow solid. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 256.36; Freezing/Melting point 122°C. Insoluble in water.

Potential Exposure: DBA is a polycyclic aromatic hydrocarbon (PAH) that is present in the smoke of cigarettes, burned wood and coal, coal tar, gasoline, and diesel exhaust. It is a medical and pharmaceutical research chemical.

Incompatibilities: Oxidizing agents.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: Use #5800, Polycyclic aromatic compounds (PAC).

Permissible Concentration in Water: See regulatory authority above.

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the skin and eyes. Irritates the respiratory tract. High exposure may damage the blood cells, causing anemia.

Long Term Exposure: Repeated exposure can irritate the lungs, causing coughing, wheezing, and/or difficult breathing. This chemical has been shown to cause skin and lung cancer in animals and has caused cancer in the offspring of animals exposed during pregnancy. Believed to be a transplacental carcinogen. May damage the male reproductive glands. May cause liver and kidney damage. May cause anemia.

Points of Attack: Lungs, testes, liver, kidneys, blood. Cancer site in animals: lungs, skin.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC). Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DBA you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Hazard Symbol: Risk phrases: F, Xn, N; R11; R38; R65; R67; R51/53; Safety phrases: S2; S9; S16; S29; S33; S60; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2,3-Dimethylbutane is a colorless liquid. Molecular weight = 86.20; Boiling point = 58°C; Flash point = −29°C; Autoignition temperature = 405°C. Explosive limits: LEL = 1.2%; UEL = 7.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: 2,3-Dimethylbutane is used in high octane fuel and to make organic chemicals.

Incompatibilities: Forms explosive mixture with air. Violent reaction with oxygen, strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH: 100 ppm/350 mg/m^3 TWA; STEL 510 ppm/1800 mg/m^3 [15 min].

ACGIH TLV®[1]: 500 ppm/1760 mg/m^3 TWA; 1000 ppm/3500 mg/m^3 STEL.

NO TEEL available.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin or eyes. Exposure can irritate the eyes, nose, and throat. Exposure can also cause you to feel dizzy, lightheaded, giddy, and to pass out. Swallowing the liquid may cause aspiration into the lungs with the risk of chemical pneumonia. Prolonged contact may cause dermatitis.

Long Term Exposure: Repeated exposure may damage the kidneys. May cause dermatitis.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1000 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2500 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5000 ppm*: SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with 2,3-dimethylbutane you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2,3-Dimethylbutane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where 2,3-dimethylbutane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of 2,3-dimethylbutane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of 2,3-dimethylbutane. Wherever 2,3-dimethylbutane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is flammable. Poisonous gases, including hydrocarbons and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; IARC: Human Inadequate Evidence, animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A, 1999; NIOSH: Potential occupational carcinogen, See *NIOSH Pocket Guide*, Appendix A.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; SHE—clonal assay; Positive: Host-mediated assay; Mammalian micronucleus; Positive: *E. coli* polA without S9; Histidine reversion—Ames test; Positive: *S. cerevisiae*—homozygosis; Negative: *In vitro* UDS—human fibroblast.

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

US EPA Hazardous Waste Number (RCRA No.): U097.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R22; R23; R36/37/38; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: DMCC is a liquid. Molecular weight = 107.55; Specific gravity (H_2O:1) = 1.2; Boiling point = 165°C; Freezing/Melting point = −33°C; Vapor pressure = 2.5 mmHg at 25°C; Flash point = 68.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1₩. Reactive with water; decomposes.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen. DMCC is used as a chemical intermediate in the production of pharmaceuticals, pesticides, rocket fuel, and dye synthesis. Human exposure is limited to, but not restricted to, chemical workers, pesticide formulators, dye makers, and pharmaceutical workers. DMCC has been found at levels up to 6 ppm during the production of phthaloyl chlorides. It is possible that levels of exposure might be higher in facilities in which the chemical is used for further synthesis. When DMCC is used as a dye intermediate, exposure can occur from the amount of residue in the product and its ability to migrate.

Incompatibilities: Strong oxidizers; strong acids; strong bases. Reacts with water (rapidly hydrolyzes to carbon dioxide, dimethylamine, dimethylcarbamic acid, and hydrochloric acid). Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: Potential occupational carcinogen; limit exposure to lowest feasible level.

