Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dimethyl sulfate is an oily, colorless liquid with a faint onion-like odor. Molecular weight = 126.14; Boiling point = 187.7°C (decomposes); Freezing/Melting point = − 33.8°C; Specific gravity (H_2O:1) = 1.33; Vapor pressure = 0.1 mmHg at 20°C; Flash point = 83.3°C (oc); Autoignition temperature = 188°C. Explosive limits: LEL = 3.6%; UEL = 23.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Slightly soluble in water (hydrolysis above 18°C).

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Industrial use of dimethyl sulfate is based upon its methylating properties. It is used as an alkylating agent; in the manufacture of methyl esters, ethers, and amines; in dyes, drugs, perfume, phenol derivatives, and other organic chemicals; as a solvent in the separation of mineral oils; as an intermediate in the manufacture of sodium acetylide synthesis, as well as many pharmaceuticals and pesticides.

Incompatibilities: The aqueous solution is a medium strong acid. Forms explosive mixture with air. Violent reaction with strong oxidizers, strong acids, strong alkalies, concentrated ammonia solutions with risks of fire and explosions. Reacts with water evolving heat and forming sulfuric acid. Attacks some plastics, rubber, and coatings. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air
OSHA PEL: 1 ppm/5 mg/m^3 [skin].
NIOSH REL: 0.1 ppm/0.5 mg/m^3 TWA, [skin] Potential carcinogen. Limit exposure to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.1 ppm/0.52 mg/m^3 TWA, [skin]; confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: 7 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 0.024 ppm
PAC-1: **0.024** ppm
PAC-2: **0.12** ppm
PAC-3: **1.6** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: [skin] Carcinogen Category 2.
Australia: TWA 0.1 ppm (0.5 mg/m^3), [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 0.1 ppm (0.52 mg/m^3), [skin], carcinogen, 1993; Denmark: TWA 0.01 ppm (0.05 mg/m^3), [skin], 1999; Finland: STEL 0.01 ppm (0.05 mg/m^3), [skin], carcinogen, 1999; France: VME 0.1 ppm (0.5 mg/m^3), carcinogen, 1999; Hungary: STEL 0.1 mg/m^3, [skin], carcinogen, 1993; Japan: 0.1 ppm (0.52 mg/m^3), [skin], 2A carcinogen, 1999; Norway: TWA 0.01 ppm (0.05 mg/m^3), 1999; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 0.1 mg/m^3, [skin], 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.02 ppm (0.1 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 0.1 ppm (0.5 mg/m^3), [skin], 1993; United Kingdom: TWA 0.05 ppm (0.26 mg/m^3), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for dimethyl sulfate in ambient air[60] ranging from zero (North Carolina and North Dakota) to 1.67 μg/m^3 (New York) to 2.5 μg/m^3 (Connecticut and South Carolina) to 5.0 μg/m^3 (Florida and Virginia) to 12.0 μg/m^3 (Nevada and Pennsylvania).

Determination in Air: Use NIOSH Analytical Method (IV) #2524.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Dimethyl sulfate is corrosive to the eyes, skin, and the respiratory tract. Corrosive if ingested. Ingestion of the substance may cause edema of lips, tongue, and pharynx. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Extremely toxic vapors and liquid: a few whiffs or contact on skin could be fatal. Also acutely toxic if ingested. Delayed effects which are ultimately fatal may also occur. Lethal concentrations as low as 97 ppm/10 min have been reported in humans. DNA inhibitions and damage to human somatic cells, and sister chromatid exchange in human fibroblast cells were observed. Delayed appearance of symptoms may permit unnoticed exposure to lethal quantities. Immediate effects of vapor exposure are eye irritation, cough, swelling of tongue, lips, and larynx, and lungs (later). Ingestion or direct contact with mucous membranes causes corrosion. Once absorbed, lung damage and liver and kidney injury will occur. Liquid dermal exposure causes blistering, followed by convulsions, delirium, coma, and death in severe cases.

Long Term Exposure: Lungs may be affected. May affect the liver, kidneys, and central nervous system. Dimethyl sulfate is probably carcinogenic to humans. May damage the developing fetus. In animals: nasal and lung cancer.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys, central nervous system. Cancer site in animals: nasal cavity and lung.

Medical Surveillance: Preplacement and periodic medical examinations should give special consideration to the skin, eyes, central nervous system, lungs. Chest X-rays should be taken and lung, liver, and kidney functions evaluated. Sputum and urinary cytology may be useful in detecting the presence or absence of carcinogenic effects. NIOSH lists the following tests: blood gas analysis, blood urea nitrogen, chest X-ray, electrocardiogram, liver function tests, pulmonary function tests, forced vital capacity, forced expiratory volume (1 s), sputum cytology, urine (chemical/metabolite): sediment; urinalysis (routine); white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): Barricade® coated suits; Responder™ suits; Trychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: At *any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Dimethyl sulfate must be stored to avoid contact with water, strong oxidizers (such as chlorine, bromine, and fluorine), and strong ammonia solutions, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Do not allow this chemical to contact water. Sources of ignition, such as smoking and open flames, are prohibited where dimethyl sulfate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2
Night 0.1/0.2
Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur oxides, are produced in fire. Firefighting gear (including SCBA) does not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 1.5 s minimum) of dilute, neutralized dimethyl sulfate waste is recommended. The incinerator must be equipped with efficient scrubbing devices for oxides of sulfur. Alkaline hydrolysis may also be used, as may landfill burial.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN1164/130

EC Number: 200-846-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dimethyl sulfide is a colorless to yellow liquid with an unpleasant wild radish or cabbage-like odor. Molecular weight = 62.14; Boiling point = 37°C; Freezing/Melting point = −98°C; Flash point ≤ −18°C; Autoignition temperature = 206°C. Explosive limits: LEL = 2.2%; UEL = 19.7%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Practically insoluble in water.

Potential Exposure: It is used as a presulfiding agent for variety of catalysts used by petroleum industry; a gas odorant; catalyst impregnator; as a solvent for anhydrous mineral salts; a chemical intermediate for solvents and dimethyl sulfoxide; as a flavoring ingredient in foods and beverages.

Incompatibilities: Reacts violently with strong oxidizing materials, causing fire and explosion hazard.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 10 ppm/25 mg/m^3 TWA (2001).

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 500 mg/m^3

Poland: MAC (TWA) 1 mg/m^3, 1993; Russia: STEL 50 mg/m^3, [skin], 1993; Sweden: NGV 1 ppm, 1999. Russia[43] set a MAC of 0.08 mg/m^3 in ambient air of residential areas on a momentary basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 0.84.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Dimethyl sulfide causes softening and irritation of the skin. Orally, it is an irritant. Inhalation can cause dizziness and unconsciousness.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode or any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with dimethyl sulfide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen sulfide and sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, fog, or foam extinguishers. Wear self-contained breathing apparatus and full protective clothing. If it can be done safely, move container from fire area. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Isolate for 1/2 mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DMSO is a hygroscopic colorless to yellow liquid. Molecular weight = 78.14; Boiling point = 189°C; Freezing/Melting point = 18−19°C; Flash point = 95°C; Autoignition temperature = 215°C. Explosive limits: LEL = 2.6%; UEL = 42%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slight solubility in water.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Used as a solvent and in the preparation of vanillin from lignin; as an antifreeze; as a pharmaceutical (FDA—proprietary drug); in chemicals production.

Incompatibilities: Violent reaction with strong oxidizers. Reacts with ethanoyl chloride, boron compounds, halides, metal alkoxides, perchlorates.

Permissible Exposure Limits in Air

AIHA WEEL: 250 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 250 ppm

PAC-1: 750 ppm

PAC-2: 1250 ppm

PAC-3: 2000 ppm

DFG MAK: 50 ppm/160 mg/m^3 TWA [skin]; Peak Limitation Category II(2); Pregnancy Risk Group D.

Russia: STEL 20 mg/m^3, 1993; Sweden: TWA 50 ppm (150 mg/m^3), KTV 150 ppm (500 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (160 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 150 mg/m^3, [skin], 2003.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = -2.03$.

Routes of Entry: Skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Systemically, it produces anesthesia, vomiting, chills, cramps, and lethargy. LD_{50} = (oral-rat) 14,500 mg/kg (insignificantly toxic). It reportedly irritates the eyes, skin, and the respiratory tract. However,[57] it also affects the blood. All routes of exposure can produce an intense garlic-like taste and breath odor. *Eyes:* A 7.5% solution can cause irritation and burning. *Inhalation:* Exposure to high concentrations of DMSO can cause some sedation and lowering of consciousness. Animal studies indicate that exposures of 900 ppm for 24 h produced no ill effects. *Skin:* A 10% solution applied for 14 consecutive days produced some sedation, headache, nausea, and dizziness along with such skin effects as irritation, drying, and scaling. Contact with a 70−90% solution has resulted in immediate stinging and burning. DMSO is very readily absorbed through the skin and may increase the absorption of other substances dissolved in it or on the surface of the skin. *Ingestion:* No human data available. Animal studies indicate that symptoms from swallowing DMSO include throat and stomach irritation, vomiting, and sedation.

Long Term Exposure: Repeated or prolonged contact with skin may cause irritation and dermatitis. DMSO may affect the liver, resulting in impaired function.

Points of Attack: Skin, liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Protect from physical damage. Store in cool, dry place away from oxidizers and ignition sources. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: DMSO is not specifically cited in DOT's Performance-Oriented Packaging Standards.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur dioxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Dimethyl terephthalate D:1290

Molecular Formula: $C_{10}H_{10}O_4$

Common Formula: $CH_3OCOC_6H_4COOCH_3$

Synonyms: 1,4-Benzenedicarboxylic acid dimethyl ester; Dimethyl *p*-phthalate; DMT; Terephthalic acid dimethyl ester

CAS Registry Number: 120-61-6

RTECS® Number: WZ1225000

UN/NA & ERG Number: Not regulated.

EC Number: 204-411-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); equivocal evidence: mouse; no evidence: rat.

US EPA Gene-Tox Program, Negative: Carcinogenicity—mouse/rat; Cell transform.—SA7/SHE.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (UNEP).[43]

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DMT is a combustible, white, flaky solid. Molecular weight = 194.19; Boiling point = 284−288°C; Freezing/Melting point = 141°C; Flash point = 153°C (oc); 146°C; Autoignition temperature = 515−550°C; Explosive limits: LEL = 0.8%; UEL = 11.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Essentially all DMT is consumed in the production of polyethylene terephthalate, the polymer for polyester fibers and polyester films. Less than 2% of production is used to make polybutylene terephthalate resins and other specialty products.

Incompatibilities: Incompatible with strong acids, nitrates, strong oxidizers.

Permissible Exposure Limits in Air

AIHA WEEL: 5 mg/m^3 total dust TWA.

No TEEL available.

Russia: STEL 0.1 mg/m^3, 1993.

Permissible Concentration in Water: Russia[43] set a MAC of 1.5 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation of dust or vapor, ingestion, skin and eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: DMT appears to have a very low order of toxicity. Acute animal studies indicate oral, i.p., and LD_{50} = (oral-rat)>3200 mg/kg; dermal values in excess of 3400 mg/kg; and subchronic oral (10,000 ppm DMT in the diet for 96 days) and inhalation exposures (2−10 ppm, 4 h/day × 58 days) have not resulted in any hematologic, blood chemical, or pathologic alterations attributable to DMT. Results of other experiments with rats and rabbits demonstrated that DMT is rapidly absorbed and excreted (primarily in the urine), and that no significant quantities accumulate in tissues following single or repeated oral, intratracheal, dermal, or ocular administration, DMT does not appear to irritate or sensitize rodent skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DMT you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, nitrates, acids, and sources of ignition. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Molten DMT will burn if ignited. It ignites at 153°C. Vapor or dust can form explosive mixtures in air. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21; R25; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dimetilan is a yellow to reddish-brown solid. Molecular weight = 240.30; Freezing/Melting point = 68−71°C (the technical grade at 55−65°C). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Soluble in water; solubility = 24% at 25°C.

Potential Exposure: Formerly an insecticide for insect control on livestock, especially housefly control. It is no longer produced commercially in the United States.

Incompatibilities: Hydrolyzed by acids and alkalis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Routes of Entry: Skin contact, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Very toxic; probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150-lb) person. LD_{50} = (oral-rat) 25 mg/kg. Dimetilan is highly toxic by ingestion and moderately toxic by contact with the skin. Death is primarily due to respiratory arrest of central origin; paralysis of the respiratory muscles; intense bronchoconstriction; or all three. This compound is a cholinesterase inhibitor. Symptoms are similar to carbaryl poisoning: nausea, vomiting, abdominal cramps, diarrhea, pinpoint pupils, excessive salivation, and sweating are common symptoms. Running nose and tightness in chest are common in inhalation exposures. Difficulty in breathing, raspy breathing, loss of muscle coordination may also be seen. Exposure may also result in random jerky movements, incontinence, convulsions, coma, and death.

Long Term Exposure: Many carbamates affect the central nervous system.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Carbamate pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They are in Hazard Class 6.1 and dimetilan is in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for types of surrounding fire, as the material itself burns with difficulty. Use water in flooding quantities as a fog. Wear positive-pressure breathing apparatus and special protective clothing. Move container from fire area. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkali treatment followed by soil burial.[22] Large amounts should be incinerated in a unit equipped with efficient gas scrubbing. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Dinitolmide D:1310

Molecular Formula: $C_8H_7N_3O_5$

Common Formula: $H_3CC_6H_2(NO_2)_2CONH_2$

Synonyms: Benzamide, 2-methyl-3,5-dinitro-; Coccidine A; Coccidot; D.O.T.; 2-Methyl-3,5-dinitrobenzamide, *o*-Dinitro-toluamide; Zoalene®; Zoamix®

CAS Registry Number: 148-01-6

RTECS® Number: XS4200000

UN/NA & ERG Number: UN2588 (pesticides, solid, toxic, n.o.s.)/155

EC Number: 205-706-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dinitolmide is a yellowish crystalline substance. Molecular weight = 225.18; Freezing/Melting point = 177.2°C. Very slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Those involved in the manufacture, formulation, and application of this veterinary coccidiostat, an antiparasite medicine used in poultry.

Incompatibilities: A weak oxidizing agent, but high temperatures and pressures may cause violent reactions. Heat can cause a violent exothermic reaction above 248°C. Contact with alkalies may form explosive metal salts.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 1 mg/m^3 TWA; not classifiable as a human carcinogen (2006).

No TEEL available.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; France: VME 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Switzerland: MAK-W 5 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set standards or guidelines for dinitolmide in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Filter; none; Gravimetric; NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact eczema; in animals. LD_{50} = (oral-rat) 600 mg/kg (slightly toxic).

Long Term Exposure: Dinitolmide may cause mutations. All contact with this chemical should be reduced to the lowest possible level. In animals: methemoglobinemia, liver changes.

Points of Attack: Liver, blood, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Evaluation by a qualified allergist. Complete blood count. Methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. If while wearing a filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect dinitolmide, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator.

Where there is potential for high exposures, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinitolmide you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalies and heat.

Shipping: Pesticides, solid, toxic, n.o.s. require a “POISONOUS/TOXIC MATERIALS” label. They fall in Hazard Class 6.1 and dinitolmide in Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Dinitolmide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Dinitroanilines D:1320

Molecular Formula: $C_6H_5N_3O_4$

Synonyms: 2,4-Dinitraniline; 2,4-Dinitroanilin (German); 2,4-Dinitrobenzenamime; DNA; NCI-C60753

CAS Registry Number: 97-02-9 (2,4-); 602-03-9 (2,3-); 606-22-4 (2,6-); 618-87-1 (3,5-); 26471-56-7 (mixed isomers)

RTECS$^{®}$ ***Number:*** BX9100000 (2,4-dinitroaniline)

UN/NA & ERG Number: UN1596/153

EC Number: 202-553-5 [*Annex I Index No.:* 612-040-00-1] (2,4-); 210-108-1 (2,6-); 210-567-8 (3,5-)

Regulatory Authority and Advisory Bodies (2,4-dinitroaniline)

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (***all isomers***): Hazard Symbol: T+, N; Risk phrases: R26/27/28; R33; R51/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*2,4-isomer*).

Description: Dinitroanilines are yellow to greenish-yellow, needle-like crystals with a musty odor. Molecular weight = 183.14 (*2,4-isomer*); Boiling point = 57°C; Freezing/Melting point = 188°C; Flash point = 224°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 3. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant. Used as a corrosion inhibitor, as a dye or pigment intermediate, as a toner pigment in printing inks.

Incompatibilities: Decomposes in moderate heat forming toxic vapors that form an explosive mixture with air. Violent reaction with strong oxidizers, strong acids, strong bases, acid chlorides, acid anhydrides, and chloroformates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

2,4-isomer

TEEL-0: 0.035 mg/m^3

PAC-1: 0.1 mg/m^3

PAC-2: 0.75 mg/m^3

PAC-3: 12.5 mg/m^3

Russia: STEL 0.3 mg/m^3, 1993 (2,4-dinitroaniline).

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 1.78.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. High levels can cause methemoglobinemia, causing headache, dizziness, and blue color to the skin and lips. Higher levels can cause difficult breathing; collapse and possible death.

Long Term Exposure: See entry above. May cause liver and kidney damage.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: Blood methemoglobin level. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. In the case of poisoning, special first aid is required; antidotes for the formation of methemoglobin should be available, including instructions.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with DNA you should be trained on its proper handling and storage. Before entering confined space where DNA may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases, and other incompatible materials listed above. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." Nitroanilines fall into Hazard Group 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but does not readily ignite. However, moderate heat causes decomposition that produces toxic vapors that form an explosive mixture with air. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide and nitrogen oxides. Heated vapors in confined spaces can explode. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers can explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*all isomers*).

Description: Dinitrobenzene exists in three isomers (*o*-, *m*-, and *p*-); the meta form is the most widely used. All are white to yellow crystalline solids having a characteristic odor. Molecular weight = 168.12; Boiling point = (*o*-) 318°C; (*m*-) 300°C; (*p*-) 299°C; (mixed) 305°C; Freezing/Melting point = (*o*-) 117−118°C; (*m*-) 90°C; (*p*-) 173−174°C; (mixed) 75−85°C; Flash point = (*o*-, *m*-, and *p*-) 149−150°C. NFPA 704 M Hazard Identification (ortho-): Health 3, Flammability 1, Reactivity 4. Solubility in water is poor for *o*-, *m*-, and mixed isomers; none for *p*-isomer.

Potential Exposure: Compound Description (*m*-isomer): Mutagen; Reproductive Effector; Human Data; Primary Irritant; (*o*- and *p*-isomers) Mutagen. Dinitrobenzenes are used in the synthesis of dyestuffs, dyestuff intermediates, and explosives; in celluloid production.

Incompatibilities: Dinitrobenzene is impact-, friction-, and heat-sensitive; may explode. [*Note:* Prolonged exposure to fire and heat may result in an explosion due to *spontaneous* decomposition.] Dust explosion possible if mixed with air. Reacts violently with strong oxidizers, strong bases, and chemically active metals, causing fire and explosion hazard. Mixtures with nitric acid are highly explosive. Attacks some plastics.

Permissible Exposure Limits in Air

All isomers

OSHA PEL: 1 mg/m^3 TWA [skin].

NIOSH REL: 1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.15 ppm/1 mg/m^3 TWA [skin]; BEI$_M$ issued; Methemoglobin inducers.

DFG MAK: [skin] Carcinogen Category 3B.

NIOSH IDLH: 50 mg/m^3.

Protective Action Criteria (PAC)

o-, m-, and p-isomers

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 50 mg/m^3

m- and o-isomers

Austria: [skin], Suspected: carcinogen, 1999; Denmark: TWA 0.15 ppm (1 mg/m^3), [skin], 1999; France: VME 0.15 ppm (1 mg/m^3), 1999; Japan: 0.15 ppm (1 mg/m^3), [skin], 1999; United Kingdom: TWA 0.15 ppm (1.0 mg/m^3); STEL 0.5 ppm, [skin], 2000; the Netherlands: MAC-TGG 1 mg/m^3, 2003.

p-isomer

Austria: [skin], Suspected: carcinogen, 1999; Denmark: TWA 0.15 ppm (1 mg/m^3), [skin], 1999; Japan: 0.15 ppm (1 mg/m^3), [skin], 1999; the Netherlands; MAC-TGG 1 mg/m^3, 2003.

Several states have set guidelines or standards for dinitrobenzenes in ambient air[60] as follows (all values in μg/m^3):

State	ortho-	meta-	para-
Connecticut	20.0	20.0	100.0
Florida	–	10.0	–
Nevada	–	24.0	–
New York	–	3.3	–
North Dakota	10.0	10.0	10.0
South Carolina	–	10.0	–
Virginia	16.0	16.0	16.0

Determination in Air: Use NIOSH II(4) Method #S214.

Permissible Concentration in Water: The MAC in water bodies used for domestic purposes has been set by Russia.[43]

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 1.46−1.69.

Routes of Entry: Inhalation, percutaneous absorption of liquid, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Dinitrobenzene irritates the eyes, skin, and respiratory tract. Dinitrobenzene may affect the lungs and the ability of the blood to carry oxygen, resulting in the formation of methemoglobin. This can cause headache, weakness, fatigue, dizziness, and blue color to the skin and lips. Higher levels may cause difficulty in breathing, collapse, unconsciousness, and may result in death. The effects may be delayed. Consuming alcohol, exposure to sunlight, or hot baths may make symptoms worse. Exposure to dinitrobenzene may produce yellowish coloration of the skin, eyes, and hair.

Exposure to any isomer of dinitrobenzene may produce methemoglobinemia, symptoms of which are headaches, irritability, dizziness, weakness, nausea, vomiting, dyspnea, drowsiness, and unconsciousness. If treatment is not given promptly, death may occur. Dinitrobenzene may also cause a bitter almond taste or burning sensation in the mouth, dry throat, and thirst. Reduced vision may occur. In addition, liver damage, hearing loss, and ringing of the ears may be produced. Repeated or prolonged exposure may cause anemia.

Long Term Exposure: Repeated exposure may cause hearing loss and changes to vision. Prolonged exposure may lead to liver damage and may cause anemia. Can cause serious reproductive toxicity in humans. The substance may have effects on the respiratory tract formation of methemoglobin.

Points of Attack: Blood, liver, cardiovascular system, eyes, central nervous system.

Medical Surveillance: Preemployment and periodic examinations should be concerned particularly with a history of blood dyscrasias, reactions to medications; alcohol intake; eye disease; skin; cardiovascular status. Liver and renal functions should be evaluated periodically as well as blood and general health. Blood methemoglobin levels should be followed until normal in all cases of suspected cyanosis. Dinitrobenzene can be determined in the urine; levels greater than 25 mg/L may indicate significant absorption. Complete blood count (CBC). Examination of the eyes and color vision. People with a medical condition called "G-6-P-D deficiency" may have worse problems if exposed to dinitrobenzene. NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; whole blood (chemical/metabolite), methemoglobin/end-of-shift; Complete blood count; Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinitrobenzene you should be trained on its proper handling and storage. Dinitrobenzene must be stored to avoid contact with strong oxidizers (such as chloride, bromine, chlorine dioxide, nitrates, and permanganates), since violent reactions occur. Contact with caustics and chemically active metals (such as tin and zinc) may evolve heat, causing a buildup in pressure. Store in tightly closed containers in a cool, well-ventilated area away from shock or heat, which may cause this chemical to explode. Storage outdoors or in explosion-proof areas is preferred. Sources of ignition, such as smoking and open flames, are prohibited where dinitrobenzene is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more of dinitrobenzene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of dinitrobenzene. Wherever dinitrobenzene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dinitrobenzenes all require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dinitrobenzene is an extremely explosive solid. Prolonged exposure to fire and heat may result in an explosion due to *spontaneous* decomposition. May explode on heating under confinement. Fight fires from an explosion-resistant location. Cool fire-exposed containers of dinitrobenzene with water. In advanced or massive fires, evacuate the area. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a more secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) followed by removal of the oxides of nitrogen that are formed using scrubbers and/or catalytic or thermal devices. The dilute wastes should be concentrated before incineration.

WGK (German Aquatic Hazard Class): No value assigned.

Description: DNOC exists in 9 isomeric forms of which 4,6-dinitro-*o*-cresol is the most important commercially and the most heavily regulated. It is a noncombustible, yellow crystalline solid. Molecular weight = 198.15; Boiling point = 312°C; Freezing/Melting point = 88°C; Vapor pressure = 5×10^{-5} mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.01%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data; Primary Irritant. DNOC is used as free radical polymerization inhibitor and agricultural chemical intermediate; widely used in agriculture as an herbicide and pesticide; it is also used in the dyestuff industry. Although 4,6-dinitro-*o*-cresol (DNOC) is no longer manufactured in the United States, a limited quantity is imported and used as a blossom-thinning agent on fruit trees and as a fungicide, insecticide, and miticide, on fruit trees during the dormant season. Hence, individuals formulating or spraying the compound incur the highest risk of exposure to the compound.

Incompatibilities: Dust can form an explosive mixture with air. Keep away from strong oxidizers, strong bases. Protect from heat and shock.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [skin].

NIOSH REL: 0.2 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.2 mg/m^3 TWA [skin].

NIOSH IDLH: 5 mg/m^3.

Protective Action Criteria (PAC)

PAC-1: 0.2 mg/m^3

PAC-2: 0.5 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK: [skin]; No numerical value established.

Austria: MAK 0.2 mg/m^3, [skin], 1999; Denmark: TWA 0.2 mg/m^3, [skin], 1999; France: VME 0.2 mg/m^3, [skin], 1999; The Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Norway: TWA 25 ppm (125 mg/m^3), 1999; United Kingdom: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 2000; Russia[43] set a MAC value of 0.003 mg/m^3 for the ambient air in residential areas on a momentary basis and 0.0008 mg/m^3 on a daily average basis. Several states have set guidelines or standards for DNOC in ambient air[60] ranging from 2.0 μg/m^3 (North Dakota) to 3.0 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH (II-5) Method #S166.

Permissible Concentration in Water: *To protect human health*, 13.4 μg/L.[6] Russia set a MAC of 0.05 mg/L in water bodies used for domestic purposes and 0.002 mg/L in water bodies used for fishery purposes.[43]

Determination in Water: Filter/Bubbler; 2-Propanol; High-pressure liquid chromatography/Ultraviolet detection; NIOSH II(5) Method #S166. Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection. EPA Method 604 or gas chromatography plus mass spectrometry EPA Method 625.

Routes of Entry: Inhalation, percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Early manifestations of acute dinitrocresol exposure include fever, sweating, headache, and confusion. Blood pressure, pulse, and respiratory rate are often elevated. Severe exposure may result in restlessness, seizures, and coma. Other signs and symptoms include dyspnea (shortness of breath), cyanosis (blue tint to skin and mucous membranes), pulmonary edema, nausea, vomiting, and abdominal pain. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias are commonly noted. Dermal exposure results in yellow staining of the skin, and may produce burns. Dinitrocresol may irritate and burn the eyes and mucous membranes. DNOC is an extremely toxic material; probable oral lethal dose is 5−50 mg/kg in humans or between 7 drops and 1 teaspoon for a 70-kg (150-lb) person.

Long Term Exposure: May damage the liver, kidneys, and blood cells. May stain yellow the skin, eyes, and fingernails. Repeated exposure can cause anxiety, fatigue, insomnia, excessive perspiration, unusual thirst, weight loss, and cataracts in the eyes.

Points of Attack: Cardiovascular system, endocrine system.

Medical Surveillance: Before beginning employment, at regular times after that and if symptoms develop or overexposure has occurred, the following may be useful: examination of eyes for cataracts. Examination of skin and nails for staining. Blood tests for 4,6-dinitro-*o*-cresol. Persons with blood levels *over 10 ppm* (10 mg/L) should be kept away from further exposure until levels return to normal. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Complete blood count. NIOSH lists the following tests: blood analyzed weekly.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If high fever is present, drench victim's clothes in cool water, or immerse person in cool bath before transfer.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends Saranex™ coated suits, natural rubber, Neoprene™ and chlorinated polyethylene as providing good to excellent protection. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2 mg/m^3:* Any air-purifying full-face-piece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100. *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or any self-contained breathing apparatus with a full face-piece; or SCBAF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH condition:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. 4,6-Dinitro-*o*-cresol must be stored to avoid contact with strong oxidizers (such as bromine, chlorine, chlorine dioxide, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 4,6-dinitro-*o*-cresol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of 4,6-dinitro-*o*-cresol. Wherever 4,6-dinitro-*o*-cresol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if it can be done without risk. Take up *small spills* with sand or other noncombustible absorbent material; place into containers for later disposal. *Small dry spills*: collect powdered material in the most convenient and safe manner and deposit in sealed containers. Large spills should be diked for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 4,6-Dinitro-*o*-cresol may burn but does not easily ignite. The dust can form an explosive mixture with air. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (593°C minimum) with adequate scrubbing and ash disposal facilities.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dinitronaphthalenes D:1350

Molecular Formula: $C_{10}H_6N_2O_4$
Common Formula: $C_{10}H_6(NO_2)_2$
Synonyms: 1,3-Dinitronaphthalene; 1,5-Dinitronaphthalene; Naphthalene, 1,3-dinitro-; Naphthalene, 1,8-dinitro-
CAS Registry Number: 606-37-1 (1,3-); 605-71-0 (1,5-); 602-38-0 (1,8-); 27478-34-8 (all isomers)
RTECS® Number: QJ4550800 (1,3-); QJ4551000 (1,5-); QJ4552000 (1,8-); QJ4550000 (all isomers)
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154; UN3143 (Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s.)/151
EC Number: 210-116-5 (1,3-); 210-016-1(1,8-); 248-484-4 (all isomers)
Regulatory Authority and Advisory Bodies
Water Pollution Standard Set (Russia).[43]
WGK (German Aquatic Hazard Class): No value assigned.
Description: Dinitronaphthalene is a yellowish crystalline solid. Molecular weight = 218.18; Freezing/Melting points: (1,3-) 146–148°C; (1,5-) 218°C; (1,8-) 173°C. These substances are highly flammable, potentially explosive; shock and heat sensitive.
Potential Exposure: Used as a dye intermediate; in the manufacture of explosives.
Incompatibilities: The 1,3- and 1,8-isomers are strong oxidizers. All are potentially explosive materials. These materials may form explosive metal salts with alkalies. Violent reaction with aluminum, sulfur, and sulfuric acid in the presence of heat.
Permissible Exposure Limits in Air
No TEEL available.
DFG MAK: Carcinogen Category 3B.
Permissible Concentration in Water: Russia[43] set a MAC of 1 mg/L in water bodies used for domestic purposes.
Harmful Effects and Symptoms
Short Term Exposure: Irritation of the skin, eyes, and mucous membranes; headache, dizziness, nausea, vomiting.[52]
Long Term Exposure: A suspected carcinogen. Insomnia, fatigue, weight loss; central nervous system depression; skin pigmentation; liver damage; toxic hepatitis; kidney damage; anemia, and cyanosis.
First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20–30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue (all isomers): Health Hazard/Poison: Store in a secure poison location. Prior to working with dinitronaphthalenes you should be trained on its proper handling and storage. Store in tightly closed containers in a refrigerator or cool, well-ventilated area away from alkalies, aluminum, sulfur,

sulfuric acid, and heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Nitronaphthalene is not specifically cited in DOT's Performance-Oriented Packaging Standards. But it may be considered "Toxic solids, organic, n.o.s." This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It may fall into DOT Hazard Class 6.1 and Packing Group III. Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s. carry the same label and other requirements shown.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These are very flammable materials. They are sensitive to heat and shock. Hence, extreme care must be exercised in firefighting. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Dinitrophenols D:1360

Molecular Formula: $C_6H_4N_2O_5$

Common Formula: $C_6H_3(NO_2)_2OH$

Synonyms: *2,4-isomer:* Aldifen; Chemox PE; 2,4-Dinitrofenol (Spanish); α-Dinitrophenol; Dinofan 51285; 2,4-DNP; Fenoxyl carbon N; 1-Hydroxy-2,4-dinitrobenzene; Maroxol-50; Nitro kleenup; NSC-1532; Phenol, α-dinitro-; Phenol, 2,4-dinitro-; Solfo black 2B supra; Solfo black B; Solfo black BB; Solfo black G; Solfo black SB; Tertrosulphur black PB; Tertrosulphur PBR

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R51; Safety phrases: S1/2; S28; S37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: The dinitrophenols, $C_6H_3(NO_2)_2OH$, are yellow crystalline solids with a sweet, musty odor. Molecular weight = 184.12. Hazard Identification (based on NFPA-704 M Rating System) (*2,4-*): Health 4, Flammability 3, Reactivity 3. Very slightly soluble in water.

Properties:

Isomer	Melting Point	Boiling Point
2,3-	144°C	
2,4-	112−115°C	sublimes
2,5-	104°C	
2,6-	63.5°C	
3,4-	134°C	
3,5-	122−123°C	

As noted in the "Regulatory" section above, 2,4-, 2,5-, 2,6-, and mixed isomers of dinitrophenol are the most heavily regulated of this group. Due to its explosive properties, dinitrophenol is used in the form of a wetted solution or water paste.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. 2,4-DNP is used as an intermediate for making dyes, photochemicals, pest control agents, wood preservatives, explosives, chemical indicators, photographic developers, and also in chemical synthesis.

Incompatibilities: Dust forms an explosive mixture with air. Explosion can be caused by heat, friction, or shock. Contact with reducing agents; combustibles, may cause fire and explosions. Forms shock-sensitive explosive salts with ammonia, strong bases, and most metals. May accumulate static electrical charges, and may cause ignition of its vapors.

PAC-2: 15 mg/m^3
PAC-3: 75 mg/m^3
2,6-isomer
TEEL-0: 0.15 mg/m^3
PAC-1: 0.4 mg/m^3
PAC-2: 3 mg/m^3
PAC-3: 15 mg/m^3
Mixed isomers
TEEL-0: 0.035 mg/m^3
PAC-1: 0.1 mg/m^3
PAC-2: 0.75 mg/m^3
PAC-3: 4 mg/m^3
Russia[43] set a MAC of 0.05 mg/m^3 in work-place air.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 230 μg/L on an acute toxicity basis for nitrophenols as a class. *To protect saltwater aquatic life*: 4850 μg/L on an acute toxicity basis for nitrophenols as a class. *To protect human health:* 70.0 μg/L.[6] This compares to a limit of 30 μg/L set in the USSR.[43] Kansas and Maine have set guidelines for 2,4-dinitrophenol in drinking water of 31 μg/L and 110 μg/L, respectively.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Dinitrophenol can affect you when breathed and by passing through skin. Contact with the 2,4-isomer can cause severe irritation and burns to the eyes and skin. May affect the metabolism, causing very high body temperature. May affect the peripheral nervous system causing numbness, "pins and needles," and/or weakness of the hands and feet. Exposure can cause a bluish color to skin and lips, headaches, temperature rise, dizziness, collapse, convulsions (fits), coma, and even death. Exposure may irritate the lungs, causing coughing and shortness of breath. Higher levels can cause a buildup of fluid in the lungs, a medical emergency, which can cause death.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis with rash and drying and itching of the skin. Dinitrophenol may have effects on the eyes, causing cataracts. Exposure can damage the liver and kidneys, and affect the thyroid gland. May cause lung irritation and the development of bronchitis with coughing and shortness of breath. May damage the nervous system. High exposure may damage the developing fetus. Repeated exposure to the 2,4-isomer can damage blood cells, causing anemia.

Points of Attack: Skin, liver, kidneys, lungs, peripheral nervous system, eyes, thyroid gland, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: eye examination for cataracts. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin level. Complete blood count (CBC). Lung function tests. Liver and kidney function tests. Thyroid function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dinitrophenol, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Dinitrophenol should be kept wet and protected from thermal and mechanical shock. Dinitrophenol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), metals, and metal compounds, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where dinitrophenol is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of dinitrophenol. Wherever dinitrophenol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dinitrophenol, wetted with not <15% water, by mass, requires a shipping label of "FLAMMABLE SOLID, POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 4.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wet spilled material with water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. Keep dinitrophenol out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dry dinitrophenol is a severe explosion hazard when exposed to heat or shock. Wetted dinitrophenol in solution may be combustible or flammable depending on the solvent. Poisonous gases are produced in fire, including oxides of nitrogen and carbon monoxide. Use flooding quantities of water to extinguish fire. If water is not available use dry chemical or dirt. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) with adequate scrubbing equipment for the removal of nitrogen oxides. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hazard Symbol: T, N; Risk phrases: R45; R23/24/25; R48/22; R62; R68; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water *polluting (2,4- and 2,6-isomers)*.

Description: Six isomers of DNT exist, the most important being 2,4-dinitrotoluene, an orange-yellow crystalline solid. Commercial grades of DNT typically consist of a mixture of all 6 isomers, but mainly 2,4-DNT (75−78%) and 2,6-DNT (19−22%). Molecular weight, all isomers = 182.15; Boiling point = 300°C; Freezing/Melting point = 70°C; Flash point = 207°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1 (must be preheated to burn), Reactivity 3 (heat or shock may cause detonation). Insoluble in water.

Potential Exposure: Compound Description (mixture of isomers, 25321-14-6): Tumorigen, Mutagen; Reproductive Effector; (602-01-7) Tumorigen, Drug, Mutagen, Primary Irritant; (121-14-2) Tumorigen, Mutagen; Reproductive Effector; Primary Irritant; (606-20-2) Tumorigen, Mutagen, Primary Irritant; (610-39-9) Mutagen, Primary Irritant. DNT is used in the preparation of polyurethane foams and manufacture of toluene diisocyanate for the production of polyurethane plastics; in the production of military and commercial explosives; to plasticize cellulose nitrate in explosives, to moderate the burning rate of propellants and explosives; in the manufacture of gelatin explosives; as a water-proofing coating for smokeless powders; as an intermediate in TNT manufacture; and in the manufacture of azo dye intermediate.

Incompatibilities: A strong oxidizer and explosive. Dust forms explosive mixture with air. Heat forms corrosive nitrogen oxide fumes and may cause explosion. Commercial grades will decompose at 250°C/482°F, with self-sustaining decomposition at 280°C/536°F. Contact with other strong oxidizers, caustics, and reducing agents may cause fire and explosions. Contact with nitric acid forms an explosive material. Contact with sodium oxide causes ignition. Not compatible with chemically active metals, such as tin and zinc.

Permissible Exposure Limits in Air

OSHA PEL: 1.5 mg/m^3 TWA [skin].

NIOSH REL: 1.5 mg/m^3 TWA [skin], potential carcinogen, reduce to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA [skin], confirmed animal carcinogen with unknown relevance to humans; BEI$_M$ issued for Methemoglobin inducers.

NIOSH IDLH: 50 mg/m^3.

Protective Action Criteria (PAC)

2,4-isomer
TEEL-0: 0.2 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 50 mg/m^3

2,6-isomer
TEEL-0: 0.2 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 50 mg/m^3

3,4-isomer
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 1 mg/m^3
PAC-3: 50 mg/m^3

Mixed isomers
TEEL-0: 0.2 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 12.5 mg/m^3
PAC-3: 50 mg/m^3

DFG MAK (*mixture of isomers*): [skin]; Carcinogen, Category 2.

Arab Republic of Egypt: TWA 1.5 mg/m^3, [skin], 1993; Australia: TWA 1.5 mg/m^3, [skin], 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 1.5 mg/m^3, [skin], 1993; Denmark: TWA 1.5 mg/m^3, [skin], 1999; Finland: TWA 1.5 mg/m^3; STEL 3 mg/m^3, [skin], 1999; India: TWA 1.5 mg/m^3, [skin], 1993; Norway: TWA 0.15 mg/m^3, 1999; the Philippines: TWA 1.5 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 5 mg/m^3, 1999; Sweden: NGV 0.15 ppm, KTV 0.3 ppm, [skin], 1999; Switzerland: carcinogen, [skin], 1999; Turkey: TWA 1.5 mg/m^3, [skin], 1993; United Kingdom: LTEL 1.5 mg/m^3; STEL 5 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. (602-01-7): Denmark: TWA 1.5 mg/m^3, [skin], 1999. (606-20-2): United Kingdom: carcinogen, 2000. Several states have set guidelines or standards for DNT in ambient air[60] ranging from 15 μg/m^3 (Connecticut and North Dakota) to 25 μg/m^3 (Virginia) to 36 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #44.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 300 μg/L on an acute toxicity basis and 230 μg/L on a chronic toxicity basis. *To protect saltwater aquatic life:* 590 μg/L on an acute toxicity basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a concentration of 1.1 μg/L of 2,4-DNT.[6] Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes. In addition, the states of Kansas and Minnesota have set guidelines for DNT in drinking water,[61] both at a level of 1.1 μg/L.

Determination in Water: Methylene chloride extraction followed by exchange to toluene and gas chromatography with flame ionization detection (EPA Method 609) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion, and eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May affect the central nervous system, cardiovascular system, and the blood, resulting in the formation of methemoglobin. Symptoms may be delayed for up to 4 h. Both the nervous system and the blood are affected. Nervous system effects may include confusion, disorientation, dizziness, weakness, drowsiness, and coma. Convulsions may occur. Blood effects are from a decreased ability to carry oxygen and may include moderate to severe headache, nausea, vomiting, blue coloring of skin, fall in blood pressure, and an irregular heartbeat. Ingestion of alcohol is reported to aggravate toxic effects. *Skin:* Readily absorbed through the skin. Small amounts absorbed from clothes or shoes may cause or increase the severity of the symptoms listed above. Irritates the skin. *Eyes:* Hot fumes may cause severe burning of eyelids and cornea, resulting in permanent scarring. *Ingestion:* Animal studies suggest that ingestion causes symptoms listed under Inhalation.

Long Term Exposure: Reported or prolonged exposure may cause anemia, decrease of oxygen-carrying capacity of the blood, blue skin coloration, liver damage and jaundice, anemia, weight loss, and skin rash. May affect the nervous system causing fatigue, nausea, vomiting, personality changes, such as irritability, anxiety, confusion, and depression. May be a cancer-causing agent in humans since it has been shown to cause liver cancer in animals. The 2,6-isomer caused mutations, liver cancer in animals; and may decrease fertility in males and females.