ACGIH TLV®[1]: 0.005 ppm/0.02 mg/m^3 TWA [skin]; Suspected Human Carcinogen; See *NIOSH Pocket Guide*, Appendix A.

Protective Action Criteria (PAC)

Several states have set guidelines or standards for DMCC in ambient air[60] ranging from zero in North Dakota to 0.03 $\mu g/m^3$ (New York) to 0.24 $\mu g/m^3$ (Pennsylvania) to 3.0 $\mu g/m^3$ (Virginia).

Determination in Air: No method available.

Determination in Water: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the skin and eyes. Breathing dimethyl carbamoylchloride can irritate the nose, throat, and lungs, causing cough, wheezing, shortness of breath, dyspnea (breathing difficulty), headache, nausea, vomiting.

Long Term Exposure: Repeated exposure may cause laryngitis, bronchitis, liver damage. A Suspected Human Carcinogen.

Points of Attack: Eyes, skin, respiratory system, liver. Cancer site in animals: nasal cavity.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Exposed workers should check their skin from time to time for new growths, changes in moles and sores that would not heal. In case skin exposure occurs, it is usually easily cured when treated promptly.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DMCC you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids, strong bases, and moisture, since violent reactions can occur. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dimethyl carbamoylchloride is a combustible liquid. Do not allow water to get inside containers. Use dry chemical, CO_2, or foam extinguishers. Poisonous gases, including carbon monoxide, hydrochloric acid, and nitrogen oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration with scrubbing of flue gas for HCl and nitrogen oxides removal. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2,5-Dimethyl-2,5-di (*tert*-butyl peroxy) hexane is a colorless to yellow substance. Molecular weight = 290.50; Boiling point = 55−57°C at 0.1 mmHg; Freezing/Melting point = 8°C; Flash point = 65°C. Insoluble in water.

Potential Exposure: It is used as a catalyst in making polyethylene, polystyrene, and polyester resins.

Incompatibilities: Unstable organic peroxide. Strong oxidizer; potentially explosive. Forms explosive mixture with air. Reacts with reducing agents, strong oxidizers, strong acids, combustible materials.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Little is known about the health effects of this substance; however, similar chemicals can irritate, or may burn, the skin and eyes. Exposure to high levels may cause you to feel dizzy, lightheaded, and to pass out.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to 2,5-dimethyl-2,5-di(*tert*-butyl peroxy)hexane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a

NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), and combustibles. Sources of ignition, such as smoking and open flames, are prohibited where 2,5-dimethyl-2,5-di(*tert*-butyl peroxy)hexane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of 2,5-dimethyl-2,5-di(*tert*-butyl peroxy)hexane. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "ORGANIC PEROXIDE." It falls in Hazard Class 5.2 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36/37/38; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dimethyldichlorosilane is a colorless liquid with sharp, irritating odor. Molecular weight = 129.07; Specific gravity = 1.07 at 25°C; Boiling point = 70.5°C; Melting point = − 86°C; Vapor pressure = 110 mmHg at 20°C; Flash point = −7°C; Autoignition temperature = 375°C. Explosive limits: LEL = 3.4%; UEL ≥9.5°C. Hazard Identification (based on NFPA-704 M Rating

System): Health 3, Flammability 3, Reactivity 2₩. Decomposes in water.

Potential Exposure: Compound Description: Primary Irritant. Used as an intermediate in the manufacture of silicone polymers.

Incompatibilities: Forms explosive gas mixture with air. Water, steam, and moisture forms toxic and corrosive hydrogen chloride gas. Incompatible with acetone, amines, ammonia, alcohols, strong oxidizers, caustics. Attacks most metals. Do not store in temperatures above 122°F/50°C.

Permissible Exposure Limits in Air

AIHA WEEL: 2 ppm, Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 0.3 ppm

PAC-1: **0.90** ppm

PAC-2: **11** ppm

PAC-3: **50** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air: Not established. However, this chemical is highly corrosive and a dangerous fire hazard.

Permissible Concentration in Water: Reacts with water. No criteria set.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Acute inhalation exposure may result in sneezing, choking, laryngitis, dyspnea (shortness of breath), respiratory tract irritation, and chest pain. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Bleeding of nose and gums, ulceration of the nasal and oral mucosa, pulmonary edema, chronic bronchitis, and pneumonia may also occur. If the eyes have come in contact with dimethyldichlorosilane, irritation, pain, swelling, corneal erosion, and blindness may result. Dermatitis (red, inflamed skin), severe burns, pain, and shock generally follow dermal exposure. Inhalation irritates mucous membranes. Severe gastrointestinal damage may occur. Vapors cause severe eye and lung injury. Upon short contact, second- and third-degree burns may occur. Signs and symptoms of acute ingestion of dimethyldichlorosilane may be severe and include increased salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of dimethyldichlorosilane.

Long Term Exposure: Very irritating substances may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim *is conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dimethyldichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Dimethyldichlorosilane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, or moisture, because toxic and corrosive hydrogen chloride gas can be produced. Do not store at temperatures above 50°C/122°F. Sources of ignition, such as smoking and open flames, are prohibited where dimethyldichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of dimethyldichlorosilane should be grounded and bonded.

Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of dimethyldichlorosilane.

Shipping: Dimethyldichlorosilane requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use water spray to reduce vapors; however, do not get water inside containers. *Small spills*: Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Use effective fume removal device. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.3/2.0

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Move container from fire area if it can be done without risk. Do not get water inside container. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dimethyl disulfide is a flammable liquid. The odor threshold in water is 0.3−1.2 parts per billion. Molecular weight = 94.20; Boiling point = 110°C; Flash point = 7°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Reacts with water.

Potential Exposure: Compound Description: Primary Irritant. This material may be used as an organic intermediate.

Incompatibilities: Forms explosive mixture with air. Contact with water or acids forms flammable and toxic vapors of hydrogen sulfide. Contact with oxidizing materials or acids can cause a violent reaction.

Permissible Exposure Limits in Air
ACGIH TLV®[1]: 0.5 ppm/2 mg/m^3 TWA [skin].
Protective Action Criteria (PAC)*
TEEL-0: 0.5 ppm
PAC-1: 1.5 ppm
PAC-2: **50** ppm
PAC-3: **250** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Russia[43] set a MAC of 0.7 mg/m^3 in ambient air in residential areas on a momentary basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.04 mg/L in water bodies used for domestic purposes.

Harmful Effects and Symptoms
Short Term Exposure: Eye contact can cause severe irritation and burns. This material is highly irritating and toxic by inhalation. Health hazards resemble those of sulfides and alkyl disulfides. The related dimethyl sulfide causes softening and irritation of the skin.

Long Term Exposure: Highly irritating substances may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.

Respirator Selection: Use any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with Dimethyl disulfide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from any form of moisture, oxidizers, acids. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of

spill or leak. Use water spray to reduce vapors. *Small spills:* Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may be ignited by heat, sparks, or flames. Poisonous gases, including sulfur oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Stay upwind; keep out of low areas. Wear positive-pressure breathing apparatus and special protective clothing. Vapor explosion and poison hazard indoors, outdoors or in sewers. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

PAC-2: 10,000 ppm

PAC-3: 60.000 ppm (LEL)

DFG MAK: 1000 ppm/1900 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group D.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. High exposure can cause headache, dizziness, lightheadedness, and unconsciousness. Rapid evaporation of the liquid can cause severe frostbite. May affect the nervous system.