Points of Attack: Blood, liver, cardiovascular system, reproductive system. Cancer sites in animals: liver, skin, and kidney.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: complete blood count (CBC). Urinary dinitrotoluene level. Liver and kidney function tests. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The formation of methemoglobin may be delayed; medical observation is recommended.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinitrotoluenes you should be trained on its proper handling and storage. 2,4-Dinitrotoluene must be stored to avoid contact with strong oxidizers, such as chlorine, chlorine dioxide, bromine, nitrates, and permanganates; caustics, such as sodium hydroxide and potassium hydroxide; and chemically active metals, such as tin or zinc, since violent reactions occur. Contact with strong oxidizers can cause fire or explosions. Also, striking it or dropping it may cause detonation and explosion. Store in tightly closed containers in a cool, well-ventilated area away from heat (temperatures above 250°C). Sources of ignition, such as smoking and open flames, are prohibited where 2,4-dinitrotoluene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of 2,4-dinitrotoluene. Wherever 2,4-dinitrotoluene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dinitrotoluenes, solid or molten, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of

potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Molten 2,4-dinitrotoluene is combustible. It may burn but does not readily ignite. Use extreme caution when fighting a fire, since 2,4-dinitrotoluene could explode. Use dry chemical, CO_2, or water spray extinguishers. If the fire is advanced, evacuate the area. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves contact of the dinitrotoluene contaminated waste with $NaHCO_3$ and solid combustibles followed by incineration in an alkaline scrubber-equipped incinerator unit. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dinoseb is an orange crystalline solid when pure, or may be formulated with a flammable solvent as a brown viscous liquid with a pungent odor. Molecular weight = 240.24; 282.32 (acetate); Freezing/Melting point = 38−42°C; 26.7°C (acetate); Flash point (hydrocarbon solvent) = 16−29°C (for 3 commercial products). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. This material is used for herbicide formulation; as a plant growth regulator, insecticide, and herbicide. Dinoseb is primarily used as a contact herbicide for postemergence weed control in cereals, undersown cereals, seedling lucerne and peas. Dinoseb is also used as a corn yield enhancer and an insecticide and miticide.[US EPA]

Incompatibilities: The solution in water is a weak acid. Attacks many metals in the presence of water.

Permissible Exposure Limits in Air

88-85-7
Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 4.5 mg/m^3
PAC-3: 4.5 mg/m^3

Permissible Concentration in Water: A health advisory of 3.5 μg/L has been developed by EPA based on possible teratogenic action of dinoseb as described in the EPA document below. Several states have set guidelines for dinoseb in drinking water[61] ranging from 2.0 μg/L (Maine) to 5.0 μg/L (Massachusetts) to 13.0 μg/L (Wisconsin) to 39.0 μg/L (Kansas). Russia set a MAC of 0.1 mg/L in surface water. Octanol−water coefficient: Log $K_{ow} = 3.7$. Values above 3.0 are likely to bioaccumulate in marine organisms.

Determination in Water: Extraction with ether, conversion to methyl ester and determination by electron capture gas chromatography. Fish Tox = 2.85539000 ppb (MATC) High.

Harmful Effects and Symptoms

Short Term Exposure: Dinoseb causes eye irritation. May affect the gastrointestinal tract and central nervous system. Early manifestations of dinoseb exposure include fever, sweating, headache, and confusion. Elevations of blood pressure, pulse, and respiratory rate are common. Severe exposure may result in restlessness, seizures, and coma. Other signs and symptoms include dyspnea (shortness of breath), nausea, vomiting, and abdominal pain. Liver injury with associated jaundice, kidney failure, and cardiac arrhythmias may be noted. Inhalation of the aerosol may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Muscle weakness may be pronounced. Dermal exposure results in yellow staining of the skin and may produce burns. Human Tox = 0.70000 ppb (EXTRA HIGH).

Warning: Exposure to dinoseb fumes or aerosol in hot environment may cause death. Effects may be delayed from several hours to 2 days. Caution is advised. Toxicity of dinoseb is enhanced by high ambient temperature and physical activity. Dinoseb is extremely toxic: Probable oral lethal dose is 5−50 mg/kg; between 7 drops and 1 teaspoonful for 70-kg (150-lb) person.

Long Term Exposure: Dinoseb may affect the kidneys, liver, blood, immune system, and eyes; may cause cataracts. May cause reproductive toxicity in humans.

Points of Attack: Liver, kidneys, blood, cardiovascular system, immune system, eyes.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC). Eye examination. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Consult poison center on use of antidotes.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. If working with liquid wear splash-proof chemical goggles, if working with dry material wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.2 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinoseb you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Dinoseb and dinoseb acetate are toxic pesticide and should be labeled "SUBSTITUTED NITROPHENOL PESTICIDES, SOLID (or LIQUID), TOXIC." They fall into DOT/UN Hazard Class 6.1(b) and Packing Group III.

Spill Handling: Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water.

Dry material: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep spilled material wet. Do not attempt to sweep up dry material. Use HEPA vacuum or wet method to reduce dust during cleanup. *Do not dry sweep*. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep material out of water sources and sewers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep material out of water sources and sewers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish by flooding with water. Cool all affected containers with flooding quantities of water. Wear self-contained breathing apparatus and full protective clothing. If fire becomes uncontrollable, evacuate for a radius of 1 mile. It is dangerously explosive. When not water-wet it is a high explosive. Dry, the material is easily ignited and it will burn very vigorously. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Conduct at 1000°C for 2.0 s minimum with scrubber for nitrogen oxides removal is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Dinoterb D:1390

Molecular Formula: $C_{10}H_{12}N_2O_5$
Common Formula: $C_6H_2(NO_2)_2(C_4H_9)(OH)$
Synonyms: *o*,*tert*-Butyl-4,6-dinitrophenol; 2-(1,1-Dimethylethyl)-4,6-dinitrophenol; 2,4-Dinitro-6-*tert*-butylphenol; Dinitroterb; DNTBP; Herbogil; Phenol-2-*tert*-butyl-4,6-dinitro-; Phenol, 2-(1,1-dimethylethyl)4,6-dinitro-
CAS Registry Number: 1420-07-1
RTECS® Number: SK0160000
UN/NA & ERG Number: UN1599/153; UN2779 (Substituted nitrophenol pesticides, solid, toxic)/153
EC Number: 215-813-8 [*Annex I Index No.:* 609-030-00-4]
Regulatory Authority and Advisory Bodies
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 500 lb (227 kg).
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R61; R24; R28; R44; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: Dinoterb is a yellow solid. May be formulated in a hydrocarbon solvent which changes the physical properties shown here. Molecular weight = 240.24; Freezing/Melting point = 126°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Practically insoluble in water.

Potential Exposure: This material is an herbicide and a rodenticide.

Incompatibilities: Strong caustics. Heat may cause material to explode.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 25 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of poisoning are similar to other dinitrophenols and may include nausea, gastric distress, restlessness, sensation of heat, flushed skin, sweating, thirst, deep and rapid breathing, rapid heart rate, fever, and lack of oxygen to tissues (blueness of skin). This compound is toxic by all routes of exposure. The dangerous single oral dose of dinitro-*o*-cresol, a structurally similar compound, is estimated to be about 29 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dinoterb, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dinoterb you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Substituted nitrophenol pesticides, solid, toxic, require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and dinoterb in Packing Group II.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Wet spills: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Heat may cause material to explode. Use dry chemical, carbon dioxide, water spray, or foam for *small fires*, and for *large fires* use water spray, fog, or foam. Move container from fire area if it can be done safely. Isolate hazard area, stay upwind, and keep out of low areas. Wear self-contained breathing apparatus and full protective clothing. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Di-*n*-octyl phthalate D:1400

Molecular Formula: $C_{24}H_{38}O_4$

Common Formula: $C_6H_4(COOC_8H_{17})_2$

Synonyms: 1,2-Benzenedicarboxylic acid, di-*n*-octyl ester; Bis(2-ethylhexyl)phthalate; Cellulex DOP; Di-*sec*-(2-ethylhexyl)phthalate; Dinopol NOP; Di-*n*-octyl phthalate; Di-*sec*-octyl phthalate; DNOP; DOP; *n*-Octyl phthalate; Octyl phthalate; Phthalic acid, dioctyl ester; PX-138; Vinicizer-85

CAS Registry Number: 117-84-0

RTECS® Number: TI1925000

UN/NA & ERG Number: UN3082/171

EC Number: 204-214-7

Regulatory Authority and Advisory Bodies

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

US EPA Hazardous Waste Number (RCRA No.): U107.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.017; Nonwastewater (mg/kg), 28.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8060 (30); 8270 (10).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DNOP is a liquid. Molecular weight = 390.62; Boiling point = 230°C under 5 mmHg; Flash point = 215°C; Autoignition temperature = 390°C. Explosive Limits: LEL = 0.3% at 245°C; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: DNOP is used as a plasticizer in the manufacture of plastic products.

Incompatibilities: Water contact causes foaming. Incompatible with oxidizers, strong acids, alkyl halides, since violent reactions occur.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 50 mg/m^3

PAC-2: 400 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: Insufficient data are available to permit EPA to define criteria to prevent damage to aquatic life or harm to humans.[6] Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 606) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Di-*n*-octyl phthalate can affect you when breathed in and may enter the body through the skin. Eye contact may cause irritation. Repeated skin contact may cause dryness, cracking, and rash. Breathing the vapor may irritate the nose, throat, and bronchial tubes. High exposure levels can irritate the lungs and, if prolonged, could cause death.

Long Term Exposure: High or repeated exposure may affect the liver or kidneys. Repeated skin contact can cause dryness, cracking, and rash. This chemical has been shown to be a teratogen in animals.

Points of Attack: Skin, liver, kidneys.

Medical Surveillance: Liver, kidney, and lung function tests. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. ACGIH recommends butyl rubber, nitrile rubber, and Viton as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to di-*n*-octyl phthalate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Di-*n*-octyl phthalate must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric); and alkyl halides, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dioxane is a volatile, colorless liquid that may form explosive peroxides during storage. Molecular weight = 88.12; Specific gravity (H_2O:1) = 1.03; Boiling point = 101°C; Freezing/Melting point = 12°C; Vapor pressure = 29 mmHg at 20°C; Flash point = 12°C; Autoignition temperature = 180°C. Explosive limits: LEL = 2.0%; UEL = 22%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Dioxane is used as a stabilizer in chlorinated solvents, and as a solvent for cellulose acetate; other primary uses include as a solvent for dyes, fats, greases, lacquers, mineral oil; paints, polyvinyl polymers; resins, varnishes, and waxes. It finds particular usage in paint and varnish strippers; as a wetting agent and dispersing agent in textile processing; dye baths; stain and printing compositions; and in the preparation of histological slides.

Incompatibilities: Forms explosive mixture with air. Moisture forms unstable and explosive peroxides. Incompatible with strong oxidizers, strong acids, decaborane, triethyl aluminum, oxygen, halogens, reducing agents, moisture, and heat. Reacts explosively with catalysts, such as Raney nickel (above 210°C). Attacks many plastics. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.60 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/360 mg/m^3 TWA [skin].

NIOSH REL: 1 ppm/3.6 mg/m^3/30 min, Ceiling Concentration [skin], Potential carcinogen. Limit exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 20 ppm/72 mg/m^3 TWA [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 17 ppm

PAC-1: **17** ppm

PAC-2: **320** ppm

PAC-3: **760** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 20 ppm/73 mg/m^3; [skin]; Peak Limitation Category I(2); Carcinogen Category 4; Pregnancy Risk Group C.

Australia: TWA 25 ppm (90 mg/m^3), [skin], 1993; Austria: MAK 50 ppm (180 mg/m^3), [skin], Suspected: carcinogen, 1999; Belgium: TWA 25 ppm (90 mg/m^3), [skin], 1993;

Denmark: TWA 10 ppm (36 mg/m^3), [skin], 1999; Finland: TWA 25 ppm (90 mg/m^3); STEL 40 ppm (135 mg/m^3), [skin], 1999; France: VME 10 ppm (35 mg/m^3), VLE 40 ppm, continuous carcinogen, 1999; Hungary: STEL 10 mg/m^3, [skin], carcinogen, 1993; the Netherlands: MAC-TGG 40 mg/m^3, [skin], 2003; the Philippines: TWA 100 ppm (360 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 80 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 25 ppm (90 mg/m^3), KTV 50 ppm, [skin], carcinogen, 1999; Switzerland: MAK-W 25 ppm (90 mg/m^3); STEL 50 ppm, [skin], 1999; Turkey: TWA 100 ppm (360 mg/m^3), [skin], 1993; United Kingdom: TWA 25 ppm (91 mg/m^3); STEL 100 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[35, 43] set a MAC of 0.7 mg/m^3 in the ambient air of residential areas[35] on a once-daily basis. Several states have set guidelines or standards for Dioxane in ambient air[60] ranging from zero (North Carolina) to 2.4 μg/m^3 (Massachusetts) to 214.286 μ/m^3 (Kansas) to 300 μg/m^3 (New York) to 311 μ/m^3 (Pennsylvania) to 450 μg/m^3 (Connecticut and South Carolina) to 900 μg/m^3 (Florida, South Dakota) to 1500 μg/m^3 (Virginia) to 2140 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1602 or OSHA Analytical Method 7.[18]

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 2480 μg/L based on health effects. The EPA[48] has developed a 1-day health advisory of 4 mg/L and a 10-day health advisory of 0.4 mg/L but notes that carcinogenicity makes formulation of a long-term advisory inadvisable. Connecticut[61] has set a guideline for dioxane in drinking water of 20 μg/L.

Determination in Water: Purge and trap; gas chromatography-mass spectrometry may be used.[48] Octanol−water coefficient: Log $K_{ow} = < -0.5$.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with dioxane can cause eye and skin irritation and burns. Inhalation can cause irritation of the respiratory tract with coughing and shortness of breath. Higher exposure to dioxane vapor can cause headache, lightheadedness, dizziness, loss of appetite, headache, nausea, vomiting, stomach pain, drowsiness, and unconsciousness. Overexposure may cause liver and kidney damage. Prolonged skin exposure to the liquid may cause drying and cracking.

Long Term Exposure: Prolonged or repeated exposure may cause liver and kidney damage. The liquid defats the skin, causing drying and cracking. This chemical is a potential occupational carcinogen.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys. Cancer site in animals: lung, liver, and nasal cavity.

Medical Surveillance: Preplacement and periodic examinations should be directed to symptoms of headache and dizziness, as well as nausea and other gastrointestinal disturbances. The condition of the skin should be considered. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended, before beginning work and at regular times after that: Liver function tests. Kidney function tests, including routine urine test.

NIOSH lists the following tests: whole blood (chemical/metabolite), during exposure; blood plasma; blood urea nitrogen; chest X-ray; kidney function tests; liver function tests; pulmonary function tests; urine (chemical/metabolite); urine (chemical/metabolite), sediment; urine (chemical/metabolite) end-of-shift; urinalysis (routine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): 4H™ and Silver Shield™ gloves, Tychem 10000® suits; **4 h** (at least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Remove clothing immediately if wet or contaminated to avoid flammability hazard.

Respirator Selection: *NIOSH: At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with dioxane you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,4-Dioxane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where 1,4-dioxane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of 1,4-dioxane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 1,4-dioxane. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Do not use halogens. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA Gene-Tox Program, Negative: Carcinogenicity—mouse/rat; NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24; R26/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dioxathion is a viscous, reddish-brown liquid or powder with a garlic-like odor. Technical product is a mixture of *cis*- and *trans*-isomers. Molecular weight = 456.56; Boiling point = (decomposes)>135°C; Freezing/Melting point = −20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Human Data. Those involved in the manufacture, formulation, or application of this insecticide and acaricide for control of insects and mites on grapes, citrus, etc.

Incompatibilities: Incompatible with strong acids. Decomposes above 135°C, forming toxic oxides of phosphorus and sulfur. Attacks iron and tin surfaces. Hydrolyzed by alkalies. Dioxathion is hydrolyzed by strong bases; attacks iron and tin surfaces. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.2 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA [skin] inhalable fraction and vapor; Not Suspected as a Human Carcinogen (2001); TLV-BEI$_A$ issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 3.4 mg/m^3

PAC-3: 150 mg/m^3

Australia: \TWA 0.2 mg/m^3, [skin], 1993; Belgium: TWA 0.2 mg/m^3, [skin], 1993; Denmark: TWA 0.2 mg/m^3, [skin], 1999; France: VME 0.2 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Switzerland: MAK-W 0.2 mg/m^3, [skin], 1999; United Kingdom: TWA 0.2 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for Dioxathion in ambient air[60] ranging from zero (New York) to 2.0 μg/m^3 (North Dakota) to 3.0 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Dioxathion is a cholinesterase inhibitor. It may affect the nervous system, resulting in convulsions and respiratory failure. Exposure to high levels may cause death. Acute exposure to dioxathion may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Dioxathion is very toxic. Probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoonful and 1 oz for a 70-kg (150-lb) person. It is a cholinesterase inhibitor. Death is primarily due to respiratory arrest arising from failure of the respiratory center, paralysis of respiratory muscles, intense bronchoconstriction, or all three. LD$_{50}$ = (oral-rat) 20 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions and respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.2 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Dioxathion requires a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and in Packing Group II. This chemical is a regulated marine pollutant.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Small spill: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dioxathion does not burn. Use fire extinguishing agents suitable for surrounding fire. Decomposes above 135°C; Poisonous gases, including nitrogen, phosphorus, and sulfur oxides, are produced. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: For small quantities: mix with lime and bury. For large amounts, use incineration with effluent gas scrubbing.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; Safety phrases: S2; S16 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dioxolane is a water-white liquid. Molecular weight = 74.09; Boiling point = 74°C; Flash point = 2°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. Soluble in water.

Potential Exposure: It is a low-boiling solvent and used for extraction of oils, fats, waxes, dyes, and cellulose derivatives. May be used as a cross-linking agent in phenolic resins.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 20 ppm/61 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 60 ppm

PAC-2: 69 ppm

PAC-3: 3000 ppm

DFG MAK: 100 ppm/310 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C.

Russia[43] has set a workplace MAC: 50 mg/m^3.

Determination in Air: No method available.

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Moderately toxic by inhalation and ingestion. May be poisonous if inhaled or absorbed through skin. Contact may irritate or burn skin and eyes. Vapors may cause dizziness or suffocation.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to the chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: This chemical is a flammable liquid. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. If material is not on fire and not involved in fire, then keep sparks, flames, and other sources of ignition away. Build dikes to contain flow as necessary. Attempt to stop leak if this can be done without hazard. Use water spray to disperse vapors, and dilute standing pools of liquid. Avoid breathing vapors. Keep upwind. Wear boots, protective goggles, and gloves. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Do not extinguish unless flow can be stopped. Use water in flooding quantities as fog. Solid streams of water may be ineffective. Use "alcohol" foam, carbon dioxide, or dry chemical. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity as (*D-limonene 5989-27-5*): IARC: Human Inadequate Evidence; Animal, No Evidence, *not classifiable as carcinogenic to humans*, Group 3.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R38; R43; R50/53 Safety phrases: S2; S24; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dipentene is a colorless liquid with a lemon-like odor. A racemic mixture of the D- and L-isomers. Molecular weight = 136.26; Boiling point = 170°C; Flash point = 45°C; Autoignition temperature = 237°C. Explosive limits: LEL = 0.7% at 150°C; UEL = 6.1% at 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Dipentene is used as a solvent; in rubber compounding and reclamation; and to make paints, enamels, lacquer, and perfumes.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosion hazard.

Permissible Exposure Limits in Air

AIHA WEEL: 30 ppm TWA [*as D-limonene (CAS:138-86-3)*].

No TEEL available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Dipentene can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. High exposures may damage the kidneys.

Long Term Exposure: Dipentene may cause a skin allergy. If allergy develops, very low future exposures can cause itching and a skin rash. There is limited evidence that dipentene causes kidney cancer in male rats.

Points of Attack: Skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dipentene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: T +, N; Risk phrases: R28; R48/23/24/25; Safety phrases: S1/2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diphacinone is an odorless, pale yellow, crystalline solid. Molecular weight = 340.39; Freezing/Melting point = 146−147°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Very slightly soluble in water.

Potential Exposure: This material is used as a rodenticide and as an anticoagulant medication.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.15 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 0.9 mg/m^3

PAC-3: 500 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: This material is extremely toxic; probable oral lethal dose in humans is 5−50 mg/kg, or between 7 drops and 1 teaspoonful for a 150-lb person. Diphacinone is an anticoagulant (inhibits blood clotting). Hemorrhage is the most common effect and may be manifested by nose bleeding, gum bleeding, bloody stools and urine, ecchymoses (extravasations of blood into skin), and hemoptysis (coughing up blood). Bruising is heightened. Abdominal and flank pains are also common. Other signs and symptoms include flushing, dizziness, hypotension (low blood pressure), dyspnea (shortness of breath), cyanosis (blue tint to the skin and mucous membranes), fever, and diarrhea.

Long Term Exposure: May affect the liver and kidneys. Repeated exposure may cause low white blood cell count and affect the brain.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: Blood test for clotting time (PT, INR, or PTT). Stool and urine tests for blood. Liver and kidney function tests. Complete blood count (CBC). EEG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to a health-care facility. Acute exposure to Diphacinone may require decontamination and life support for the victims. Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies, such as plastic sheeting and disposable plastic bags, to assist in preventing spread of contamination.

Personal Protective Methods: For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Diphacinone, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Coumarin-derivative pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and diphacinone in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: Take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 213-482-4 [*Annex I Index No.:* 616-007-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R52/53; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diphenamid is a white crystalline solid in various forms. Molecular weight = 239.34; Freezing/Melting point = 135°C; Vapor pressure = 2.8×10^{-8} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Very slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. This material is used as a preemergent and selective herbicide for tomatoes, peanuts, alfalfa, soybeans, cotton, and other crops.

Incompatibilities: Reacts with strong oxidants, strong acids, and alkalies.

Permissible Exposure Limits in Air

No TEEL available.

Russia: STEL 5 mg/m^3, 1993.

Permissible Concentration in Water: Russia set a MAC of 1.2 mg/L in water bodies used for domestic purposes. A lifetime health advisory of 0.2 mg/L has been calculated by EPA. California[61] has set a guideline for diphenamid in drinking water of 40 μg/L.

Determination in Water: Fish Tox = 5.00495000 ppb (HIGH).

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 685 mg/kg (slightly toxic). Human Tox = 200.00000 ppb (VERY LOW).

Long Term Exposure: A slight increase in liver weights was observed in long-term animal feeding studies. Mutation data reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to diphenamid, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, strong acids, strong alkalies.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Diphenamid decomposes at 210°C forming toxic and corrosive gases, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be destroyed by alkaline hydrolysis. Admixture with alkali can be followed by soil burial.[22] Larger quantities can be disposed of by incineration in admixture with acetone or xylene and using effluent gas scrubbing.[22]

Diphenylamine D:1470

Molecular Formula: $C_{12}H_{11}N$

Common Formula: $(C_6H_5)_2NH$

Synonyms: Acetamide, 2-Biphenylyl-*N*-pyridyl-; AI3-00781; Aniline, *n*-phenyl-; Anilinobenzene; Benzenamine, *n*-phenyl-; Benzene, anilino-; Benzene, (phenylamino)-; Big Dipper; 2-Biphenylyl-*N*-pyridylacetamide; Caswell No. 398; C.I. 10355; Deccoscald 282; DFA; Difenilamina (Spanish); Diphenpyramide; *N,N*-Diphenylamine; DPA; EPA pesticide chemical code 038501; No scald DPA 283; NSC 215210; *n*-Phenylaniline; Phenylaniline; *n*-Phenylbenzenamine; *n*-Phenylbenzeneamine; Poly(diphenylamine); Pyridyl-biphenylyl-acetamide; Scaldip; Z-876

CAS Registry Number: 122-39-4

RTECS® Number: JJ7800000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 204-539-4 [*Annex I Index No.:* 612-026-00-5]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Gene-Tox Program, Positive: Cell transform.—SA7/SHE.

RCRA Hazardous Constituent Waste.[5]

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: DPA is a colorless to amber to brown crystalline solid or liquid with a pungent, floral odor. Contact with light causes a color change. Molecular weight = 169.24; Boiling point = 302°C; Freezing/Melting point = 53°C; Vapor pressure = 1 mmHg at 108°C; Flash point = 153°C (cc); Autoignition temperature = 634°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. DPA is used as a stabilizer for plastics including solid rocket propellants; antioxidant for polymers, greases, and industrial oils; in the manufacture of pharmaceuticals; pesticides, explosives, and dyes.

Incompatibilities: Dust may form an explosive mixture with air. Incompatible with strong acids, strong oxidizers, aldehydes, organic anhydrides, isocyanates, hexachloromelamine, trichloromelamine. Reacts with nitrogen oxides forming *n*-nitrosodiphenylamine and heat-, friction-, and shock-sensitive nitro products.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 100 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 10 mg/m^3, 1993; Austria: MAK 10 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; the Netherlands: MAC-TGG 0.7 mg/m^3, 2003; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 10 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

The Czech Republic[35] TWA 5 mg/m^3; ceiling value 10 mg/m^3. Several states have set guidelines or standards for diphenylamine in ambient air[60] ranging from 0.68 μg/m^3 (Massachusetts) to 100.0 μg/m^3 (North Dakota) to 160.0 μg/m^3 (Virginia) to 200.0 μg/m^3 (Connecticut and Rhode Island) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method 78.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.05 mg/L in water bodies used for domestic purposes.

Determination in Water: No tests listed. Octanol–water coefficient: Log K_{ow} = 3.34.

Routes of Entry: Inhalation of dust, ingestion, skin absorption, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: DFA irritates the eyes, skin, and respiratory tract. It may affect the blood (resulting in the formation of methemoglobin). Industrial poisoning has been encountered and was manifested clinically by bladder symptoms, tachycardia, hypertension, and skin trouble. Overexposure can damage the liver, kidneys (polycystic kidneys), and may cause bladder symptoms and blood in the urine.

Long Term Exposure: DFA may affect the liver, kidneys, and blood, forming methemoglobin. NIOSH warns that the carcinogen 4-aminodiphenyl may be present as an impurity in the commercial product. In animals: teratogenic effects.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, blood, bladder, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation of the kidneys and urinary system. Urine cytology (to look for abnormal cells). Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. If while wearing a filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect diphenylamine, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from light. Sources of ignition, such as smoking and open flames, are prohibited where diphenylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic solids, flammable, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Burn in admixture with flammable solvent in furnace equipped with afterburner and scrubber.[22]

Diphenyl dichlorosilane D:1480

Molecular Formula: $C_{12}H_{10}Cl_2Si$

Common Formula: $(C_6H_5)_2SiCl_2$

Synonyms: Dichlorodiphenylsilane; Diphenylsilicon dichloride

CAS Registry Number: 80-10-4

RTECS® Number: VV3190000

UN/NA & ERG Number: UN1769/156

EC Number: 201-251-0

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Diphenyl dichlorosilane is a colorless liquid. It has a sharp, pungent, HCl-like odor. Molecular weight = 253.21; Specific gravity = 1.22 at 25°C; Boiling point = 305°C; Autoignition temperature = 633.6°C; Flash point = 142°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Reacts with water; insoluble.

Potential Exposure: This material is used in the synthesis of silicone lubricants.

Incompatibilities: Water, steam, strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.3 ppm

PAC-1: 0.9 ppm

PAC-2: 11 ppm

PAC-3: 50 ppm

Harmful Effects and Symptoms

Short Term Exposure: Vapors can irritate the eyes, nose, and throat. Higher levels could irritate the lungs and even lead to pulmonary edema, a medical emergency. This can cause death. This substance is a corrosive chemical and contact can cause severe skin burns and severe eye burns leading to permanent damage.

Long Term Exposure: Corrosive materials may affect the lungs, bronchitis with coughing and shortness of breath.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for

pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/ clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to diphenyl dichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Diphenyl dichlorosilane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), bases, alcohols, and acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames, are prohibited where diphenyl dichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Fire Extinguishing: Diphenyl dichlorosilane is a combustible liquid. Diphenyl dichlorosilane may burn but does not readily ignite. Poisonous gases are produced in fire, including hydrogen chloride and phosgene. Fire may restart after it has been extinguished. Using water or foam extinguishers may cause frothing. Water spray may be useful. Use dry chemical or CO_2 as extinguishing agents. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; 50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: DPH is a white to yellow crystalline compound. Molecular weight = 184.26; Freezing/Melting point = 131°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. 1,2-Diphenylhydrazine (DPH) is a precursor in the manufacture of benzidine, an intermediate in the production of dyes. 1,2-Diphenylhydrazine is used in the synthesis of phenylbutazone, a potent anti-inflammatory (antiarthritic) drug. Manufacturers of dyes and pharmaceuticals are subject to occupational exposure. Groups working in the laboratory and forensic medicine may also be subject to 1,2-diphenylhydrazine exposure.

Incompatibilities: Not compatible with oxidizers, strong acids, acid chlorides, acid anhydrides, and mineral acids forming benzidine. Store under nitrogen.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 400 mg/m^3

DFG MAK: Carcinogen Category 2.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 270 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* no criterion developed due to insufficient data. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of 0.4 μg/L.[6] Two states have set guidelines for 1,2-diphenylhydrazine in drinking water both at the level of 0.45 μg/L.

Determination in Water: Gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = about 3.0.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract causing coughing and wheezing.

Long Term Exposure: This substance is possibly carcinogenic to humans. It has been shown to cause liver and breast cancer in animals. Diphenylhydrazine is a suspected carcinogen in humans because of its structural relationship to benzidine, which is an established human bladder carcinogen. Recent studies in rats and mice have shown that diphenylhydrazine produces both benign and malignant tumors when administered subcutaneously. Carcinogenicity in rats of both sexes and female mice has been established. In view of the relative paucity of data on the mutagenicity, teratogenicity, and long-term oral toxicity of diphenylhydrazine, estimates of the effects of chronic oral exposure at low levels cannot be made with any confidence according to NAS/NRC.[46] May cause skin allergy with itching and skin rash. Repeated exposure may cause anemia and may damage the liver.

Points of Attack: Liver, blood, skin.

Medical Surveillance: Liver function tests. Evaluation by a qualified allergist. Complete blood count (CBC).

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to 1,2-diphenylhydrazine, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store under nitrogen away from oxidizers, strong acids, acid chlorides, acid anhydrides. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Diphenyl oxide is a colorless solid or liquid with a highly disagreeable odor. The odor threshold is 0.1 ppm. Molecular weight = 170.22; Specific gravity (H_2O:1) = 1.08; Boiling point = 258.8°C; Freezing/Melting point = 27.8°C; Vapor pressure = 0.02 mmHg at 25°C; Flash point = 115°C (cc). Explosive limits: LEL = 0.7%; UEL = 6.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water. It is often used commercially in admixture with diphenyl also known as biphenyl. See also "Biphenyl" record.

Potential Exposure: Compound Description: Primary Irritant. This material is used as a heat transfer medium; as a chemical intermediate; in organic synthesis; in perfuming soaps.

Incompatibilities: Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.96 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/7 mg/m^3 TWA [vapor].

NIOSH REL: 1 ppm/7 mg/m^3 TWA [vapor].

ACGIH TLV®[1]: 1 ppm/7 mg/m^3 TWA; 2 ppm/14 mg/m^3 TWA STEL [vapor].

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 2 ppm

PAC-2: 20 ppm

PAC-3: 100 ppm

DFG MAK: 1 ppm/7.1 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group C.

NIOSH IDLH: 100 ppm.

Australia: TWA 1 ppm (7 mg/m^3); STEL 2 ppm, 1999; Austria: MAK 1 ppm (7 mg/m^3), 1999; Belgium: TWA 1 ppm (7 mg/m^3); STEL 2 ppm (14 mg/m^3), 1993; Denmark: TWA 1 ppm (7 mg/m^3), 1999; Finland: TWA 1 ppm (7 mg/m^3); STEL 3 ppm (21 mg/m^3) [skin] 1999; France: VME 1 ppm (7 mg/m^3), 1999; Hungary: TWA 5 mg/m^3; STEL 10 mg/m^3 [skin] 1993; Norway: TWA 1 ppm (7 mg/m^3), 1999; the Philippines: TWA 1 ppm (7 mg/m^3), 1993; Poland: MAC (TWA) 7 mg/m^3, MAC (STEL) 14 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 1 ppm (7 mg/m^3), 1999; United Kingdom: LTEL 1 ppm (7 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 2 ppm.

Russia[35,43] set a MAC of 0.03 mg/m^3 in ambient air of residential areas on a once-daily basis. Several states have set guidelines or standards for diphenyl oxide in ambient air ranging from 70−140 μg/m^3 (North Dakota) to 115 μg/m^3 (Virginia) to 140 μg/m^3 (Connecticut) to 168 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1617 or OSHA Analytical Method PV-2022.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{\text{ow}} = 4.21$.

Routes of Entry: Inhalation, eye and skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation may cause irritation of eyes, skin, and respiratory system. The odor can cause nausea.

Long Term Exposure: May cause dermatitis.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof goggles and face shield if working with the liquid or dust-proof chemical goggles and face shield if working with the crystalline material, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *50 ppm:* Any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with diphenyl oxide you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of “CLASS 9.” It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen dry material with alcohol to avoid any dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Dry material:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

Dipropylamine D:1510

Molecular Formula: $C_6H_{15}N$

Synonyms: Di-*N*-propilamina (Spanish); *n*-Dipropylamine; Di-*N*-propylamine; 1-Propylamine, *n*-propyl; *n*-Propyl-1-propanamine

CAS Registry Number: 142-84-7

RTECS® Number: JL9200000

UN/NA & ERG Number: UN2383/132

EC Number: 205-565-9 [*Annex I Index No.:* 612-048-00-5]

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): U110.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Reportable Quantity (RQ): 5000 lb (2270 kg).
European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R20/21/22; R35; Safety phrases: S1/2; S16; S26; S36/37/39; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dipropylamine is a colorless, water-white liquid with a strong ammonia-like odor. Molecular weight = 101.22; Boiling point = 110°C; Freezing/Melting point = −63°C; Vapor pressure = 29.8 mmHg at 25°C; Flash point = 17°C; Autoignition temperature = 299°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 1. Insoluble in water.

Potential Exposure: Used as a chemical intermediate and in the manufacture of herbicides.

Incompatibilities: Forms explosive mixture with air. Incompatible with acids, organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, mercury, phenols, cresols, caprolactum solution, strong oxidizers. Attacks aluminum, copper, lead, tin, zinc, and their alloys.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.2 mg/m^3
PAC-1: 0.6 mg/m^3
PAC-2: 4 mg/m^3
PAC-3: 400 mg/m^3

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = 1.7$.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Contact with the eyes and skin can cause severe irritation and burns. Inhaling the aerosol can irritate the respiratory tract and cause coughing, wheezing, and/or shortness of breath; headache, nausea, dizziness, anxiety, unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and polycarbonate are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with dipropylamine you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID, CORROSIVE.” It falls into Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and nitrogen oxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 252-104-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DPGME is a colorless liquid with a weak odor. Molecular weight = 148.23; Specific gravity (H_2O:1) = 0.95; Boiling point = 180°C; Freezing/Melting point = − 80°C; Vapor pressure = 0.5 mmHg at 20°C; Flash point = 74.6°C (cc); Autoignition temperature = 270°C. Explosive limits: LEL = 1.3%; UEL = 10.4. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Highly soluble in water.

Potential Exposure: Compound Description: Primary Irritant. This material is used in antifreeze formulations, cosmetics, cleaning compounds, and heat transfer fluids; as a solvent for nitrocellulose and other synthetic resins.

Incompatibilities: Strong oxidizers. The substance can presumably form explosive peroxides in contact with air. Reacts violently with strong oxidants.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/600 mg/m^3 TWA [skin].

NIOSH REL: 100 ppm/600 mg/m^3 TWA; 150 ppm/900 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 100 ppm/606 mg/m^3 TWA; 150 ppm/909 mg/m^3 STEL [skin].

NIOSH IDLH: 600 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 150 ppm

PAC-2: 300 ppm

PAC-3: 600 ppm

DFG MAK: 50 ppm/310 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

Australia: TWA 100 ppm (600 mg/m^3); STEL 150 ppm, [skin], 1993; Austria: MAK 50 ppm (300 mg/m^3), 1999; Belgium: TWA 100 ppm (606 mg/m^3); STEL 150 ppm, [skin], 1993; Denmark: TWA 50 ppm (300 mg/m^3), [skin], 1999; Finland: TWA 100 ppm (600 mg/m^3); STEL 150 ppm, [skin], 1999; France: VME 100 ppm (600 mg/m^3), 1999; the Netherlands: MAC-TGG 300 mg/m^3, 2003;

the Philippines: TWA 100 ppm (600 mg/m^3), [skin], 1993; Sweden: TWA 50 ppm (300 mg/m^3); STEL 75 ppm (450 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (300 mg/m^3); STEL 100 ppm (600 mg/m^3), 1999; Turkey: TWA 300 ppm (600 mg/m^3), [skin], 1993; United Kingdom: TWA 50 ppm (308 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 150 ppm [skin]. Several states have set guidelines or standards for ambient air ranging from 6.0−9.0 mg/m^3 (North Dakota) to 10 mg/m^3 (Virginia) to 12.0 mg/m^3 (Connecticut) to 14.3 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #S-69.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: DPGME can be absorbed through the skin, thereby increasing exposure. Exposure causes irritation of eyes and nose. Extremely high levels can cause dizziness, lightheadedness, headaches, unconsciousness.

Long Term Exposure: Repeated exposure to very high levels may affect the liver.

Points of Attack: Eyes, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 600 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire, including carbon monoxide. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.

Dipropyl ketone D:1530

Molecular Formula: $C_7H_{14}O$

Common Formula: $C_3H_7COC_3H_7$

Synonyms: Butyrone; Dipropil cetona (Spanish); DPK; GBL; 4-Heptanone; Heptan-4-one; Propyl ketone

CAS Registry Number: 123-19-3

RTECS® Number: MJ5600000

UN/NA & ERG Number: UN2710/128

EC Number: 204-608-9 [*Annex I Index No.:* 606-027-00-X]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn assigned; Risk phrases: R10; R20; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dipropyl ketone is a colorless liquid with a pleasant odor. Molecular weight = 114.21; Specific gravity (H_2O:1) = 0.82; Boiling point = 143.9°C; Melting point: −32.7°C; Vapor pressure = 5 mmHg at 20°C; Flash point = 49°C; Autoignition temperature = 429.7°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. This compound is used as a solvent for nitrocellulose and many other natural and synthetic resins. It is used in lacquer formulations and in food flavorings.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause a fire and explosion hazard. Incompatible with strong bases and strong reducing agents.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.67 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 50 ppm/235 mg/m^3 TWA.

ACGIH TLV®[1]: 50 ppm/233 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 350 ppm

PAC-2: 350 ppm

PAC-3: 350 ppm

Austria: MAK 50 ppm (230 mg/m^3), 1999; Denmark: TWA 50 ppm (230 mg/m^3), 1999; France: VME 50 ppm (235 mg/m^3), 1999; the Netherlands: MAC-TGG 235 mg/m^3, 2003; Norway: TWA 25 ppm (115 mg/m^3), 1999. States which have set guidelines or standards for dipropyl ketone in ambient air[60] include Connecticut at 4.7 mg/m^3 and Nevada at 5.595 mg/m^3.

Determination in Air: Use OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Dipropyl ketone can affect you when breathed in and by passing through your skin. Contact can irritate the eyes and skin. Dipropyl ketone is a central nervous system depressant; can cause depression, dizziness, somnolence (sleepiness, unnatural drowsiness), decreased breathing, unconsciousness.

Long Term Exposure: High or repeated exposures may damage the liver and kidney. Repeated contact can dry out the skin, causing irritation and rash.

Points of Attack: Eyes, skin, central nervous system, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Interview for brain effects, including memory, mood, concentration, headaches, malaise, and altered sleep patterns. Consider cerebellar, autonomic, and peripheral nervous system evaluation. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with dipropyl ketone you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Diquat D:1540

Molecular Formula: $C_{12}H_{12}N_2Br_2$

Note: Diquat is a cation ($C_{12}H_{12}N_2 + +$; 1,1′-Ethylene-2,2-bipyridyllium ion). Various diquat salts are commercially available.

Synonyms: Aquacide; Cleansweep; Deiquat; Dextrone; 9,10-Dihydro-8a,10,-diazoniaphenanthrene dibromide; 9,10-Dihydro-8a,10a-diazoniaphenanthrene(1,1′-ethylene-2,2′-bipyridylium)dibromide; 5,6-Dihydro-dipyrido (1,2a,2,1c) pyrazinium dibromide; 5,6-Dihydro-dipyrido (1,2-a: 2,1′-c) pyrazinium dibromide; 6,7-Dihydropyridol(1,2-a: 2′,1′-c) pyrazinedium dibromide; 6,7-Dihydropyrido(1,2-a: 2′,1′-c) pyrazinedium dibromide; Dipyrido(1,2-a: 2′,1′-c) pyrazinediium, 6,7-dihydro-, dibromide; *o*-Diquat; Diquat dibromide; 1,1′-Ethylene-2,2′-bipyridyliumdibromide; 1,1-Ethylene 2,2-dipyridylium dibromide; 1,1′-Ethylene-2,2′-

dipyridylium dibromide; Ethylene dipyridylium dibromide; Farmon PDQ; FB/2; Feglox; Groundhog soltair; Pathclear; Preeglone; Reglon; Reglone; Reglox; Weedol (ICI); Weedtrine-D

Diquat dibromide: 1,1′-Ethylene-2,2′-bipyridyllium dibromide

CAS Registry Number: 2764-72-9; 85-00-7 (Diquat dibromide)

RTECS® Number: JM5690000

UN/NA & ERG Number: UN1760 (diquat dibromide)/154

EC Number: 201-579-4 [*Annex I Index No.:* 613-089-00-1] (*85-00-7*)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Gene-Tox Program, Inconclusive: *D. melanogaster* sex-linked lethal.

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Safe Drinking Water Act: MCL, 0.02 mg/L; MCLG, 0.02 mg/L; Regulated chemical (47FR9352).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations (*includes salts*): Hazard Symbol: T, N; Risk phrases: Risk phrases: R22; R26; R36/37/38; R43; R48/25; R50/53; Safety phrases: S1/2; S28; S36/37/39; S45; 60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Diquat forms a monohydrate which consists of colorless to yellow crystals. Dibromide salt (herbicide) is a yellow crystal. The commercial product may be found in a liquid concentrate or a solution. Molecular weight = 344.08; Boiling point = not determined (decomposes); Freezing/Melting point = 335°C; Vapor pressure = 0.0001 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data; Primary Irritant. Those involved in the manufacture, formulation, and application of this herbicide used to control a wide range of aquatic and terrestrial weeds.

Incompatibilities: Keep away from alkalis, UV light, basic solutions. Concentrated solutions of Diquat attack aluminum.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.5 mg/m^3 TWA.