Points of Attack: Nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers recommend butyl and Neoprene™ as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. For gas wear gas-proof goggles and face shield, for liquid wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. May form peroxides in storage. Prior to working with DME you should be trained on its proper handling and storage. Before entering confined space where DME may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, dark, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Note: Forms unstable peroxides in ether containers that have been opened and remain in storage for more than 6 months. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1 and there is no Packing Group listed.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or liquid under pressure. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: T; Risk phrases: R61; R20/21; R36; Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Dimethylformamide is a flammable, colorless liquid with a fishy, unpleasant, amine-like odor at relatively low concentrations. The odor threshold is 0.47−100 ppm. Molecular weight = 73.11; Specific gravity (H_2O:1) = 0.95; Boiling point = 153°C; Freezing/Melting point = −61°C; Vapor pressure = 3 mmHg at 20°C; Flash point = 58°C; Autoignition temperature = 444.5°C. Explosive limits are: LEL = 2.2%; UEL = 15.2% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. DMFA is used as a solvent for liquids, gases, and as a gasoline additive. Dimethylformamide has powerful solvent properties for a wide range of organic compounds. Because of its physical properties, this chemical has been used when solvents with a slow rate of evaporation are required. It finds particular usage in the manufacture of polyacrylic fibers, butadiene, purified acetylene, pharmaceuticals, dyes, petroleum products, and other organic chemicals.
Incompatibilities: Forms explosive mixture with air. Contact with carbon tetrachloride and other halogenated compounds, particularly in contact with iron or strong oxidizers, may cause fire and explosions. Violent reaction with alkylaluminums. Incompatible with nonoxidizing mineral acids, strong acids, chlorinated hydrocarbons, isocyanates, inorganic nitrates, phenols, cresols, ammonia, bromine, chromic anhydride, magnesium nitrate, methylene diisocyanate (possible violent polymerization), phosphorous trioxide, triethylaluminum. Attacks some plastics, rubber, and coatings.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.99 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 10 ppm/30 mg/m^3 TWA [skin].
NIOSH REL: 10 ppm/30 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 10 ppm/30 mg/m^3 TWA [skin]; BEI: 15 mg (*N*-Methylformamide)/g creatinine in urine at end-of-shift; 40 mg [*N*-Acetyl-*S*-(*N*-methylcarbamoyl)cystein]/g in urine prior to last shift of workweek; not classifiable as a human carcinogen.
NIOSH IDLH: 500 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 2 ppm
PAC-1: **2** ppm

PAC-3: **530** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 5 ppm/15 mg/m^3, [skin]; Peak Limitation Category II(4); Pregnancy Risk Group B; BAT: 15 mg (*N*-Methylformamide)/g creatinine in urine at end of exposure or end-of-shift.
Australia: TWA 10 ppm (30 mg/m^3), [skin], 1993; Austria 10 ppm (30 mg/m^3), [skin], 1999; Belgium: TWA 10 ppm (30 mg/m^3), [skin], 1993; Denmark: TWA 10 ppm (30 mg/m^3), [skin], 1999; Finland: TWA 10 ppm (30 mg/m^3); STEL 20 ppm (60 mg/m^3), [skin], 1999; France: VME 10 ppm (30 mg/m^3), [skin], 1999; Hungary: TWA 10 mg/m^3; STEL 20 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 15 mg/m^3, [skin], 2003; the Philippines: TWA 10 ppm (30 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 60 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 10 ppm (30 mg/m^3), KTV 15 ppm (45 mg/m^3), [skin], 1999; Switzerland: MAK-W 10 ppm (30 mg/m^3), KZG-W 20 ppm (60 mg/m^3), [skin], 1999; Turkey: TWA

10 ppm (30 mg/m^3), [skin], 1993; United Kingdom: TWA 10 ppm (30 mg/m^3); STEL 20 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for DMF in ambient air[60] ranging from 8.1 μg/m^3 (Massachusetts) to 300 μg/m^3 (North Dakota) to 500 μg/m^3 (Virginia) to 600 μg/m^3 (Connecticut) to 714 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Method (IV) #2004[18] or OSHA Analytical Method 66.

Permissible Concentration in Water: A MAC value in water bodies used for domestic purposes has been set by Russia[35,43] at 10.0 mg/L. Beyond that a MAC in water bodies used for fishery purposes is 0.28 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = < 1.0$.

Routes of Entry: Inhalation of vapor, and absorption through intact skin; ingestion and skin and eye contact.

Harmful Effects and Symptoms

Short Term Exposure: DMF irritates the eyes, skin, and respiratory tract. *Inhalation:* Thirteen workers exposed to concentrations below 20 ppm and occasionally to higher levels for up to 32 weeks complained of nausea, vomiting, and colicky abdominal pain; some cases of liver enlargement were detected. A worker who was splashed over 20% of his body surface and simultaneously exposed to high concentrations initially suffered only skin irritation; abdominal pain began 62 h after the exposure and became progressively more severe, with vomiting and high blood pressure; the effects were gone by the 7th day after exposure. Some workers have noted facial flushing (especially after alcohol ingestion). May also cause loss of appetite, stomach pain, constipation, diarrhea, nausea, vomiting, and liver injury. *Skin:* Rapidly penetrates the skin. May cause or increase the severity of effects reported above. It is also highly irritating to skin. *Eyes:* Highly irritating to eyes and mucous membranes. *Ingestion:* Fatal dose for humans has been estimated at 10 g (about 1/3 oz).

Long Term Exposure: Prolonged or repeated skin contact with the liquid defats the skin and may cause irritation and rash. Prolonged inhalation at 100 ppm has caused liver damage in animals. Kidney and liver damage in animals has also been reported. May cause damage to the developing fetus and there is limited evidence that DMF is a teratogen in animals.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, cardiovascular system.

Medical Surveillance: Preplacement and periodic examinations should be concerned particularly with liver and kidney function, and with possible effects on the skin. Liver function tests. Kidney function tests. Urine *n*-methylformamide level should not be above 40 mg/g creatinine. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, liver function tests; urine (chemical/metabolite), urine (chemical/metabolite) 24-hour collection; urine (chemical/metabolite), end-of-shift, end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves, CPF3® suits; Responder™ suits, Trellchem HPS™ suits; Trychem 10000® suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm:* Sa (APF = 10) (any supplied-air respirator). *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *500 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away

from ignition sources and corrosive and reactive materials. Prior to working with DMF you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dimethylformamide must be stored to avoid contact with carbon tetrachloride and other halogenated compounds, particularly when in contact with iron; with strong oxidizers (such as chlorine, chlorine dioxide, and bromine); and with alkyl aluminums, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including dimethylamine and nitrogen oxides, are produced in fire. *Do not* use halogenated extinguishing media. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Burn in solution in flammable solvent in furnace equipped with alkali scrubber.[22] Recovery and recycling is an alternative to disposal for DMF from fiber spin baths and from PVC reactor cleaning solvents.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: UDMH is a fuming colorless liquid that turns yellow on contact with air, with a fishy, amine-like odor. The odor threshold is 6.1−14 ppm.[41] Molecular weight = 60.12; Boiling point = 63.9°C; Freezing/Melting point = −57.7°C; Vapor pressure = 103 mmHg at 20°C; Flash point = −15°C; Autoignition temperature = 249°C. Explosive limits: LEL = 2.0%; UEL = 95%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 1. Highly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. This material is used as a component in liquid rocket propellant combinations; it is also used in photography; as an absorbent; and to make other chemicals.

Incompatibilities: Forms explosive mixture with air; may spontaneously ignite on contact with air and porous materials, such as asbestos, wood, earth, cloth, etc. Reacts with oxygen causing fire and explosion hazard. A strong reducing agent, this chemical is incompatible with strong acids, halogens, metallic mercury, copper alloys, brass, iron, iron salts. Contact with strong oxidizers, such as nitric acid, nitrogen tetroxide, hydrogen peroxide, may cause spontaneous ignition. A strong base, this chemical is corrosive and reacts violently with acids. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Determination in Air: Use NIOSH Analytical Method (IV) #3515.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 13.8 μg/L based on health effects.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

This compound exhibits high acute toxicity as a result of exposure by all routes. Death or permanent injury may result after very short exposure to small quantities. Chronic exposure may cause pneumonia, liver damage, and kidney damage. Signs and symptoms of acute exposure to dimethylhydrazine may include eye irritation, facial numbness, facial swelling, and increased salivation. Headache, twitching, seizures, convulsions, and coma may also occur. Gastrointestinal effects include anorexia, nausea, and vomiting. Pulmonary edema and hypotension (low blood pressure) are common. Dimethylhydrazine is toxic to the liver, ruptures red blood cells, and may cause kidney damage. Dermal contact may result in strong skin and mucous membrane irritation.

Short Term Exposure: UDMH can be absorbed through the skin, thereby increasing exposure. It is corrosive to the eyes, skin, respiratory tract. Contact with the liquid may cause permanent eye damage. Inhalation of vapors can cause headache, nausea, dizziness, coughing, and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. UDMH may affect the central nervous system, kidneys, and liver.

Long Term Exposure: UDMH may be carcinogenic to humans. It may affect the nervous system, liver, kidneys, and blood.