ACGIH TLV®[1]: 0.5 mg/m^3 TWA, inhalable fraction, 0.1 mg/m^3 TWA, respirable fraction; not classifiable as a human carcinogen [skin].

No TEEL available.

Australia: TWA 0.5 mg/m^3, 1993; Belgium: TWA 0.5 mg/m^3, 1993; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, 1999; France: VME 0.5 mg/m^3, 1999; Hungary: STEL 0.1 mg/m^3, 1993; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Norway: TWA 0.5 mg/m^3, 1999; Switzerland: MAK-W 0.5 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 0.5 mg/m^3 TWA, inhalable fraction, 0.1 mg/m^3 TWA, respirable fraction; not classifiable as a human carcinogen [skin]. Russia set a MAC of 0.2 mg/m^3 in work-place air. Several states have set guidelines or standards for diquat in ambient air[60] ranging from 5 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Diquat can affect you when breathed in and by passing through your skin. Skin contact can cause burns. High exposure can cause nausea, diarrhea, lung, liver, and kidney damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. Irritation of eyes, skin, mucous membrane; respiratory system; rhinorrhea (discharge of thin mucus), epistaxis (nosebleed); skin burns; nausea, vomiting, diarrhea, malaise (vague feeling of discomfort); kidney, liver injury; cough, chest pain; dyspnea (breathing difficulty), pulmonary edema; tremor, convulsions; delayed healing of wounds.

Long Term Exposure: Long-term or repeated exposure may cause cataracts. Repeated contact causes dry, cracked skin and nail damage. Exposure can cause nosebleeds. Diquat may cause mutations. Handle with extreme caution. Diquat may damage the developing fetus. Lung damage may occur.

Points of Attack: Eyes, skin, respiratory system, kidneys, liver, central nervous system.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: lung function tests. Examination of the eyes. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **4 h** (at least 4 but <8 h of resistance to breakthrough $>0.1\ \mu g/cm^2/min$): 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over $0.5\ mg/m^3$, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air-purifying respirators. If while wearing filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect diquat, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a MSHA/NIODH approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with diquat you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Diquat dibromide requires a Corrosive liquid, n.o.s. label. It falls in Hazard Class 8 and Packing Group III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Diquat is a combustible solid but does not readily ignite and burns with difficulty. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Diquat is inactivated by inert clay or by anionic surfactants. Therefore, an effective and environmentally safe disposal method would be to mix the product with ordinary household detergent and bury the mixture in clay soil.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies
Carcinogenicity: NTP: 7th Report on Carcinogens, 1982; NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; no evidence, mouse; IARC: Human Inadequate Evidence, animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A, 1998.
In 1998 EPA set an MCL for TTHM (total trihalomethane) at MCLs to 0.80 mg/L (down from 0.100 mg/L set in 1976), and Maximum Residual Disinfectant level Goals (MRDG) for chloramines was set at 4 mg/L.
Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer 1/1/88 [Direct Black 38 (technical grade)].
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R63; Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Direct black 38 is a black powder. An AZO compound. Molecular weight = 781.78; Freezing/Melting point ≥ 400°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: Mutagen; Human Data. Direct black 38 is an azo compound and is used to dye fabric, leather, cotton, cellulosic materials, and paper; these are then used in consumer products. The chemical may be used by artists (CPSC, EPA). The FDA has indicated that although direct black 38 is identified in the literature as a hair-dye component, it is currently not used by the cosmetic industry. In view of a health hazard alert issued in December 1980 by OSHA, which cautioned workers and employers of the

carcinogenic effect of benzidine-derived direct black 38, new nonbenzidine direct black dyes have been developed and used successfully in commercial applications by the paper and leather industry. These nonbenzidine dyes were developed with the hope of replacing benzidine-based dyes throughout industry.

Incompatibilities: Azo dyes can form explosive mixtures in air, especially if sensitized with metal salts and/or strong acids. Contact with alkali metals forms explosive gases. Contact with oxidizers and reducing agents forms toxic fumes and gases; also with acids, acryl halides, aldehydes, amides, carbamates, cyanides, epoxides, fluorides (inorganic), halogenated organic materials, isocyanates, ketones, metals, nitrides, peroxides, phenols. May form explosive mixtures with oxidizers, metal salts, peroxides, and sulfides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 25 mg/m^3
PAC-1: 75 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

North Dakota[60] has set a guideline for Direct black 38 in ambient air of zero.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Permissible Concentration in Water: In 1998 EPA set an MCL for TTHM (total trihalomethane) at MCLs to 0.80 mg/L (down from 0.100 mg/L set in 1976), and Maximum Residual Disinfectant Level Goals (MRDG) for chloramines was set at 4 mg/L.

Routes of Entry: Human exposure to Direct black 38 may occur through inhalation, skin absorption, and unintentional ingestion. Consumer exposure to Direct black 38 depends upon the ability of the dye to migrate out of consumer products and either penetrate the skin or degrade prior to penetrating the skin. No additional data quantifying the rate of migration or degradation of this dye are currently available.

Harmful Effects and Symptoms

Short Term Exposure: Causes eye irritation. Toxic if inhaled or ingested.

Long Term Exposure: There is sufficient evidence that commercial Direct black 38 is carcinogenic to experimental animals. In an occupational hazard review, it was concluded that all benzidine-based dyes, including Direct black 38, regardless of their physical state or proportion in the mixture, should be recognized as potential human carcinogens. Mutation data reported.

First Aid: *Skin Contact*[52]*:* Flood all areas of the body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to direct black 38, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: *Dry material*: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen dry material with water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogen: IARC: (Direct Blue 6, technical grade) Animal Sufficient Evidence (rats); Human Sufficient Evidence*, carcinogenic to humans*, Group 1, 1999; NTP: 7th Report on Carcinogens, 1982; NCI: Carcinogenesis Bioassay (feed); clear evidence: rat; no evidence, mouse.

In 1998 EPA set an MCL for TTHM (total trihalomethane) at MCLs to 0.80 mg/L (down from 0.100 mg/L set in 1976), and Maximum Residual Disinfectant level Goals (MRDG) for chloramines was set at 4 mg/L.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88 [Direct Blue 6 (technical grade)].

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R63; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Direct blue 6 is a benzidine-based dyestuff somewhat analogous to Direct black 38 (which see). It is a dark blue powder. Molecular weight = 932.78; Freezing/Melting point ≥ 400°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: Mutagen; Human Data. Direct Blue 6 may be used by artists. It is potentially used to dye fabric, leather, cotton, cellulosic materials, and paper; these are then used in consumer products (CPSC, EPA). The FDA has indicated that although Direct Blue 6 has been identified in the literature as a hair dye component, it is not presently used by the cosmetic industry. The primary source for exposure to Direct Blue 6 is at the production site. The initial production step is in a closed system. However, other production operations, such as filter press, drying, and blending, may be performed in the open and, therefore, may afford a greater potential for worker exposure. The general population may be exposed to Direct Blue 6 through the use of retail packaged dyes containing this benzidine-based dye.

Permissible Exposure Limits in Air

No TEEL available.

The state of North Dakota[60] has set a guideline for Direct Blue 6 in ambient air of zero.

Determination in Air: NIOSH Analytical Method #5013, Dyes.

Permissible Concentration in Water: In 1998 EPA set an MCL for TTHM (total trihalomethane) at MCLs to 0.80 mg/L (down from 0.100 mg/L set in 1976), and Maximum Residual Disinfectant Level Goals (MRDG) for chloramines was set at 4 mg/L.

Routes of Entry: Human exposure to direct blue 6 may occur through inhalation, skin absorption; and to a lesser extent, unintentional ingestion; when the dye is in the press cake or dry powder form.

Harmful Effects and Symptoms

Long Term Exposure: There is sufficient evidence for the carcinogenicity of direct blue 6 (technical grade) in experimental animals. In an occupational hazard review, it was concluded that all benzidine-based dyes, including direct blue 6, regardless of their physical state or proportion in the mixture should be recognized as potential human carcinogens. Mutation data reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to direct blue 6, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with direct blue 6 you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Hazard Symbol: Xn, N; Risk phrases: R22; R43; R48/22; R50/53; Safety phrases: S2; S24; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Disulfiram is a white to off-white or light-gray powder with a slight odor. Molecular weight = 296.56; Boiling point = 117°C at 17 mmHg; Freezing/Melting point = 70°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Very slightly soluble in water; solubility = 0.2%.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Some thiurams have been used as rubber components. Disulfiram is used as an accelerator in compounding natural, styrene-butadiene, and Neoprene™ rubbers as a rubber accelerator and vulcanizer; as a seed disinfectant and fungicide; in therapy; as an alcohol deterrent; in adhesives.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2 mg/m^3 TWA [Precautions should be taken to avoid concurrent exposure to ethylene dibromide.]

ACGIH TLV®[1]: 2 mg/m^3 TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 125 mg/m^3

DFG MAK: 2 mg/m^3 measured as the inhalable fraction TWA; Peak Limitation Category II(8), [skin] danger of skin sensitization; Pregnancy Risk Group D.

Australia: TWA 2 mg/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg/m^3, 1993; Denmark: TWA 2 mg/m^3, 1999; Finland: TWA 2 mg/m^3; STEL 6 mg/m^3, 1999; France: VME 2 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Sweden: TWA 1 mg/m^3; STEL 2 mg/m^3, 1999; Switzerland: MAK-W 2 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: No method available.

Permissible Concentration in Water: Zero, according to USSR-UNEP/IRPTC joint project.[43]

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{\mathrm{ow}} = 3.9$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory system. Eye contact can lead to damage. Disulfiram can affect you when breathed in and by passing through your skin. Exposure to disulfiram and alcohol within 1−2 days of each other can cause a reaction with flushing of the face and neck, rapid heartbeat, and vomiting. This could be fatal. If working with disulfiram, you should never be exposed to ethylene dibromide because of possible severe reaction. Symptoms of exposure include lassitude (weakness, exhaustion), fatigue, tremor, restlessness, headache, dizziness, metallic taste, vomiting, peripheral neuropathy.

Long Term Exposure: May cause liver and kidney damage. It may damage the developing fetus. Damage to vision, nervous system with numbness, "pins and needles," weakness and poor coordination can result from repeated exposure. May cause personality changes of depression, anxiety, or irritability. Can cause skin sensitization dermatitis. Enlarged thyroid and skin rash can also occur.

Points of Attack: Eyes, skin, respiratory system, central nervous system, peripheral nervous system, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver, kidney, and thyroid function tests. Skin testing with dilute Disulfiram may help diagnose allergy, if done by a qualified allergist. Examination of the nervous system, eyes, and vision. Evaluate for brain effects. Alcohol use may increase liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: For alcohol/disulfiram or ethylene dibromide/disulfiram reaction, remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 mg/m^3*, use an NIOSH/MSHA- or European Standard EN 149-approved full face-piece respirator with a pesticide cartridge. Increased protection is obtained from full face-piece air-purifying respirators. If while wearing a filter, cartridge, or canister respirator, you can smell, taste, or otherwise detect Disulfiram, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: Toxic solids, flammable, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall into Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Disulfiram itself does not burn readily. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disulfiram can be dissolved in alcohol or other flammable solvent and burned in an incinerator equipped with afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Disulfoton is a combustible, colorless to yellowish oil with a characteristic odor. Technical product is a brown liquid. Molecular weight = 274.42; Boiling point = 132−133°C at 1.5 mm pressure; Freezing/Melting point ≥ −25°C; Vapor pressure = 0.0002 mmHg at 20°C; Flash point ≥82°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.003% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Human Data. Those involved in the manufacture, formulation, and application of this systemic insecticide and acaricide.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI$_A$ issued for acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 75 mg/m^3

Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2000; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, 1999; United Kingdom: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Several states have set guidelines or standards for disulfoton in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: A long-term health advisory for an adult has been calculated by EPA as 0.009 mg/L (9 μg/L) and a lifetime health advisory of 0.3 μg/L.

Determination in Water: Extraction with methylene chloride followed by measurement by gas chromatography using a nitrogen-phosphorus detector. Fish Tox = 2.90001000 pbb (HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause burns to skin and eyes. Symptoms include pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Probable oral lethal dose in humans is less that 5 mg/kg or a taste (less than 7 drops) for a 70-kg (150-lb) person. It is poisonous and may be fatal if inhaled, swallowed, or absorbed through the skin. Human Tox = 0.30000 pbb (EXTRA HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure; resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended following acute overexposure.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with disulfoton you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalies. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Disulfoton in Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spill material. Exposure by skin contact is likely to be more significant than inhalation. *Small spills:* take up with sand or other noncombustible absorbent materials and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: A combustible liquid, but will not ignite easily. Poisonous gases may be generated from the fire, including sulfur oxides and phosphorus oxides. Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added flammable solvent in a furnace with alkali scrubber. Acid or alkaline hydrolysis may also be used.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with

EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 208-186-7

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dithiazanine iodide is a green, needle-like crystalline solid which decomposes at 248°C. Sulfur-like odor. Molecular weight = 519.51. Melting point = −25°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Insoluble in water.

Incompatibilities: Stable under normal conditions of temperature and pressure. Keep away from alkalies, strong oxidizers.

Potential Exposure: This material is used as a veterinary anthelmintic and for insecticides. Not registered as a pesticide in the United States. It is also used as a sensitizer for photographic emulsions.

Permissible Exposure Limits in Air

As iodides

ACGIH TLV®[1]: 0.01 ppm/0.1 mg/m^3, inhalable fraction and vapor, TWA.

Protective Action Criteria (PAC)

TEEL-0: 4 mg/m^3

PAC-1: 12.5 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if swallowed, or if dust is inhaled. LD_{50} = (oral-rat) 20 mg/kg (highly toxic).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Pesticides, solid, toxic, n.o.s. have a label requirement of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and this material in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Poisonous gases, including sulfur oxides, iodine, and nitrogen oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear self-contained, positive-pressure if available, breathing apparatus and full protective clothing. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P049.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Dithiobiuret is a colorless, crystalline solid. Molecular weight = 135.22; Freezing/Melting point = (decomposition) 189°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solubility = 0.25 g/110 mL at 25°C.

Potential Exposure: This material is used as a plasticizer, as a rubber accelerator; and as an intermediate in manufacturing of pesticides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 5 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes on contact. May cause muscular weakness and/or paralysis leading to difficulty in breathing. This may be fatal. Can cause nausea, watery diarrhea, dehydration, and weight loss. The material is highly toxic. It may cause respiratory failure. Symptoms include respiratory paralysis. LD_{50} = (oral-rat) 5 mg/kg (extremely toxic).

Long Term Exposure: May affect the nervous system.

Points of Attack: Nervous system, eyes.

Medical Surveillance: Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with dithiobiuret you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Pesticides, solid, toxic, n.o.s. have a label requirement of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and this material in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Keep sparks, flames, and other sources of ignition away. Keep material out of water sources and sewers. Avoid breathing dusts and fumes from burning material. Keep upwind; avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Use a vacuum or wet method to reduce dust during cleanup. *Do not* dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire. (Material itself does not burn or burns with difficulty.) Use water in flooding quantities as fog. Use alcohol foam, carbon dioxide, or dry chemical. Poisonous gases are produced in fire, including sulfur oxides and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN2767 (Phenyl urea pesticides, solid, toxic)/151; UN2588/155

EC Number: 206-354-4 [*Annex I Index No.:* 006-015-00-9]

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: *S. cerevisiae* gene conversion.

US EPA, FIFRA 1998 Status of Pesticides: Supported, 1998.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 5/31/02.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R40; R48/22; R50/53; Safety phrases: S2; S13; S36/37; S46; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Diuron is a white, odorless crystalline solid. Molecular weight = 233.11; Boiling point = 180°C (decomposes); Freezing/Melting point = 157.8°C; Vapor pressure = 2×10^{-9} mmHg; 6.9×10^{-8} mmHg at 20°C. Flash point = >200°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.004%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those involved in the manufacture, formulation, and application of this herbicide for control of germinating broadleaf and grass weeds in crops.

Incompatibilities: Strong acids.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 10 mg/m^3 TWA.

ACGIH TLV®[1]: 10 mg/m^3 TWA; not classifiable as a human carcinogen.

No TEEL available.

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 10 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia set a MAC of 0.5 mg/m^3 in ambient air of residential areas either on a momentary or a daily average basis.[35,43] Several states have set guidelines or standards for diuron in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μ/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5601or OSHA Analytical Method PV-2097.

Permissible Concentration in Water: Russia[35,43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes and a MAC of 1.5 μg/L in water bodies used for fishery purposes. A long-term health advisory of 0.875 mg/L has been calculated by EPA and a lifetime health advisory of 0.014 mg/L (14 μg/L).

Determination in Water: High-performance liquid chromatography may be used after extraction with methylene chloride. Measurement is made using an ultraviolet detector. Fish Tox = 40.39243000 pbb (INTERMEDIATE). Moderately toxic to fish; highly toxic to aquatic invertebrates.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure may irritate the skin, eyes, and throat. Human Tox = 18.32460 pbb (INTERMEDIATE).

Long Term Exposure: May damage the developing fetus. In animals: anemia, methemoglobinemia.

Points of Attack: Eyes, skin, respiratory system, blood.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved respirator with a pesticide cartridge. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. If while wearing a filter, cartridge, or canister respirator, you can detect diuron, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Phenyl urea pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Diuron may burn, but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gas is produced in fire: toxic gases dimethylamine and 3,4-dichlorophenyl isocyanate are produced at temperatures exceeding 180°C/355°F. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Diuron, stable under normal conditions, decomposes on heating to 180−190°C giving dimethylamine and 3,4-dichlorophenyl isocyanate. Treatment at elevated temperatures by acid or base yields dimethylamine and 3,4-dichloroaniline. Hydrolysis is not recommended as a disposal procedure because of the generation of the toxic products, 3,4-dichloroaniline and dimethylamine.[22] Incineration is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Divinyl benzene D:1620

Molecular Formula: $C_{10}H_{10}$

Common Formula: $C_6H_4(CH{=}CH_2)_2$

Synonyms: Benzene, divinyl-; Diethenylbenzene; Diethyl benzene; 1,4-Divinyl benzene; DVB; DVB-22; DVB-27; DVB-55; Vinylstyrene

CAS Registry Number: 1321-74-0 (*all isomers*); 108-57-6 (*m*-isomer)

RTECS® Number: CZ9370000 (*mixed isomers*); CZ9400000 (*m*-isomer)

UN/NA & ERG Number: UN2049/130

EC Number: 215-325-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*m*-isomer).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Water polluting (CAS: 1321-74-0).

Description: DVB exists as *o*-, *m*-, and *p*-isomers. The commercial product contains all 3 isomers, but *m*-isomer predominates. Usually contains an inhibitor to prevent polymerization. The CAS number for the mixed isomers appears on most regulatory lists.

DVB is a pale, straw-colored liquid. Molecular weight = 130.20; Specific gravity (H_2O:1) = 0.93; Boiling point = 195−200°C; Freezing/Melting point = −66.7 to −52°C; Vapor pressure = 0.7 mmHg at 20°C; Flash point = 62°C (cc); 76°C (oc); Autoignition temperature = 469°C. Explosive limits: LEL = 0.7%; UEL = 6.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. This compound is used as a monomer for the preparation of special synthetic rubbers, drying oils, ion-exchange resins and casting resins, and in polyester resin manufacture.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers, metallic salts. Able to polymerize; add inhibitor and monitor to insure effective levels are maintained at all times. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.33 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 10 ppm/50 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/53 mg/m^3 TWA.

Protective Action Criteria (PAC)

m-isomer and mixed isomers

TEEL-0: 10 ppm

PAC-1: 10 ppm

PAC-2: 75 ppm

PAC-3: 350 ppm

DFG MAK: No numerical value established. Data may be available.

Denmark: TWA 10 ppm (50 mg/m^3), 1999; United Kingdom: TWA 10 ppm (54 mg/m^3), 2000. Several states have set guidelines or standards for divinyl benzene in ambient air[60] ranging from 500 μg/m^3 (North Dakota) to 800 μg/m^3 (Virginia) to 1000 μg/m^3 (Connecticut) to 1190 μ/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #89.

Determination in Water: No test listed. Octanol−water coefficient: Log K_{ow} = 3.6 (estimated).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin, eye, and respiratory system irritation. Divinyl benzene can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Prolonged skin contact can cause burns and rash. Exposure can irritate the nose and throat. A central nervous system depressant; higher exposure can cause dizziness, drowsiness, and passing out.

Long Term Exposure: Repeated or prolonged contact may cause skin dryness, burns, and rash.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. NIOSH recommends: **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm^2/min): polyvinyl alcohol gloves; Viton™ gloves, suits Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with DVB you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from metallic salts (such as ferric and aluminum chlorides) and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Diethylbenzene requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a furnace equipped with afterburner and scrubber.

Dodecylbenzenesulfonic acid D:1630

Molecular Formula: $C_{18}H_{30}O_3S$

Synonyms: Acido dodecilbencenosulfonico (Spanish); Benzenesulfonic acid, dodecyl-; Benzene sulfonic acid, dodecyl ester; Benzenesulphonic acid, dodecyl-; Benzene sulphonic acid, dodecyl ester; Calsoft LAS 99; DDBSA; Dodanic acid 83; Dodecyl benzenesulfonate; *N*-Dodecyl benzenesulfonic acid; Dodecyl benzenesulphonate; *N*-Dodecyl benzenesulphonic acid; Dodecylbenzenesulphonic acid; E 7256; Elfan WA sulphonic acid; Lauryl benzenesulfonate; Laurylbenzenesulfonic acid; Lauryl benzenesulphonate; Laurylbenzenesulphonic acid; Nacconol 98 SA; Nansa SSA; Pentine acid 5431; Rhodacal ABSA; Richonic acid; Sulframin acid 1298

CAS Registry Number: 27176-87-0; *(alt.)* 1886-81-3

UN/NA & ERG Number: UN2584 (Alkyl sulfonic acids, liquid or Aryl sulfonic acids, liquid with more than 5 percent free sulfuric acid)/153; UN2586 (liquid, with>5% free H_2SO_4)/153

EC Number: 248-289-4

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Supported, 1998.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

NIOSH Profile, "Sulfonic Acids and Salts," ARYL, SRC, 12/79.

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Dodecylbenzenesulfonic acid is a light yellow to brown liquid with a slight SO_2 odor. Molecular weight = 326.54; Boiling point = 315°C; Freezing/Melting point = 10°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Soluble in water.

Potential Exposure: Used as a laboratory chemical. Used for cleaning electronic components; emulsifier for agricultural herbicides; in polymerization; in pickling baths; as a wetting agent in various industrial applications Used in the production of biologically soft detergents, including household detergents (laundry liquids and powders, dishwashing liquids, and various other cleaners).

Incompatibilities: May attack metals, forming flammable hydrogen gas. Keep away from combustible materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 2.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: A corrosive. Contact with the eyes and skin can cause severe irritation and burns. Inhalation can irritate the respiratory tract. LD_{50} (oral-rat) = 650 mg/kg.

Long Term Exposure: Repeated skin contact may cause dermatitis. Corrosive materials may affect the lungs or cause bronchitis with coughing, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with DDBSA you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Dodecylbenzenesulfonic acid requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II. The symbol "D" identifies proper shipping names which are appropriate for describing materials for domestic transportation but may be inappropriate for international transportation under the provisions of international regulations (e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Poisonous gases, including sulfur oxides and hydrogen sulfide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators

recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Dodecyl trichlorosilane D:1640

Molecular Formula: $C_{12}H_{25}Cl_3Si$

Synonyms: Dodeciltriclorosilano (Spanish); Dodecyl trichlorosilane; Silane, dodecyltrichloro-; Silane, trichlorododecyl-; Trichlorododecylsilane

CAS Registry Number: 4484-72-4

RTECS$^{®}$ Number: VV3940000

UN/NA & ERG Number: UN1771/156

EC Number: 224-769-9

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Dodecyl trichlorosilane is a colorless to yellow liquid with a pungent odor. Molecular weight = 303.81; Boiling point ≥ 149°C; Flash point ≥ 65°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩ (water reactive).

Potential Exposure: This material is used in silicone polymer manufacture.

Incompatibilities: Forms explosive mixture with air. Reacts with strong bases and oxidizers. Hydrolyzes with moist air, water, or steam, forming corrosive and toxic chloride gases, including hydrogen chloride. Corrosive to common metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.60** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Dodecyl trichlorosilane can affect you when breathed in. This substance can cause severe eye burns leading to permanent damage. Dodecyl trichlorosilane is a corrosive chemical and contact can cause severe skin burns. Breathing Dodecyl trichlorosilane can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. Exposure can irritate the eyes, nose, and throat.

Short Term Exposure: Dodecyl trichlorosilane can affect you when breathed in. This substance can cause severe eye burns leading to permanent damage. Dodecyl trichlorosilane is a corrosive chemical and contact can cause severe skin burns. Breathing dodecyl trichlorosilane can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to dodecyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied/air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where dodecyl trichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Dodecyl trichlorosilane requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, crushed limestone, soda ash, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.9/1.5

Fire Extinguishing: This chemical is a combustible liquid but does not easily ignite. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Use dry chemical, carbon dioxide, or alcohol-resistant foam extinguishers. *Do not use water*; may react violently. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

E

Emetine dihydrochloride E:0050

Molecular Formula: $C_{29}H_{42}Cl_2N_2O_4$
Common Formula: $C_{29}H_{40}N_2O_4 \cdot 2HCl$
Synonyms: Amebicide; (−)Emetine, dihydrochloride; 1-Emetine, dihydrochloride; Emetine, hydrochloride; NSC-33669
CAS Registry Number: 316-42-7
RTECS® Number: JY5250000
UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154
EC Number: 206-259-8
Regulatory Authority and Advisory Bodies
Banned or Severely Restricted (Mauritius) (UN).[13]
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1/10,000 lb (0.454/4540 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Emetine dihydrochloride is a colorless, combustible powder which turns yellow on exposure to heat or light. Molecular weight = 553.63; Boiling point = 600°C; Freezing/Melting point = 235−250°C (decomposes); Flash point = >310°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Primary Irritant. Emetine dihydrochloride is an injectable form of emetine. It is an antiamebic. Emetine is the active ingredient of Ipecac. Emetine dihydrochloride is used as a chemical reagent, organic intermediate; in pharmaceutical R&D.
Incompatibilities: Keep away from strong oxidizers.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.05 mg/m^3
PAC-1: 0.15 mg/m^3
PAC-2: 0.4 mg/m^3
PAC-3: 0.4 mg/m^3
Routes of Entry: Inhalation, ingestion, eye and/or skin contact.
Harmful Effects and Symptoms
Symptoms include nausea, vomiting, diarrhea, muscle weakness, pain, tenderness, hypotension, precordial pain, and rapid heartbeat. This material is highly toxic when administered orally. It is an eye irritant. Probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 1 teaspoon for a 150-lb person. LD_{50} = (oral-rat) 0.012 mg/kg (12 μg/kg) (extremely toxic).
Short Term Exposure: Irritates the eyes. Symptoms include nausea, vomiting, diarrhea, muscle weakness, pain, tenderness, hypotension, precordial pain, and rapid heartbeat, diarrhea, dyspnea, hallucinations, nausea, or vomiting. This material is highly toxic when administered orally. Probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 1 teaspoon for a 150-lb person. LD_{50} = (oral-rat) 0.012 mg/kg (12 μg/kg) (extremely toxic).
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Emetine is an alkaloid. Procedures for alkaloid salts are as follows. Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00005-9

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place and protect from light.

Shipping: Emetine may be classified as Toxic solids, organic, n.o.s. and falls in Hazard Class 6.1 and Packing Group I. It requires a "POISONOUS/TOXIC MATERIALS" label.

Spill Handling: The following procedures should be used for alkaloid salts. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguishing methods for alkaloid salts are as follows. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Procedures for alkaloid salts include the following. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including chlorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) Severe pollutant.

WGK (German Aquatic Hazard Class): 3—Highly water polluting (CAS: 115-29-7).

Description: Endosulfan is a chlorinated cyclodiene insecticide. The pure product is a colorless crystalline solid. The technical product is a light to dark brown waxy solid. It has a rotten egg or sulfur odor. Molecular weight = 406.90; Melting point = 406.91; Boiling point = decomposes; Freezing/Melting point = 70−100°C (technical); 106.1°C (pure); 106°C (a); 212°C (b); Vapor pressure = 1.7×10^{-7} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water; solubility = 0.00001%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those engaged in the manufacture, formulation, and application of this material.

Incompatibilities: Strong acids, strong bases. Hydrolyzed by acids. Contact with alkalis forms toxic sulfur dioxide fumes. Corrosive to iron in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.006 ppm/0.1 mg/m^3 TWA measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen.

115-29-7

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 8 mg/m^3

PAC-3: 200 mg/m^3

Australia: TWA 0.1 mg/m^3, [skin], 1993; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Finland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; India: TWA 0.1 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; United Kingdom: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[35,43] set a MAC of 0.1 mg/m^3 in work-place air as well as a MAC in ambient air of residential areas of 0.005 mg/m^3 on a momentary basis and 0.001 mg/m^3 on a daily average basis. Several states have set guidelines or standards for endosulfan in ambient air[60] ranging from 0.238 μg/m^3 (Kansas) to 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada) to 2.4 μg/m^3 (Pennsylvania).

Determination in Air: Use OSHA Analytical Method PV-2023.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.056 μg/L as a 24-h average, never to exceed 0.22 μg/L. *To protect saltwater aquatic life:* 0.0087 μg/L as a 24-h average, never to exceed 0.034 μg/L. *To protect human health:* 74.0 μg/L.[6] Mexico[35] set a MAC of 2 μg/L in estuaries and 0.2 μg/L in coastal waters. Kansas[61] has set a guideline of 74.0 μg/L for endosulfan in drinking water.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 3.6$. Fish Tox = 0.00446000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Endosulfan may affect the central nervous system, blood, resulting in irritability, convulsions, and renal failure. High-level exposure may result in death. The effects may be delayed. Ingestion of endosulfan may result in nausea, vomiting, and diarrhea. Dizziness, agitation, nervousness, tremor, a lack of coordination, and convulsions may also occur. Central nervous system depression may terminate in respiratory failure. Contact with endosulfan may irritate or burn the skin, eyes, and mucous membranes. Human Tox = 42.00000 ppb (INTERMEDIATE). The probable oral lethal dose is 50−500 mg/kg or between 1 teaspoonful and 1 oz for a 150-lb person. LD_{50} = (oral-rat) 18 mg/kg (highly toxic). Death has occurred within 2 h of heavy dust exposure during bagging operations.

Long Term Exposure: Repeated exposure may cause brain damage, causing convulsions, loss of coordination, and memory loss. May cause liver and kidney damage. May damage the testes.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver and kidney function tests. Examination of the nervous system. EEG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Consult hospital or poison control center on use of antidotes. Transport to health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton or Neoprene™ materials are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If used out of doors adequate emergency water should be available.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode. A dust respirator approved for pesticide use may be worn. An organic vapor respirator may be necessary if exposure to the solvent is significant.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated area, free of alkalis, acids, and acid fumes. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organochlorine pesticides, solid, toxic, require "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and Endosulfan in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. In case of spills, stay upwind; stay out of low areas. Use water spray to reduce vapors. Do not dry sweep. Do not touch spilled material; stop leak if you can do it without risk. *Small wet spills*: take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fire. Poisonous gases are produced in fire, including sulfur oxides and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A recommended method for disposal is burial 18 in. deep in noncropland, away from water supplies, but bags can be burned.[22] Large quantities should be incinerated at high temperature in a unit with effluent gas scrubbing. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Endothall E:0110

Molecular Formula: $C_8H_{10}NO_5PS$

Synonyms: Accelerate; Aquathol; Des-I-Cate; 1,2-Dicarboxy 3,6-endoxocyclohexane; 3,6-Endo-epoxy-1,2-cyclohexanedicarboxylic acid; 3,6-Endooxohexahydrophthalic acid; Endothal chlorophenoxy herbicide; Endothall technical; 3,6-Endoxohexahydrophthalic acid; 3,6-Epoxycyclohexane-1,2-dicarboxylic acid; Hexahydro-3,6-endooxyphthalic acid; Hydout; Hydrothal-47; Hydrothol; 7-Oxabicyclo(2.2.1)heptane-2,3-dicarboxylic acid; Tri-endothal

CAS Registry Number: 145-73-3; 129-67-9 (disodium salt)

RTECS® Number: RN7875000; RN8225000 (disodium salt)

UN/NA & ERG Number: UN2588/151

EC Number: 205-660-5 [*Annex I Index No.:* 607-150-00-1] (*145-73-3*); 204-959-8 [*Annex I Index No.:* 607-055–00-5] (*129-67-9*)

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

US EPA Hazardous Waste Number (RCRA No.): P088.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Safe Drinking Water Act: MCL, 0.1 mg/L; MCLG, 0.1 mg/L; Regulated chemical (47 FR 9352).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations (*145-73-3; 129-67-9*): Hazard Symbol: T; Risk phrases: R21; R25; R36/37/38; Safety phrases: S1/2; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Endothall, when pure, is a white crystalline solid. The technical grade is a light brown liquid. Molecular weight = 186.18; Freezing/Melting point = 144°C with conversion to the anhydride. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; solubility = 100% at 20°C.

Potential Exposure: Endothall is used as a defoliant and as an herbicide on both terrestrial and aquatic weeds.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Disodium salt

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 20 mg/m^3

Permissible Concentration in Water: A no-observed-adverse-effects-level (NOAEL) of 2 mg/kg/day has been determined by EPA. This gives a reference dose (or acceptable daily intake) of 0.02 mg/kg/day on the basis of which a lifetime health advisory of 0.14 mg/L (140 μg/L) was calculated. Drinking Water Standards: MCLG: 0.1 ppm; MCL: 0.1 ppm.

Determination in Water: No test listed. Fish Tox = 240.32545000 ppb (LOW).

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes, skin, and respiratory tract. Poisonous: approximate lethal dose (human) is about 2.5 teaspoonfuls. Little information was found in the available literature on the health effects of endothall in humans except for one case history of a young male suicide victim who ingested an estimated 7−8 g of disodium endothall in solution (approximately 100 mg endothall ion/kg). Repeated vomiting was evident. Autopsy revealed focal hemorrhages and edema in the lungs and gross hemorrhage of the gastrointestinal (GI) tract. LD50 = (oral-rat) 18 mg/kg. Human Tox = 100.00000 ppb MCL (VERY LOW).

Long Term Exposure: May be mutagenic.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear rubber gloves for all handling. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear hats, protective suits, and boots for all handling.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with endothall you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Pesticides, solid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1 and endothall in Packing Group II or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not dry sweep. Use industrial vacuum. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be disposed of by burial in soil which is rich in organic matter. Large quantities are best disposed of by incineration.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (=100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 220-472-3 [*Annex I Index No.:* 015-049-00-3]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T; Risk phrases: R24/25; Safety phrases: S1/2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Endothion is a white crystalline solid with a slight odor. Molecular weight = 280.25; Freezing/Melting point = 96°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is a systemic insecticide. It is not sold in the United States or Canada.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 17 mg/m^3

PAC-3: 17 mg/m^3

Routes of Entry: Inhalation, ingestion, skin contact.

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Exposure may cause psychotic behavior, loss of coordination, unconsciousness, and rarely convulsions. This material is poisonous to humans. Its toxic effects are most likely related to action on the nervous system; LD_{50} = (oral-rat) 23 mg/kg (highly toxic).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Endothion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Endothion in Packing Group II.

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel, place material into clean, dry containers and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including phosphorus oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US EPA Hazardous Waste Number (RCRA No.): U058.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 1/1/89.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Endoxan is a white crystalline powder (monohydrate). It may be used or shipped in solution. Darkens on exposure to light. Odorless. Molecular weight = 261.11; Freezing/Melting point = 41−45°C; Flash point = 112°C. Soluble in water; solubility = 4%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Natural Product. Exodan is used as an immunosuppressive agent in nonmalignant diseases and in the treatment of malignant lymphoma, multiple myeloma, leukemias, and other malignant diseases. Exodan has been tested as an insect chemosterilant and for use in the chemical shearing of sheep. Exodan is not produced in the United States. It is produced in Germany and exported to the United States where one company has formulated and marketed the drug since 1959. The FDA estimates that 200,000−300,000 patients per year are treated with exodan. It is administered orally and through injection. The adult dosage is usually 1−5 mg/kg of body weight daily or 10−15 mg/kg administered intravenous every 7−10 days.

Incompatibilities: Should be protected from exposure to temperatures above 30°C/86°F.

Permissible Exposure Limits in Air

No standard or TEEL available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Exodan irritates the eyes, skin, and respiratory tract. Eye contact can cause severe damage with possible loss of vision. This chemical can be absorbed through the skin, thereby increasing exposure. Exodan may affect the blood, bladder, central nervous system, and heart. Symptoms of exodan exposure include GI disturbance, leukopenia, nausea, dizziness, liver dysfunction, and hair loss. When used as a medical drug it can cause nausea, vomiting, and may interfere with the body's manufacture of blood cells (anemia). It is not known if this also occurs in workplace exposures. Contact may cause eye damage.

Long Term Exposure: Exodan is a carcinogen and probable teratogen in humans. It causes bladder and skin cancer. There is limited evidence that this chemical causes sterility in males and females. Repeated exposure may interfere with the body's ability to produce blood cells (anemia). May cause liver damage. The substance may have effects on the blood, bladder, lungs, and bone marrow, resulting in leucopenia, cystitis, pulmonary fibrosis. There is sufficient evidence for the carcinogenicity of exodan both in humans and in experimental animals. Exodan was carcinogenic in rats following administration in drinking water and intravenous injection and in mice following subcutaneous injection. Dosages were comparable to those used in clinical practice. The chemical produced benign and malignant tumors at various sites including bladder tumors in the rats. Epidemiological studies are available in which persons treated with Exodan for a variety of medical conditions were compared with similarly affected controls. These studies consistently demonstrate an excess of various neoplasms and leukemias in the treated groups; although the number in all five studies was small. LD_{50} = (oral-mouse) 137 mg/kg (MODERATELY TOXIC).

Points of Attack: Blood, lungs, bladder, skin, liver.

Medical Surveillance: Complete blood count. Lung function tests. Kidney function tests. GI tests. Tests for blood in urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If you are required to work in a "sterile" environment, you require special training.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Store at below 25°C. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a "POISONOUS/TOXIC MATERIALS" label. Medicine, solid, toxic, n.o.s. falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including chlorine, nitrogen oxides, phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Sax, N. I. (Ed.). (1981). *Dangerous Properties of Industrial Materials Report*, 1, No. 3, 62−64 (As Endoxan)

New Jersey Department of Health and Senior Services. (1998). *Hazardous Substances Fact Sheet: Cyclophosphamide*. Trenton, NJ

Endrin E:0140

Molecular Formula: $C_{12}H_8Cl_6O$

Synonyms: Compound 269; 2,7: 3,5-Dimethanonaphth(2,3-b)oxirene, 3,4,5,6,9,9-hexachloro-1a,2,2a,3,6,6a,7,7a-octahydro-, (aa,2.b,2ab,2ab,3a,6a,6ab,7b,7aa)-; Endrex; Endrina (Spanish); Endrin chlorinated hydrocarbon insecticide; Endrine (French); ENT 17,251; Hexachloroepoxyoctahydro-endo, endo-dimethanonapthalene; (1r, 4s, 4as, ss, 7r, 8r, 8ar)-1,2,3,4,10-Hexachloro-1,4,4a,5,6,7,8,8a-octahydro-6,7-epoxy-1,4: 5,8-dimethano naphthalene; Hexadrin; 1,2,3,4,10,10-Hexachloro-6,7-epoxy-1,4,4a,5,6,7,8,8a-octahydro-1,4-endo-endo-1,4,5,8-dimethanonaphthalene; Mendrin; NCI-C00157; Nendrin

CAS Registry Number: 72-20-8

RTECS® Number: IO1575000

UN/NA & ERG Number: UN2761 (Organochlorine pesticides, solid toxic)/151

EC Number: 200-775-7 [*Annex I Index No.:* 602-051-00-X]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat; IARC: Human No Adequate Evidence; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; EPA: Not Classifiable as to human carcinogenicity.

US EPA Gene-Tox Program, Negative: Histidine reversion—Ames test; Negative: *In vitro* UDS—human fibroblast; TRP reversion; Negative: *S. cerevisiae*—homozygosis; Negative/limited: Carcinogenicity—mouse/rat; Inconclusive: *D. melanogaster* sex-linked lethal.

Banned or Severely Restricted (many countries) (UN).[13]

Persistent Organic Pollutants (UN).

US EPA, FIFRA1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR423, Appendix A, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): P051; D012.

RCRA Toxicity Characteristic (Section 261.24), Maximum Concentration of Contaminants, regulatory level, 0.02 mg/L.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.0028; Nonwastewater (mg/kg), 0.13.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.1); 8250 (10).

Safe Drinking Water Act: MCL, 0.002 mg/L; MCLG, 0.002 mg/L; Regulated chemical (47 FR 9352).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

Mexico, Drinking Water Criteria, 0.07 mg/L.

California Proposition 65 Chemical: Developmental/Reproductive toxin 5/15/98.

List of Stockholm Convention POPs: Annex A (Elimination).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases R24; R28; R50/53; Safety phrases: S1/2; S21; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Endrin is the common name of one member of the cyclodiene group of pesticides. It is a cyclic hydrocarbon having a chlorine-substituted, methano-bridge structure. Endrin is a white, crystalline solid. Molecular weight = 380.90; Boiling point = (decomposes) below 245°C; Freezing/Melting point = (decomposes) 200°C/392°F; Vapor pressure = $2x10^{-7}$ mmHg at 20°C. *Mixture in xylene:* Flash point = 27°C. Explosive limits: LEL = 1.1%; UEL = 7.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those involved in manufacture, formulation, and field application of this insecticide, avicide, and rodenticide.

Incompatibilities: Parathion, strong acids (forms explosive vapors), strong oxidizers. Slightly corrosive to metals.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg/m^3 TWA[skin].

NIOSH REL: 0.1 mg/m^3 TWA[skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA[skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 2 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 2 mg/m^3

DFG MAK: 0.1 mg/m^3, measured as the, inhalable fraction TWA; Peak Limitation Category II(8); [skin]; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 0.1 mg/m^3, [skin], 1993; Australia: TWA 0.1 mg/m^3, [skin], 1993; Austria: MAK 0.1 mg/m^3, [skin], 1999; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Finland: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Norway: TWA 0.1 mg/m^3, 1999; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1.5 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; Thailand: TWA 0.1 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3; STEL 0.3 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for Endrin in ambient air[60] ranging from 0.07 μg/m^3 (Pennsylvania) to 0.238 μg/m^3 (Kansas) to 1.0 μg/L (North Dakota) to 1.6 μg/L (Virginia) to 2.0 μg/L (Connecticut and Nevada).