Points of Attack: Central nervous system; liver, gastrointestinal tract; blood, respiratory system; eyes, skin. Cancer sites in animals: lungs, liver, blood vessels, and intestines. May sensitize the skin and lungs, causing dermatitis and asthma-like symptoms.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Examination by a qualified allergist. Consider chest X-ray following acute overexposure. NIOSH lists the following tests: whole blood (chemical/metabolite): blood urea nitrogen, calcium, carbon dioxide; sugar/glucose; complete blood count; liver function tests; pulmonary function tests; urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; Barricade® coated suits; Responder™ suits, Trellchem HPS™ suits; Trychem 10000® suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (3) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with UDMH you should be trained on its proper handling and storage. Outside or detached storage is preferred. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Keep dry and separate from porous materials, oxidizing agents, and other incompatible materials, some of which are listed above. Store in an inert atmosphere below 50°C. Do not use copper containers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, POISON GAS, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Do not touch spilled material. Stop leak if this can be done without risk. Use water spray to reduce vapors. Take up *small spills* with vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Dike far ahead of *large spills* for later disposal. Spills also may be removed with an aspirator. Transfer to glass container and neutralize with dilute sulfuric acid. Drain with copious amounts of water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 1.5/2.4

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, hydrogen, ammonia, dimethylamine, and hydrazoic acid, are produced in fire. Use dry chemical, carbon dioxide, or foam for small fires. Water may be ineffective. For *large fires* use water fog, carbon dioxide; bicarbonate agents may allow flashback and explosive reignition. Move containers from fire area if it can be done without risk. Dike fire control water for later disposal, do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Isolation distances are listed above. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices). Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U099.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%; Classification B3 Flammable liquid, D2B Toxic Material Causing Other Toxic Effects.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R23/24/25; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1,2-Dimethylhydrazine is a flammable, colorless, fuming liquid with a fishy, amine-like odor. Molecular weight = 60.12; Boiling point = 80−81°C; Freezing/Melting point = −9°C; Flash point = ≤23°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Soluble in water.

Potential Exposure: 1,2-Dimethylhydrazine is an experimental rocket fuel and is used in chemical synthesis; a laboratory chemical. Mutagen.

Incompatibilities: Forms explosive mixture with air. A strong reducing agent and strong base. Violent reaction with strong oxidizers, strong acids, metallic oxides. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 ppm

PAC-1: 1.5 ppm

PAC-2: 3 ppm

PAC-3: 11 ppm

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2.

South Carolina has set a guideline for ambient air of 5.0 μ/m^3.

Determination in Air: Bubbler; phosphomolybdic acid; visible spectrophotometry; NIOSH Analytical Method (IV) #3515 (for 1,1-Dimethylhydrazine).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: SDMH is corrosive to the skin, eyes, and respiratory system. It is probably a hemolytic agent.

Long Term Exposure: SDMH is a mutagen, teratogen, and carcinogen.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (3) Color Code—Blue: Health Hazard/Poison (mutagen): Store in a secure poison location. Prior to working with SDMH you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cold, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.1/1.8

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See entry for "1,1-Dimethylhydrazine." Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Water Pollution Standard Proposed (EPA)[6] (California, Kansas).[61]

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants; 40CFR423, Appendix A, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): U101.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.036; Nonwastewater (mg/kg), 1.4.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8040 (5); 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R24/25; R34; R51/53; Safety phrases: S1/2; S26; S36/3739; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 2,4-DMP is a combustible, colorless, crystalline solid. The 2,4-isomer is 1 of 5 isomers of this formula. Molecular weight = 122.18; Boiling point 212°C; Freezing/Melting point = 27−28°C; Flash point = 110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug. 2,4-DMP finds use commercially as an important chemical feedstock or constituent for the manufacture of a wide range of commercial products for industry and agriculture. 2,4-Dimethylphenol is used in the manufacture of phenolic antioxidants, disinfectants, solvents, pharmaceuticals, insecticides, fungicides, plasticizers, rubber chemicals, polyphenylene oxide wetting agents, and dyestuffs; and is an additive or constituent of lubricants, gasolines, and cresylic acid. 2,4-Dimethylphenol (2,4-DMP) is a naturally occurring substituted phenol derived from the cresol fraction of petroleum or coal tars by fractional distillation and extraction with aqueous alkaline solutions. It is the cresylic acid or tar acid fraction of coal tar. Workers involved in the fractionation and distillation of petroleum or coal, and coal tar products comprise one group at risk. Workers who are intermittently exposed to certain commercial degreasing agents containing cresol may also be at risk. Cigarette and marijuana smoking groups and those exposed to cigarette smoke inhale microgram quantities of 2,4-demthylphenol.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.3 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: *To protect freshwater aquatic life:* 2120 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* no criterion established due to insufficient data. *To protect human health:* in view of the relative paucity of data on the mutagenicity, carcinogenicity, teratogenicity, and long-term oral toxicity of 2,4-dimethylphenol, estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence. It is recommended that studies to produce such information be conducted before limits in drinking water are established. A criterion of 400 μg/L is suggested by EPA on an organoleptic basis.[6] Kansas and California have set guidelines[61] at 400 μg/L also.

Determination in Water: Methyl chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *m*-Xylenol can be absorbed through the skin, thereby increasing exposure. Causes severe skin and eye irritation. Inhalation can cause lung irritation, with coughing and shortness of breath. May cause headaches, dizziness, nausea, vomiting, stomach pain, and exhaustion.

Long Term Exposure: High or repeated exposure may affect the liver and kidneys.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers, eyewash, and self-contained breathing apparatus (SCBA).

Respirator Selection: Use any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode; or any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and sources of ignition.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS" for xylenols. It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. *Do not DRY SWEEP.* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.5/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dimethyl-*p*-phenylenediamine is a colorless to reddish-violet crystalline solid; Molecular weight = 136.23; Boiling point = 262°C; Freezing/Melting point = 41°C; Flash point = 90°C. Insoluble in water.

Potential Exposure: Used in the production of Methylene blue and photodeveloper. It is a reagent for hydrogen sulfide, cellulose, organic synthesis. Chemical intermediate for dyes and diazonium chloride salts; analytical reagent for chloramine detection in water. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.025 mg/m^3

PAC-1: 0.075 mg/m^3

PAC-2: 0.13 mg/m^3

PAC-3: 1 mg/m^3

European/International Regulations: Hazard Symbol: T; Risk phrases R23/24/25; Safety phrases: S1/2; S28; S45.

DFG MAK: Danger of skin sensitization (*p*-phenylenediamine compounds used as rubber components).

Harmful Effects and Symptoms

Short Term Exposure: Irritant to skin and eyes. Lowest toxic dose with skin effect is 14 mg/kg. LD_{50} = (oral-rat) 50 mg/kg (moderately toxic).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in cool, dry place away from strong oxidizers and acids.

Shipping: Phenylenediamines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Dimethyl phosphorochloridothioate D:1240

Molecular Formula: $C_2H_6ClO_2PS$

Common Formula: $(CH_3O)_2PSCl$

Synonyms: Chlorodimethoxyphosphine sulfide; Dimethoxythiophosphonyl chloride; *O,O*-Dimethyl chlorothionophosphate; Dimethyl chlorothionophosphate; *O,O*-Dimethyl chlorothiophosphate; Dimethyl chlorothiophosphonate; *O,O*-Dimethyl phosphorochloridothioate; Dimethyl phosphorochloridothioate; Dimethyl phosphorochloridothionate; *O,O*-Dimethyl phosphorochlorothioate; Dimethylphosphorochlorothioate; *O,O*-Dimethylphosphorothionochloridate; Dimethyl thionochlorophosphate; *O,O*-Dimethylthionophosphorochloridate; Dimethylthionophosphorochloridate; *O,O*-Dimethyl thionophosphoryl chloride; *O,O*-Dimethylthiophosphoric acid chloride; Dimethylthiophosphorochloridate; *O,O*-Dimethyl thiophosphoryl chloride; Dimethyl thiophosphoryl chloride; Methyl PCT; NSC 132984; Phosphonothioic acid, chloro-, *O,O*-dimethyl ester; Phosphorochloridothioic acid, *O,O*-dimethyl ester

CAS Registry Number: 2524-03-0

RTECS®Number: TD1830000

UN/NA & ERG Number: UN2267/156

EC Number: 219-754-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dimethyl chlorothiophosphate is a colorless to light amber, combustible liquid. Molecular weight = 160.56; Specific Gravity (H_2O:1) 1.32 at 25°C; Boiling point = 66−67°C at 16 mmHg; flash point = 104.8°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2. Insoluble in water.