Determination in Air: Use NIOSH (IV), Method #5519.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0023 μg/L as a 24-h average, never to exceed 0.18 μg/L. *To protect saltwater aquatic life:* 0.0023 μg/L as a 24-h average, never to exceed 0.037 μg/L. *To protect human health:* 1.0 μg/L[6]. According to a UN publication,[35] the limit on endrin in drinking water delivered at the tap is 0.2 μg/L. Mexico has imposed limits on endrin in water[35] as follows: 2 μg/L in estuaries; 1 μg/L in receiving waters used for drinking water supply and 0.2 μg/L in coastal waters. The EPA has derived a no-observed-adverse-effects-level (NOAEL) of 0.045 mg/kg/day on the basis of which they have arrived at a long-term health advisory of 16 μg/L and a lifetime health advisory of 0.32 μg/L. Massachusetts has set a standards of 0.2 μg/L and Maine has set a guideline of 0.2 μg/L for endrin in drinking water.[61] Mexico's drinking water criteria is 0.07 mg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 5.3. Fish Tox = 0.00440000 pbb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Quickly passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin and eyes and may affect vision. Inhalation can cause irritation of the respiratory tract. Exposure can cause headache, nausea, vomiting, diarrhea, loss of appetite, sweating and weakness, lightheadedness, dizziness, convulsions, and unconciousness. Lower exposure can affect concentration, memory, and muscle coordination. Endrin can cause death by respiratory arrest. Symptoms include headache, nausea, vomiting, dizziness, tremors, convulsions, loss of consciousness, rise in blood pressure, fever, frothing of the mouth, deafness, coma, and death. This material is extremely toxic. It is rapidly absorbed through the skin. Symptoms appear between 20 min and 12 h after exposure. Doses of 1 mg/kg can cause symptoms. Also, it is a central nervous system depressant and hepatotoxin. Inhalation may cause irritation to nose and throat; and sudden convulsions, which may occur from 30 min to 10 h after exposure. Recovery is usually rapid, but headache, dizziness, lethargy, weakness, and weight loss may persist to 2−4 weeks. Prolonged breathing or ingestion can result in an onset of symptoms in 3 h at a dose of 1 mg per kg of body weight. Ingestion of 12 g has caused death. Pregnant women are considered to be at special risk. A rebuttable presumption notice against pesticide registration was issued on July 27, 1976 by EPA on the basis of oncogenicity, teratogenicity, and reductions in endangered species and nontarget species. Human Tox = 2.00000 ppb MCL (HIGH).

Long Term Exposure: May damage the developing fetus. May damage the nervous system causing numbness and weakness in the extremities. Repeated exposure may cause personality changes of depression, anxiety, and/or irritability. May cause anorexia. High or repeated exposure may cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Examination of the nervous system. Electroencephalogram (a test for abnormal seizure activity). Blood endrin level. Liver and kidney function tests. NIOSH lists the following tests: whole blood (chemical/metabolite), end-of-shift; blood plasma, blood serum; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1 mg/m^3*: Any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator); *2 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter) or CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with endrin you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organochlorine pesticides, solid toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and endrin in Packing Group I.

Spill Handling: For leaks or spills, use water spray to disperse vapor and to flush spills. Liquid containing this material should be absorbed in vermiculite, dry sand, or earth. Do not touch spilled material; stop leak if you can do it without risk. Establish forced ventilation to keep levels below explosive limit. *Small dry spills:* collect powdered material in the most convenient and safe manner and deposit in sealed containers; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Endrin itself does not burn but it may be dissolved in a flammable liquid. Poisonous gases are produced in fire, including phosgene and hydrogen chloride. Use dry chemical, foam, carbon dioxide, water spray for solution. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Use water to keep fire-exposed containers cool. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind: keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear positive-pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A disposal procedure recommended by the manufacturer consists of absorption, if necessary, and burial at least 18 in. deep; preferably in sandy soil in a flat or depressed location away from wells, livestock, children, wildlife, etc. Incineration is the recommended method.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Enflurane E:0150

Molecular Formula: $C_3H_2ClF_5O$

Common Formula: CHF_2OCF_2CHFCl

Synonyms: 2-Chloro-1-(difluoromethoxy)-1,1,2-trifluoroethane; 2-Chloro-1,1,2-trifluoroethyl difluoromethyl ether; Ethrane®; Ethrane methylflurether

CAS Registry Number: 13838-16-9; *(alt.)* 22194-21-4; *(alt.)* 22194-22-5
RTECS® Number: KN6800000
UN/NA & ERG Number: Not regulated.
EC Number: 237-553-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Negative: V79 cell culture-gene mutation; Inconclusive: Histidine reversion—Ames test; Sperm morphology—mouse.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Enflurane is a clear, colorless liquid with a mild, sweet odor, which easily turns into a nonflammable gas. Molecular weight = 184.50; Specific gravity (H_2O:1) = 1.52; Boiling point = 56.7°C; Vapor pressure = 175 mmHg; Relative vapor density (air = 1) = 1.92. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Very slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. FDA—proprietary drug, used as an anesthetic (gas). Axphyxiant.

Incompatibilities: May be able to form unstable peroxides. Decomposes on heating, forming toxic and corrosive fumes of hydrogen chloride, hydrogen fluoride, phosgene.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL*: 2 ppm/15.1 mg/m^3 [60-min] Ceiling Concentration [**Note*: REL for exposure to waste anesthetic gas.]

ACGIH TLV®[1]: 75 ppm; not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: 20 ppm/150 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group C.

Australia: TWA 0.5 ppm (3.8 mg/m^3), 1993; Belgium: TWA 75 ppm (566 mg/m^3), 1993; Denmark: TWA 2 ppm (15 mg/m^3), 1999; the Netherlands: MAC-TGG 153 mg/m^3, 2003; Norway: TWA 2 ppm (15 mg/m^3), 1999; Sweden: NGV 10 ppm (80 mg/m^3), KTV 20 ppm (150 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (80 mg/m^3), KZG-W 20 ppm (160 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use OSHA Analytical Methods 29 and 103.

Permissible Concentration in Water:

No standards or TEEL available.

Routes of Entry: Inhalation of vapors.

Harmful Effects and Symptoms

Short Term Exposure: Enflurane can affect you when breathed in. There is an association between exposure to anesthetic vapors and increased cancers, miscarriages, and birth defects. Enflurane's role in these increased risks is unclear. Medical patients receiving enflurane as surgical anesthesia have had rare cases of seizures (fits) and liver damage. It is not known whether this happens with workplace exposures. Exposure can cause you to become dizzy, lightheaded and to pass out. LD_{50} = (oral-rat) 5450 mg/kg (insignificantly toxic).

Long Term Exposure: There is limited evidence that enflurane causes lung and liver cancer in animals. It may damage the developing fetus. Exposure to high levels may cause seizures and affect the liver.

Points of Attack: Eyes, central nervous system, liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Prior to working with enflurane you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Check oxygen content before entering confined spaces. Where possible, automatically pump liquid from drums or other storage containers to process containers. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. If the gas is leaking from a vaporizer or other equipment, stop the flow of gas if it can be done safely. Ventilate area of spill or leak to disperse gas. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid or gas. Poisonous gases, including hydrogen chloride, hydrogen fluoride, phosgene, are produced in fire. Use any extinguisher suitable for surrounding fires. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Epichlorohydrin is a colorless liquid with a slightly irritating, chloroform-like odor. Molecular weight = 92.53; Boiling point = 116.7°C; Freezing/Melting point = −48°C; Vapor pressure = 13 mmHg at 20°C; Flash point = 31°C; Autoignition temperature = 411°C. Explosive limits: LEL = 3.8%; UEL = 21.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Soluble in water; solubility = 7%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Epichlorohydrin is used in the manufacture of many glycerol and glycidol derivatives and epoxy resins; as a stabilizer in chlorine-containing materials; as an intermediate in the preparation of cellulose esters and ethers, paints, varnishes, nail enamels, and lacquers; as a cement for celluloid. It is used as an intermediate in the manufacture of various drugs.

Incompatibilities: Forms explosive mixture with air. Slowly decomposes on contact with water. Heat or strong acids, alkalies, metallic halides, or contaminants can cause explosive polymerization. Violent reaction with strong oxidizers, aliphatic amines, alkanolamines, amines (especially aniline), alkaline earths, chemically active metals (chlorides of aluminum, iron zinc), powdered metals (aluminum, zinc), alcohols, phenols, organic acids, causing fire and explosion hazard. Will pit steel in the presence of water. Decomposition forms highly toxic phosgene gas. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: 5 ppm/19 mg/m^3 TWA [skin].

NIOSH REL: Potential carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.5 ppm TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 75 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.5 ppm

PAC-1: **5.7** ppm

PAC-2: **24** ppm

PAC-3: **72** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 2; Germ Cell Mutagen Group: 3B.

Arab Republic of Egypt: TWA 2 ppm (10 mg/m^3), [skin], 1993; Australia: TWA 2 ppm (10 mg/m^3), [skin], 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 2 ppm (7.6 mg/m^3), [skin], 1993; Finland: TWA 0.5 ppm (1.9 mg/m^3), [skin], carcinogen, 1999; France: VLE 2 ppm (10 mg/m^3), carcinogen, 1999; Hungary: STEL 1 mg/m^3, [skin], carcinogen, 1999; the Netherlands: MAC-TGG 1.9 mg/m^3, 2003; Norway: TWA 0.5 ppm (1.9 mg/m^3), 1999; the Philippines: TWA 5 ppm (19 mg/m^3), [skin], 1993; Poland: MAC (TWA) 1 mg/m^3; STEL 8 mg/m^3, 1999; Sweden: NGV 0.5 ppm (1.9 mg/m^3), KTV 1 ppm (4 mg/m^3), [skin], 1999; Switzerland: MAK-W 2 ppm (8 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 5 ppm (19 mg/m^3), [skin], 1993; United Kingdom: TWA 0.5 ppm (1.9 mg/m^3); STEL 1.5 ppm, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Russia set a MAC value of 0.2 mg/m^3 (200 μg/m^3) in the ambient air in residential areas[35,43] on either a momentary or a daily average basis. Several states have set guidelines or standards for epichlorohydrin in ambient air[60] ranging from 2.7 μg/m^3 (Massachusetts) to 8.3 μg/m^3 (North Carolina) to 12.0 μg/m^3 (Pennsylvania) to 20.0 μg/m^3 (Connecticut) to 33.3 μg/m^3 (New York) to 50.0 μg/m^3 (Indiana, South Carolina) to 0−100.0 μg/m^3 (North Dakota) to 0.8−200.0 μg/m^3 (Rhode Island) to 160.0 μg/m^3 (Virginia) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #1010 or OSHA Analytical Method 7.

Permissible Concentration in Water: EPA has suggested a permissible ambient goal of 276 μg/L based on health effects. The EPA more recently calculated[48] a no-observed-adverse-effects-level (NOAEL) of 2 mg/kg/day on the basis of which they have calculated a lifetime health advisory of 70 μg/L. Russia[43] set a MAC of 10 μg/L in water bodies used for drinking purposes. Several states have set guidelines for epichlorohydrin in drinking water[61] ranging from 3.5 μg/L (Arizona) to 35.4 μg/L (Minnesota) to 150 μg/L (Maine).

Determination in Water: A purge-and-trap gas chromatographic/mass spectrometric procedure for the determination of volatile organic compounds may be used for epichlorohydrin according to EPA.[48]

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Epichlorohydrin is corrosive to the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the nervous system. Exposure may result in unconsciousness. Acute exposure to epichlorohydrin may result in nausea, vomiting, and abdominal pain. Liver and kidney effects may be observed. The respiratory tract may become irritated; dyspnea (shortness of breath) may occur; and in acute cases, respiratory paralysis has been observed. Central nervous system and respiratory depression have been noted. *Inhalation:* Levels below 0.05 ppm have not caused adverse effects. Levels above 20 ppm may cause fatigue, stomach pains, nausea, vomiting, slowed breathing, loss of muscle strength, and blue coloration of the skin. *Skin:* May cause severe blistering, burns, and severe pain which may be delayed. Skin absorption may cause or increase the severity of symptoms listed above.

Eyes: Levels above 5 ppm may cause severe irritation or burns. Direct contact of the liquid may cause clouding of the cornea and tissue death. *Ingestion:* May cause nausea and stomach pain. Animal studies indicate that the probable lethal dose for an adult is 14 g (1/2 oz).

Long Term Exposure: Repeated or prolonged contact to epichlorohydrin may cause skin allergy to develop. Repeated or prolonged inhalation exposure may cause asthma. May decrease fertility in males. Repeated overexposure may cause changes in the eyes and lungs, kidney and liver damage, and chronic asthmatic bronchitis. Epichlorohydrin causes cancer and changes in the genetic material of laboratory animals and has also been linked to cancers and change in the genetic material of occupationally exposed humans. There is some evidence of lung cancer in humans.

Points of Attack: Eyes, skin, respiratory system, kidneys, liver, reproductive system. *Cancer site* (in animals): nasal cavity.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Epichlorohydrin slowly penetrates rubber, so all contaminated clothing should be thoroughly washed. **8 h:** Barricade® coated suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h:** 4H™ and Silver Shield™ gloves, Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOvAg (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor and acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Epichlorohydrin must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), and chemically active metals (such as aluminum, caustics, chlorides of iron, and aluminum and zinc) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where epichlorohydrin is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of epichlorohydrin should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Where possible, automatically pump liquid from drums or other storage containers to process containers. Use only nonsparking tools and equipment, especially when opening and closing containers of epichlorohydrin. Wherever epichlorohydrin is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Establish forced ventilation to keep levels below explosive limit. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Use water spray, dry chemical, foam or carbon dioxide. Water spray may be used to dilute spills to nonflammable mixtures. If leak or spill has not ignited, use water spray to disperse the vapors. Evacuate for a radius of 1500 feet. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Epichlorohydrin may react violently with water. Poisonous gases, including hydrogen chloride and carbon monoxide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

US EPA, FIFRA1998 Status of Pesticides: Canceled.

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Water Pollution Standard Proposed (Japan).[35]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S22; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: EPN is a light yellow crystalline solid with an aromatic odor (as a pesticide) or a brown liquid above 36°C. Molecular weight = 323.32; Freezing/Melting point = 36°C; Vapor pressure = 3.4×10^{-7} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug; Reproductive Effector; Primary Irritant. EPN is used in the preparation of emulsifiable, granular or wettable powder insecticides for cotton. Those involved in the manufacture, formulation, and application of this material.

Incompatibilities: Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas. Contact with alkalies causes decomposition (hydrolysis) producing *p*-nitrophenol.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA inhalable fraction [skin]; not classifiable as a human carcinogen (2000); BEI_A issued as Acetylcholinesterase inhibiting pesticides.

NIOSH IDLH: 5 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK: 0.5 mg/m^3 measured as the inhalable fraction TWA; Peak Limitation Category II(2) [skin].

Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: MAK 0.5 mg/m^3, [skin], 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; Denmark: TWA 0.5 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Norway: TWA 0.5 mg/m^3, 1999; Switzerland: MAK-W 0.5 mg/m^3, [skin], 1999; the Philippines: TWA 0.5 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for EPN in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH (IV), Method #5012.

Permissible Concentration in Water: Japan[35] has set a effluent maximum of 1 mg/L and an environmental water quality standard of zero.

Determination in Water: Fish Tox = 1.51635000 ppb MATC (HIGH). Octanol−water coefficient: Log K_{ow} = >5.0.

Determination in Soil: Soil Adsorption Index (K_{oc}) = 4000 (estimate).

Routes of Entry: Inhalation, ingestion, skin absorption, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: A cholinesterase inhibitor. EPN can affect the nervous system, causing convulsions and possible respiratory failure. Exposure may result in unconsciousness or death. The effects may be delayed. Medical observation is indicated. This material may be fatal if swallowed. It is poisonous if inhaled and extremely hazardous by skin contact. Repeated exposure may, without symptoms, be increasingly hazardous. The estimated fatal oral dose is 0.3 g for a 150-lb (70-kg) person. Acute exposure to EPN may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Giddiness, slurred speech, confusion, and psychosis may also be observed. A rebuttable presumption against pesticide registration was issued for EPN on September 19, 1979 by EPA on the basis of neurotoxicity. Human Tox = 0.07000 ppb (EXTRA HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. EPN may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, cardiovascular system, central nervous system, eyes, skin, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. NIOSH lists the following tests: Cholinesterase: blood serum, red blood cells/count; cholinesterase: red blood cells/count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 mg/m^3* Sa (APF = 10) (any supplied-air respirator) or SCBA (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with EPN you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and EPN in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover with soda ash; mix, and spray with water. Place in container of water and allow to stand for 2 days, then neutralize with 6 molar hydrochloric acid. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemicals, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including carbon monoxide, phosphine, phosphoric acid, nitrogen oxides, phosphorous oxides, sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Fight fire from maximum distance. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: EPN plant wastes are treated by preaeration, activated sludge treatment, recycle, chlorination, and final polishing where additional natural biological stabilization occurs. EPN is also relatively rapidly hydrolyzed in alkaline solution to benzene thiophosphoric acid; alcohol and *p*-nitrophenol and soil burial with alkali may be used. For large quantities, however, incineration is recommended.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Epoxy ethyloxy propane E:0180

Molecular Formula: $C_5H_{10}O_2$
Synonyms: 1,2-Epoxy-3-ethoxy-propane (DOT); (Ethoxymethyl)oxirane; Ethyl glycidyl ether; Oxirane, (ethoxymethyl); Ppropane, 1,2-epoxy-3-ethoxy-
CAS Registry Number: 4016-11-9
RTECS$^®$ Number: TZ3200000
UN/NA & ERG Number: UN2752/127
EC Number: 223-671-3
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): No value assigned.
Description: Epoxy ethyloxy propane is a colorless, highly flammable, polymerizable liquid. Molecular weight = 102.15. Flash point = (approx.) 37°C. Mixes with water; may partially decompose.
Potential Exposure: Compound Description: Mutagen. It has limited commercial use in organic synthesis.
Incompatibilities: Polymerizable. Keep away from strong oxidizers, heat, flames.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Epoxy ethyloxy propane can affect you when breathed in and by passing through your skin.
Harmful Effects and Symptoms
Short Term Exposure: Contact can irritate or burn the eyes and skin with possible permanent damage. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs, causing coughing and/or shortness of breath. Very high levels could cause you to feel dizzy, lightheaded, and pass out.
Long Term Exposure: Epoxy ethyloxy propane can cause a skin allergy to develop. Similar very irritating substances can affect the lungs.
Points of Attack: Skin, lungs.
Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Lung function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to epoxy ethyloxy propane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where epoxy ethyloxy propane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and 1,2-epoxy-3-ethoxypropane in Packing Group III.
Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Keep 1,2-epoxy-3-ethoxypropane out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ergocalciferol E:0190

Molecular Formula: $C_{28}H_{44}O$

Synonyms: Activated ergosterol; D-Arthin; Calciferol; Calciferon; Candacaps; Condocaps; Condol; Crtron; Crystallina; Dacitin; Daral; Davitamon D; Decaps; Dee-Osterol; Dee-Ron; Dee-Ronal; Dee-Roual; Deltalin; Deratol; Detalup; Diactol; Ergorone; Ergosterol; Ergosterol, activated; Ertron; 1,2-Ethylidene dichloride; Fortodyl; Geltabs; Hi-Deratol; Infron; Irradiated; Irradiated ergosta-5,7,22, -trien-3-β-ol; Metadee; Mulsiferol; Mykostin; Oleovitamin D; Ostelin; Radiostol; Radsterin; 9,10, Secoergosta-5,7,10(19), 22-tetraen-3-β-ol; Shock-Ferol; Sterogly; Vigantol; Viosterol; Vitamin D2; Vitavel-D

CAS Registry Number: 50-14-6

RTECS® Number: KE1050000

UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 200-014-9 [*Annex I Index No.:* 603-179-00-9]

Regulatory Authority and Advisory Bodies

DOT regulated (see 49CFR173.4); small quantity provisions apply.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: Hazard Symbol: T + ; Risk phrases: R24/25; R26; R48/25; Safety phrases: S1/2; S28; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ergocalciferol is an odorless white crystalline solid. Molecular weight = 396.72; Freezing/Melting point = 116°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Natural Product (Ergosterol); Reproductive Effector. Used as a nutrient and/or dietary supplement food additive.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 40 mg/m^3

Routes of Entry: Ingestion, inhalation, skin or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 10 mg/kg. Highly toxic. Ergocalciferol in a single acute ingestion presents no toxic hazard. Daily ingestion in excess of 5000 units/day in children or 7500 units/day in adults will produce toxic symptoms associated with hypervitaminosis D. Initial symptoms of ergocalciferol poisoning include anorexia, nausea, and vomiting. It often mimics hyperparathyroidism with thirst, muscular weakness, nervousness, kidney impairment, hypertension, and excessive urination.

Long Term Exposure: Ergocalciferol poisoning disturbs calcium metabolism and causes kidney damage.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Medicine, solid, toxic, n.o.s. requires "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and ergocalciferol in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ergotamine tartrate E:0200

Molecular Formula: $C_{70}H_{76}N_{10}O_{16}$

Common Formula: $C_{66}H_{70}N_{10}O_{10} \cdot C_4H_6O_6$

Synonyms: Ercal; Ergam; Ergate; Ergomar; Ergostat; Ergotamine bitartrate; Ergotartrate; Etin; Exmigra; Femergin; Gotamine tartrate; Gynergen; Lingraine; Lingran; Medihaler ergotamine; Migraine Dolviran; Neo-Ergotin; Rigetamin; Secagyn; Secupan; Tartrato de ergosterol (Spanish)

CAS Registry Number: 379-79-3

RTECS® Number: KE8225000

UN/NA & ERG Number: UN2811 (Toxic solid, organic, n.o.s.)/154; UN1544 (Alkaloids, solid, n.o.s.)/151

EC Number: 206-835-9

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Developmental/Reproductive toxin 4/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ergotamine tartrate is a crystalline solid. Molecular weight = 1313.56; Freezing/Melting point = (decomposes) 203°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = <1 mg/mL at 20°C.

Potential Exposure: Compound Description (Toxicity evaluation)[77]: Mutagen; Reproductive Effector. The major uses of the ergot alkaloids fall into two categories: applications in obstetrics and treatment of migraine headaches. May be used in the production of "street" drugs.

Incompatibilities: Light and heat.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 60 mg/m^3

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Has high oral toxicity and acts as a convulsant in humans. People with liver damage are at a greater risk. Nausea and vomiting occur in some patients after oral administration. Weakness in the legs is common and muscle pains in the extremities may occur. Numbness and tingling of the fingers and toes may also occur.

Long Term Exposure: May cause liver damage.

Points of Attack: Liver, nervous system.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Alkaloids, solid, n.o.s. require a label of “POISONOUS/TOXIC MATERIALS.” They fall in Hazard Class 6.1 and ergotamine tartrate in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. Use water vapor to reduce vapors. Absorb spills with sand or other noncombustible absorbent material. *Small dry spills*: with clean shovel, place material into clean, dry container and cover; move containers from spill area. For *large spills*, dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous nitrogen oxide gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Estradiol 17b E:0210

Molecular Formula: $C_{18}H_{24}O_2$

Synonyms: Altrad; Bardiol; Dihydroxyestrin; Dihydroxy follicular hormone; Oestra-1,3,5(10)triene-3,17-β-diol; Syndiol

CAS Registry Number: 50-28-2; 57-63-6 (Estradiol, 17-ethynyl-)

RTECS® Number: KG2975000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-023-8; 200-342-2 (Estradiol, 17-ethynyl-)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence (Equigyne), *carcinogenic to humans*, Group 1, 1998; NTP: 11th Report on Carcinogens.[10]

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Estradiol, 17-*beta*- is an odorless white to yellow crystalline substance. Molecular weight = 272.42; Boiling point = (decomposes); Freezing/Melting point = 173−179°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: The working environment may be contaminated during sex hormone manufacture, especially during the extraction and purification of natural steroid hormones; grinding of raw materials; handling of powdered products and recrystallization. Airborne particles of sex hormones may be absorbed through the skin, ingested, or inhaled. Enteric absorption results in quick inactivation of sex hormones in the liver. The rate of inactivation is decreased for the oral, alkylated steroid hormones (methyl testosterone, anabolic steroids, etc.). Sex hormones may accumulate and reach relatively high levels even if their absorption is intermittent. Consequently, repeated absorption of small amounts may be detrimental to health. Intoxication by sex hormones may occur in almost all the exposed workers if preventive measures are not taken. The effect in the industrial sector is more successful than the agricultural one (chemical caponizing of cockerels by stilbestrol implants and incorporation of estrogens in feed for body weight gain promotion in beef cattle), where measures taken are summary and the number of cases of intoxication is consequently bigger.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Adverse effects of estrogens in men: Anorrhexia, nausea, vomiting, edema; a feminization syndrome characterized by gynecomastia (uni- or bi-lateral); increased pigmentation of the areollae; tenderness of the nipples, with or without secretion, slight loss of libido with difficulty in erection, with or without involution of the secondary sex organs; and sterility (by inhibition of spermatogenesis), may occur. Urinary estrogens are increased. A differential diagnosis of breast tumors in men occupationally exposed to estrogen is needed. Gynecomastia may occur in cases of functional insufficiency of organs involved in the metabolism of estrogens (chronic liver or kidney diseases) or of increased endogenous estrogen synthesis by neoplastic growths, such as pituitary, adrenal and testicular tumors, or ectopic secretion of gonadotropins or prolactin by lung tumors. Endocrinopathies may be accompanied by gynecomastia. The conversion of androgen into estrogen may explain the occurrence of gynecomastia in the case of gonadotropin or androgen excess in men. Some drugs (spironolactone, digitalis, etc.) may induce gynecomastia. Physiological gynecomastia at birth, puberty, and old age, as well as the possibility of the occurrence of breast cancer in men, should be also considered.

Adverse effects of estrogens in women: Prolonged estrogen therapy has caused malignant endometrial changes in predisposed persons. Endometrial hyperplasia and endometrial carcinoma have also occurred after exposure to diethylstilbestrol. Clear cell adenocarcinoma of the vagina and cervix uteri occurred in young women exposed prenatally to diethylstilbestrol or other nonsteroidal estrogens. Women treated with estrogen may complain of menstrual disorders, nausea, headaches, etc. Similar effects were observed during occupational exposure to natural or synthetic estrogens and oral contraceptives. Menstrual disorders were frequent. Menorrhagia occurred in women workers with endometrial hyperplasia. In menopausal women, diethylstilbestrol may produce abnormal uterine bleeding, which often leads to suspicion of cancer of the uterine body. Manifestations like metrorrhagia, nausea, and headache usually disappear after discontinuance of exposure. Excess of progesterone may be responsible for weight gain, acne, mastalgia, breast enlargement, and recurrent monilial virginities. Toxicity may also include headache, nausea, chloasma, breakthrough bleeding, weight gain, loss of libido, cholestatic liver damage; sterility may also occur.

Medical Surveillance: Persons directly involved in the hazardous sectors of manufacture should be examined every 2 weeks. Persons engaged in the pharmaceutical stage of manufacture should be examined monthly. The frequency of the physical examination of the employees should increase with the age of the worker. Feminization in men, masculinization or menstrual disorders in women, changes in certain metabolic parameters, and other symptoms detrimental to health are indications for changing the workplace. Before admission of a new employee, a very careful health examination will serve to exclude persons at risk, namely women of childbearing age, epileptics (steroid hormones may increase the frequency of seizures by changes in fluid retention), and persons with hepatic insufficiency.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Adequate preventive measures, taken in the pharmaceutical industry, have succeeded in eliminating the occurrence of intoxications almost completely. The air polluting processes are isolated in areas having adequate exhaust facilities and hermetically sealed machines. The isolated areas are entered only by workers wearing special clothing including underwear, stockings, long-sleeved overalls (with no pockets) buttoned to the neck and with ties at the bottom of the trousers for tying over the boots, rubber gloves, head cover, and dust respirators. Air-supplied vinyl suits may be used by the groups at highest risk. When workers leave the polluted area they should undress, take a shower, wash their hair, clean their nails, and put on their own clothes if the working day is over. Workers indirectly exposed to hormonal dust (i.e., mechanics who change the filters in the ventilation system) must also be provided with adequate protective equipment. The contaminated work clothing should be thoroughly cleaned. Disposable paper garments can be burned. Gloves should be rinsed with acetone or methanol, then washed and dried. Respiratory protection equipment should also be cleaned before reuse. Workrooms must be kept very clean. An alkaline detergent has been found to be most suitable for washing clothes and wiping surfaces. Mixers, stirring rods, spatulas, glassware, dishes, etc. should be rinsed after use with acetone or methanol in a hood or near a vacuum and then washed in the conventional manner. Methanol should be used on plastic items. It is important to inform workers of the risk represented by the workplace and to win their cooperation in lowering of occupational exposure; for example, not putting on rubber gloves after having worked barehanded; not rubbing the face or nose with contaminated gloves; not contaminating the inside of respirators by leaving them exposed to processing dust; not using outside the work area items which have been inside it (cigarettes, pipes, handkerchiefs); and being alert to detect deficiencies in preventive measures. In some pharmaceutical companies, the workers alternate 1 week in the polluted areas with 2 weeks in another place of work. In other companies rotation is carried out only when signs of intoxication occur. If women are employed, the alternating work environment should respect their cyclic hormonal pattern. Workers who develop symptoms of chronic intoxication in the presence of a low concentration of hormones in the air must be FORBIDDEN to return to the polluted area. The effectiveness of preventive measures should be checked by analyses of the amount of hormonal compounds in the air of the working environment, and in the plasma of the employees, and by clinical examinations. The fact that cases of chronic intoxication may occur in spite of considerable efforts to minimize occupational exposure to sex hormones suggests the need for a closed system of the entire production process.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and estradiol in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Endocrinopathies may be accompanied by gynecomastia. The conversion of androgen into estrogen may explain the occurrence of gynecomastia in the case of gonadotropin or androgen excess in men. Some drugs (spironolactone, digitalis, etc.) may induce gynecomastia. Physiological gynecomastia at birth, puberty, and old age, as well as the possibility of the occurrence of breast cancer in men, should be also considered.

Adverse effects of estrogens in women: Prolonged estrogen therapy has caused malignant endometrial changes in predisposed persons. Endometrial hyperplasia and endometrial carcinoma have also occurred after exposure to diethylstilbestrol. Clear cell adenocarcinoma of the vagina and cervix uteri occurred in young women exposed prenatally to diethylstilbestrol or other nonsteroidal estrogens. Women treated with estrogen may complain of menstrual disorders, nausea, headaches, etc. Similar effects were observed during occupational exposure to natural or synthetic estrogens and oral contraceptives. Menstrual disorders were frequent. Metrorrhagia was observed in women who started to work. Menorrhagia occurred in women workers with endometrial hyperplasia. In menopausal women, diethylstilbestrol may produce abnormal uterine bleeding, which often leads to suspicion of cancer of the uterine body. Manifestations like metrorrhagia, nausea, and headache, usually disappear after discontinuance of exposure. Excess of progesterone may be responsible for weight gain, acne, mastalgia, breast enlargement, and recurrent monilial virginities. Toxicity may also include headache, nausea, chloasma, breakthrough bleeding, weight gain, loss of libido, cholestatic liver damage, sterility may also occur.

Long Term Exposure: Confirmed carcinogen.

Medical Surveillance: Persons directly involved in the hazardous sectors of manufacture should be examined every 2 weeks. Persons engaged in the pharmaceutical stage of manufacture should be examined monthly. The frequency of the physical examination of the employees should increase with the age of the worker. Feminization in men, masculinization or menstrual disorders in women, changes in certain metabolic parameters, and other symptoms detrimental to health are indications for changing the workplace. Before admission of a new employee, a very careful health examination will serve to exclude persons at risk, namely women of childbearing age, epileptics (steroid hormones may increase the frequency of seizures by changes in fluid retention), and persons with hepatic insufficiency.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Adequate preventive measures, taken in the pharmaceutical industry, have succeeded in eliminating the occurrence of intoxications almost completely. The air-polluting processes are isolated in areas having adequate exhaust facilities and hermetically sealed machines. The isolated areas are entered only by workers wearing special clothing including underwear, socks, long-sleeved overalls (with no pockets) buttoned to the neck and with ties at the bottom of the trousers for tying over the boots, rubber gloves, head cover, and dust respirators. Air-supplied vinyl suits may be used by the groups at highest risk. When workers leave the polluted area they should undress, take a shower, wash their hair, clean their nails, and put on their own clothes if the working day is over. Workers indirectly exposed to hormonal dust (i.e., mechanics who change the filters in the ventilation system) must also be provided with adequate protective equipment. The contaminated work clothing should be thoroughly cleaned. Disposable paper garments can be burned. Gloves should be rinsed with acetone or methanol, then washed and dried. Respiratory protection equipment should also be cleaned before reuse. Workrooms must be kept very clean. An alkaline detergent has been found to be most suitable for washing clothes and wiping surfaces. Mixers, stirring rods, spatulas, glassware, dishes, etc. should be rinsed after use with acetone or methanol in a hood or near a vacuum and then washed in the conventional manner. Methanol should be used on plastic items.

It is important to inform workers of the risk represented by the workplace and to win their cooperation in lowering of occupational exposure; for example, not putting on rubber gloves after having worked barehanded; not rubbing the face or nose with contaminated gloves; not contaminating the inside of respirators by leaving them exposed to processing dust; not using outside the work area items which have been inside it (cigarettes, pipes, handkerchiefs); and being alert to detect deficiencies in preventive measures. In some pharmaceutical companies, the workers alternate 1 week in the polluted areas with 2 weeks in another place of work. In other companies, rotation is carried out only when signs of intoxication occur. If women are employed, the alternating work environment should respect their cyclic hormonal pattern. Workers who develop symptoms of chronic intoxication in the presence of a low concentration of hormones in the air must be FORBIDDEN to return to the polluted area. The effectiveness of preventive measures should be checked by analyses of the amount of hormonal compounds in the air of the working environment, and in the plasma of the employees, and by clinical examinations. The fact that cases of chronic intoxication may occur in spite of considerable efforts to minimize occupational exposure to sex hormones suggests the need for a closed system of the entire production process.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and estrone in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethane E:0230

Molecular Formula: C_2H_6

Synonyms: Bimethyl; Dimethyl; Etano (Spanish); Ethyl hydride; Methylmethane

CAS Registry Number: 74-84-0

RTECS® Number: KH3800000

UN/NA & ERG Number: UN1035 (compressed gas)/115; UN1961 (refrigerated liquid)/115

EC Number: 200-814-8 [*Annex I Index No.:* 601-002-00-X]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: Hazard Symbol: F+; Risk phrases: R12; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Ethane is a compressed, liquefied, colorless gas with a mild, gasoline-like odor. Odorless when pure. Odor threshold = 899 ppm. Molecular weight = 30.08; Boiling point = −89°C; Freezing/Melting point = −183°C; Flash point = flammable gas; Autoignition temperature = 472°C. Explosive limits: LEL = 3.0%; UEL = 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water. An aliphatic hydrocarbon gas (C_1-C_4).

Potential Exposure: Ethane is used as a fuel, in making chemicals, or as a freezing agent. The health effects caused by ethane exposure are much less serious than the fire and explosion risk posed by this chemical.

Incompatibilities: Flammable gas; forms explosive mixture with air. Strong oxidizers may cause fire and explosions. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: Simple asphyxiant (Shipyards, Construction).

ACGIH TLV®[1]: 1000 ppm TWA *as aliphatic hydrocarbon gas* (C_1-C_4).

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3000 ppm

PAC-2: 5000 ppm

PAC-3: 25,000 ppm

Australia: Asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: MAK-W 10000 ppm (12500 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can cause headache, dizziness, and make you feel lightheaded. Very high levels can cause suffocation from lack of oxygen. Contact with liquid ethane can cause frostbite. Ethane is highly flammable. It is a dangerous fire hazard.

Long Term Exposure: Chronic health effects are unknown at this time.

First Aid: Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyethylene is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Wear gas-proof goggles unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Chemical cartridge respirators should not be used where ethane exposure occurs. For high exposures use air-supplied respirators. Exposure to ethane is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in the positive-pressure mode should be used in oxygen deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where ethane is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of ethane. Wherever ethane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Ethane requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1 and there is no Packing Group.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ethane is a flammable gas. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*all isomers*).

Description: Ethanolamines can be detected by odor as low as 2−3 ppm. *Monoethanolamine* is a colorless, viscous liquid or solid (below 111°C) with an unpleasant, ammonia-like odor. Molecular weight = 61.10; Boiling point = 170.6°C; Freezing/Melting point = 10.6°C; Vapor pressure = 0.4 mmHg at 20°C; Flash point = 85°C (cc); Autoignition temperature = 410°C. Explosive limits: LEL = 3.0% (at 140°C); UEL = 23.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water. *Triethanolamine* has only a faint nonammonia odor. Molecular weight = 149.22; Boiling point = 343°C; Freezing/Melting point = 21°C; Flash point = 179°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Soluble in water. All three compounds are water-soluble liquids.

Potential Exposure: Compound Description (*mono-*): Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant; (*tri-*) Agricultural Chemical; Tumorigen, Mutagen, Primary Irritant. *Monoethanolamine* is widely used in industry for scrubbing acid gases and in production of detergents and alkanolamide surfactants; to remove carbon dioxide and hydrogen from natural gas; to remove hydrogen sulfide and carbonyl sulfide; as an alkaline conditioning agent; as an intermediate for soaps, detergents, dyes, and textile agents. *Diethanolamine* is an absorbent for gases, a solubilizer for 2,4-dichlorophenoxyacetic acid (2,4-D), and a softener and emulsifier intermediate for detergents. It also finds use in the dye and textile industry. *Triethanolamine* is used as plasticizers, neutralizer for alkaline dispersions; lubricant additive; corrosion inhibitor; and in the manufacture of soaps, detergents, shampoos, shaving preparations, face and hand creams, cements, cutting oils, insecticides, surface active agents, waxes, polishes, and herbicides.

Incompatibilities: *Monoethanolamine:* This chemical is a medium strong base. Reacts violently with strong oxidizers, acetic acid, acetic anhydride, acrolein, acrylic acid, acrylonitrile, cellulose nitrate, chlorosulfonic acid, epichlorohydrin, hydrochloric acid, hydrogen fluoride, mesityl oxide, nitric acid, oleum, sulfuric acid, β-propiolactone, vinyl acetate. Reacts with iron. May attack copper, aluminum and their alloys, and rubber. *di-isomer*: Oxidizers, strong acids, acid anhydrides, halides. Reacts with CO_2 in the air. Hygroscopic (i.e., absorbs moisture from the air). Corrosive to copper, zinc, and galvanized iron (di-). The aqueous solution is a medium strong base. Attacks copper, zinc, aluminum, and their alloys.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.50 mg/m^3 at 25°C & 1 atm.

Monoethanolamine 141-43-5

Denmark: TWA 0.5 ppm (3.1 mg/m^3), 1999; Sweden: NGV 5 mg/m^3, KTV 10 mg/m^3 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003.

Diethanolamine 111-42-2

Several states have set guidelines or standards for diethanolamine in ambient air[60] ranging from 150 μg/m^3 (North Dakota) to 250 μg/m^3 (Virginia) to 300 μg/m^3 (Connecticut) to 357 μg/m^3 (Nevada). A large number of states have set guidelines or standards for monoethanolamine in ambient air[60] ranging from 19.048 μg/m^3 (Kansas) to 26.7 μg/m^3 (New York) to 80.0 μg/m^3 (Florida) to 80.0−150.0 μg/m^3 (North Dakota) to 120 μg/m^3 (Connecticut) to 130.0 μg/m^3 (Virginia) to 190.0 μg/m^3 (Nevada) to 200.0 μg/m^3 (South Carolina).

Determination in Air: *Monoethanolamine*: Use NIOSH Analytical Method: Aminoethanol compounds I: 2007; or OSHA Analytical Method PV-2111.

Permissible Concentration in Water: EPA[32] has suggested permissible ambient limits of 83 μg/L. Russia[43] has set a MAC value of 0.8 mg/L in water bodies used for domestic purposes for diethanolamine and 1.4 mg/L for triethanolamine but no MAC for monoethanolamine.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = -1.3$.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion and skin and/or eye contact.

Harmful Effects and Symptoms

The LD_{50} oral-rat for the isomers is as follows: *mono*-2,050 mg/kg (slightly toxic); *di*-710 mg/kg (slightly toxic); *tri*-8000 mg/kg (insignificantly toxic). All three compounds cause irritation to nose, throat, and lungs upon inhalation. Skin contact causes irritation, stinging, and burns. Eye contact can cause severe irritation. Ingestion can cause nausea and intestinal irritation. Fatal doses are estimated by NY State to be 6 g of monoethanolamine for a 150-lb man.

Short Term Exposure: *Mono-isomer:* Corrosive to the eyes and irritates the skin and respiratory tract. Inhalation may cause asthmatic reactions. May affect central nervous system and may cause unconsciousness. *Di-isomer:* Corrosive to the eyes. Irritates the eyes, skin, respiratory tract.

Long Term Exposure: *Mono-isomer:* Repeated or prolonged contact with skin may cause dermatitis and ulceration and lungs may be affected. May affect the central nervous system, kidneys, liver, and blood, causing asthenia, hematological changes, and tissue lesions. *di-isomer:* May affect the kidneys and liver.

Points of Attack: Eyes, skin, respiratory system, central nervous system

Medical Surveillance: With monoethanolamine, if symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

With diethanolamine: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Skin testing with dilute diethanolamine may help diagnose allergy if done by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. **8 h:** Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Tychem 1000™ suits; **4 h:** polyvinyl chloride gloves, suits, boots. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Monoethanolamine: Up to 30 ppm:* CcrS* (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethanolamine must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) and strong acids (such as hydrochloric, sulfuric, and nitric acids) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethanolamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of “CORROSIVE.” It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound

increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

EC Number: 200-342-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Limited Evidence (Equigyne), *carcinogenic to humans*, Group 1, 1998; NTP: 11th Report on Carcinogens.[10]

California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin 1/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethinylestradiol is a white to creamy-white odorless powder. Molecular weight = 296.44; Freezing/Melting point = 142−146°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: Used in medicine as an estrogenic hormone and as an oral contraceptive.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Nausea, vomiting, abdominal cramps, bloating, cholasma, cholestatic jaundice, skin eruptions, loss of scalp hair, hirsutism, changes in menstrual flow, headache, migraine, dizziness, mental depression, increase or decrease in weight, edema, changes in libido, and breast enlargement.