Potential Exposure: This material is used as a chemical intermediate for insecticides, pesticides, and fungicides; oil and gasoline additives; plasticizers; corrosion inhibitors; flame retardants; and flotation agents. It is not registered as a pesticide in the United States.[EPA]

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.5 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 32 mg/m^3
PAC-3: 150 mg/m^3

Russia[43] set a MAC of 0.5 mg/m^3 in work-place air.

Permissible Concentration in Water: Russia[43] set a MAC of 0.07 mg/L in water bodies used for domestic purposes.

Harmful Effects and Symptoms

Short Term Exposure: Contact with the skin, eyes, or mucous membranes may result in severe irritation, burns, and pain. Acute exposure to methyl PCT may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may either decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur.

Long Term Exposure: Corrosive materials may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. EKG. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dimethyl thiophosphoryl chloride requires a shipping label of "POISONOUS/TOXIC MATERIALS/CORROSIVE." This compound falls in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation. Apply powdered limestone, slaked lime, soda ash, or sodium bicarbonate. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. This material may ignite combustibles (wood, paper, oil, etc.). May react violently with water. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Wear positive-pressure breathing apparatus and special protective clothing. Move container from fire area if you can do so without risk. Poisonous gases are produced in fire, including poisonous oxides of phosphorus and sulfur. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92); Toxic Pollutant (Section 401.15).

US EPA Hazardous Waste Number (RCRA No.): U102.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.047; Nonwastewater (mg/kg), 28.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8060 (5); 8270 (10).

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dimethyl phthalate is a colorless, oily liquid with a slight ester odor. Molecular weight = 124.90; Specific gravity (H_2O:1) = 1.19; Boiling point = 285°C; Freezing/Melting point = 5.5°C; Vapor presure = 0.1 mmHg at 20°C; Flash point = 146°C; Autoignition temperature = 490°C. The LEL is 0.9% at 180°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.4%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant. Dimethyl phthalate is used as a solvent, dye carrier, plasticizer for cellulose ester plastics, and as an insect repellent.

Incompatibilities: Nitrates, strong oxidizers, strong alkalis, strong acids.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA.

NIOSH IDLH: 2000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 3 mg/m^3, 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3, [skin], 1993; Sweden: NGV 3 mg/m^3, KTV 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA mg/m^3. Several states have set guidelines or standards for DMP in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Collection by OSHA versatile sampler-Tenax; Toluene; analysis by gas chromatography/flame ionization; OSHA Analytical Method #104.

Permissible Concentration in Water: To protect freshwater and saltwater aquatic life: no criteria developed due to insufficient data. *To protect human health:* 313 mg/L.[6] Kansas[61] has set 313 mg/L as a guideline for drinking water also.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 606) or gas chromatography plus mass spectrometry (EPA Method 626). Octanol−water coefficient: Log $K_{ow} = 2.1$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of the nose and throat with coughing. Prolonged inhalation of high levels may cause dizziness, disorientation, loss of coordination, and slowing of heart and respiratory rate. Animal studies suggest that irritation may occur at 2000 mg/m^3 and may cause death at 9000 mg/m^3 for 6.5 h. *Skin:* No effects reported.

Eyes: May cause irritation and chemical burns. *Ingestion:* May cause irritation of the lips, tongue, mouth, and stomach, vomiting, diarrhea, dizziness, unconsciousness, and coma. Animal studies suggest that the lethal dose for an adult is 6−18 oz.

Long Term Exposure: No information available. Dimethyl phthalate is a possible teratogen in humans; there is limited evidence that it is a teratogen in animals. It may reduce fertility in males and females.

Points of Attack: Eyes, respiratory system, gastrointestinal tract.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended. NIOSH lists the following tests: urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter). *125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *2000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with dimethyl phthalate you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Dimethyl phthalate must be stored to avoid contact with nitrates; strong alkalis, such as sodium hydroxide, potassium hydroxide, and lithium hydroxide; strong oxidizers, such as chlorine, chlorine dioxide, and bromine; and strong acids, such as sulfuric acid, hydrochloric acid, and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]