Long Term Exposure: A confirmed carcinogen. May have teratogenic effects and reproductive effects. Human mutation data reported.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from exposure to light.

Shipping: Medicine, solid, toxic, n.o.s. requires a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and estrogen in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources and dampen spilled material with 60−70% ethanol. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethion E:0260

Molecular Formula: $C_9H_{22}O_4P_2S_4$

Synonyms: AC 3422; Bis[S-(diethoxy-phosphinothioyl) mercapto]methane; Bis (dithiophosphatede *O*,*O*-diethyle) de *S*,*S*′-methylene (French); Bladan; Diethion; Embathion; ENT 24,105; Ethanox; Ethiol; Ethodan; Ethyl methylene phosphorodithioate; Etion (Spanish); FMC-1240; Fosfono 50; Hylemox; Itopaz; Kwit; Methanedithiol, *S*,*S*-diester with *O*,*O*-diethyl phosphorodithioate acid; Methylene-*S*,*S*′-bis(*O*,*O*-diaethyl-dithiophosphat) (German); a,*S*′-Methylene *O*,*O*,*O*′,*O*′-tetraethyl ester phosphorodithioic acid; *S*,*S*′-Methylene *O*,*O*,*O*′,*O*′-tetraethyl phosphorodithioate; NIA 1240; Niagara 1240; Nialate; Phosphorodithioic acid, *O*,*O*-diethyl ester, *S*,*S*-diester with methanedithiol; Phosphotox E; Rhodiacide; Rhodocide; Rodocid; RP 8167; Soprathion; STCC 4921565; *O*,*O*,*O*′,*O*′-Tetraaethyl-bis(dithiophosphat) (German); *O*,*O*,*O*′,*O*′-Tetraethyl *S*,*S*′-methylenebis(dithiophosphate); *O*,*O*,*O*′,*O*′-Tetraethyl *S*,*S*′-methylenebisphosphordithioate; Tetraethyl *S*,*S*′-methylene bis (phosphorothiolothionate); *O*,*O*,*O*′,*O*′-Tetraethyl *S*,*S*′-methylene di(phosphorodithioate); Vegfru Fosmite; Vegfrufosmite

CAS Registry Number: 563-12-2

US EPA Gene-Tox Program, Negative: Histidine reversion—Ames test Negative: *In vitro* UDS—human fibroblast; TRP reversion Negative: *S. cerevisiae*—homozygosis Inconclusive: *B. subtilis* rec assay; *E. coli* polA without S9.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazardous Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21; R25; R50/53; Safety phrases: S1/2; S25; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethion is a colorless to amber-colored, odorless liquid. The technical product has a very disagreeable odor; Freezing/Melting point = −13 to −12°C. Molecular weight = 384.49; Boiling point = 164°C; Vapor pressure = 0.0000015 mmHg at 20°C; Flash point = 176°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.0001%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Human Data. Those involved in the manufacture, formulation, and application of this insecticide and acaricide. Ethion is a preharvest topical insecticide used primarily on citrus fruits, deciduous fruits, nuts, and cotton. It is also used as a cattle dip for ticks and as a treatment for buffalo flies.

Incompatibilities: Incompatible with alkaline formulations and strong acids. Decomposes violently when heated above 150°C. Mixtures with magnesium may be explosive. Contact with oxidizers may cause the release of phosphorous oxides. Contact with strong reducing agents, such as hydrides, may cause the formation of flammable and toxic phosphine gas.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.4 mg/m^3 [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued as Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 13 mg/m^3

PAC-3: 350 mg/m^3

Australia: TWA 0.4 mg/m^3, [skin], 1993; Belgium: TWA 0.4 mg/m^3, [skin], 1993; Denmark: TWA 0.4 mg/m^3, [skin], 1999; France: VME 0.4 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.4 mg/m^3, [skin], 2003; Switzerland: MAK-W 0.4 mg/m^3, [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for Ethion in ambient air[60] ranging from 4.0 $\mu g/m^3$ (North Dakota) to 6.0 μ/m^3 (Connecticut) to 9.0 $\mu g/m^3$ (Nevada).

Determination in Air: Use NIOSH (IV), Method #5600, Organophosphorus Pesticide.

Permissible Concentration in Water: California[61] has set a guideline for Ethion in drinking water of 35 μg/L.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 5.073.

Harmful Effects and Symptoms

Symptoms may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, weakness, muscle twitching, difficult breathing, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. This material is very toxic; the probable oral lethal dose for humans is 50−500 mg/kg, which is between 1 teaspoonful and 1 oz for a 150-lb person.

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Exposure may cause unconsciousness and death. The effects may be delayed and medical observation is recommended.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Ethion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **4 h:** Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or wear dust-proof goggles when working with powders or dusts unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.4 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline material, strong acids, and other incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and ethion in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts can be burned with alkali.[22] For larger amounts, the suggested method is incineration with added solvent in furnace equipped with afterburner and alkali scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethoprophos is a pale yellow liquid. Molecular weight = 242.36; Boiling point = 88°C at 0.2 mmHg; Vapor pressure = 0.0004 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this nematocide and soil insecticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 26 mg/m^3

PAC-3: 26 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 0.47783000 ppb (EXTRA HIGH).

Determination in Soil: Soil Adsorption Index (K_{oc}) = 70.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms are similar to parathion and may include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, weakness, muscle twitching, difficult breathing, blurring or dimness of vision, and loss of muscle coordination. Death may occur from failure of the respiratory center, paralysis of the respiratory muscles, intense bronchoconstriction, or all three. Human Tox = 12.45550 ppb (INTERMEDIATE). It is a cholinesterase inhibitor which affects the nervous system.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and ethoprop in Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including phosphorus oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U359.

US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0892-9072.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Developmental/Reproductive toxin (male) 1/1/89.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; R10; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 2-Ethoxyethanol is a colorless, viscous liquid with a sweetish odor. Odor threshold = 2.7 ppm. Molecular weight = 90.12; Boiling point = 135°C; Freezing/Melting point = −90°C; Vapor pressure = 4 mmHg at 20°C; Flash point = 43.3°C; Autoignition temperature = 235°C. Explosive limits: LEL = 1.7% at 93°C; UEL = 15.6% at 93°C. Hazard

Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. This material is used as a solvent for nitrocellulose and alkyd resins in lacquers; as a solvent for printing inks; in dyeing leathers and textiles; in the formulation of cleaners and varnish removers; as an anti-icing additive in brake fluids and auto and aviation fuels.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings. Able to form peroxides. Incompatible with strong acids, aluminum and its alloys.

Permissible Exposure Limits in Air

OSHA PEL: 200 ppm/740 mg/m^3 TWA [skin].

NIOSH REL: 0.5 ppm/1.8 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/18 mg/m^3 TWA [skin]; BEI: 100 mg [2-ethoxyacetic acid]/g creatinine in urine at end-of-work-week.

NIOSH IDLH: 500 ppm.

Temporary Emergency Exposure Limits (DOE).

TEEL-0: 5 ppm

PAC-1: 5 ppm

PAC-2: 5 ppm

PAC-3: 500 ppm

DFG MAK: 5 ppm/19 mg/m^3 TWA; Peak Limitation Category II(8) [skin]; BAT: 50 mg [Ethoxyacetic acid]/g creatinine in urine at end-of-shift; after several shifts (long term); Pregnancy Risk Group B.

Australia: TWA 5 ppm (19 mg/m^3), [skin], 1993; Austria: MAK 20 ppm (75 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (18 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (18.5 mg/m^3), [skin], 1999; Finland: TWA 50 ppm (185 mg/m^3); STEL 100 ppm (370 mg/m^3), [skin], 1999; France: VME 5 ppm (19 mg/m^3), [skin], 1999; Hungary: TWA 70 mg/m^3; STEL 140 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 19 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (18 mg/m^3), 1999; the Philippines: TWA 200 ppm (740 mg/m^3), [skin], 1993; Poland: MAC (TWA) 20 mg/m^3, MAC (STEL) 80 mg/m^3, 1999; Russia: TWA 5 ppm; STEL 5 mg/m^3, 1993; Sweden: NGV 5 ppm (19 mg/m^3), KTV 10 ppm (40 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (19 mg/m^3), KZG-W 10 ppm (38 mg/m^3), [skin], 1999; Turkey: TWA 200 ppm (740 mg/m^3), 1993; United Kingdom: TWA 10 ppm (37 mg/m^3), [skin], 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm [skin]. Finally, Russia[43] set a MAC of 0.7 mg/m^3 in ambient air in residential areas on a once daily basis.[35] Several states have set guidelines or standards for ethoxyethanol in ambient air[60] ranging from 120−190 μ/m^3 (North Carolina) to 180 μg/m^3 (Florida and New York) to 190 μg/m^3 (North Dakota) to 320 μg/m^3 (Virginia) to 380 μg/m^3 (Connecticut) to 452 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1403, alcohols IV or OSHA Analytical Methods 53 or 79.

Permissible Concentration in Water: Russia set a MAC of 1.0 mg/L in surface water.

Determination in Water: No tests listed. Octanol−water coefficient: Log $K_{ow} = -0.5$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: 2-Ethoxyethanol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. High levels may cause headache, drowsiness, dizziness, lightheadedness, and even passing out. Exposure may cause central nervous system depression, liver and kidney damage. LD_{50} = (oral-rat) 2125 mg/kg (slightly toxic). Medical observation is recommended.

Long Term Exposure: 2-Ethoxyethanol should be handled as a teratogen—with extreme caution. It may damage the testes, resulting in decreased fertility. Exposure may affect blood cells, causing a low blood count (anemia) and lesions of blood cells. Prolonged or repeated contact defats the skin. May cause liver and kidney damage.

Points of Attack: Eyes, respiratory system, blood, kidneys, liver, reproductive system, hematopoietic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: complete blood count. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Liver function tests. NIOSH lists the following test: urine (chemical/metabolite) End-of-shift at end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim under medical observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** Saranex™ coated suits; Responder™ suits; **4 h:** 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 5 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 25 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Ethoxyethanol must be stored to avoid contact with strong oxidizers, such as nitrates, permanganates, chlorine, bromine, or chlorine dioxide, since violent reactions occur. Store in tightly closed containers in a dark, cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 2-ethoxyethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Keep in dark because of possible formation of explosive peroxides.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0693-9068.

California Proposition 65 Chemical: Developmental/Reproductive toxin 1/1/93.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; R10; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-Ethoxyethyl acetate is a colorless liquid with a mild, nonresidual odor. The odor threshold is 0.056 ppm in air. Molecular weight = 132.18; Specific gravity (H_2O:1) = 0.98 at 20°C; Boiling point = 156°C; Freezing/Melting point = −61.7°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 47°C; Autoignition temperature = 380°C. Explosive limits: LEL = 1.7%; UEL = 12.7%. The UEL is also reported as 14%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water; solubility = 23%.

Potential Exposure: Compound Description: Reproductive Effector; Primary Irritant. This material is used as a solvent for different purposes, including for nitrocellulose and other resins. Used in automobile lacquers to retard evaporation and impart a high gloss.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, strong alkalies, nitrates. Violent reaction with oxidizers. May form unstable peroxides. Softens many plastics. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.41 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/540 mg/m^3 TWA [skin].

NIOSH REL: 0.5 ppm/2.7 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/27 mg/m^3 TWA [skin]; BEI: 100 mg [2-Ethoxyacetic acid]/g creatinine in urine at end-of-work-week.

NIOSH IDLH: 500 ppm.

Australia: TWA 5 ppm (27 mg/m^3), [skin], 1993; Austria: MAK 20 ppm (110 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (27 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (27.0 mg/m^3), [skin], 1999; Finland: TWA 50 ppm (270 mg/m^3); STEL 100 ppm (540 mg/m^3), [skin], 1999; France: VME 5 ppm (27 mg/m^3), [skin], 1999; Hungary: TWA 25 mg/m^3; STEL 50 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 27 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (27 mg/m^3), 1999; the Philippines: TWA 100 ppm (540 mg/m^3), [skin], 1993; Poland: MAC (TWA) 100 mg/m^3, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 5 ppm (30 mg/m^3), KTV 10 ppm (50 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (27 mg/m^3), KZG-W 10 ppm (54 mg/m^3), [skin], 1999; Turkey: TWA 100 ppm (540 mg/m^3), 1993; United Kingdom: TWA 10 ppm (55 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm [skin]. Several states have set guidelines or standards for ethoxyethyl acetate in ambient air[60] ranging from 270 $\mu g/m^3$ (North Dakota) to 450 $\mu g/m^3$ (Virginia) to 540 $\mu g/m^3$ (Connecticut and South Dakota) to 643 $\mu g/m^3$ (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1450 or OSHA Analytical Methods 53 and 79.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = <0.3.

Routes of Entry: Inhalation, ingestion, eyes and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: 2-Ethoxyethyl acetate can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. High levels could cause you to become dizzy, lightheaded, and to pass out. Very high exposures could cause kidney damage and even death. May affect the blood and central nervous system.

Long Term Exposure: 2-Ethoxyethyl-acetate may damage the developing fetus. It may damage the testes (male reproductive glands), resulting in decreased fertility. It may affect the blood, liver, and kidneys. Many similar petroleum-based solvents have been shown to cause brain and nerve damage.

Points of Attack: Inhalation, skin absorption, ingestion, skin and/or eye contact

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Complete blood count. Evaluate for brain effects and consider evaluation of the nervous systems.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. **8 h:** Barricade® coated suits; Responder™ suits; **4 h:** polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *5 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *25 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Ethoxyethyl acetate must be stored to avoid contact with strong oxidizers, such as nitrates, permanganates, bromine, chlorine, and chlorine dioxide; strong alkalis, such as sodium hydroxide and potassium hydroxide; and strong acids, such as nitric, hydrochloric, and sulfuric acids, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 2-ethoxyethyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Common Formula: $CH_3COOC_2H_5$

Synonyms: Acetato de etilo (Spanish); Acetic acid, ethyl ester; Acetic ester; Acetic ether; Acetidin; Acetoxyethane; Aethylacetat (German); Arsenosilica film 0308; AS-1; AS 1400; AS 18CZ10A; AS 18CZ5E; AS 18CZ6E; AS 1CE; AS 5CE; B446; Essigester (German); Ethyl acetic ester; Ethyle (acetate d') (French); Ethyl ester of acetic acid; Ethyl ethanoate; KTI 1470(+); Vinegar naphtha

CAS Registry Number: 141-78-6

RTECS® Number: AH5425000

UN/NA & ERG Number: UN1173/129

EC Number: 205-500-4 [*Annex I Index No.:* 607-022-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA1998 Status of Pesticides: Canceled.

US EPA Gene-Tox Program, Inconclusive: *B. subtilis* rec assay.

US EPA Hazardous Waste Number (RCRA No.): U112.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.34; Nonwastewater (mg/kg), 33.

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36; R66; R67; Safety phrases: S2; S16; S26; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl acetate is a colorless liquid with a pleasant, fruity odor (odor threshold = 3.9 ppm in air). Molecular weight = 88.12; Specific gravity = 0.90; Boiling point = 77°C; Freezing point = −82.8; Vapor pressure = 73 mmHg at 20°C; Flash point = −4.4°C; Autoignition temperature = 426°C. Explosive limits: LEL = 2.0%; UEL = 11.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 0.9%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Human Data; Primary Irritant. This material is used as a solvent for nitrocellulose and lacquer. It is also used in making dyes, flavoring, and perfumery; and in smokeless powder manufacture.

Incompatibilities: Forms explosive mixture with air. Heating may cause violent combustion or explosion. Incompatible with strong acids, strong alkalies, nitrates, strong oxidizers, chlorosulfonic acid, lithium aluminum hydride; oleum will hydrolyze on standing in forming acetic acid and ethyl alcohol. This reaction is greatly accelerated by alkalies. Decomposes under influence of UV light, bases, acids. Attacks aluminum and plastics.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.60 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 400 ppm/1400 mg/m^3 TWA.

NIOSH REL: 400 ppm/1400 mg/m^3 TWA.

ACGIH TLV®[1]: 400 ppm/1440 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 400 ppm

PAC-1: 400 ppm

PAC-2: 400 ppm

PAC-3: 2000 ppm

DFG MAK: 400 ppm/1500 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

NIOSH IDLH: 2000 ppm [LEL].

Australia: TWA 400 ppm (1400 mg/m^3), 1993; Austria: MAK 400 ppm (1400 mg/m^3), 1999; Belgium: TWA 400 ppm (1440 mg/m^3), 1993; Denmark: TWA 150 ppm (540 mg/m^3), 1999; Finland: TWA 300 ppm (1100 mg/m^3); STEL 500 ppm (1800 mg/m^3), 1993; France: VME 400 ppm (1400 mg/m^3), 1999; Hungary: TWA 400 mg/m^3; STEL 1200 mg/m^3, 1993; the Netherlands: MAC-TGG

550 mg/m^3, 2003; Norway: TWA 150 ppm (550 mg/m^3), 1999; the Philippines: TWA 400 ppm (1400 mg/m^3), 1993; Poland: MAC (TWA) 200 ppm, MAC (STEL) 600 mg/m^3, 1999; Russia: TWA 400 ppm; STEL 200 mg/m^3, 1993; Sweden: NGV 150 ppm (500 mg/m^3), KTV 300 ppm (1100 mg/m^3), 1999; Switzerland: MAK-W 400 ppm (1400 mg/m^3), KZG-W 800 ppm (2800 mg/m^3), 1999; Turkey: TWA 400 ppm (1400 mg/m^3), 1993; United Kingdom: TWA 400 ppm (1460 mg/m^3), 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 400 ppm. The Czech Republic[35]: 400 mg/m^3, Russia[35,43] set a MAC value of 0.1 mg/m^3 in the ambient air of residential areas on either a momentary or a daily average basis. Several States have set guidelines or standards for ethyl acetate in ambient air[60] ranging from 2.0 mg/m^3 (Massachusetts) to 14.0 mg/m^3 (North Dakota) to 23.0 mg/m^3 (Virginia) to 28.0 mg/m^3 (Connecticut, Florida, New York and South Dakota) to 33.333 mg/m^3 (Nevada) to 140.0 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1450 or OSHA Analytical Method 7.

Permissible Concentration in Water: Russia set a MAC of 0.2 mg/L in surface water.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl acetate can affect you when breathed in and by passing through your skin. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels could cause you to pass out. Repeated contact can cause drying and cracking of the skin. The vapor can irritate the eyes and respiratory tract. Ethyl acetate is a flammable liquid and a fire hazard. May affect the central nervous system. Very high exposure may result in death.

Long Term Exposure: May decrease fertility in males. Repeated contact can cause drying and cracking of the skin. Many similar petroleum-based chemicals can cause brain and nerve damage.

Points of Attack: Eyes, skin, and respiratory system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Evaluate for brain and nervous system damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** 4H™ and Silver Shield™ gloves; Barricade® coated suits; CPF3™ suits; Responder™ suits, Trellchem HPS™ suits; Trychem 1000™ suits, **4 h:** polyvinyl alcohol gloves; Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl acetate must be stored to avoid contact with nitrates; strong oxidizers, such as chlorine, bromine, chlorine dioxide, nitrates, and permanganates; strong alkalis, such as sodium hydroxide and potassium hydroxide; or strong acids, such as sulfuric acid, hydrochloric acid, and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethyl acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of ethyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl acetate. Store in containers that are properly labeled with health hazard information and safe handling procedures. Wherever ethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ethyl acetylene E:0310

Molecular Formula: C_4H_6

Common Formula: $C_2H_5C{\equiv}CH$

Synonyms: 1-Butino (Spanish); 1-Butyne; Ethyl ethyne

CAS Registry Number: 107-00-6

RTECS® Number: ER9553000

UN/NA & ERG Number: UN2452 (stabilized)/116

EC Number: 203-451-3

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl acetylene is a colorless, compressed gas or liquid. Molecular weight = 54.0; Boiling point = 8.1°C; Freezing/Melting point = −130°C; Flash point ≤ −7°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: A simple asphyxiant. Ethyl acetylene is used as a fuel and as a chemical intermediate.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosion danger. May undergo violent polymerization when subjected to heat, direct sunlight, or contamination.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl acetylene can affect you when breathed in. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Exposure to very high levels can cause suffocation and death due to lack of oxygen.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear gas-proof goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to ethyl acetylene is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethyl acetylene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Protect cylinders from physical damage and store away from potential heat sources. Sources of ignition, such as smoking and open flames, are prohibited where ethyl acetylene is handled, used, or stored. Wherever ethyl acetylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Water spray may be used to reduce vapors. Keep ethyl acetylene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

Fire Extinguishing: This chemical is an unstable, flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethyl acrylate is a colorless liquid with a sharp, acrid odor. The odor threshold is 0.00024−0.0009 ppm. Molecular weight = 100.13; Boiling point = 94.4°C; Melting point = −71°C; Vapor pressure = 29 mmHg at 20°C; Flash point = 10°C (oc); Autoignition temperature = 372°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Explosive limits: LEL = 1.4%; UEL = 14%. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. This material is used in emulsion polymers for paints, textiles, adhesives, coatings, and binders; as a monomer in the manufacture of homopolymer and copolymer resins for the production of paints and plastic films.

Incompatibilities: Forms explosive mixture with air. Atmospheric moisture and strong alkalies may cause fire and explosions unless properly inhibited (*Note:* Inert gas blanket not recommended). Heat, light, or peroxides can cause polymerization. Incompatible with oxidizers (may be violent), peroxides, polymerizers, strong alkalis, moisture, chlorosulfonic acid, strong acids, amines. May accumulate static electrical charges, and may cause ignition of its vapors. Polymerizes readily unless an inhibitor, such as hydroquinone, is added. Uninhibited vapors may plug vents by the formation of polymers.

Permissible Exposure Limits in Air

OSHA PEL: 25 ppm/100 mg/m^3 TWA [skin].

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 5 ppm/20 mg/m^3 TWA; 15 ppm/61 mg/m^3 STEL; [skin], not classifiable as a human carcinogen.

NIOSH IDLH: 300 ppm, Potential occupational carcinogen.

Protective Action Criteria (PAC)*

DFG MAK: 5 ppm/21 mg/m^3; [skin] danger of skin sensitization; Pregnancy Risk Group C.

Australia: TWA 5 ppm (20 mg/m^3), 1993; Austria: MAK 5 ppm (20 mg/m^3), 1999; Belgium: TWA 5 ppm (20 mg/m^3); STEL 25 ppm (100 mg/m^3), 1993; Denmark: TWA 5 ppm (20 mg/m^3), [skin] 1999; Finland: TWA 5 ppm (20 mg/m^3); STEL 10 ppm (40 mg/m^3), [skin] 1993; France: VME 5 ppm (20 mg/m^3), [skin] 1999; Hungary: STEL 10 mg/m^3, [skin] carcinogen, 1993; the Netherlands: MAC-TGG 20 mg/m^3, [skin] 2003; Norway: TWA 5 ppm (20 mg/m^3), 1999; the Philippines: TWA 25 ppm (100 mg/m^3), [skin] 1993; Poland: TWA 20 mg/m^3; STEL 80 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Sweden: NGV 5 ppm (20 mg/m^3), KTV 10 ppm (40 mg/m^3), [skin] 1999; Switzerland: MAK-W 5 ppm (20 mg/m^3), KZG-W 10 ppm (40 mg/m^3), 1999; Turkey: TWA 25 ppm (100 mg/m^3), [skin] 1993; United Kingdom: TWA 5 ppm (21 mg/m^3); STEL 15 ppm (62 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm.

The Czech Republic[35] and Russia[43] have set a MAC value of 0.05 mg/m^3 (50 μg/m^3) in ambient air of residential areas. Several states have set guidelines or standards for ethyl acrylate in ambient air[60] ranging from 0.28 μg/m^3 (Massachusetts) to 350.0 μg/m^3 (Virginia) to 400 μg/m^3 (Connecticut) to 200−1000 μg/m^3 (North Dakota) to 476.0 μ/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1450 or OSHA Analytical Method 92.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.005 mg/L (5 μg/L) in water bodies used for domestic purposes.

Determination in Water: No tests listed. Octanol−water coefficient: Log K_{ow} = 1.3.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl acrylate can affect you when breathed in and by passing through your skin. Ethyl acrylate is corrosive and can severely irritate and burn the eyes and skin. Inhalation can cause severe irritation and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Breathing very high levels of ethyl acrylate can cause dizziness, difficulty in breathing, and even death. Contact may cause a skin allergy.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis and skin allergy. May affect the liver and kidneys. This chemical may be a human carcinogen; it has been shown to cause stomach cancer in animals. May damage the developing fetus. Highly irritating substances may cause lung damage.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: forestomach.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests; liver function tests; kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** polyvinyl alcohol gloves; Teflon™ gloves, suits, boots; Responder™ suits; Trychem 1000™ suits, **4 h:** 4H™ and Silver Shield™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Remove clothing immediately if wet or contaminated to avoid flammability hazard. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Ethyl acrylate must be stored to avoid contact with oxidizers (such as peroxides, perchlorates, chlorates, nitrates, and permanganates), strong alkalis (such as sodium hydroxide and potassium hydroxide) and moisture since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Heat can cause ethyl acrylate to react by itself. If this takes place in a closed container, an explosion could occur. Ethyl acrylate usually contains an inhibitor, such as hydroquinone or its methyl ether, to prevent a self-reaction. If it does not contain an inhibitor, the reaction may occur without the application of heat. Sources of ignition, such as smoking and open flames, are prohibited where ethyl acrylate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl acrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl acrylate. Wherever ethyl acrylate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Ethyl acrylate requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases or irritating fumes are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas.

Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration[22] or by absorption and landfill disposal.[22]

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1; Class B2, D2A, D2B.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; Safety phrases: S2; S7−S16 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl alcohol is a colorless, volatile, flammable liquid with a sweet, fruity odor. The odor threshold is 0.135−5 ppm. Molecular weight = 46.08; Specific gravity (H_2O:1) = 0.8; Boiling point = 78.3°C; Melting point = − 113.9°C; Vapor pressure = 44 mmHg at 20°C; Flash point = 12.8°C (96%). Explosive limits: LEL = 3.3%; UEL = 19.0%; Autoignition temperature = 363°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Ethyl alcohol is used as a topical anti-infective agent; solvent to make beverages; in the chemical synthesis of a wide variety of compounds, such as acetaldehyde, ethyl ether, ethyl chloride, and butadiene. It is a solvent or processing agent in the manufacture of pharmaceuticals, plastics, lacquers, polishes, plasticizers, perfumes, cosmetics, rubber accelerators, explosives, synthetic resins, nitrocellulose, adhesives, inks, and preservatives. It is also used as an antifreeze and as a fuel. It is an intermediate in the manufacture of many drugs and pesticides.

Incompatibilities: Forms explosive mixture with air. May accumulate static electrical charges, and may cause ignition of its vapors. Reactions may be violent with oleum, sulfuric acid, nitric acid, bases, aliphatic amines, isocyanates, strong oxidizers. Also incompatible with potassium dioxide, bromine pentafluoride, acetyl bromide, acetyl chloride, platinum, sodium.

Permissible Exposure Limits in Air

OSHA PEL: 1000 ppm/1900 mg/m^3 TWA.

NIOSH REL: 1000 ppm/1900 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/1880 mg/m^3 STEL; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 500 ppm

PAC-1: **1800** ppm

PAC-2: **3300** ppm

PAC-3: 3300 ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 500 ppm/960 mg/m^3 TWA; Peak Limitation Category II(2); Carcinogen Category 5; Pregnancy Risk Group C.

NIOSH IDLH: 3300 ppm [LEL].

Australia: TWA 1000 ppm (1900 mg/m^3), 1993; Austria: MAK 1000 ppm (1900 mg/m^3), 1999; Belgium: TWA 1000 ppm (1880 mg/m^3), 1993; Denmark: TWA 1000 ppm (1900 mg/m^3), 1999; Finland: TWA 1000 ppm (1900 mg/m^3); STEL 1250 ppm (2400 mg/m^3), 1999; France: VME 1000 ppm (1900 mg/m^3), VLE 5000 ppm, 1999; Hungary: TWA 1000 mg/m^3; STEL 3000 mg/m^3, 1993; the Netherlands: MAC-TGG 1000 mg/m^3, 2003; Norway: TWA 500 ppm (950 mg/m^3), 1999; the Philippines: TWA 1000 ppm (1900 mg/m^3), 1993; Poland: MAC (TWA) 1000 mg/m^3, MAC (STEL) 3000 mg/m^3, 1999; Russia: STEL 1000 mg/m^3, 1993; Sweden: NGV 500 ppm (1000 mg/m^3), KTV 1000 ppm (1900 mg/m^3), 1999; Switzerland: MAK-W 1000 ppm (1900 mg/m^3), 1999; Thailand: TWA 1000 ppm (1900 mg/m^3), 1993; Turkey: TWA 1000 ppm (1900 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (1950 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] set a MAC in ambient air of residential areas of 5.0 mg/m^3 on either a momentary or a daily average basis. Several states have set guidelines or standards for ethanol in ambient air[60] ranging from 0.26 mg/m^3 (Massachusetts) to 16.0 mg/m^3 (Virginia) to 19.0 mg/m^3 (North Dakota) to 38.0 mg/m^3 (Connecticut and South Dakota) to 45.238 mg/m^3 (Nevada).

Determination in Air: Collection by charcoal tube, 2-butanol/CS_2; analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1400, alcohols I.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 26,000 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.32$.

Routes of Entry: Inhalation of vapor and percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Levels of 5000−10,000 ppm may result in irritation of mouth, nose, throat and coughing, leading to sleep and stupor. *Skin:* Pure ethyl alcohol may cause drying, redness, and irritation. May be absorbed through damaged skin. *Eyes:* Irritation and tearing may result at 5000 ppm of vapor. Contact with liquid may cause severe irritation. *Ingestion:* 1 oz of pure ethyl alcohol may cause reddening of face and neck and an exaggerated feeling of well-being. 3 oz of pure ethyl alcohol may cause an initial burst of excitement and activity followed by increasing loss of coordination, slurred speech, nausea, and drowsiness. This may proceed to stupor, coma, and death. Lethal dose of ethyl alcohol ranges from 2 to 5 oz, depending on age and size of the individual. *Note:* many denatured alcohols contain additives which are extremely poisonous and cannot be removed by normal methods. Ingestion of denatured alcohol will produce much more serious poisoning.

Long Term Exposure: Prolonged inhalation of concentrations above 5000 ppm may produce symptoms listed under inhalation and the additional symptoms of headache, dizziness, tremor, and fatigue. Additives in denatured alcohol may result in other more severe symptoms. Alcohol has been linked to birth defects in humans. Ethyl alcohol may cause mutations. Repeated exposure (including alcoholic beverages) may cause spontaneous abortions as well as birth defects and other developmental problems, including "fetal alcohol syndrome." Chronic use of ethanol may cause cirrhosis of the liver. *Alcoholic Beverage Consumption* is on the NTP 11th Report on Carcinogens, Known to be a Human Carcinogen.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, blood, reproductive system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater or significant skin contact), the following are recommended before beginning work and at regular times after that: Liver function tests. Ethyl alcohol can be measured in the blood, urine, and exhaled breath. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite) End-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; **4 h:** Neoprene™ rubber gloves, suits, boots; Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *3300 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl alcohol must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, chlorates, nitrates, and permanganates, because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or flame. Sources of ignition, such as smoking and open flames, are prohibited where ethyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of ethyl alcohol should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl alcohol.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 7500 lb.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F +, Xi; Risk phrases: R12; R36/37; Safety phrases: S2; S16; S26; S29 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethylamine is a colorless gas or water-white liquid (below 17°C) with a strong, ammonia-like odor. Shipped as a liquefied compressed gas. Molecular weight = 45.10; Specific gravity (H_2O:1) = 0.69 (liquid); Boiling point = 16.7°C; Freezing/Melting point = − 81°C; Vapor pressure = 847 mmHg at 20°C; Flash point ≤ − 18°C; Autoignition temperature = 385°C. Explosive limits: LEL = 3.5%; UEL = 14.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Monoethylamine (MEA) is used as an intermediate in the manufacture of the following chemicals: triazine herbicides, 1,3-diethylthiourea (a corrosion inhibitor); ethylamino-ethanol; 4-ethylmorpholine (urethane foam catalyst); ethyl isocyanate; and dimethylolethyltriazone (agent used in wash-and-wear fabrics). The cuprous chloride salts of MEA are used in the refining of petroleum and vegetable oil.

Incompatibilities: The aqueous solution is a strong base. Forms explosive mixture with air. Reacts violently with strong acids, strong oxidizers, cellulose nitrate, and organic compounds, causing fire and explosion hazard. Also incompatible with organic anhydrides, isocyanates, vinyl acetate, acrylates, substituted allyls, alkylene oxides, epichlorohydrin, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks nonferrous metals: aluminum, copper, lead, tin, zinc and alloys; some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.85 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/18 mg/m^3 TWA.

NIOSH REL: 10 ppm/18 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/9.2 mg/m^3 TWA; 15 ppm/27.6 mg/m^3 STEL [skin].

Protective Action Criteria (PAC)*

TEEL-0: 7.5 ppm

PAC-1: **7.5** ppm

PAC-2: **49** ppm

PAC-3: **270** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/9.4 mg/m^3 TWA; Peak Limitation Category I(2) a momentary value of 10 mL/m^3/19 mg/m^3 should not be exceeded; Pregnancy Risk Group D.

NIOSH IDLH: 600 ppm.

Australia: TWA 10 ppm (18 mg/m^3), 1993; Austria: MAK 10 ppm (18 mg/m^3), 1999; Belgium: TWA 10 ppm (18 mg/m^3), 1993; Denmark: TWA 10 ppm (18 mg/m^3), [skin], 1999; Finland: TWA 10 ppm (18 mg/m^3); STEL 20 ppm (37 mg/m^3), [skin], 1999; France: VME 10 ppm (18 mg/m^3), VLE 15 ppm (27 mg/m^3), 1999; Japan: 10 ppm (18 mg/m^3), 1993; the Netherlands: MAC-TGG 9 mg/m^3, 2003; Norway: TWA 10 ppm (18 mg/m^3), 1999; the Philippines: TWA 10 ppm (18 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3, MAC (STEL) 15 mg/m^3, 1999; Russia: TWA 10 ppm, 1993; Sweden: NGV 10 ppm (18 mg/m^3), KTV 15 ppm (30 mg/m^3), [skin], 1999; Switzerland: MAK-W 10 ppm (18 mg/m^3), KZG-W 20 ppm (36 mg/m^3), 1999; Turkey: TWA 10 ppm (18 mg/m^3), 1993; United Kingdom: TWA 2 ppm (3.8 mg/m^3); STEL 6 ppm (11 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm [skin]. Russia set a MAC of 0.01 mg/m^3 in ambient air in residential areas on both a momentary and a daily average basis. Several states have set guidelines or standards for monoethylamine in ambient air[60] ranging from 180 μg/m^3 (North Dakota) to 300 μg/m^3 (Virginia) to 360 μg/m^3 (Connecticut) to 429 μg/m^3 (Nevada).

Determination in Air: Use NIOSH [II(3)] Method #S144 or OSHA Analytical Method 36.

Permissible Concentration in Water: EPA[32] has suggested an ambient environmental goal of 248 μg/L on a health basis. Russia[35] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = −0.27/−0.08 (calculated).

Routes of Entry: Inhalation, skin absorption (liquid), ingestion (liquid), skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Ethylamine can affect you when breathed in and by passing through your skin. Contact can severely burn the eyes and skin. Inhalation can severely irritate the eyes, nose, throat, and lungs, causing cough, wheezing, and/or shortness of breath. Repeated exposure may damage the lungs, kidneys, and heart.

Long Term Exposure: Repeated exposure can cause damage to the kidneys, liver, and heart. Can affect the eyes, causing blurred vision and/or cause the victim to see halos around lights, and result in permanent damage. Repeated exposure can affect the lungs, causing bronchitis; and tissue lesions.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Examination of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: examination of the heart; kidney function tests; liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** butyl rubber gloves, suits, boots; **4 h:** Teflon™ gloves, suits, boots; Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *500 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s) or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *600 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Ethylamine must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) or strong oxidizers (such as chlorine and bromine) because violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethylamine is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more of ethylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethylamine. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1 and there is no Packing Group listed. Ethylamine, aqueous solution with not <50% but not >70% ethylamine, requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Gas:* This chemical is flammable. Poisonous gases are produced in fire, including nitrogen oxides. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Solution: This chemical is flammable. Poisonous gases, including nitrogen oxides, are produced in fire. Shut off supply. If not possible, and at no risk to surroundings, let the fire burn itself out; in other cases use dry chemical or carbon dioxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.[22]

Ethyl amyl ketone E:0350

Molecular Formula: $C_8H_{16}O$

Common Formula: $CH_3CH_2COCH_2CH(CH_3)CH_2CH_3$

Synonyms: Amyl ethyl ketone; EAK; Ethyl *sec*-amyl ketone; 5-Methyl-3-heptanone (NIOSH, OSHA); 5-Metilheptano-3-ona (Spanish); 3-Octanone

CAS Registry Number: 541-85-5

RTECS® Number: MJ7350000

UN/NA & ERG Number: UN2271/128

EC Number: 208-793-7 [*Annex I Index No.:* 606-020-00-1]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R36/37; Safety phrases: S2; S23 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl amyl ketone is a colorless liquid with a mild, fruity odor. Molecular weight = 128.24; Boiling point = 157.2°C; Freezing/Melting point = −56.7°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 57°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. Ethyl amyl ketone is used as a solvent for resins, in the manufacture of perfume, and as an organic intermediate.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers may cause fire and explosions. Incompatible with strong bases, reducing agents, aldehydes, nitric acid, aliphatic amines.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.24 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/130 mg/m^3 TWA.

NIOSH REL: 25 ppm/130 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/52 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 25 ppm

PAC-1: 25 ppm

PAC-2: 25 ppm

PAC-3: 100 ppm

DFG MAK: 10 ppm/53 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

NIOSH IDLH: 100 ppm.

Australia: TWA 25 ppm (130 mg/m^3), 1993; Austria: MAK 25 ppm (130 mg/m^3), 1999; Belgium: TWA 25 ppm (131 mg/m^3), 1993; Denmark: TWA 25 ppm (130 mg/m^3), 1999; Finland: TWA 25 ppm (130 mg/m^3), ceiling 50 ppm (260 mg/m^3), 1999; France: VME 25 ppm (130 mg/m^3), 1999; the Netherlands: MAC-TGG 133 mg/m^3, 2003; Norway: TWA 20 ppm (100 mg/m^3), 1999; Sweden: TWA

25 ppm (130 mg/m^3); STEL 50 ppm (250 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (130 mg/m^3), 1999; United Kingdom: TWA 25 ppm (133 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. Several states have set guidelines or standards for ethyl amyl ketone in ambient air[60] ranging from 1.3 mg/m^3 (North Dakota) to 2.2 mg/m^3 (Virginia) to 2.6 mg/m^3 (Connecticut) to 3.095 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1301 or #2553.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Prolonged contact can cause skin rash. Inhalation can irritate the respiratory tract with coughing and shortness of breath. Exposure can cause headache, nausea, dizziness, lightheadedness, and unconsciousness.

Long Term Exposure: Can cause skin rash and drying and cracking of skin. Similar petroleum-based chemicals can cause brain and nerve damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Evaluate for brain and nervous system damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *100 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethyl amyl ketone must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl amyl ketone. Wherever ethyl amyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EAK out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

2-Ethylaniline E:0360

Molecular Formula: $C_8H_{11}N$

Synonyms: 2-Aethylanilin (German); *o*-Aminoethylbenzene; Aniline, *o*-ethyl-; Benzenamine, 2-ethyl-; 2-Ethyl aniline; 2-Ethylbenzenamine; 2-Ethylbenzenamino; 2-Etilanilina (Spanish)

CAS Registry Number: 578-54-1

RTECS® Number: BX9800000

UN/NA & ERG Number: UN2273/153

EC Number: 209-424-2

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Ethylaniline is a yellow liquid that turns brown on standing in air. Molecular weight = 121.20; Boiling point = 215°C; 210°C at 760 mmHg; Freezing/Melting point = 44°C; Vapor pressure = 0.11 mmHg at 20°C; Flash point = 85°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used in making drugs, dyes, and pesticides.

Incompatibilities: Decomposes on contact with light or air. Violent reaction on contact with strong oxidizers, strong acid anhydrides, and chloroformates.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: *N*-Ethylaniline can affect you when breathed in and by passing through your skin. High exposure can reduce the blood's ability to supply oxygen to the body (methemoglobinemia) and can cause the skin and lips to turn a blue color. Headache, weakness, and passing out may occur. Death could result from high exposures to skin or breathing. Contact can irritate or burn skin and eyes.

Long Term Exposure: Exposure can cause skin allergy to develop, with rash and itching. Once allergy is present, even low exposures may trigger symptoms. May affect the nervous system, causing headache, drowsiness, irritability, and confusion. May cause liver damage.

Points of Attack: Skin, blood, nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin (the blood change caused by ethylaniline). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver function tests.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention if any symptoms are present. *Skin Contact:* Quickly remove contaminated clothing. Immediately wash area with large amounts of soap; promptly seek medical attention. *Breathing:* Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethylaniline, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. 2-Ethylaniline must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), strong oxidizers, acid anhydrides (such as maleic anhydride), and chloroformates since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where 2-ethylaniline is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep 2-ethylaniline out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including aniline and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethylbenzene is a colorless liquid with a pungent aromatic odor. The odor threshold is 0.092−0.60 ppm. Molecular weight = 106.18; Specific gravity (H_2O:1) = 0.87; Boiling point = 136°C; Freezing/Melting point = − 95°C; Vapor pressure = 7% mmHg at 20°C; Flash point = 12.8°C; Autoignition temperature = 432°C. Explosive limits: LEL = 0.8%; UEL = 6.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.7%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylbenzene is used in styrene manufacture and in the synthesis of *p*-nitroacetophenone; in the manufacture of cellulose acetate and synthetic rubber. It is also used as a solvent or diluent and as a component of automotive and aviation gasoline. Significant quantities of EB are present in mixed xylenes. These are used as dilatants in the paint industry, in agricultural sprays for insecticides, and in gasoline blends (which may contain as much as 20% EB). In light of the large quantities of EB produced and the diversity of products in which it is found, there may exist environmental sources for ethylbenzene, e.g., vaporization during solvent use; pyrolysis of gasoline and emitted vapors at filling stations. Groups of individuals who are exposed to EB to the greatest extent and could represent potential pools for the expression of EB toxicity include (1) individuals in commercial situations where petroleum products or by-products are manufactured (e.g., rubber or plastics industry); (2) individuals residing in areas with high atmospheric smog generated by motor vehicle emissions.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, nitric acid. Attacks plastics and rubber. May accumulate static electrical charges, and may cause ignition of its vapors.

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Germ Cell Mutagen Category 3A (2006).

Australia: TWA 100 ppm (435 mg/m^3); STEL 125 ppm, 1993; Austria: MAK 100 ppm (440 mg/m^3), 1999; Belgium: TWA 100 ppm (434 mg/m^3); STEL 125 ppm (543 mg/m^3), 1993; Denmark: TWA 50 ppm (217 mg/m^3), 1999; Finland: TWA 100 ppm (435 mg/m^3); STEL 150 ppm (655 mg/m^3), 1999; France: VME 100 ppm (435 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 200 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 215 mg/m^3, [skin], 2003; Norway: TWA 50 ppm (220 mg/m^3), 1999; the Philippines: TWA 100 ppm (435 mg/m^3), 1993; Poland: MAC (TWA) 100 mg/m^3, MAC (STEL) 350 mg/m^3, 1999; Russia: TWA 100 ppm; STEL 50 mg/m^3, 1993; Sweden: NGV 50 ppm (200 mg/m^3), KTV 100 ppm (450 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (435 mg/m^3), KZG-W 500 ppm (2175 mg/m^3), [skin], 1999; Turkey: TWA 100 ppm (435 mg/m^3), 1993; United Kingdom: TWA 100 ppm (441 mg/m^3); STEL 125 ppm (552 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: STEL 125 ppm. The Czech Republic: TWA 200 mg/m^3. Russia[35, 43] set a MAC of 0.02 mg/m^3 in the ambient air in residential areas on either a momentary or a daily average basis. Several states have set guidelines or standards for ethylbenzene in ambient air[60] ranging from 0.12 mg/m^3 (Massachusetts) to 1.45 mg/m^3 (New York) to 4.35 mg/m^3 (Florida, South Carolina) to 4.35−5.45 mg/m^3 (North Dakota) to 7.25 mg/m^3 (Virginia) to 8.7 mg/m^3 (Connecticut) to 10.357 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with CS_2, analysis by gas chromatography/flame ionization. NIOSH Analytical Method #1501 for aromatic hydrocarbons.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 32,000 μg/L, on an acute toxicity basis. *To protect saltwater aquatic life:* 430 μg/L, on an acute toxicity basis. *For the protection of human health*: 1.4 mg/L.[6] The EPA[48] has developed a lifetime health advisory for ethylbenzene of 0.68 mg/L, rounded to 0.7.[61] Russia[35,43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes and 0.011 mg/L in water bodies used for fishery purposes. Several states have set guidelines for ethylbenzene in drinking water[61] ranging from 1.0 μg/L (Illinois) to 680 μg/L (Arizona, California, Kansas, Minnesota) to 750 μg/L (New Mexico) to 1400 μg/L (Vermont and Wisconsin).

Determination in Water: Inert gas purge followed by gas chromatography and photoionization detection (EPA Method 602) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethylbenzene irritates the eyes, skin, and respiratory tract. Exposure to high concentrations can cause dizziness, lightheadedness, and unconsciousness. Very high exposures (above the OEL) can cause difficult breathing, narcosis, coma, and even death. Swallowing the liquid may cause aspiration into the lungs, resulting in chemical pneumonitis. May affect the central nervous system. Concentration of 200 ppm can cause irritation.

Long Term Exposure: Repeated or prolonged exposure to the skin may cause drying, scaling, and blistering. May cause kidney disease, liver disease, chronic respiratory disease, skin disease: EB is not nephrotoxic. Concern is expressed because the kidney is the primary route of excretion of EB and its metabolites. EB is not hepatotoxic. Since EB is metabolized by the liver, concern is expressed for these tissues. Exacerbation of pulmonary pathology might occur following exposure to EB. Individuals with impaired pulmonary function might be at risk. EB is a defating agent and may cause dermatitis following prolonged exposure. Individuals with preexisting skin problems may be more sensitive to EB. There is limited evidence that EB may damage the developing fetus, and may cause mutations.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Kidney function tests. Evaluate for brain and nervous system effects. NIOSH lists the following tests: whole blood (chemical/metabolite); during exposure, expired air, expired air: prior to next shift; urine (chemical/metabolite); urine (chemical/metabolite) End-of-shift; urine (chemical/metabolite) End-of-shift, end-of-work-week; urine (chemical/metabolite). Last 2 h of 8-h exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Viton™ gloves, suits, Barricade® coated suits; Responder™ suits; Trychem 1000™ suits, **4 h:** Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *800 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferable. Inside storage should be in a standard flammable liquids storage room or cabinet. Isolate from acute fire hazards and oxidizing agents. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EB out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22]

N-Ethylbenzyltoluidine E:0390

Molecular Formula: $C_{16}H_{19}N$

Common Formula: $H_3CC_6H_4N(C_2H_5)(CH_2C_6H_5)$

Synonyms: Benzenemethanamine; Ethylbenzyltoluidine*; N*-Ethyl-*N*-(3-methylphenyl)toluidine

CAS Registry Number: 119-94-8

RTECS® Number: XU3676000

UN/NA & ERG Number: UN2753/153

EC Number: 204-359-6

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethylbenzyltoluidine is a yellowish to light brown liquid with an unpleasant odor. Boiling point = 230°C; Flash point = 167°C. Insoluble in water.

Potential Exposure: This compound is used in dye synthesis.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can interfere with the ability of the blood to carry oxygen (methemoglobinemia), causing headaches, dizziness, weakness, a bluish skin color, and even death. This substance can damage the kidneys and bladder, causing painful, bloody urine. Eye contact causes irritation and can lead to permanent damage. Skin contact can cause a rash and burning feeling.

Points of Attack: Blood, skin.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: blood methemoglobin level. Kidney function tests. Urine tests for blood and for *n*-acetyl *p*-aminophenol.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately.

Skin Contact: Quickly remove contaminated clothing. Immediately wash area with large amounts of soap and water. Seek medical attention if symptoms develop and remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethylbenzyltoluidine, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and light. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ethylbenzyltoluidine may burn but does not readily ignite. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethylbis(2-chloroethyl)amine (Agent HN-1, WMD) E:0400

Molecular Formula: $C_6H_{13}Cl_2N$

Common Formula: $C_2H_5N(CH_2CH_2Cl)_2$

Synonyms: AI3-16200; 2-Chloro-*N*-(2-chloroethyl)-*N*-ethylethanamine; 2,2′-Dichlorotriethylamine; Ethanamine, 2-chloro-*N*-(2-chloroethyl)-*N*-ethyl-; Ethyl-S; Ethylbis (β-chloroethyl)amine; HN-1 (military designation); Nitrogen mustard-1; TL 1149; TL329; Triethylamine, 2,2′-dichloro-

CAS Registry Number: 538-07-8

RTECS® Number: YE1225000

UN/NA & ERG Number: UN2810 (toxic liquids, organic, n.o.s.)/153

UN/NA & ERG Number: Not assigned.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

According to NIOSH, HN-1 is a *known carcinogen, developmental toxin, and reproductive toxin.*[NIOSH]

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrogen mustard is a pale yellow, oily, mobile liquid. HN-1 is a mustard blister agent (vesicant) that has a faint musty or fishy odor. *Nitrogen mustards* are colorless when pure but are typically a yellow to brown oily substance. Odors are variably described as sweet, agreeable, slightly garlic- or mustard-like. It evaporates slowly. Molecular weight = 170.11; 170.08[NIOSH]; Specific gravity 1.09 g/cm^3 at 25°C; Boiling point = (decomposes) 194°C; Freezing/Melting point = − 3.4°C; Volatility = 2.29 mg/L at 25°C; Vapor density (air = 1) = 5.9; Vapor pressure = 0.25 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Slightly soluble in water. 160 mg/L at 25°C.

Potential Exposure: Sulfur mustards were formerly used as a gas warfare agent. Nitrogen mustards have not previously been used in warfare.[NIOSH] HN-1 can be used as a delayed-action military casualty agent. Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal.[NIOSH]

Persistence of Chemical Agent: HN: Summer: 3 days to 1 week; Winter: May last for weeks.

Incompatibilities: Avoid contamination with oxidizing agents, e.g., nitrates, oxidizing acids, chlorine bleaches, swimming pool chlorine, which may result in ignition. Toxic intermediate products are produced during hydrolysis of HN-1.[NIOSH] Unstable in the presence of light and heat and forms dimers at temperatures above 122°F/50°C. Corrosive to ferrous alloys beginning at 149°F/65°C. Contact with metals may evolve flammable hydrogen gas. Polymerizes slowly, so munitions would be effective for several years.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) HN-1*
TEEL-0: 0.004 mg/m^3
PAC-1: 0.0125 mg/m^3
PAC-2: **0.022** mg/m^3
PAC-3: **0.37** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face.**

Determination in Water: HN-1 is a water contaminant. Octanol−water coefficient: Log K_{ow} = (estimated) 2.02.

Harmful Effects and Symptoms

Nitrogen mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells. Clinical effects do not appear until hours after exposure. Nitrogen mustards penetrate and bind quickly to cells of the body; their health effects develop slowly. The full extent of cellular injury may not be known for days. The sooner after exposure that health effects occur, the more likely it is that the patient/victim was exposed to a high concentration of HN-2. Similarly, the sooner that health effects occur, the more likely it is that they will progress and become severe. *Eye exposure*: The eyes are the organs that are most sensitive to mustard vapor; eye injury may occur within 1−2 h after severe exposure or 3−12 h after a mild to moderate exposure. Inhalation exposure: Airway injury may occur within 2−6 h after severe exposure and within 12−24 h after mild exposure. Skin exposure: The symptom-free (latent) period is 6−12 h in temperate conditions; hot, humid weather strikingly increases the action of nitrogen mustards. Some skin injury may appear as late as 48 h after exposure.[NIOSH]

Short Term Exposure: Poisonous by all routes. HN-1 is a nitrogen mustard. It is highly irritating to skin, eyes, and mucous membranes. Nitrogen mustards have preferential toxicity for rapidly dividing cells. Workers exposed briefly to estimated concentrations of 10−100 ppm by inhalation became severely ill. The median lethal dosage is 1500 mg-min/m^3. Irritate the eyes in quantities which do not significantly damage the skin or respiratory tract, insofar as single exposures are concerned. After mild vapor exposure, there may be no skin lesions. After severe vapor exposures, or after exposure to the liquid, erythema may appear. Irritation and itching may occur. Later, blisters may appear in the erythematous areas. Effects on the respiratory tract include irritation of the nose and throat, hoarseness progressing to loss of voice, and a persistent cough. Fever, labored respiration, and moist riles develop. Bronchial pneumonia may appear after the first 24 h. Following ingestion or systemic absorption, material causes inhibition of cell mitosis, resulting in depression of the blood-forming mechanism and injury to other tissues. Severe diarrhea, which may be hemorrhagic, occurs. Lesions are most marked in the small intestine and consist of degenerative changes and narcosis in the mucous membranes. Ingestion of 2−6 mg causes nausea and vomiting.

Long Term Exposure: Following significant whole-body (systemic) absorption of nitrogen mustard, injury to the bone marrow, lymph nodes, and spleen may cause a drop in white blood cell counts (beginning on days 3−5), which can result in an increased risk for developing (life-threatening) infections. Counts of red blood cells and platelets may also fall due to bone marrow damage.

First Aid: There is no antidote for nitrogen mustard toxicity. Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage.[NIOSH] Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 h. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. Stop exposure and treat symptomatically. Move victim to fresh air; call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage.[NIOSH] Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first 2 min following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/health-care providers or the health-care facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing. (2) Patients exposed to liquid should be decontaminated by (a) washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes, or open wounds with sterile saline or water.

(3) The health-care provider should (a) check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process; (b) be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time-consuming process. The health-care provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Personal Protective Methods: Wear Totally Encapsulating Chemical Protective (TECP) suit that provides protection against CBRN agents; Chemical-resistant inner and outer gloves; Chemical-resistant boots with a steel toe and shank; Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items. Take all necessary precautions to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Where a potential exposure to the chemical exists, use a NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation Hazard, Packing Group I, Zone B] requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group 1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation and skin contact. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

HN-1, when used as a weapon

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)

Day	0.2/0.3
Night	0.4/0.6

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. When heated to decomposition, it emits poisonous gases of hydrogen chloride and nitrogen oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethyl bromide E:0410

Molecular Formula: C_2H_5Br
Synonyms: Bromic ether; Bromoethane; Bromure d'ethyle (French); Halon 2001; Hydrobromic ether; Monobromoethane; NCI-C55481
CAS Registry Number: 74-96-4
RTECS® Number: KH6475000
UN/NA & ERG Number: UN1891/131
EC Number: 200-825-8 [*Annex I Index No.:* 602-055-00-1]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse; equivocal evidence: rat; NTP: Carcinogenesis Studies (inhalation); some evidence: rat; IARC: Human No Adequate Evidence; Animal Limited Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Gene-Tox Program, Inconclusive: *D. melanogaster* sex-linked lethal.

California Proposition 65 Chemical: Cancer 12/22/00.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xn; Risk phrases: R11; R20/21/22; R40; Safety phrases: S2; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl bromide is a colorless liquid (turns yellow on contact with air) with an ether-like odor and a burning taste. A gas above the boiling point. Odor threshold = 3.1 ppm. Molecular weight = 108.98; Specific gravity (H_2O:1) = 1.46; Boiling point = 38.3°C; Freezing/Melting point = -118.9; Vapor pressure = 375 mmHg at 20°C; Flash point = < -15.6°C; Autoignition temperature = 511°C. Explosive limits: LEL = 6.8%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.9%.

Potential Exposure: Compound Description: Tumorigen, Mutagen. This chemical is used as an industrial chemical, pharmaceutical, and veterinary drug; as an ethylating agent in organic synthesis and gasoline; as a refrigerant; and as an extraction solvent. It has limited use as a local anesthetic.

Incompatibilities: Forms explosive mixture with air. Hydrolyzes in water, forming hydrogen bromide. Oxidizers may cause fire or explosions. Fire and explosions may be caused by contact with chemically active metals: aluminum, magnesium or zinc powders, lithium, potassium, sodium. Attacks some plastic, rubber, and coatings.

Note: Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine, vigorously chlorinate nitrogen mustards to the carbon chain, giving low toxicity products. In the presence of water this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.46 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 200 ppm/890 mg/m^3 TWA.
NIOSH REL: None.

ACGIH TLV®[1]: 5 ppm/22 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: 2000 ppm.
Protective Action Criteria (PAC)
TEEL-0: 5 ppm
PAC-1: 750 ppm
PAC-2: 2000 ppm
PAC-3: 2000 ppm
DFG MAK: [skin] Carcinogen Category 2.
Australia: TWA 200 ppm (890 mg/m^3); STEL 250 ppm, 1993; Austria: carcinogen, 1999; Belgium: TWA 200 ppm (891 mg/m^3); STEL 250 ppm (1100 mg/m^3), 1993; Denmark: TWA 5 ppm (22 mg/m^3), [skin], 1999; Finland: TWA 200 ppm (890 mg/m^3); STEL 250 ppm (1115 mg/m^3), 1999; France: VME 288 ppm (890 mg/m^3), 1999; Hungary: TWA 50 mg/m^3; STEL 100 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 22 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (22 mg/m^3), 1999; the Philippines: TWA 300 ppm (890 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3, MAC (STEL) 400 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 5 ppm (22 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 200 ppm (890 mg/m^3), 1993; United Kingdom: TWA 200 ppm (906 mg/m^3); STEL 250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines for ethyl bromide in ambient air[60] ranging from 8.9−11.1 mg/m^3 (North Dakota) to 14.8 mg/m^3 (Virginia) to 17.8 mg/m^3 (Connecticut) to 21.19 mg/m^3 (Nevada).

Determination in Air: Charcoal adsorption, workup with isopropanol, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1011.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Nitrogen Mustard is a blister agent (vesicant) that causes delayed severe damage to the respiratory tract. It is an alkylating agent that damages the cells within the bone marrow that are necessary for making blood cells.

Short Term Exposure: Irritates the skin, eyes, and respiratory tract. Inhalation can cause lung irritation with coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause central nervous system depression, headache, nausea, dizziness, loss of balance, slurred speech, numbness, unconsciousness, and death. Exposure to high concentrations can cause cardiac arrhythmia. This can be fatal.

Points of Attack: Skin, liver, kidneys, respiratory system, lungs, cardiovascular system, central nervous system.

Medical Surveillance: Liver and kidney function tests. EKG. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *Up to 2000 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBA (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator under an inert atmosphere and protect from light. Keep away from incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup

is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl bromide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and hydrogen bromide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with adequate scrubbing and ash disposal facilities.

Ethyl bromoacetate E:0420

Molecular Formula: $C_4H_7BrO_2$

Synonyms: Acetic acid, bromo-, ethyl ester; Antol; Bromoacetic acid, ethyl ester; Ethoxycarbonylmethyl bromide; Ethyl α-bromoacetate; Ethyl bromoacetate; Ethyl monobromoacetate

CAS Registry Number: 105-36-2

RTECS® Number: AF6000000

UN/NA & ERG Number: UN1603/155

EC Number: 203-290-9 [*Annex I Index No.:* 607-069-00-1]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T+; Risk phrases: R26/27/28; Safety phrases: S1/2; S7/9; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl bromoacetate is a clear, colorless to light-yellow liquid. Molecular weight = 167.02; Boiling point = 159°C. Freezing point ≤−20°C; Flash point = 48°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Used for making pharmaceuticals; as a warning gas in poisonous, odorless gasses; as a tear gas.

Incompatibilities: Forms explosive mixture with air. Oxidizers, strong acids, strong bases, and reducing agents.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.00075 ppm
PAC-1: 0.0025 ppm
PAC-2: 0.02 ppm
PAC-3: 0.1 ppm

Routes of Entry: Inhalation, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can irritate the respiratory tract and cause headache, nausea, and vomiting. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Can irritate the skin causing rash or a burning sensation on contact. Can cause severe eye burns leading to permanent damage.

Long Term Exposure: May cause skin allergy and irritate the lungs, causing bronchitis to develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs, skin.

Medical Surveillance: Lung function tests. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases, reducing agents, heat, and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: DOT label requirement of "POISONOUS/ TOXIC MATERIALS, FLAMMABLE LIQUID." Ethyl bromoacetate falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and hydrogen bromide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: S21/22; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethylbutanol is a colorless liquid with a mild, alcoholic odor. Molecular weight = 102.20; Boiling point = 149°C. Freezing/Melting point = −114°C; Vapor pressure = 0.89 mmHg at 20°C; Flash point = 58°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Primary Irritant. Used as a solvent; for making dyes, perfumes, flavorings, and drugs.

Incompatibilities: Forms explosive mixture with air. Incompatible with oxidizers, strong acids, caustics, isocyanates, amines, isocyanates.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, eyes, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause skin irritation. Eye contact can cause severe irritation and burns; possible permanent damage. Inhalation can cause irritation of the respiratory tract, causing coughing and wheezing. Exposure can cause headache, dizziness, nausea, and vomiting.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases, reducing agents, heat, and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." Ethylbutanol is in DOT/UN Hazard Class 3 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Ethyl butyl ether E:0440

Molecular Formula: $C_6H_{14}O$

Synonyms: Butane, 1-ethoxy-; Butyl ethyl ether; Ether ethylbutylique (French); Ethyl-*n*-butyl ether

CAS Registry Number: 628-81-9

RTECS® Number: KN4725000

UN/NA & ERG Number: UN1179/127

EC Number: 211-055-7

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl butyl ether is a colorless liquid. Molecular weight = 102.21; Boiling point = 92°C; Freezing/Melting point = − 124°C; Flash point = 4°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a solvent for extraction and in making other chemicals.

Incompatibilities: Forms explosive mixture with air. Heat or prolonged storage may cause the formation of unstable peroxides. Violent reaction with strong oxidizers. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, eyes, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract with coughing and wheezing. High levels can cause dizziness and loss of consciousness.

Long Term Exposure: Repeated or high exposures may affect the nervous system. Repeated exposure may remove the oils from the skin causing dryness, rash, or cracking.

Points of Attack: Skin, nervous system.

Medical Surveillance: Test the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, heat, and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "FLAMMABLE LIQUID." It is in DOT/UN Hazard Class 3 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure

position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R 10; R20; R36; Safety phrases: S2; S24 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl butyl ketone is a colorless liquid with a powerful, fruity odor. Molecular weight = 114.21; Specific gravity (H_2O:1): 0.82; Boiling point = 147.8°C; Freezing/ Melting point = −38.9°C; Vapor pressure = 4 mmHg at 20°C; Flash point = 46°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water; solubility = 1%.

Potential Exposure: Compound Description: Primary Irritant. Ethyl butyl ketone is used as a solvent and as an intermediate in organic synthesis. It is a solvent for vinyl and nitrocellulose resins. It is used in food flavoring.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers, acetaldehyde, perchloric acid. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 50 ppm/230 mg/m^3 TWA.

NIOSH REL: 50 ppm/230 mg/m^3 TWA.

ACGIH TLV®[1]: 50 ppm/234 mg/m^3 TWA; 75 ppm/ 350 mg/m^3 STEL.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 75 ppm

PAC-2: 200 ppm

PAC-3: 1000 ppm

DFG MAK: 10 ppm/47 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D.

Australia: TWA 50 ppm (230 mg/m^3), 1993; Austria: MAK 50 ppm (230 mg/m^3), 1999; Belgium: TWA 50 ppm (234 mg/m^3), 1993; Denmark: TWA 50 ppm (230 mg/m^3), 1999; Finland: TWA 50 ppm (230 mg/m^3); STEL 75 ppm (345 mg/m^3), 1999; France: VME 50 ppm (230 mg/m^3), 1999; the Netherlands: MAC-TGG 163 mg/m^3, 2003; Norway: TWA 25 ppm (115 mg/m^3), 1999; Sweden: TWA 25 ppm (120 mg/m^3); STEL 50 ppm (250 mg/m^3), 1999; Switzerland: MAK-W 50 ppm (230 mg/m^3), 1999; United Kingdom: TWA 50 ppm (237 mg/m^3); STEL 100 ppm [skin] 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 75 ppm. Several states have set guidelines or standards for ethyl butyl ketone in ambient air[60] ranging from 2.3−3.45 mg/m^3 (North Dakota) to 3.8 mg/m^3 (Virginia) to 4.6 mg/m^3 (Connecticut) to 5.476 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1301, #2553, or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl butyl ketone irritates the eyes, skin, and respiratory tract. Exposure to high concentrations can affect the central nervous system, cause dizziness, lightheadedness, and to lose consciousness.

Long Term Exposure: Repeated or prolonged contact with skin may cause dryness and cracking.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing

material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash promptly when skin is wet or contaminated. Remove nonimpervious clothing promptly if wet or contaminated.

Respirator Selection: *500 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or Sa (APF = 10) (any supplied-air respirator). *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethyl butyl ketone must be stored to avoid contact with oxidizers, such as peroxides, chlorates, perchlorates, permanganates, and nitrates, because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethyl butyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Ketones, liquid, n.o.s. require a shipping label of "FLAMMABLE LIQUID." They fall in Hazard Class 3 and ethyl butyl ketone in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl butyl ketone out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ethyl butyraldehyde E:0460

Molecular Formula: $C_6H_{12}O$

Common Formula: $(C_2H_5)_2CHCHO$

Synonyms: Aldehyde-2-ethylbutyrique (French); Butyraldehyde, 2-ethyl-; Diethyl acetaldehyde; 2-Ethylbutanal; α-Ethylbutyraldehyde; 2-Ethylbutyraldehyde; Ethylbutyraldehyde; 2-Ethylbutyric aldehyde
CAS Registry Number: 97-96-1
RTECS® Number: ES2625000
UN/NA & ERG Number: UN1178/130
EC Number: 202-623-5
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Ethyl butyraldehyde is a colorless liquid. Molecular weight = 100.18; Boiling point = 116.8°C; Freezing/Melting point = −89°C; Flash point = 21°C (oc). Explosive limits: LEL = 1.2%; UEL = 7.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Insoluble in water.
Potential Exposure: Used in organic synthesis of pharmaceuticals and rubber chemicals.
Incompatibilities: Strong oxidizers, strong bases, reducing agents.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the skin and eyes on contact. Inhalation irritates the respiratory tract causing coughing and wheezing.
Long Term Exposure: Unknown at this time.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, polyurethane foams, or a similar material and deposit in sealed containers. Keep ethyl butyraldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be

trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ethyl butyrate E:0470

Molecular Formula: $C_6H_{12}O_2$

Common Formula: $C_3H_7COOC_2H_5$

Synonyms: Butonic acid, ethyl ester; Butyric acid, ethyl ester; Butyric ether; Ethyl butanoate; Ethyl *n*-butyrate

CAS Registry Number: 105-54-4

RTECS® Number: ET1660000

UN/NA & ERG Number: UN1180/130

EC Number: 203-306-4

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl butyrate is a colorless liquid with a pineapple-like odor. The odor threshold is 0.015 ppm.[41] Molecular weight = 116.16; Boiling point = 120°C; Flash point = 24°C; Autoignition temperature = 463°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Ethyl butyrate is used in flavorings, extracts, perfumery, and as a solvent.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidizers, strong acids, strong bases, heat.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl butyrate can affect you when breathed in and by passing through your skin. Contact can irritate the skin and eyes. The vapor irritates the eyes, nose, throat, and lungs. Symptoms may include nosebleeds, sore throat, cough with phlegm, and/or difficulty in breathing. Overexposure may cause headaches and make you feel dizzy and lightheaded. Higher levels can make you pass out.

Long Term Exposure: Unknown at this time.

Points of Attack: Lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests, especially with irritation symptoms. Consider liver function tests after suspected overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl butyrate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethyl butyrate is incompatible with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), bases, and heat. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where ethyl butyrate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl butyrate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl butyrate.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill. Cover spill with activated carbon adsorbent, take up and deposit in sealed containers. Keep ethyl butyrate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethyl chloride is a colorless gas or liquid (below 12°C) with a pungent, ether-like odor and a burning taste. Shipped as a liquefied compressed gas. Molecular weight = 64.52; Specific gravity (H_2O:1) = 0.92 (liquid at 0°C); Boiling point = 12.2°C; Freezing/Melting point = −138.9; Vapor pressure = 1000 mmHg at 20°C; Flash point = −50°C (liquid); Autoignition temperature = 519°C. Explosive limits: LEL = 3.8%; UEL = 15.4%. Hazard Identification (based on NFPA-704

M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.6%.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone. Ethyl chloride is used as an ethylating agent in the manufacture of tetraethyl lead, dyes, drugs, and ethyl cellulose; as a pharmaceutical solvent; alkylating agent; as a refrigerant; and as a local anesthetic (freezing).

Incompatibilities: Flammable gas. Slow reaction with water; forms hydrogen chloride gas. Contact with moisture (water, steam) forms hydrochloric acid and/or fumes of hydrogen chloride. May accumulate static electrical charges, and may cause ignition of its vapors. Forms explosive mixture with air. Contact with chemically active metals: aluminum, lithium, magnesium, sodium, potassium, zinc may cause fire and explosions. Attacks some plastics and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.64 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/2600 mg/m^3 TWA.

NIOSH REL: Handle with caution in the workplace. NIOSH considers chloroethanes to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 100 ppm [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 3800 [LEL].

Temporary Emergency Exposure Limits (DOE).

TEEL-0: 100 ppm

PAC-1: 200 ppm

Australia: TWA 1000 ppm (2600 mg/m^3), 1993; Austria Suspected: carcinogen, 1999; Belgium: TWA 1000 ppm (2640 mg/m^3), 1993; Denmark: TWA 1000 ppm (2600 mg/m^3), 1999; Finland: TWA 500 ppm (1300 mg/m^3); STEL 625 ppm (1625 mg/m^3), 1999; France: VME 1000 ppm (2600 mg/m^3), 1999; Hungary: TWA 100 mg/m^3; STEL 300 mg/m^3, 1993; the Netherlands: MAC-TGG 2600 mg/m^3, 2003; Norway: TWA 500 ppm (1300 mg/m^3), 1999; the Philippines: TWA 1000 ppm (2600 mg/m^3), 1993; Poland: MAC (TWA) 200 mg/m^3, MAC (STEL) 1600 mg/m^3, 1999; Russia: TWA 1000 ppm; STEL 50 mg/m^3, 1993; Sweden: NGV 500 ppm (1300 mg/m^3), KTV 700 ppm (1900 mg/m^3), 1999; Switzerland: MAK-W 1000 ppm (2600 mg/m^3), 1999; Turkey: TWA 1000 ppm (2600 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (2700 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[35, 43] set a MAC in work-place air of 50 mg/m^3. Limits on ambient air in residential areas have been set by Russia[35] at 0.2 mg/m^3 on a daily average basis and by the Czech Republic at 0.1 mg/m^3 on a daily average basis. Several states have set guidelines or standards for ethyl chloride in ambient air[60] ranging from zero (Virginia) to 0.36 mg/m^3 (Massachusetts) to 26.0 mg/m^3 (North Dakota) to 52.0 mg/m^3 (Connecticut, Florida, New York) to 61.88 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 2519.[18]

Permissible Concentration in Water: No criteria set due to volatility and low specific gravity.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.53$.

Routes of Entry: Inhalation of gas, slight percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl chloride irritates eyes, skin, and respiratory tract. Inhalation of vapor may have a narcotic effect. Skin contact with the liquid may cause frostbite. Ethyl chloride exposure may produce headache, dizziness, lack of coordination, stomach cramps, and eventual loss of consciousness. In high concentrations, it is a respiratory tract irritant, and death due to cardiac arrest has been recorded. Renal damage has been reported in animals.

Long Term Exposure: There is limited evidence that ethyl chloride causes skin or uterine cancer in animals. May affect the nervous system, liver, and kidneys.

Points of Attack: Liver, kidneys, respiratory system, cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heartbeat. Tests of liver and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **4 h:** Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *Up to 3800 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF* (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl chloride must be stored to avoid contact with oxidizers (such as peroxides, chlorates, perchlorates, nitrates, and permanganates) or chemically active metals (such as sodium, potassium, calcium, powdered aluminum, zinc, and magnesium) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where ethyl chloride is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more of ethyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl chloride. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1 and there is no Packing Group.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *If ethyl chloride gas is leaked*, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep ethyl chloride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid or gas. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire.

Liquid: Establish forced ventilation to keep levels below explosive limit. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Establish forced ventilation to keep levels below explosive limit. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in

OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Ethyl chloroacetate E:0490

Molecular Formula: $C_4H_7ClO_2$

Common Formula: $CH_3CH_2OCO \cdot CH_2Cl$

Synonyms: Chloroacetic acid, ethyl ester; Ethyl α-chloroacetate; Ethyl chloroacetate; Ethyl chloroethanoate; Ethyl monochloracetate; Ethyl monochloroacetate

CAS Registry Number: 105-39-5

RTECS® Number: AF9110000

UN/NA & ERG Number: UN1181/155

EC Number: 203-294-0 [*Annex I Index No.*: 607-070-00-7]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/24/25; R50; Safety phrases: S1/2; S7/9; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethyl chloroacetate is a water-white liquid with a pungent, fruity odor. Molecular weight = 122.56; Boiling point = 145°C. Freezing point = −27°C; Flash point = 64°C. Hazard Identification (based on NFPA-704 M Rating System): Health: 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Primary Irritant. Used to make rodenticides, dyes, and other chemicals. Also used as a military poison.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong bases, strong acids, reducing agents. Moisture, water, and steam contact forms toxic and corrosive fumes. Violent reaction with oxidizers, alkaline earth metals (barium, calcium, magnesium, strontium, etc.), alkaline metals, sodium cyanide. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.15 ppm
PAC-1: 0.4 ppm
PAC-2: 3 ppm
PAC-3: 15 ppm

Routes of Entry: Inhalation, eyes, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can severely irritate and burn eyes and skin. Inhalation can irritate the respiratory tract with coughing and wheezing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, nausea, and vomiting.

Long Term Exposure: Very irritating substances may cause lung damage.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases, reducing agents, heat, and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ethyl 2-chloropropionate E:0500

Molecular Formula: $C_5H_9ClO_2$

Common Formula: $CH_3CHClCOOC_2H_5$

Synonyms: 2-Chloropropionic acid, ethyl ester; Propanoic acid, 2-chloro-, ethyl ester

CAS Registry Number: 535-13-7

RTECS® Number: UE8870000

UN/NA & ERG Number: UN2935/129

EC Number: 208-610-0

Regulatory Authority and Advisory Bodies

WGK (Germany) 3 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl-2-chloropropionate is a liquid with a pleasant odor. Molecular weight = 136.8; Boiling point = 147°C; Flash point = 41.8°C.

Potential Exposure: This material is used in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Acids, bases, oxidizers, reducing agents.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl-2-chloropropionate can affect you when breathed in. Eye or skin contact may irritate the nose, throat, and bronchial tubes. High exposures might cause a dangerous fluid buildup in the lungs (pulmonary edema); a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Some related chemicals may cause skin allergy. Very irritating substances may cause lung problems.

Points of Attack: Respiratory tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider lung function tests, especially if lung symptoms are present. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl-2-chloropropionate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids, bases, oxidizing and reducing agents. Sources of ignition, such as smoking and open flames, are prohibited where ethyl-2-chloropropionate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including chlorides, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethyl cyanoacetate E:0510

Molecular Formula: $C_5H_7NO_2$

Synonyms: Acetic acid, cyano-, ethyl ester; Cyanacetate ethyle (German); Cyanoacetic acid ethyl ester; Cyanoacetic ester; Estere cianoacetico; Ethyl cyanoacetate; Ethyl cyanoethanoate; Malonic acid, ethyl ester nitrile

CAS Registry Number: 105-56-6

RTECS® Number: AG4110000

UN/NA & ERG Number: UN2666/156

EC Number: 203-309-0

Regulatory Authority and Advisory Bodies

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl cyanoacetate is a colorless to straw-colored liquid with a mild pleasant odor. Molecular weight = 113.14; Boiling point = 207°C; Freezing/Melting point = −23°C; Vapor pressure = 1 mmHg at 68°C; Flash point = 110°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Used to manufacture dyes, pharmaceuticals, and other chemicals.

Incompatibilities: Oxidizers, strong acids, strong bases, and reducing agents. Reacts with moisture, water, and steam, forming toxic fumes.

Permissible Exposure Limits in Air

NIOSH REL: (*nitriles*) 2 ppm, Ceiling Concentration, not to be exceeded in any 15-min work period.

No TEEL available.

Determination in Air: See NIOSH Criteria Document 78-212, NITRILES.

Routes of Entry: Inhalation. May be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: An organic cyanide compound. Irritates the eyes, skin, and respiratory tract. Exposure can cause headache, nausea, and vomiting. Poisonous if ingested.

Long Term Exposure: Unknown at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases, strong acids, reducing agents, moisture, and sources of ignition. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: DOT label requirement is “POISONOUS/TOXIC MATERIALS.” Ethyl cyanoacetate falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, nitrogen oxides, and cyanides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound

increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl 4,4′-dichlorobenzilate is a yellow solid when pure. The technical product is a brownish liquid. Molecular weight = 82.04; Specific gravity (water = 1) = 1.282; Boiling point = 146−148°C; Freezing/Melting point = 35−37.3°C (pure); Vapor pressure = 2.2×10^{-6} mmHg at 20°C; Flashpoint = 40°C. Practically insoluble in water; solubility = <0.1 mg/mL at 22°C.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. It is a buffer in many chemical intermediates; an organochlorine miticide to kill mites, ticks, and other insects; as a synergist for DDT.

Incompatibilities: Strong acids, strong bases, lime.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 300 mg/m^3

Routes of Entry: Inhalation, ingestion, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the skin causing rash or burning sensation. Exposure can cause headache, loss of appetite, nausea, vomiting, and diarrhea.

Long Term Exposure: This chemical may damage the male reproductive glands. May cause liver and kidney damage. Repeated or prolonged exposure may affect the nervous system, causing a loss of coordination, muscle weakness, tremors, convulsions, dizziness, and possible coma. This chemical may be a human carcinogen.

Points of Attack: Liver, kidneys, nervous system.

Medical Surveillance: Examination of the nervous system. Liver and kidney function tests. More than light alcohol consumption may exacerbate liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention

immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, strong bases. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition are prohibited where this chemical is used, handled, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Organochlorine pesticide, liquid, toxic. DOT label requirement is "POISONOUS/TOXIC MATERIALS." This chemical falls in Hazard Class 6.1 and Packing Group II.[19,20]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

New Jersey Department of Health and Senior Services. (May 1999). *Hazardous Substances Fact Sheet: Ethyl-4,4′-Dichlorobenzilate*. Trenton, NJ

Ethyl dichlorosilane E:0530

Molecular Formula: $C_2H_6Cl_2Si$

Common Formula: $Cl_2SiHC_2H_5$

Synonyms: Dichloroethylsilane; Ethyldichlorosilane; Monoethyldichlorosilane; Silane, dichloroethyl-

CAS Registry Number: 1789-58-8

RTECS® Number: VV3230000

UN/NA & ERG Number: UN1183/139

EC Number: 217-255-0

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl dichlorosilane is a colorless liquid with a sharp, irritating odor. Molecular weight = 129.07; Boiling point = 75.5°C; Flash point = −1°C. Explosive limits: LEL: 2.9%; UEL: unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 2₩. Dangerously reactive with water.

Potential Exposure: This material is used in silicone polymer manufacture.

Incompatibilities: Forms explosive mixture with air. Reacts vigorously with water, steam, or surface moisture, generating hydrogen chloride. Incompatible with strong oxidizers, strong bases. Attacks most common metals in the presence of moisture.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl dichlorosilane is corrosive. It can affect you when breathed in. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause a buildup of fluid in the lungs (pulmonary edema), a medical emergency that can be delayed for several hours. This can cause death. Ethyl dichlorosilane is a corrosive chemical and contact can cause severe skin and eye burns leading to permanent eye damage.

Long Term Exposure: This chemical can irritate the lungs. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl dichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl dichlorosilane must be stored to avoid contact with moisture and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride can be produced. Sources of ignition, such as smoking and open flames, are prohibited where ethyl dichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl dichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl dichlorosilane.

Shipping: This compound requires a shipping label of “DANGEROUS WHEN WET, CORROSIVE, FLAMMABLE LIQUID.” It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical. *Do not use water* (forms hydrogen chloride gas). Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 200-815-3 [*Annex I Index No.:* 601-010-00-3]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Human Inadequate Evidence; Animal No Adequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1994.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Clean Air Act: Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: F + ; Risk phrases: R12; R67; Safety phrases: S2; S9; S16; S33; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Ethylene, an alkene, is a colorless gas (at room temperature) with a sweet odor. The minimum detectable odor is 260 ppm. Molecular weight = 28.06; Boiling point = −104°C; Freezing/Melting point = −169°C; Autoignition temperature = 450−490°C. Explosive limits: LEL = 2.7%; UEL = 36.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen. Ethylene is used in the production of fabricated plastics, antifreeze; making fibers; to manufacture ethylene oxide, polyethylene for plastics, alcohol, mustard gas, and other organics. It is used to accelerate ripening of fruit; as an anesthetic; and for oxyethylene welding; and cutting of metals.

Incompatibilities: A highly flammable gas at room temperature. Contact with oxidizers may cause explosive polymerization and fire. May be spontaneously explosive in sunlight or ultraviolet light when mixed with chlorine. Reacts violently with mixtures of carbon tetrachloride and benzoyl peroxide; bromotrichloromethane; aluminum chloride; and ozone. Incompatible with acids, halogens, nitrogen oxides, hydrogen bromide, aluminum chloride, chlorine dioxide, nitrogen dioxide. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL (*construction & shipyards only*): Simple asphyxiants—inert gas and vapor.

NIOSH REL: None.

ACGIH TLV®[1]: 200 ppm/230 mg/m^3 TLV; not classifiable as a human carcinogen (2001).
Protective Action Criteria (PAC)
TEEL-0: 200 ppm
PAC-1: 600 ppm
PAC-2: 1500 ppm
PAC-3: 7500 ppm
DFG MAK: Carcinogen Category 3B.
Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; the Netherlands: MAC-TGG 330 mg/m^3, 2003; Russia: STEL 100 mg/m^3, 1993; Switzerland: MAK-W 10000 ppm (11500 mg/m^3), 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia cites a MAC of 3 mg/m^3 for ambient air of residential areas on either a momentary or a daily average basis. Virginia[60] has set a guideline of 3.0 μg/m^3 for ethylene in ambient air.

Permissible Concentration in Water: Russia[43] gives a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Severe exposures may cause faintness, a lack of coordination; excitement, stupor, unconsciousness, convulsions, stopped breathing; paralysis; and heart, liver, and kidney damage. 20−25% (200,000−250,000 ppm) gas has caused loss of sense of pain. 80−90% (800,000−900,000 ppm) has caused anesthesia. *Skin:* Contact with liquid can cause a "freezing burn." *Eyes:* Same as skin. *Ingestion:* No information available.

Long Term Exposure: Inhalation may cause loss of appetite and weight, irritability, insomnia, increase in red blood cell count, and inflammation of the kidneys.

Points of Attack: Kidneys.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to ethylene gas is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from chlorine compounds, oxidizing agents, and combustible materials. Sources of ignition, such as smoking and open flames, are prohibited where ethylene is handled, used, or stored, Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene. Wherever ethylene is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Piping should be electrically bonded and grounded. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Compressed or cryogenic liquid ethylene requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1 and there is no Packing Group.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal

environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible gas or liquid. Poisonous gases are produced in fire.

Liquid: Use dry chemical, carbon dioxide, or water spray in large amounts. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Ventilate area of leak to disperse gas. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethylene chlorohydrin is a colorless liquid with a faint, ether-like odor. Molecular weight = 80.52; Specific gravity (H_2O:1) = 1.20; Boiling point = 127.8°C; Freezing/Melting point = − 67.8°C; Vapor pressure = 5 mmHg at 20°C; Flash point = 60°C (cc); Autoignition temperature = 425°C. Explosive limits: LEL = 4.9%; UEL = 15.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene chlorohydrin is used as a solvent and emulsifier; in the synthesis of ethylene glycol, ethylene oxide, amines, carbitols, indigo, malonic acid, novocaine; and in other reactions where the hydroxyethyl group is introduced into organic compounds; for the separation of butadiene from hydrocarbon mixtures; in dewaxing and removing cycloalkanes from mineral oil; in the refining of rosin; in the manufacture of certain pesticides; and in the extraction of pine lignin. In the lacquer industry, it is used as a solvent for cellulose acetate, cellulose esters, resins and waxes; and in the dyeing and cleaning industry, it is used to remove tar spots; as a cleaning agent for machines; and as a solvent in fabric dyeing. It has also found use in agriculture in speeding up sprouting of potatoes and in treating seeds to inhibit biological activity. Making chemical warfare agents.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with strong caustics (formation of ethylene gas), strong acids, alkaline metals, aliphatic amines, isocyanates. Violent reaction with ethylene diamine, chlorosulfonic acid. Attacks some plastics, rubber, and coatings. Reacts with water or steam producing toxic and corrosive fumes.

Permissible Exposure Limits in Air

Several states have set guidelines or standards for 2-chloroethanol in ambient air[60] ranging from 30 μg/m^3 (North Dakota) to 71 μg/m^3 (Nevada) to 320 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #2513 or OSHA Analytical Method 7.[18]

Permissible Concentration in Water: Russia[43] set a MAC of 0.7 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.06$.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause severe irritation, with cough and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure to 18 ppm has resulted in vomiting and shock. Additional symptoms may include irritation of the nose, throat, and lungs. Poor coordination, numbness, visual disturbance, headache, difficult breathing, and unconsciousness may also occur. Death has resulted from inhalation of 300 ppm for 2½ h. Signs and symptoms of acute exposure to this chemical may include weakness, dizziness, confusion, visual disturbances, shock, seizures, and coma. Weak pulse, hypotension (low blood pressure), and cyanosis (blue tint to the skin and mucous membranes) may be observed. Nausea, vomiting, and hematuria (bloody urine) may be seen after exposure. Chloroethanol affects the central nervous system, cardiovascular system, liver, and kidneys. This chemical readily absorbed through the skin even though no irritation occurs and may cause symptoms listed above. Death has occurred from skin absorption of 1 teaspoon of liquid. Ingestion can cause irritation to the throat. May cause symptoms listed under inhalation. About 1/5 oz may be lethal to a 150-lb adult.

Long Term Exposure: Can cause damage to the kidneys, liver, cardiovascular system, and nervous system. May cause reproductive damage. Can irritate the lungs. Repeated exposure may cause bronchitis. High or repeated exposure can cause disturbed sleep; with loss of coordination in arms and legs.

Points of Attack: Respiratory system, liver, kidneys, central nervous system, cardiovascular system, eyes.

Medical Surveillance: Preplacement examination, including a complete history and physical should be performed. Examination of the respiratory system, liver, kidneys, and central nervous system should be stressed. The skin should be examined. A chest X-ray should be taken and pulmonary function tests should be performed (FVC-FEV). The above procedures should be repeated on an annual basis, except that the X-ray is needed only when indicated by pulmonary function testing. NIOSH lists the following tests: Expired Air; liver function tests; urinalysis (routine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. *Beware:* the liquid penetrates rubber. **8 h:** Viton™ gloves, suits, polyvinyl alcohol gloves; Barricade® coated suits; **4 h:** 4H™ and Silver Shield™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear eye protection to prevent any possibility of eye contact. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *7 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosivecon-centration does not exist. Keep in a cool, well-ventilated area, protected from physical damage, ignition sources, and separated from strong oxidizers or caustics. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.7/1.2

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to

fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethylenediamine, a polyamine, is a strongly alkaline, colorless, clear, thick liquid with an ammonia odor. A solid below 8.5°C. The odor threshold is 1.0 ppm. Molecular weight = 60.12; Specific gravity (H_2O:1) = 0.91; Boiling point = 116°C; Freezing/Melting point = 8.5°C; Vapor pressure = 11 mmHg at 20°C; Flash point = 33.9°C; Autoignition temperature = 385°C. Explosive limits: LEL = 2.5% at 100°C; UEL = 12% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Ethylenediamine is used as an intermediate; as a urine acidifier; as a solvent; an emulsifier for casein and shellac solutions; a stabilizer in rubber late. A chemical intermediate in the manufacture of dyes; corrosion inhibitors; synthetic waxes; fungicides, resins, insecticides, asphalt wetting agents; and pharmaceuticals. Ethylenediamine is a degradation product of the agricultural fungicide Maneb.

Incompatibilities: Forms explosive mixture with air. Ethylenediamine is a medium strong base. Violent reaction with strong acids, strong oxidizers, chlorinated organic compounds, acetic acid, acetic anhydride, acrolein, acrylic acid, acrylonitrile, allyl chloride, carbon disulfide, chlorosulfonic acid, epichlorohydrin, ethylene chlorohydrin, oleum, methyl oxide, vinyl acetate. Also incompatible with silver perchlorate, 3-propiolactone, mesityl oxide, ethylene dichloride, organic anhydrides, isocyanates, acrylates, substituted allyls, alkylene oxides, ketones, aldehydes, alcohols, glycols, phenols, cresols, caprolactum solution. Attacks aluminum, copper, lead, tin, zinc and alloys and some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.46 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/25 mg/m^3 TWA.

NIOSH REL: 10 ppm/25 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/25 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 9.7 ppm

PAC-1: 9.7 ppm

PAC-2: **9.7** ppm
PAC-3: **20** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: previous MAK suspended 2004; [skin] Danger of sensitization of the airways and skin.

Australia: TWA 10 ppm (25 mg/m^3), 1993; Austria: MAK 10 ppm (25 mg/m^3), 1999; Belgium: TWA 10 ppm (25 mg/m^3), 1993; Denmark: TWA 10 ppm (25 mg/m^3), 1999; Finland: TWA 10 ppm (25 mg/m^3); STEL 20 ppm (50 mg/m^3), 1999; France: VME 10 ppm (25 mg/m^3), VLE 15 ppm (35 mg/m^3), 1999; Japan; 10 ppm (25 mg/m^3) [skin] 1999; the Netherlands: MAC-TGG 18 mg/m^3, 2003; Norway: TWA 10 ppm (25 mg/m^3), 1999; the Philippines: TWA 10 ppm (25 mg/m^3), 1993; Poland: MAC (TWA) 2 mg/m^3, MAC (STEL) 6 mg/m^3, 1999; Russia: TWA 10 ppm; STEL 2 mg/m^3, 1993; Sweden: NGV 10 ppm (25 mg/m^3), KTV 15 ppm (35 mg/m^3), 1999; Switzerland: MAK-W 1000 ppm (6400 mg/m^3), 1999; Turkey: TWA 10 ppm (25 mg/m^3), 1993; United Kingdom: TWA 10 ppm (25 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for ethylenediamine in ambient air[60] ranging from 250 μg/m^3 (North Dakota) to 300−2500 μg/m^3 (North Carolina) to 400 μg/m^3 (Virginia) to 500 μg/m^3 (Connecticut) to 595 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2540 or OSHA Analytical Method 60.

Permissible Concentration in Water: Russia[43] set a MAC of 0.7 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -1.2$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethylenediamine is corrosive to the eyes, skin, and respiratory tract. Skin contact can cause blistering. Eye contact can cause pain, serious injury, and permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Acute exposure to ethylenediamine may result in cough, difficulty in breathing, irritation of the lungs, and pneumonia. Nausea, vomiting, and diarrhea are often seen. Contact with ethylenediamine may result in redness, pain, irritation, and burns. Vapor inhalation at a concentration of 200 ppm for 5−10 min will lead to nasal irritation and produce a tingling sensation. Inhalation at concentrations of 400 ppm or greater leads to severe nasal irritation. Respiratory irritation may result. Many individuals are hypersensitive to ethylenediamine exposure; therefore, safe threshold limits are difficult to set.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy. Repeated or prolonged exposure can cause an asthma-like allergy. Repeated high exposure may cause liver, kidney, and lung damage.

Points of Attack: Respiratory system, liver, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests; liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Saranex™ coated suits; Responder™ suits; **4 h:** Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash if liquids containing >5% contaminants are involved.

Respirator Selection: *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *500 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] organic vapor and acid gas cartridge(s) or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethylenediamine must be stored to avoid contact with acetic acid, acetic anhydride, acrolein, acrylic acid, acrylonitrile, allyl chloride, carbon disulfide, chlorosulfonic acid, epichlorhydrin, ethylene chlorohydrin, oleum, methyl oxide, vinyl acetate, hydrogen chloride, and sulfuric acid since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Detached outdoor storage is preferred. Sources of ignition, such as smoking and open flames, are prohibited where ethylenediamine is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethylenediamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of ethylenediamine.

Shipping: This compound requires a shipping label of "CORROSIVE, FLAMMABLE LIQUID." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stay upwind and keep out of low areas. Isolate area for 1/2 mile in all directions if tank car or truck is involved in fire. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use water spray, dry chemical, alcohol foam, or carbon dioxide. Wear full protective clothing including gloves and boots. If necessary to enter closed area, wear full-faced gas masks with self-contained breathing apparatus. *Do not use water* in case of drum or tank fires. If a leak or spill has not ignited, use water spray to reduce the vapors and dilute spills to nonflammable mixtures. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

US EPA, FIFRA1998 Status of Pesticides: Canceled.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Reportable Quantity (RQ): 5000 lb (2270 kg).
European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36; Safety phrases: S2; S26 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: EDTA is a white, odorless, crystalline material or white powder. Molecular weight = 292.28; Boiling point = 150°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: Compound Description: Drug, Mutagen, Primary Irritant. EDTA is a general purpose chelating agent; used as a drug and food additive; in cosmetics; in household and textile articles; in pharmaceutical products; and in biochemicals. It is also used as a laboratory chemical in research; in photographic processing.
Incompatibilities: Reacts with strong oxidants, strong bases, copper, copper alloys, and nickel.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 40 mg/m^3
PAC-1: 125 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 150 mg/m^3
Determination in Air: None available.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: EDTA irritates the eyes, skin, and respiratory tract. Skin contact may cause a burning sensation and rash. May affect the kidneys.
Long Term Exposure: May damage the developing fetus. May cause kidney damage.
Points of Attack: Kidneys.
Medical Surveillance: Kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: Not regulated.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It does not easily ignite. Use dry chemical, carbon dioxide, water spray, alcohol or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and carbon monoxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] [as 1,2-dibromoethane (EDB)].

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/24/25; R36/37/38; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethylene dibromide is a colorless nonflammable liquid or solid (below 10°C) with a sweet, chloroform-like odor. The minimum concentration detectable by odor is 10 ppm. Molecular weight = 187.88; Specific gravity (H_2O:1) = 2.17; Boiling point = 131°C; Freezing/Melting point = 10°C; Relative vapor density (air = 1) = 6.5; Vapor pressure = 12 mmHg. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene dibromide is used as a chemical intermediate; as a fumigant for ground pest control; as a constituent of ethyl gasoline (antiknock agent). It is also used in fire extinguishers, gauge fluids, and waterproofing preparations, and it is used as a solvent for celluloid, fats, oils, and waxes.

Incompatibilities: Reacts vigorously with chemically active metals, liquid ammonia, strong bases, strong oxidizers, causing fire and explosion hazard. Light, heat, and moisture can cause slow decomposition, forming hydrogen bromide. Attacks fats, rubber, some plastics and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.69 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm TWA; 30 ppm Ceiling Concentration; 50 ppm [5-min maximum peak] [skin]. For Construction, Shipyards, and Federal Contractors: 25 ppm/190 mg/m^3 Ceiling Concentration [skin].

NIOSH REL: 0.045 ppm TWA; 0.13 ppm [15-min] Ceiling Concentration; Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: Potential occupational carcinogen, 100 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 17 ppm

PAC-1: **17** ppm

PAC-2: **24** ppm

PAC-3: **46** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

Arab Republic of Egypt: TWA 0.13 ppm (1 mg/m^3), 1999; Australia: [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: [skin], carcinogen, 1993; Finland: TWA 20 ppm (145 mg/m^3); STEL 30 ppm, [skin], carcinogen, 1999; France: carcinogen, 1993; Hungary: STEL 0.8 mg/m^3, [skin], carcinogen, 1993; the Netherlands: MAC-TGG 0.002 mg/m^3, 2003; the Philippines: TWA 25 ppm (190 mg/m^3), [skin], 1993; Poland: MAC (TWA) 0.5 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.8 mg/m^3), [skin], carcinogen, 1999; Thailand: TWA 20 ppm; STEL 30 ppm, 1993; Turkey: TWA 25 ppm (190 mg/m^3), [skin], 1993; United Kingdom: TWA 0.5 ppm (3.9 mg/m^3), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic[35] has set a TWA of 10 mg/m^3 with a ceiling value of 20 mg/m^3. Several states have set guidelines or standards for ethylene dibromide in ambient air[60] ranging from zero (North Dakota and New York) to 0.045 μg/m^3 (North Carolina) to 2.47 μg/m^3 (Pennsylvania) to 720 μg/m^3 (Indiana) to 770 μg/m^3 (South Carolina) to 1500 μg/m^3 (Virginia) to 1550 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #1008 or OSHA Analytical Method 2.

Permissible Concentration in Water: Several states have set guidelines or standards for ethylene dibromide in drinking water[61] ranging from 0.005 μg/L (Kansas) to 0.008 μg/L (Minnesota) to 0.01 μg/L (Arizona) to 0.02 μg/L (California and Washington) to 0.04 μg/L (Massachusetts) to 0.10 μg/L (Connecticut and New Mexico) to 0.50 μg/L (Wisconsin) to 1.0 μg/L (Maine). EPA[62] has proposed a maximum concentration level of 0.05 μg/L in drinking water.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.93

Routes of Entry: Inhalation of the vapor, absorption through the skin, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause severe skin and eye burns, with permanent eye damage. Exposure to the vapor may also damage the eyes. Inhalation may irritate and damage the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High exposure can cause dizziness, drowsiness, vomiting, unconsciousness, and death. High exposure can damage the liver or kidneys enough to cause death. *Inhalation:* Levels of 75 ppm may cause irritation of the nose, throat, and lungs. 100−200 ppm for 1 h may cause diarrhea, abdominal pain, and vomiting. Other symptoms may include headache, loss of appetite, swollen glands, pale skin coloring, insomnia, dizziness, and depression. Accidental high exposure has caused symptoms as listed above; internal bleeding and death. *Skin:* Contact with as little as 1 g (1/28 oz) may cause itching, swelling, redness, burning, and blistering. May be absorbed through the skin and cause symptoms as listed under inhalation. *Eyes:* May cause irritation of eyes and eyelids. *Ingestion:* May cause vomiting, diarrhea, abdominal pain, nausea, and damage to the liver and kidneys. As little as 4.5 mL (about 1 teaspoon) has caused death.

Long Term Exposure: May cause irritation of the throat, headaches, loss of appetite, swollen glands, paleness, insomnia, vomiting, diarrhea, abdominal pain, and damage to the liver and kidneys. Ethylene dibromide is a probable carcinogen in humans. It causes birth defects and changes in the genetic material of laboratory animals. It may damage the reproductive system, causing abnormal sperm in males and decreased fertility in females. Handle with extreme caution.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, reproductive system. Cancer site in animals: skin and lung.

Medical Surveillance: Preemployment and periodic examinations should evaluate the skin and eyes, respiratory tract, and liver and kidney functions.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** polyvinyl alcohol gloves; Teflon™ gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade® coated suits; Trychem 1000™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place that is well ventilated. Keep in tightly sealed containers and away from light, heat, active metals, and liquid ammonia. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: EDB is a noncombustible liquid. Use an extinguishing agent suited to a surrounding fire. Poisonous gases are produced in fire, including bromine and hydrogen bromide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with adequate scrubbing and ash disposal facilities.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,2-Dichloroethane is a colorless, flammable liquid which has a pleasant, chloroform-like odor and a sweetish taste. Decomposes slowly: turns dark and acidic on contact with air, moisture, and light. The odor threshold is 100 ppm. Molecular weight = 98.96; Specific gravity (H_2O:1) = 1.24; Boiling point = 83.3°C; Freezing/Melting point = −35.6°C; Vapor pressure = 64 mmHg at 20°C; Flash point = 13°C (cc); Autoignition temperature = 413°C. Explosive limits: LEL = 6.2%; UEL = 16.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. In recent years, 1,2-dichloroethane is used in the production of vinyl chloride and as a lead-scavenging agent in petrol; it has found wide use in the manufacture of ethylene glycol, diaminoethylene, polyvinyl chloride, nylon, viscose rayon, styrenebutadiene rubber, and various plastics. It is a solvent for resins, asphalt, bitumen, rubber, cellulose acetate, cellulose ester, and paint; a degreaser in the engineering, textile, and petroleum industries; and an extracting agent for soybean oil and caffeine. It is also used as an antiknock agent in gasoline; a pickling agent; a fumigant; and a dry-cleaning agent. It has found use in photography, xerography, water softening; and also in the production of adhesives, cosmetics, pharmaceuticals, and varnishes.

Incompatibilities: Forms explosive mixture with air. Reacts violently with strong oxidizers and caustics; chemically active metals, such as magnesium or aluminum powder, sodium and potassium; alkali metals; alkali amides; liquid ammonia. Decomposes to vinyl chloride and HCl above 600°C. Attacks plastics, rubber, coatings. Attacks many metals in presence of water.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.05 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm TWA; 100 ppm Ceiling Concentration; 200 ppm [5-min maximum peak in any 3 h]. For Construction and Shipyards: 50 ppm/200 mg/m^3 TWA.

NIOSH REL: 1 ppm/4 mg/m^3 TWA; 2 ppm/8 mg/m^3 STEL, a potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm, not classifiable as a human carcinogen as chloroethanes.

Protective Action Criteria (PAC)*

TEEL-0: 10 ppm

PAC-1: **50** ppm

PAC-2: **200** ppm

PAC-3: **300** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

NIOSH IDLH: 50 ppm.

Arab Republic of Egypt: TWA 5 ppm (2 mg/m^3), 1993; Australia: TWA 10 ppm (40 mg/m^3), 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (40 mg/m^3), 1993; Finland: TWA 10 ppm (40 mg/m^3); STEL 20 ppm (80 mg/m^3), carcinogen, 1999; France: VME 10 ppm (40 mg/m^3), continuous carcinogen, 1999; Hungary: STEL 4 mg/m^3, carcinogen, 1993; the Netherlands: MAC-TGG 7 mg/m^3, 2003; Norway: TWA 1 ppm (4 mg/m^3), 1999; the Philippines: TWA 50 ppm (200 mg/m^3), 1993; Poland: TWA 50 mg/m^3; STEL 60 mg/m^3, 1999; Russia: TWA 10 ppm, 1993; Sweden: NGV 1 ppm (4 mg/m^3), KTV 5 ppm (20 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-W 5 ppm (20 mg/m^3), carcinogen, 1999; Turkey: TWA 50 ppm (200 mg/m^3), 1993; United Kingdom: TWA 5 ppm (21 mg/m^3), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[43] has set MAC value of 3 mg/m^3 in ambient air in residential areas on a momentary basis and 1 mg/m^3 on a daily average basis. Several states have set guidelines or standards for ethylene dichloride in ambient air[60] ranging from 0−400 μg/m^3 (North Dakota) to 0.038 μg/m^3 (North Carolina) to 0.04 μg/m^3 (Rhode Island) to 0.2 μg/m^3 (New York) to 0.39 μg/m^3 (Massachusetts) to 20.0 μg/m^3 (Connecticut) to 148.0 μg/m^3 (Pennsylvania) to 200.0 μg/m^3 (South Carolina) to 650.0 μg/m^3 (Nevada) to 1000.0 μg/m^3 (Indiana).

Determination in Air: Use NIOSH Analytical Method (IV) #1003 for halogenated hydrocarbons or OSHA Analytical Method 3.[18]

Permissible Concentration in Water: *To protect freshwater aquatic life:* 118,000 μg/L on an acute toxicity basis and 20,000 μg/L on a chronic basis. *To protect saltwater aquatic life:* 113,000 μg/L on an acute toxicity basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 occurs at a concentration of 9.4 μg/L.[6]

The WHO has set a limit for drinking water of 0.01 mg/L (10 μg/L).[35] Russia has set a limit in water bodies used for domestic purposes variously quoted at 2.0 mg/L[43] and 0.02 mg/L.[35] EPA[48] has set a longer term health advisory of 2.6 mg/L for an adult. Several states have set guidelines or standards for ethylene dichloride in drinking water.[61] The standards set range from 2.0 μg/L (New Jersey) to 3.0 μg/L (Florida) to 10.0 μg/L (New Mexico). The guidelines range from 0.38 μg/L (New Hampshire) to 1.0 μg/L (California and Connecticut) to 3.8 (Minnesota) to 5.0 μg/L (Maine).

Determination in Water: Inert gas purge followed by chromatography with halide-specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log K_{ow} = 1.48.

Routes of Entry: Inhalation of vapor, skin absorption of liquid, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause nausea, vomiting, headaches, drowsiness, and loss of consciousness. Overexposure to ethylene dichloride may damage the central nervous system, kidneys, liver. *Inhalation:* Levels of 10−30 ppm may cause dizziness, nausea, and vomiting. Levels up to 50 ppm may cause weakness, trembling, headaches, abdominal cramps, liver and kidney damage; and fluid buildup in lungs. May cause coma and death at high levels. *Skin:* Contact may cause irritation and skin rash and irritates the eyes. *Eyes:* May cause redness, pain, and blurred vision. Vapor can damage the cornea. *Ingestion:* Ingestion of 2 oz has resulted in nausea, vomiting, faintness, drowsiness, troubled breathing, pale skin, internal bleeding, kidney damage, and death due to respiratory failure. Other possible symptoms may include abdominal spasms, severe headache, lethargy, lowered blood pressure, diarrhea, shock, physical collapse, and coma.

Long Term Exposure: Repeated or prolonged contact can chronically irritate the skin causing dryness, redness, and a rash. Prolonged or repeated exposure may cause eye, nose, and throat irritation; nerve damage; liver and kidney damage. This substance has been determined to cause cancer of the lung, stomach, breast, and other sites in laboratory animals; and may be a human carcinogen. Can irritate the lungs and bronchitis may develop. Repeated or prolonged exposure can cause loss of appetite; nausea and vomiting; trembling and low blood sugar.

Points of Attack: Eyes, skin, kidneys, liver, central nervous system, cardiovascular system. Cancer sites in animals: forestomach, mammary gland, and circulatory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests; liver and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. NIOSH lists the following tests: expired air; liver function tests; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Teflon™ gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade® coated suits; CPF3™ suits; Responder™ suits; Trychem 1000™ suits; **4 h:** polyvinyl alcohol gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), chemically active metals (such as potassium, sodium, magnesium, and zinc), strong caustics (such as sodium hydroxide), and dimethylaminopropylamine since violent reactions occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethylene dichloride out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Ethylene fluorohydrin E:0600

Molecular Formula: C_2H_5FO

Common Formula: $HOCH_2CH_2F$

Synonyms: 2-Fluoetanol (Spanish); β-Fluoroethanol; 2-Fluroethanol; TL 741

CAS Registry Number: 371-62-0

RTECS® Number: KL1575000

UN/NA & ERG Number: UN2929 (Toxic liquids, flammable, organic, n.o.s.)/131

EC Number: 206-740-2

Regulatory Authority and Advisory Bodies

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: not listed in Annex I (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethylene fluorohydrin is a colorless liquid. Molecular weight = 64.07; Boiling point = 103.5°C; Flash point = 34°C; Vapor pressure = 16 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Ethylene fluorohydrin is used as a rodenticide, insecticide, and acaricide. It is not registered as a pesticide in the United States.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.005 ppm

PAC-1: 0.015 ppm

PAC-2: 0.0267 ppm
PAC-3: 1.25 ppm

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include tremors, severe muscular weakness, nausea, headache, and slight swelling of the liver. Delayed convulsant. Toxicity rating is the same as for fluoroacetate, super toxic. The probable oral lethal dose in humans is a taste (less than 7 drops) for a 70-kg (150-lb) person. The chemical is highly toxic when inhaled or absorbed through the skin. Toxicity depends on its oxidation to fluoroacetate by tissue alcohol dehydrogenase.

First Aid: Acute poisoning should be treated like poisoning by fluoroacetate. Ethylene fluorohydrin (2-fluoroethanol) is listed among the organic fluorine derivatives of fluoroacetic acid. The emergency procedures for fluoroacetic acid are move victim to fresh air and call emergency medical care. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: For emergency situations, wear a positive-pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Toxic liquids, flammable, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including toxic fluoride, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Ethylene glycol is a colorless, viscous, hydroscopic liquid with a sweetish taste. Often colored fluorescent yellow-green when used in automotive antifreeze. Ethylene glycol is odorless; odor does not provide any warning of inhalation exposure to hazardous concentrations. The odor threshold in air is 25 ppm. Molecular weight = 62.07; Specific gravity (H_2O:1) = 1.1; Relative vapor density (air = 1) = 2.12; Boiling point = 197°C; Freezing/Melting point = −12.8°C; Vapor pressure = 0.06 mmHg at 20°C; Flash point = 111°C; Autoignition temperature = 398°C. Explosive limit: LEL = 3.2%; UEL = 15.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene glycol is used in antifreeze (especially as car radiator antifreeze) and in the production of polyethylene terephthalate fibers and films; in hydraulic fluids; electrolytic condensers; and heat exchangers. It is also used as a solvent and as a chemical intermediate for ethylene glycol dinitrate, glycol esters, resins, and for pharmaceuticals.
Incompatibilities: Reacts with sulfuric acid, oleum, chlorosulfonic acid, strong oxidizing agents, strong bases, chromium trioxide, potassium permanganate, sodium peroxide. Hygroscopic (i.e., absorbs moisture from the air).
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: After reviewing available published literature, NIOSH provided comments to OSHA on August 1, 1988, regarding the "*Proposed Rule on Air Contaminants*" (29 CFR 1910, Docket No. H-020). In these comments, NIOSH questioned whether the PELs proposed (Ceiling 50 ppm) were adequate to protect workers from recognized health hazards.
ACGIH TLV®[1]: 100 mg/m^3 (hour) Ceiling Concentration; (aerosol only) not classifiable as a human carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 10 ppm
PAC-1: 10 ppm
PAC-2: 40 ppm
PAC-3: 60 ppm
DFG MAK: 10 ppm/26 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group C.
Australia: TWA 60 mg/m^3; STEL 120 mg/m^3, 1993; Austria: MAK 10 ppm (26 mg/m^3), [skin], 1999; Belgium: STEL 50 ppm (127 mg/m^3), 1993; Denmark: TWA 50 ppm (130 mg/m^3), 1999; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1993; France: VLE 50 ppm (125 mg/m^3), 1999; Hungary: STEL 50 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 52 mg/m^3 (fume), 2003; MAC-TGG 10 mg/m^3 (drops), 2003; Norway: TWA 25 ppm (63 mg/m^3), 1999; Poland: MAC (TWA) 15 mg/m^3, MAC (STEL) 50 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; Sweden: NGV 10 ppm (25 mg/m^3), KTV 20 ppm (50 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (125 mg/m^3), 1999; United Kingdom: TWA 10 mg/m^3, particulate; TWA 60 mg/m^3; STEL 125 mg/m^3, vapor, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV®: 100 mg/m^3 (hour) Ceiling Concentration. Several states have set guidelines or standards for ethylene glycol in ambient air[60] ranging from 0.17 mg/m^3 (Massachusetts) to 1.0 mg/m^3 (Virginia) to 1.25 mg/m^3 (North Dakota) to 2.976 mg/m^3 (Nevada).
Determination in Air: Use NIOSH Analytical Method (IV) #5523.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 140 μg/L based on health effects and also a lifetime health advisory of 7000 μg/L.[48] Several states have set guidelines for ethylene glycol in drinking water[61] ranging from 100 μg/L (Connecticut) to 290 μg/L (New Jersey)[59] to 5500 μg/L (Arizona, Massachusetts and Maine).
Determination in Water: Octanol−water coefficient: Log $K_{ow} = -1.9$.
Routes of Entry: Inhalation of particulate or vapor. Percutaneous absorption may also contribute to intoxication.

Harmful Effects and Symptoms

In the body, ethylene glycol is chemically broken down into toxic compounds. Ethylene glycol and its toxic by-products first affect the central nervous system (CNS), then the heart, and finally the kidneys. Ingestion of sufficient amounts can be fatal.

Short Term Exposure: Ethylene glycol irritates the eyes, skin, and respiratory tract. *Inhalation:* Mild throat irritation resulted from exposure of 28 mg/m^3. Levels above 140 mg/m^3 resulted in more marked irritation, with levels of more than 250 mg/m^3 being unbreathable. These levels are only reached at elevated temperature. *Skin:* May cause mild irritation if not promptly removed. *Eyes:* Accidental eye contact with concentrated ethylene glycol resulted in extreme swelling of the eyes, cloudy vision, and slow response to light. These symptoms lasted a month. *Ingestion:* May cause symptoms in the nervous system, heart, lungs, and kidneys. Earliest effects are usually felt in the nervous system between 1/2 and 12 h after ingestion. Symptoms from 1 liquid ounce may include nausea, vomiting, dizziness, loss of coordination, and abdominal pain. Large amounts may cause stupor, coma, convulsions, and death. Survival of this stage may lead to development of rapid heartbeat, enlarged heart and fluid in the lungs which, too, can lead to death usually after 1−3 days. Some individuals who drank 3−4 fluid ounces survived both the above stages because of prompt medical treatment, later (3−17 days) died of kidney failure.

Long Term Exposure: Occupational exposure to heated ethylene glycol has caused involuntary eye movement that may indicate nerve damage. Some individuals also reported attacks of unconsciousness lasting 5−10 min which went away when they stopped working with ethylene glycol. Ethylene glycol may affect the central nervous system and eyes. Has been shown to be a teratogen in animals. Ethylene glycol may damage the developing fetus. May cause kidney and brain damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function test. Urine oxalate level. Examination of the nervous system. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Natural, Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyethylene gloves, polyvinyl chloride gloves, suits, boots; Teflon™ gloves, suits, boots; Viton™ gloves, suits, Saranex™ coated suits; 4H™ and Silver Shield™ gloves, Trellchem HPS™ suits; **4 h:** Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethylene glycol must be stored to avoid contact with sulfuric acid since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizing agents (such as perchlorates, peroxides, permanganates, chlorates, and nitrates).

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethylene glycol out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of

potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Alternatively, ethylene glycol can be recovered from polyester plant wastes.

Ethylene glycol diethyl ether E:0620

Molecular Formula: $C_6H_{14}O_2$
Common Formula: $C_2H_5OCH_2CH_2OC_2H_5$
Synonyms: 1,2-Diethoxyethane; Diethoxyethane; Diethyl cellosolve; Ethyl glyme
CAS Registry Number: 629-14-1
RTECS® Number: KI1225000
UN/NA & ERG Number: UN1153/127
EC Number: 211-076-1[*Annex I Index No.:* 603-208-00-5]

Regulatory Authority and Advisory Bodies

As glycol ethers:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol $R{-}(OCH_2CH_2)_n{-}OR'$ where $n = 12$ or 3; R = alkyl or aryl groups; R′ = R, H, or groups which when removed, yield glycol ethers with the structure: $R{-}(OCH_2CH)_n{-}OH$. Polymers are excluded from the glycol category.

EPCRA Section 313: Certain glycol ethers are covered. $R{-}(OCH_2CH_2)_n{-}OR'$; Where $n = 12$ or 3; R = alkyl C_7 or less; or R = phenyl or alkyl substituted phenyl; R′ + H, or alkyl C_7 or less; or OR′ consisting of carboxylic ester, sulfate, phosphate, nitrate, or sulfonate.

Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: F,T; Risk phrases: R61; R11; R19; R36; R62; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethylene glycol diethyl ether is a colorless liquid. Molecular weight = 118.20; Boiling point = 122°C; Freezing/Melting point = − 74°C; Flash point = 35°C; Autoignition temperature = 406°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Primary Irritant. Ethylene glycol diethyl ether is used as an aprotic solvent; in chemical manufacturing; as a solvent for detergents and in other cleaning products.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings. Able to form peroxides. Also incompatible with strong acids, aluminum, and its alloys.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Ethylene glycol diethyl ether can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. Contact can irritate the skin and eyes. High levels can cause you to feel drowsy and dizzy. Very high levels could cause you to pass out. Repeated high or single very high exposures may damage the kidneys.

Long Term Exposure: Repeated or high exposures may damage the kidneys. There is limited evidence that ethylene glycol diethyl ether may damage the developing fetus.

Points of Attack: Kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: complete blood count (CBC); kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Glove manufacturers have recommended gloves of Neoprene™ or nitrile butyl rubber construction for protection against liquid ethylene glycol diethyl ether. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethylene glycol diethyl ether, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Ethylene glycol diethyl ether must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and strong acids (such as hydrochloric, sulfuric, and nitric) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where ethylene glycol diethyl ether is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethylene glycol diethyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene glycol diethyl ether. Wherever ethylene glycol diethyl ether is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep ethylene glycol diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethylene glycol dinitrate E:0630

Molecular Formula: $C_2H_4N_2O_6$

Common Formula: $O_2NOCH_2CH_2ONO_2$

Synonyms: EGDN; 1,2-Ethanediol dinitrate; Ethanediol dinitrate; Ethylene dinitrate; Ethylene nitrate; Glycol (dinitrate de) (French); Glycol dinitrate; Glykoldinitrat (German)

CAS Registry Number: 628-96-6

RTECS® Number: KW5600000

UN/NA & ERG Number: FORBIDDEN

EC Number: 211-063-0 [*Annex I Index No.:* 603-032-00-9]

Regulatory Authority and Advisory Bodies

Explosive Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: E, T + ; R3;R26/27/28; R33; Safety phrases: S1/2; S27/28; S33; S35; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethylene glycol dinitrate is a colorless to yellow, oily, odorless liquid. An explosive ingredient (60−80%) in dynamite along with nitroglycerine (40−20%). It may be detonated by mechanical shock, heat, or spontaneous chemical reaction. Molecular weight = 152.08; Specific gravity (H_2O:1) = 1.49; Boiling point = 114−116°C (explodes); Freezing/Melting point = −22.2°C; Vapor pressure = 0.05 mmHg at 20°C; Flash point = 215°C. Very slightly water soluble; solubility = 0.48%.

Potential Exposure: An explosive ingredient (60−80%) in dynamite along with nitroglycerine (40−20%). Although ethylene glycol dinitrate is an explosive in itself, it is primarily used to lower the Freezing/Melting point of nitroglycerin; together these compounds are the major constituents of commercial dynamite, cordite, and blastine gelatin. Occupational exposure generally involves a mixture of the two compounds. Ethylene glycol dinitrate is 160 times more volatile than nitroglycerin.

Incompatibilities: Highly explosive. Heating may cause violent combustion or explosion producing toxic fumes (nitrogen oxides). May explosively detonate violently from mechanical shock, friction, impact, or concussion. Not compatible with strong acids and alkalies.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.22 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.2 ppm/1 mg/m^3 Ceiling Concentration [skin].

NIOSH REL: 0.1 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.05 ppm/0.31 mg/m^3 TWA [skin].

NIOSH IDLH: 75 mg/m^3.

No TEEL available.

DFG MAK: 0.05 ppm/0.32 mg/m^3 TWA; Peak Limitation Category II(1); [skin]; BAT: 0.3 μg/L in blood; end of exposure; end-of-shift.

Australia: TWA 0.05 ppm (0.3 mg/m^3), [skin], 1993; Austria: MAK 0.05 ppm (0.3 mg/m^3), [skin], 1999; Belgium: TWA 0.05 ppm (0.31 mg/m^3), [skin], 1993; Denmark: TWA 0.02 ppm (0.12 mg/m^3), [skin], 1999; Finland: TWA 0.1 ppm (0.6 mg/m^3); STEL 0.3 ppm (2 mg/m^3), [skin], 1999; France: VME 0.17 ppm (1 mg/m^3), [skin], 1999; Japan: STEL 0.05 ppm (0.31 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 0.3 mg/m^3, [skin], 2003; Norway: TWA 0.03 ppm (0.18 mg/m^3), 1999; the Philippines: TWA 0.2 ppm (1.2 mg/m^3), [skin], 1993; Poland: TWA 0.3 mg/m^3; STEL 0.4 mg/m^3, 1999; Russia: TWA 0.05 mg/m^3, 1993; Sweden: NGV 0.03 ppm (0.2 mg/m^3), KTV 0.1 ppm (0.6 mg/m^3), [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.3 mg/m^3), KZG-W 0.1 ppm, [skin], 1999; Thailand: TWA 0.2 ppm (1 mg/m^3), 1993; Turkey: TWA 0.2 ppm (1 mg/m^3), [skin], 1993; United Kingdom: TWA 0.2 ppm (1.3 mg/m^3); STEL 0.2 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 ppm [skin]. Several states have set guidelines or standards for EGDN in ambient air[60] ranging from 3.0 μg/m^3 (North Dakota) to 6.0 μg/m^3 (Connecticut) to 7.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2507 or OSHA Analytical Method 43.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <1.2.

Routes of Entry: Inhalation of dust or vapor, ingestion of dust, percutaneous absorption, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: EGDN can cause headache, dizziness, nausea, vomiting, abdominal pain; and may affect the cardiovascular system, causing a fall in blood pressure. High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia). Exposure may result in death. The effects may be delayed. Skin contact can cause a rash or burning feeling on contact. Exposure to small amounts of ethylene glycol dinitrate and/or nitroglycerin by skin exposure, inhalation, or swallowing may cause severe throbbing headaches. With large exposure, nausea, vomiting, cyanosis, palpitations of the heart, coma, cessation of breathing, and death may occur. A temporary tolerance to the headache may develop, but this is lost after a few days without exposure. On some occasions a worker may have anginal pains a few days after discontinuing repeated daily exposure.

Long Term Exposure: EGDN can damage the heart causing pain in the chest and/or increased heart rate or cause arrhythmia (irregular heartbeat). This can be fatal. High exposure may affect the nervous system. May damage the red blood cells leading to anemia.

Points of Attack: Skin, cardiovascular system, blood, liver, kidneys.

Medical Surveillance: Placement and periodic examinations should be concerned with central nervous system, blood, glaucoma, and especially history of alcoholism. Urinary and blood ethylene glycol dinitrate may be determined by gas chromatography. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), during exposure; complete blood count; electrocardiogram, expired air, during exposure; urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Both EGDN and nitroglycerin are readily absorbed through the skin, lungs, and mucous membranes. It is, therefore, essential that adequate skin protection should be provided for each worker: impervious clothing where liquids are likely to contaminate and full body clothing where dust creates the problem. All clothing should be discarded at the end of the shift and prior to changing to street clothing. In case of spill or splash that contaminates work clothing, the clothes should be changed at once and the skin area washed thoroughly. Masks of the dust type or organic vapor canister type may be necessary in areas of concentration of dust or vapors. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 mg/m^3*: Sa* (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 mg/m^3*: SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 75 mg/m^3:* SAF: PD/PP (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive and Strong Oxidizer. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where EGDN is present, check to make certain that explosive concentrations do not exist. EGDN is highly explosive and can detonate violently upon heating or impact. Store in tightly closed containers in a cool, well-ventilated area away from strong acids and alkalies. All sources of ignition are prohibited. Use non-sparking tools and equipment especially when opening or closing containers. Use explosion-proof electrical equipment and fittings in all areas of handling, use, or manufacture. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: DOT[19] simply lists this material as FORBIDDEN to transport.

Spill Handling: Spread sodium bisulfate over the spill area and sprinkle with water. Then flush to sewer with water.[24] Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EGDN out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Evacuate area of fire. Heat may cause violent combustion (explodes at 114°C) or explosion. Fight fires only from a secure, explosion-resistant position. This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethylene glycol monomethyl ether E:0640

Molecular Formula: $C_3H_8O_2$
Common Formula: $CH_3OCH_2CH_2OH$
Synonyms: Aethylengykol-monomethylaether (German); Dowanol EM; EGM; EGME; Ether monomethylique de l'ethylene-glycil (French); Ethylene glycol methyl ether; Glycol ether EM; Glycol methyl ether; Glycol monomethyl ether; Jeffersol EM; MECS; 2-Methoxyethanol; Methoxyhydroxyethane; Methyl Cellosolve® (NIOSH); Methyl ethoxol; Methyl glycol; Methyl oxitol; Poly-Solv EM; Prist
CAS Registry Number: 109-86-4
RTECS® Number: KL5775000
UN/NA & ERG Number: UN1188/127
EC Number: 203-713-7 [*Annex I Index No.:* 603-011-00-4]
Regulatory Authority and Advisory Bodies
US EPA, FIFRA1998 Status of Pesticides: Canceled.
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
California Proposition 65 Chemical: Cancer; Developmental/Reproductive toxin 1/1/89.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: Hazard Symbol: T; Risk phrases: R60; R61; R10; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
As glycol ethers:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) includes mono- and di-ethers of ethylene glycol, diethyl glycol, and triethylene glycol $R-(OCH_2CH_2)_n-OR'$ where $n = 12$, or 3; R = alkyl or aryl groups; $R' = R$, H, or groups which when removed, yield glycol ethers with the structure: $R-(OCH_2CH)_n-OH$. Polymers are excluded from the glycol category.
Description: Ethylene glycol monomethyl ether is a colorless liquid with a slight ether-like odor. The odor threshold is 0.9−2.3 ppm. Molecular weight = 76.11; Specific gravity (H_2O:1) = 0.96; Boiling point = 124.4°C; Flash point = 39°C; Freezing/Melting point = −85°C; Vapor pressure = 0.6 mmHg; Autoignition temperature = 285°C. Explosive limits: LEL = 1.8%; UEL = 14%, both at STP. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene glycol monomethyl ether is used as a jet fuel additive; solvent for protective coating; and in chemical synthesis. Ethylene glycol ethers are used as solvents for resins used in the electronics industry, lacquers, paints, varnishes, gum, perfume; in dyes and inks; and as a constituent of painting pastes, cleaning compounds; liquid soaps; cosmetics, nitrocellulose, and hydraulic fluids.
Incompatibilities: Above flash point, explosive vapor/air mixtures may be formed. Heat or oxidizers may cause the formation of unstable peroxides. Attacks many metals. Strong oxidizers cause fire and explosions. Strong bases cause decomposition and the formation of toxic gas. Attacks some plastics, rubber, and coatings. May accumulate static electrical charges, and may cause ignition of its vapors.
Permissible Exposure Limits in Air
OSHA PEL: 25 ppm/80 mg/m^3 TWA [skin].
NIOSH REL: 0.1 ppm/0.3 mg/m^3 TWA [skin].

Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.35 ppm
PAC-2: 2.5 ppm
PAC-3: 200 ppm
DFG MAK: 1 ppm/3.2 mg/m^3 (the sum of the concentrations of EGME and its acetate in air); Peak Limitation Category II(8) [skin]; Pregnancy Risk Group B.
NIOSH IDLH: 200 ppm.
Australia: TWA 5 ppm (16 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (15 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (16 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (16 mg/m^3), [skin], 1999; Finland: TWA 25 ppm (80 mg/m^3); STEL 40 ppm (120 mg/m^3), [skin], 1999; France: VME 5 ppm (16 mg/m^3), [skin], 1999; Hungary: TWA 15 mg/m^3; STEL 30 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 1 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (16 mg/m^3), 1999; the Philippines: TWA 25 ppm (80 mg/m^3), [skin], 1993; Poland: MAC (TWA) 15 mg/m^3, MAC (STEL) 60 mg/m^3, 1999; Russia: TWA 5 ppm, 1993; Sweden: NGV 5 ppm (16 mg/m^3), KTV 10 ppm (30 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (15 mg/m^3), KZG-W 10 ppm (30 mg/m^3), [skin], 1999; Turkey: TWA 25 ppm (80 mg/m^3), 1993; United Kingdom: TWA 5 ppm (16 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 ppm [skin]. The former USSR-UNEP/IRPTC[35] set a MAC of 0.3 mg/m^3 for ambient air in residential areas (on a once daily basis). Several states have set guidelines or standards for 2-methoxyethanol in ambient air[60] ranging from 21.0 μg/m^3 (Massachusetts) to 53.3 μg/m^3 (New York) to

100 μg/m^3 (Rhode Island) to 160.0 μg/m^3 (Florida and North Dakota) to 270.0 μg/m^3 (Virginia) to 320.0 μg/m^3 (Connecticut) to 381.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1403, alcohols I or OSHA Analytical Method 53 and 79.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.5$.

Routes of Entry: Inhalation of vapor, ingestion, eye and/or skin contact, plus cutaneous absorption of liquid.

Harmful Effects and Symptoms

Short Term Exposure: EGME irritates the eyes and the respiratory tract. More severe exposures may cause damage to brain, nervous system, liver and kidneys, and death. *Inhalation:* Exposure to levels above 25 ppm may cause headache, drowsiness, lethargy, weakness, and tremors. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Readily absorbed through the skin. May cause stinging and reddening upon contact; and cause or contribute to symptoms in the lungs. *Eyes:* Contact with liquid or high vapor concentrations may cause burning irritation and clouded vision. *Ingestion:* 3 liquid ounces (100 mL) has been reported to cause confusion, nausea, weakness, and rapid breathing. Symptoms were delayed 8−18 h.

Long Term Exposure: Prolonged exposure can cause anemia and lesions of blood cells. May cause symptoms listed under inhalation. Repeated exposure can cause headaches, weakness, drowsiness, personality changes, loss of weight, upset stomach, and tremors. May cause kidney damage. Extended exposures of 25−75 ppm has caused anemia and nervous system effects, such as fatigue, weakness, loss of muscle control, and mental changes. Ethylene glycol monomethyl ether has been shown to cause reproductive problems, damage to the testes, and cause birth defects in animal studies.

Points of Attack: Eyes, respiratory system, central nervous system, blood, kidneys, reproductive system, hematopoietic system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests; complete blood count; kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Examination of the nervous system. NIOSH lists the following tests: complete blood count; urine (chemical/metabolite), end-of-shift.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h:** butyl rubber gloves, suits, boots; Tychem 1000™ suits. **4 h:** 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 ppm:* Sa: Pd,Pp* (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Up to 200 ppm*: SaF: Pd, Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Methoxyethanol must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong caustics since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where 2-methoxyethanol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever 2-methoxyethanol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep EGME out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides: discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides: perforation of a container of the waste from a safe distance followed by open burning.[24]

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, T+, N; Risk phrases R45; R46; R11; R26/27/28; R34; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethyleneimine is a colorless volatile liquid with an ammoniacal odor. Molecular weight = 43.08; Specific gravity (H_2O:1) = 0.83; Boiling point = 56.1°C; Freezing/Melting point = − 71.7°C; Vapor pressure = 160 mmHg at 20°C; Flash point = −11°C (cc); Autoignition temperature = 322°C. Explosive limits: LEL = 3.3%; UEL = 54.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Highly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Ethyleneimine is used in the production of binding agents, formation of plastics, and improving paper strength, in many organic syntheses, as an intermediate and monomer for fuel oil and lubricating refining. The polymerization products, polyethyleneimines, are used as auxiliaries in the paper industry and as flocculation aids in the clarification of effluents. It is also used in the textile industry for increasing wet strength, flame-, water-, shrink-proofing, and stiffening.

Incompatibilities: Forms explosive mixture with air. Ethyleneimine is a medium strong base. Contact with acids, aqueous acid conditions, oxidizers, aluminum, or carbon dioxide may cause explosive polymerization. Explosive silver derivatives may be formed with silver alloys (e.g., silver solder). Self-reactive with heat or atmospheric carbon dioxide. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks rubber, coatings, plastics, and chemically active metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.76 mg/m^3 at 25°C & 1 atm.

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices, and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.5 ppm/ 0.09 mg/m^3 TWA; 0.1 ppm/ 0.18 mg/m^3 [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.05 ppm

PAC-1: 0.1 ppm

PAC-2: **4.6** ppm

PAC-3: **9.9** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 2.

Australia: TWA 0.5 ppm (1 mg/m^3), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Denmark: TWA 0.5 ppm (1 mg/m^3), [skin], 1999; Finland: STEL 0.5 ppm (1 mg/m^3), [skin], carcinogen, 1999; Japan: 0.5 ppm (0.88 mg/m^3), [skin], 1999; Norway: TWA 0.5 ppm (1 mg/m^3), 1999; Russia: TWA 0.5 ppm; STEL 0.02 mg/m^3, [skin], 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.5 ppm (0.9 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 0.5 ppm (1 mg/m^3), [skin], 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[43] has set a MAC of 0.001 mg/m^3 in ambient air of residential areas on either a momentary or a daily average basis. Several states have set guidelines or standards for ethyleneimine in ambient air[60] ranging from zero (North Carolina) to 3.3 μg/m^3 (New York) to 5.0 μg/m^3 (South Carolina) to 10.0 μg/m^3 (Florida and North Dakota) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3514.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 14 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.4$.

Routes of Entry: Inhalation and percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethyleneimine is corrosive to the eyes, skin, and respiratory tract. Eye contact can cause severe illness or death. Inhalation of the vapors can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms include tearing and burning of the eyes, sore throat, nausea, vomiting, coughing (may persist for weeks or months), and a slow healing dermatitis due to severe blistering. Ethyleneimine is classified as extremely toxic with a probable oral lethal dose of 5−50 mg/kg which is approximately 7 drops to 1 teaspoonful for a 75-kg (150-lb) person. Ethyleneimine gives inadequate warning when overexposure is by inhalation or skin absorption. It is a severe blistering agent, causing third degree chemical burns of the skin. Also, it has a corrosive effect on mucous membranes and may cause scarring of the esophagus. It is corrosive to eye tissue and may cause permanent corneal opacity and conjunctival scarring. Severe exposure may result in overwhelming pulmonary edema. Renal damage has been described. Hemorrhagic congestion of all internal organs has been observed. May affect the central nervous system, kidneys, and liver.

Long Term Exposure: May be a carcinogen in humans. May damage the developing fetus. May damage the testes. Repeated or prolonged contact with skin may skin allergy. May damage the liver and kidneys.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys. Cancer site in animals: lung and liver.

Medical Surveillance: OSHA Mandated Tests: *Increased Risks* check for Reduced Immunologic Competence; steroid treatment; pregnancy; cigarette smoking. NIOSH lists the following tests: electrocardiogram, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 45 min, occasionally lifting upper and lower lids. Seek medical attention immediately since eye splashes can cause severe illness or death. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Tychem 1000™ suits; **4 h:** Teflon™ gloves, suits, boots; Responder™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: Employees engaged in handling operations involving this carcinogen must be provided with, and required to wear and use, a half-mask filter-type respirator for dusts, mists, and fumes. A respirator affording higher levels of protection than this respirator may be substituted. NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyleneimine must be inhibited and stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where ethyleneimine is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyleneimine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyleneimine. Wherever ethyleneimine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid breathing vapors. Stay upwind; keep out of low areas. Avoid bodily contact with the material. *Do not* handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.4/2.3

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Dry chemical, alcohol foam, or carbon dioxide are useful for small fires. For large fires: water spray, fog, or foam. Do not extinguish fire unless flow can be stopped; use water in flooding quantities as a fog. Solid streams of water may be ineffective. Apply water from as far a distance as possible. If tank car or truck is involved in fire, isolate the surrounding area as shown above. May polymerize in fires with evolution of heat and container rupture. Runoff to sewer may create fire or explosion hazard. Ethyleneimine vapors are not inhibited and may form polymers in vents or flame arresters, resulting in stopping of the vents. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration; incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ethylene oxide is a colorless, compressed, liquefied gas or liquid (below 11°C) with a sweetish odor. The odor threshold is 50 ppm. Molecular weight = 44.06; Specific gravity (H_2O:1) = 0.82 (liquid at 10°C); Boiling point = 11°C; Freezing/Melting point = − 112°C; Vapor pressure = 1.46 atm; Relative vapor density (air = 1) = 1.49; Relative vapor density (air = 1) = 1.49; Flash point = flammable gas (−20°C, liquid); Autoignition temperature = 429°C. Explosive limits: LEL = 3.0%; UEL = 100%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3. Easily dissolved in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene oxide is a man-made chemical used in the production of glycols (ethylene glycol, polyglycols, glycol ethers, esters), nontonic surface-active agent, ethanolamines, acrylonitrile, plastics. It is also used as a fumigant for foodstuffs and textiles; an agricultural fungicide; and for sterilization, especially for surgical instruments. It is used in drug synthesis and as a pesticide intermediate.

Incompatibilities: Forms explosive mixture with air. Dangerously reactive; may rearrange chemically and/or polymerize violently with evolution of heat, when in contact with highly active catalytic surfaces, such as anhydrous chlorides of iron, tin, and aluminum; pure oxides of iron and aluminum; and alkali metal hydroxides. Even small amounts of strong acids, alkalis, or oxidizers can cause a reaction. Avoid contact with copper. Protect container from physical damage, sun, and heat. Attacks some plastics, rubber, or coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.80 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/5 ppm [15 min excursion] TWA, cancer hazard, see 29CFR1910.1047(c).

NIOSH REL: <0.1 ppm/<0.18 mg/m^3 TWA; 5 ppm/9 mg/m^3 [10 min/day] Ceiling Concentration; Potential carcinogen. Limit exposure to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 1 ppm/1.8 mg/m^3 TWA, Suspected Human Carcinogen.

NIOSH IDLH: 800 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 5 ppm
PAC-2: 45 ppm
PAC-3: 200 ppm
DFG MAK: [skin]; Carcinogen Category 2; Germ Cell Mutagen Category 2; TRK: 1 ppm/1.83 mg/m^3; Sampling time: not fixed; 90 μg [hydroxyethylvaline]/L blood.

Arab Republic of Egypt: TWA 10 ppm (20 mg/m^3), 1993; Australia: TWA 1 ppm (2 mg/m^3), carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 1 ppm (1.8 mg/m^3), carcinogen, 1993; Denmark: TWA 1 ppm (1.8 mg/m^3), 1999; Finland: TWA 1 ppm (2.8 mg/m^3), carcinogen, 1999; Hungary: STEL 1 mg/m^3, carcinogen, 1993; the Netherlands: MAC-TGG 0.84 mg/m^3, 2003; Norway: TWA 1 ppm, 1999; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 3 mg/m^3, 1999; Russia: TWA 50 ppm; STEL 1 mg/m^3, 1993; Sweden: NGV 1 ppm (2 mg/m^3), KTV 5 ppm (9 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-W 1 ppm (2 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 50 ppm (90 mg/m^3), 1993; United Kingdom: TWA 5 ppm (9.2 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. The Czech Republic: 1 mg/m^3; Russia[35,43] set a MAC of 0.3 mg/m^3 for ambient air in residential areas on a momentary basis and 0.03 mg/m^3 on a daily average basis. Several states have set guidelines or standards for ethylene oxide in ambient air[60] ranging from zero (North Dakota) to 0.01 mg/m^3 (Rhode Island) to 0.1 μg/m^3 (North Carolina) to 4.87 μg/m^3 (Pennsylvania) to 6.67 μg/m^3 (New York) to 10.0 μg/m^3 (South Carolina) to 20.0 μg/m^3 (Connecticut, South Dakota and Virginia) to 48.0 μg/m^3 (Nevada) to 450.0 μg/m^3 (Indiana).

Determination in Air: Use NIOSH Analytical Method (IV) s #1614, Ethylene oxide; by portable GC #3800; passive monitor, OSHA Analytical Method 49, 30 (superceded by 50).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.29$.

Routes of Entry: Inhalation of gas, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Signs and symptoms of acute exposure to ethylene oxide may be severe and include dyspnea (shortness of breath), cough, pulmonary edema, pneumonia, and respiratory failure. Lethargy, headache, dizziness, twitching, convulsions, paralysis, and coma may be observed. Cardiac arrhythmias and cardiovascular collapse may also occur. Gastrointestinal effects of acute exposure may include nausea, vomiting, and abdominal pain. Ethylene oxide irritates the eyes, skin, and respiratory tract. Very high exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. *Inhalation:* Exposure to 500−700 ppm for 2−3 min resulted in nausea, vomiting, headache, disorientation, fluid in the lungs, followed by seizures. Human volunteers breathing a concentration of about 2500 ppm experienced slight irritation of the respiratory tract; breathing in 12,500 ppm showed definite respiratory tract irritation within 10 s. Symptoms may not occur for hours after exposure. Other symptoms reported at unknown concentrations include headache, nausea, coughing, vomiting, difficult breathing, respiratory tact irritation, weakness, a lack of coordination, seizures, and fluid in the lungs. *Skin:* The pure liquid may cause frostbite. A 1% water solution can cause irritation and redness. A 40−80% water solution may cause extensive blister formation. Ethylene oxide may severely irritate or burn mucous membranes and moist skin. *Eyes:* May cause irritation and severe burns. May affect the eyes, causing delayed development of cataract. Eye contact may result in conjunctivitis (red, inflamed eyes) and erosion of the cornea. *Ingestion:* May cause gastric irritation and liver injury.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin allergy. ETO may affect the nervous system, kidneys, adrenal glands, skeletal muscles, and cause reproductive effects. It may be carcinogenic to humans. Exposure to low concentrations of gaseous ETO may cause irritation to the respiratory tract and eyes, loss of sense of smell, and nausea and vomiting. Repeated skin exposure can cause scaling, cracking, and redness. Exposure to 5−10 ppm for 11 years or to 1 ppm for 15 years has caused blood changes. ETO has caused cancer in several species of laboratory animals. It has also caused changes in genetic material and reproductive problems in laboratory animals. May damage the developing fetus. It may cause inheritable genetic damage in humans. There is an increased incidence of gynecological disorders and spontaneous abortions among workers in ethylene oxide production. Its role in this increase is unclear at this time. Increased incidence of leukemia and stomach cancer have been reported; however the evidence is not considered conclusive. Leukemia, brain tumors, lung tumors, and other cancers have been observed in laboratory animals.[DHHS]

Points of Attack: Eyes, skin, respiratory system, liver, central nervous system, blood, kidneys, reproductive system. *Cancer site:* peritoneum, blood or bone marrow.

Medical Surveillance: OSHA Mandated Tests: complete blood count/white blood cells/differential, red blood cells/count, hematocrit, hemoglobin. NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); complete blood count; expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); red blood cells/count; sputum cytology; white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If ethylene oxide gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** Barricade® coated suits; Responder, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h:** Teflon™ gloves, suits, boots; 4H™ and Silver Shield™ gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas and splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: Employees engaged in handling operations involving this carcinogen must be provided with, and required to wear and use, a half-mask filter-type respirator for dusts, mists, and fumes. A respirator affording higher levels of protection than this respirator may be substituted. NIOSH: *5 ppm:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*End-of-service life indicator (ESLI) required.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. It must be stored to avoid contact with even small amounts of acids (such as nitric or sulfuric acids); alkalis (such as sodium hydroxide or potassium hydroxide); catalytic anhydrous chlorides of iron, aluminum or tin; iron or aluminum oxide; or metallic potassium since it may react by itself, liberating much heat and causing a possible explosion. Ethylene oxide should not contact oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since an explosion could occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or sunlight. Sources of ignition, such as smoking and open flames, are prohibited where ethylene oxide is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethylene oxide should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethylene oxide. Wherever ethylene oxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Ethylene oxide requires a shipping label of "POISON, GAS, FLAMMABLE GAS." It falls in Hazard Class 2.3 and there is no Packing Group. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: *Gas:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations.

Liquid: For *small spills* flush area with flooding amounts of water. For *large spills* dike spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Ethylene oxide and Ethylene oxide with Nitrogen

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.6/2.5

Fire Extinguishing: Highly flammable. *Gas:* Poisonous gases, including carbon monoxide, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: Highly flammable. Acrid and poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Although soluble in water, solutions will continue to burn until diluted to approximately 22 volumes of water to one volume of ethylene oxide. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethylene thiourea is a white to light green, needle-like crystalline solid with a faint amine odor. Molecular weight = 102.17; Boiling point = 230−312.8°C; Freezing/Melting point = 200°C; Vapor pressure = 16 mmHg at 20°C; Flash point = 252.2°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in cold water; solubility = 2% at 30°C; highly soluble in hot. Commercial ethylene thiourea is available as a solid powder, as a dispersion in oil (which retards the formation of fine dust dispersions in work-place air), and "encapsulated" in a matrix of compatible elastomers. In this latter form, ethylene thiourea may be least likely to escape into the work-place air.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Ethylene thiourea is used extensively as an accelerator in the curing of polychloroprene (Neoprene™) and other elastomers; as a vulcanizing accelerator in rubber processing; in electroplating baths. In addition, exposure to ethylene thiourea also results from the very widely used ethylene bisdithiocarbamate fungicides. Ethylene thiourea may be present as a contaminant in the ethylene bisdithiocarbamate fungicides and can also be formed when food containing the fungicides is cooked.

Incompatibilities: Strong oxidizers, acids, acid anhydrides, acrolein.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. Use encapsulated form.

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: Carcinogen Category 3B.

Finland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, carcinogen, 1993; France: carcinogen, 1993; the Netherlands: MAC-TGG 0.024 mg/m^3, 2003; Sweden: carcinogen, 1999. States which have set guidelines or standards for ethylene thiourea in ambient air[60] include North Dakota (zero level) and Pennsylvania (0.7 μg/m^3).

Determination in Air: Use NIOSH Analytical Method (IV) #5011 or OSHA Analytical Method 95.

Permissible Concentration in Water: Maine[61] has set a guideline for drinking water of 4.4 μg/L. The US EPA in a health advisory (see "References" below) has developed a no-observed-adverse-effect level (NOAEL) of 1.25 mg/kg/day based on absence of thyroid effects in male rats exposed to ETU in the diet for up to 12 months. This results in a longer term health advisory of 0.44 mg/L for an adult.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.7$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause irritation of the respiratory tract with soreness, hoarseness, cough, and phlegm. High exposure can cause sweating, thirst, nausea, an increase in the heart rate and blood pressure that can last for hours or days. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Contact can cause irritation of the skin and eyes, and may cause eye burns. A related chemical, ziram, can cause brain swelling and hemorrhage with muscle weakness, liver and kidney effects.

Long Term Exposure: Ethylene thiourea has been shown to be carcinogenic and teratogenic (causing malformation in offspring) in laboratory animals. May cause malformations in human babies. Ethylene thiourea may cause thyroid and liver damage. In addition, ethylene thiourea can cause myxedema (the drying and thickening of skin, together with a slowing down of physical and mental activity), goiter, and other effects related to decreased output of thyroid hormone. Maneb, a related fungicide, can cause nerve damage.

Points of Attack: Eyes, skin, thyroid, reproductive system. Cancer site in animals: liver, thyroid, and lymphatic system.

Medical Surveillance: Initial and routine employee exposure surveys should be made by competent industrial hygiene and engineering personnel. These surveys are necessary to determine the extent of employee exposure and to ensure that controls are effective. The *NIOSH Occupational Exposure Sampling Strategy Manual*, NIOSH Publication #77-173, may be helpful in developing efficient programs to monitor employee exposures to ethylene thiourea. The manual discusses determination of the need for exposure measurements, selection of appropriate employees for exposure evaluation, and selection of sampling times. Employee exposure measurements should consist of 8-h TWA exposure estimates calculated from personal or breathing zone samples (air that would most nearly represent that inhaled by the employees). Area and source measurements may be useful to determine problem areas, processes, and operations. Thyroid function tests. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: There are four basic methods of limiting employee exposure to ethylene thiourea. None of these is a simple industrial hygiene or management decision and careful planning and thought should be used prior to implementation of any of these.

Product Substitution: The substitution of an alternative material with a lower potential health and safety risk in one method. However, extreme care must be used when selecting possible substitutes. Alternatives to ethylene thiourea should be fully evaluated with regard to possible human effects. Unless the toxic effects of the alternative have been thoroughly evaluated, a seemingly safe replacement, possibly only after years of use, may be found to induce serious health effects.

Contaminant Control: The most effective control of ethylene thiourea, where feasible, is at the source of contamination by enclosure of the operation and/or local exhaust ventilation. If feasible, the process or operation should be enclosed with a slight vacuum so that any leakage will result in the flow of air into the enclosure. The next most effective means of control would be a well-designed local exhaust ventilation system that physically encloses the process as much as possible, with sufficient capture velocity to keep the contaminant from entering the work atmosphere. To ensure that ventilation equipment is working properly, effectiveness (e.g., air velocity, static pressure, or air volume) should be checked at least every 3 months. System effectiveness should be checked soon after any change in production, process or control, which might result in significant increases in airborne exposures to ethylene thiourea.

Employee Isolation: A third alternative is the isolation of employees. It frequently involves the use of automated equipment operated by personnel observing from a closed control booth or room. The control room is maintained at a greater air pressure than that surrounding the process equipment so that air flow is out of, rather than into, the room. This type of control will not protect those employees that must do process checks, adjustments, maintenance, and related operations.

Personal Protective Equipment: The least preferred method is the use of personal protective equipment. This equipment, which may include respirators, goggles, gloves, and related items, should not be used as the only means to prevent or minimize exposure during routine operations. Exposure to ethylene thiourea should not be controlled with the use of respirators except: During the time necessary to install or implement engineering or work practice controls; or in work situation in which engineering and work practice controls are technically not feasible; or for maintenance; or for operations which require entry into tanks or closed vessels; or in emergencies.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, acids, acid anhydrides, acrolein. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in a furnace equipped with afterburner and scrubber.[22]

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl ether is a colorless, mobile, highly flammable, volatile liquid with a characteristic pungent odor. The odor threshold is 0.63 ppm.[41] Molecular weight = 74.14; Specific gravity (H_2O:1) = 0.71; Boiling point = 34.4°C; Freezing/Melting point = −116°C; Relative vapor density (air = 1) = 2.62; Vapor pressure = 440 mmHg at 20°C; Flash point = −45°C; Autoignition temperature = 180°C. Explosive limits: LEL = 1.9%; UEL = 36.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 7%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen, Human Data; Primary Irritant. Ethyl ether is used as a solvent for waxes, fats, oils, perfumes, alkaloids, dyes, gums, resins, nitrocellulose, hydrocarbons, raw rubber, and smokeless powder. It is also used as an inhalation anesthetic, a refrigerant, in diesel fuels, in dry cleaning, as an extractant, and as a chemical reagent for various organic reactions.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, strong oxidizers, halogens, sulfur, sulfur compounds, causing fire and explosion hazard. Can form peroxides from air, heat, sunlight; may explode when container is unstoppered or otherwise opened. Attacks some plastics, rubber, and coatings. Being a nonconductor, chemical may accumulate static electric charges that may result in ignition of vapor.

Permissible Exposure Limits in Air

OSHA PEL: 400 ppm/1200 mg/m^3 TWA.

NIOSH REL: None. See Appendix D (NIOSH Pocket Guide).

DFG MAK: 400 ppm/1200 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

NIOSH IDLH: 1900 ppm [LEL].

Australia: TWA 400 ppm (1200 mg/m^3); STEL 500 ppm, 1993; Austria: MAK 400 ppm (1200 mg/m^3), 1999; Belgium: TWA 400 ppm (1210 mg/m^3); STEL 500 ppm, 1993; Denmark: TWA 400 ppm (1200 mg/m^3), 1999; Finland: TWA 400 ppm (1200 mg/m^3); STEL 500 ppm (1500 mg/m^3), 1999; France: VME 400 ppm (1200 mg/m^3), VLE 500 ppm (1500 mg/m^3), 1999; Hungary: TWA 300 mg/m^3; STEL 600 mg/m^3 [skin] 1993; the Netherlands: MAC-TGG 308 mg/m^3, 2003; Norway: TWA 200 ppm (600 mg/m^3), 1999; the Philippines: TWA 400 ppm (1200 mg/m^3), 1993; Poland: MAC (TWA) 300 mg/m^3, MAC (STEL) 1500 mg/m^3, 1999; Russia: TWA 400 ppm; STEL 300 mg/m^3, 1993; Switzerland: MAK-W 400 ppm (1200 mg/m^3), KZG-W 800 ppm (2400 mg/m^3), 1999; Turkey: TWA 400 ppm (1200 mg/m^3), 1993; United Kingdom: TWA 400 ppm (1230 mg/m^3); STEL 500 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 500 ppm.

The Czech Republic[35]: TWA 500 mg/m^3; STEL 1500 mg/m^3. Russia[35] set a MAC of 1.0 mg/m^3 in the ambient air of residential areas on a once-a-day basis and 0.6 mg/m^3 on a daily average basis. Several states have set guidelines or standards for ethyl ether in ambient air[60] ranging from 0.16 mg/m^3 (Massachusetts) to 12.0−15.0 mg/m^3 (North Dakota) to 20.0 mg/m^3 (Virginia) to 24.0 mg/m^3 (Connecticut, Florida, New York) to 28.571 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1610 or OSHA Analytical Method 7.[18]

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.3 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.9$.

Routes of Entry: Inhalation of vapor, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Local: Ethyl ether vapor is mildly irritating to the eyes, nose, and throat. Contact with liquid may produce a dry, scaly, fissured dermatitis. *Systemic:* Ethyl ether has predominantly narcotic properties. Overexposed individuals may experience drowsiness, vomiting, and unconsciousness. Death may result from severe overexposure. Chronic exposure results in some persons in anorexia, exhaustion, headache, drowsiness, dizziness, excitation, and psychic disturbances. Albuminuria has been reported. Chronic exposure may cause an increased susceptibility to alcohol. There is an association between exposure to anesthetic vapors and increased miscarriages and birth defects. Diethyl ether's role in these increased risks is unclear.

Short Term Exposure: Ethyl ether irritates the eyes and respiratory tract. Inhalation can cause drowsiness, excitement, dizziness, vomiting, irregular breathing, and increased saliva. Swallowing the liquid may cause chemical pneumonitis. High exposure can affect the central nervous system, causing unconsciousness and even death.

Long Term Exposure: Repeated or prolonged contact can cause skin cracking, scaling, and extreme drying. Repeated exposure may cause an addiction.

Points of Attack: Central nervous system, skin, respiratory system, eyes.

Medical Surveillance: Preplacement or periodic examinations should evaluate the skin and respiratory tract, liver and kidney function. Persons with a past history of alcoholism may be at some increased risk due to possibility of ethyl ether addiction (known as "ether habit"). Tests for exposure may include expired breath for unmetabolized ethyl ether and blood for ethyl ether content by oxidation with chromate solution or by gas chromatographic methods. NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of saltwater and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **8 h:** polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves; Barricade® coated suits; **4 h:** Teflon™ gloves, suits, boots; Responder™ suits, Trellchem HPS™ suits. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *1900 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Ethyl ether must be stored to avoid contact with strong oxidizers (such as bromine, chlorine, chlorine dioxide, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and sunlight. Unstable peroxides may form if diethyl ether is exposed for a long time to air or sunlight, causing explosions. Sources of ignition, such as smoking and open flames, are prohibited where ethyl ether is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl ether should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl ether. Wherever ethyl ether is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep diethyl ether out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an extremely flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; R20/22; R36/37; Safety phrases: S2; S9; S16; S24; R26; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl formate is a colorless liquid with a fruity odor. Molecular weight = 74.09; Specific gravity (H_2O:1) = 0.92; Boiling point = 54.4°C; Freezing/Melting point = −80.6; Vapor pressure = 200 mmHg at 20°C; Flash point = −20°C; Autoignition temperature = 440°C. Explosive limits: LEL = 2.8%; UEL = 16.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Solubility in water = 9% at 18°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Primary Irritant. This material is used as an emulsifier; food and feed additive; flavor, packaging material; as a solvent for cellulose nitrate and acetate; it is used as a fumigant and in the production of synthetic flavors. It is also a raw material in pharmaceutical manufacture.

Incompatibilities: Forms explosive mixture with air. Reacts violently with nitrates, strong oxidizers, strong alkalis, and strong acids. Decomposes slowly in water, forming ethyl alcohol and formic acid. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/300 mg/m^3 TWA.

NIOSH REL: 100 ppm/300 mg/m^3 TWA.

ACGIH TLV®[1]: 100 ppm/303 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 300 ppm

PAC-2: 500 ppm

PAC-3: 1500 ppm

DFG MAK: 100 ppm/310 mg/m^3 TWA; Peak Limitation Category I(1);[skin]; Pregnancy Risk Group C.

NIOSH IDLH: 1500 ppm.

Australia: TWA 100 ppm (300 mg/m^3), 1993; Austria: MAK 100 ppm (300 mg/m^3), 1999; Belgium: TWA 100 ppm (303 mg/m^3), 1993; Denmark: TWA 100 ppm (300 mg/m^3), 1999; Finland: TWA 100 ppm (300 mg/m^3), 1999; France: VME 100 ppm (300 mg/m^3), 1999; the Netherlands: MAC-TGG 300 mg/m^3, 2003; Norway: TWA 50 ppm (150 mg/m^3), 1999; Poland: MAC (TWA) 100 mg/m^3, MAC (short-term exposure limit) 450 mg/m^3, 1999; Turkey: TWA 100 ppm (300 mg/m^3), 1993; United Kingdom: TWA 100 ppm (308 mg/m^3), STWL 150 ppm, 2000: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 100 ppm. Several states have set guidelines or standards for ethyl formate in ambient air[60] ranging from 3.0−4.5 mg/m^3 (North Dakota) to 5.0 mg/m^3 (Virginia) to 6.0 mg/m^3 (Connecticut) to 7.143 mg/m^3 (Nevada).

Determination in Air: Charcoal (tube) adsorption, workup with CS_2; analysis by gas chromatography/flame ionization detection; NIOSH Analytical Method (IV) #1452.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Either contact or the vapor can cause skin and eye irritation. Inhalation irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ethyl formate may affect the central nervous system. Exposure can cause headache, nausea, and vomiting.

Long Term Exposure: Prolonged or repeated contact can cause skin dryness and cracking. May affect the nervous system.

Points of Attack: Eyes, respiratory system, central nervous system.
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Consider chest X-ray following acute overexposure. Nervous system tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, Nitrile, and styrene−butadiene rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: *Up to 1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrOv (APF = 10) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases, moisture, and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket

great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray into a furnace in admixture with a flammable solvent.[24]

2-Ethyl hexaldehyde E:0700

Molecular Formula: $C_8H_{16}O$

Common Formula: $(C_2H_5)(C_4H_9)CHCHO$

Synonyms: Butyl ethyl acetaldehyde; 2-Ethylcaproaldehyde; Ethylhexanal; 3-Formylheptane; Hexanal, 2-ethyl-; Octyl aldehyde; β-Propyl-α-ethylacrolein

CAS Registry Number: 123-05-7 (hexaldehydes)

RTECS® Number: MN7525000

UN/NA & ERG Number: UN1191/129

EC Number: 204-596-5

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl hexaldehyde is a colorless liquid with a mild, pleasant odor. Molecular weight = 128.24; Boiling point = 163°C; Flash point = 44.4°C; Autoignition temperature = 190°C. Explosive limits: LEL = 0.85% at 93°C; UEL = 7.2% at 135°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Primary Irritant. It is used as a solvent extraction chemical; in organic synthesis; perfume formulation, disinfectant.

Incompatibilities: Forms explosive mixture with air. Violent reaction with oxidizers. Incompatible with strong acids, caustics, ammonia, amines. May ignite spontaneously when spilled on clothing or other absorbent materials. May form unstable peroxides on contact with air; under certain conditions ignites spontaneously with air.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Skin absorption, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Skin or eye contact can cause severe irritation or burns. The vapors can irritate the eyes, throat, and bronchial tubes, with coughing and difficulty breathing. Headaches and nausea may occur. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may cause bronchitis with cough, phlegm, and shortness of breath.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24—48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl hexaldehyde, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials.

Prior to working with ethyl hexaldehyde you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases, and combustible materials. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This falls under "Octyl Aldehydes, Flammable," and requires a shipping label of "FLAMMABLE LIQUID." This falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl hexaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Those involved in the use of this monomer as a feedstock for chemical syntheses; in the manufacture of plastics; protective coatings, including water-based paints; in paper treatment; the production of emulsion polymers.

Incompatibilities: Unless inhibited, sunlight, heat, contaminants, or peroxides can cause polymerization. Violent reaction with strong oxidizers, with risk of fire and explosions. Forms explosive mixture with air. Incompatible with strong acids, aliphatic amines, alkanolamines. Vapors are uninhibited and may polymerize, blocking vents.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 5 ppm
PAC-1: 10 ppm
PAC-2: 10 ppm
PAC-3: 10 ppm

DFG MAK: 5 ppm/38 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D; [skin] danger of skin sensitization.

Poland: TWA 35 mg/m^3; STEL 100 mg/m^3, 1999; Russia: STEL 1 mg/m^3, 1993.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.67$.

Routes of Entry: Skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Severely irritates the eyes and skin. Irritates the respiratory tract. High exposure may cause respiratory difficulty and collapse. CNS stimulation following ingestion.

Long Term Exposure: Repeated or prolonged contact may cause skin allergy.

Points of Attack: Skin.

Medical Surveillance: Evaluation by a qualified allergist.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area or refrigerator away from oxidizers and light. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: *Note:* Unless inhibited, this material is a polymerization hazard. May be classified as a Combustible liquid, n.o.s. This class of compounds requires no particular shipping label. It falls in Hazard Class 3 and Packing Group III. Each reference to a Class 3 material is modified to read "COMBUSTIBLE LIQUID" when that material is reclassified in accordance with §173.150 (e) or (f) of this subchapter, or has a flash point above 60.5°C/141°F but below 93°C/200°F.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous and irritating gases are produced in fire. Use dry chemical or carbon dioxide. Water or foam may cause frothing.[41] Vapors are uninhibited and may polymerize, blocking vents. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure,

explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray into incinerator with added flammable solvent.

Ethylidene norbornene E:0720

Molecular Formula: C_9H_{12}

Synonyms: ENB; 5-Ethylidenebicyclo(2,21)hept-2-ene; 5-Ethylidene-2-norbornene (stabilized)

CAS Registry Number: 16219-75-3

RTECS® Number: RB9450000

UN/NA & ERG Number: UN1992/131

EC Number: 240-347-7

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 5-Ethylidene-2-norbornene is a colorless liquid with a turpentine-like odor. The odor threshold is 0.007 ppm.[41] Molecular weight = 120.21; Boiling point = 148°C; Freezing/Melting point = − 80°C; Vapor pressure = 4 mmHg; Flash point = 38.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Human Data; Primary Irritant. 5-Ethylidene-2-norbornene is used as the third monomer in terpolymer elastomers. Those engaged in the synthesis of pharmaceuticals, pesticides, or in the preparation of specialty resins.

Incompatibilities: Forms explosive mixture with air. Reacts violently with strong oxidants. Violent reaction with oxygen and strong oxidizers. May accumulate static electrical charges, and may cause ignition of its vapors. The substance may polymerize. Inhibit peroxide formation with *tert*-butyl catechol. ENB should be stored in a nitrogen atmosphere since it reacts with oxygen.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.92 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 5 ppm/25 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 5 ppm/25 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 0.06 ppm

PAC-1: **0.2** ppm

PAC-2: **100** ppm

PAC-3: **500** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 5 ppm (25 mg/m^3), 1993; Belgium: STEL 5 ppm (25 mg/m^3), 1993; Denmark: TWA 5 ppm (25 mg/m^3), 1999; Finland: TWA 5 ppm (25 mg/m^3); STEL 10 ppm (50 mg/m^3), 1999; France: VLE 5 ppm (25 mg/m^3), 1999; the Netherlands: MAC 25 mg/m^3, 2003; Norway: TWA 5 ppm (25 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (25 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 ppm. Several states have set guidelines on standards for ethylidene norbornene in ambient air[60] ranging from 200.0 μg/m^3 (Virginia) to 250.0 μg/m^3 (North Dakota) to 595.0 μg/m^3 (Nevada).

Determination in Air: No test available.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, nose, and respiratory tract. Contact can irritate and may burn the skin and eyes. Exposure can cause headache, confusion, nausea, and vomiting. Ingestion of the liquid may cause chemical pneumonitis. Exposure to high concentrations may cause unconsciousness and death.

Long Term Exposure: Repeated or high exposure may damage the liver, lungs, and kidneys. Ethylidene norbornene may damage the testes (male reproductive glands).

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys, urogenital syste, bone marrow.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; lung function tests. Reproductive history and possibly semen analysis with sperm count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved full-face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethylidene norbornene should be stored in a nitrogen atmosphere. Do not allow it to come in contact with oxygen because violent reactions can occur.

Shipping: This material may be classified as Flammable liquids, toxic, n.o.s. This class requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Ethyl isocyanate E:0730

Molecular Formula: C_3H_5NO

Common Formula: C_2H_5NCO

Synonyms: Isocyanatoethane; Isocyanic acid, ethyl ester

CAS Registry Number: 109-90-0

RTECS® Number: NQ8825000

UN/NA & ERG Number: UN2481/155

EC Number: 203-717-9

Regulatory Authority and Advisory Bodies

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl isocyanate is a clear, colorless liquid with a pungent odor. Molecular weight = 71.09; Boiling point = 60°C; Flash point = −10°C; ≤23°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2. Hydrolyzes in water.

Potential Exposure: Ethyl isocyanate is used to make pharmaceuticals and pesticides.

Incompatibilities: Forms explosive mixture with air. Violent reaction with water and strong oxidizers. Incompatible with acids, bases, ammonia, amines, amides, alcohols, glycols, caprolactum solution. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*
TEEL-0: 0.0025 ppm
PAC-1: 0.0075 ppm
PAC-2: **0.053** ppm
PAC-3: **0.16** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl isocyanate can irritate the eyes, skin, and respiratory tract. Skin contact can cause a rash. Exposure can irritate the nose and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Similar chemicals cause lung and skin allergies. It is not known if ethyl isocyanate does this.

Points of Attack: Skin, lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl isocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where ethyl isocyanate is used, handled, or stored in a manner that could create a potential fire or exposition hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl isocyanate.

Shipping: Ethyl isocyanate requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group I. A plus sign (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 2.4/3.8
Large spills (from a large package or from many small packages)
First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0 + /11.0+
Night 7.0 + /11.0+

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ethyl mercaptan E:0740

Molecular Formula: C_2H_6S
Common Formula: C_2H_5SH
Synonyms: Ethanethiol; Ethyl hydrosulfide; Ethyl sulfhydrate; Ethyl thioalcohol; LPG ethyl mercaptan 1010; Mercaptoethane; Thioethanol; Thioethyl alcohol
CAS Registry Number: 75-08-1
RTECS® Number: KI9625000
UN/NA & ERG Number: UN2363/129
EC Number: 200-837-3 [*Annex I Index No.:* 016-022-00-9]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
European/International Regulations: Hazard Symbol: F, Xn, N; Risk phrases: R11; F20; R50/53; Safety phrases: S2; S16; S25; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Ethyl mercaptan is a yellowish liquid (or a colorless gas above the BP) with a strong garlic or skunk-like odor. Molecular weight = 62.14; Specific gravity (H_2O:1) = 0.84; Boiling point = 35°C; Freezing/Melting point = −144.4°C; Relative vapor density (air = 1) = 2.14; Vapor pressure = 442 mmHg at 20°C; Flash point ≤−18°C; Autoignition temperature = 299.5°C. Explosive limits: LEL = 2.8%; UEL = 18.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Practically insoluble in water; solubility = 0.7%.

Potential Exposure: Compound Description: Primary Irritant. This material is used as a warning odorant for liquefied petroleum gases. It is used as an intermediate in the manufacture of many pesticides and other organic chemicals.

Incompatibilities: Forms explosive mixture with air. This material is a weak acid. Reacts with oxidizers, causing fire and explosion hazard. Reacts with strong acids evolving toxic and flammable hydrogen sulfide. May accumulate static electrical charges, and may cause ignition of its vapors. Attacks some forms of plastics, coatings, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.54 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 10 ppm/25 mg/m^3 Ceiling Concentration (General Industry); 0.5 ppm/1.3 mg/m^3 TWA (Construction and Shipyards).
NIOSH REL: 0.5 ppm/1.3 mg/m^3/15 min, Ceiling Concentration [15-min].
ACGIH TLV®[1]: 0.5 ppm/1.3 mg/m^3 TWA.
NIOSH IDLH: 500 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 0.5 ppm
PAC-1: **1.0** ppm
PAC-2: **120** ppm
PAC-3: **360** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: 0.5 ppm/1.3 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D, *as ethanethiol*.
Australia: TWA 0.5 ppm (1 mg/m^3), 1993; Austria: MAK 0.5 ppm (1 mg/m^3), 1999; Belgium: TWA 0.5 ppm (1.3 mg/m^3), 1993; Finland: STEL 0.5 ppm (1.3 mg/m^3), 1999; France: VME 0.5 ppm (1 mg/m^3), 1999; Hungary: STEL 1 mg/m^3, 1993; the Netherlands: MAC-TGG 1 mg/m^3, 2003; the Philippines: TWA 10 ppm (25 mg/m^3), 1993; Poland: MAC (TWA) 1 mg/m^3, MAC (STEL) 3 mg/m^3,

1999; Russia: STEL 1 mg/m^3 [skin] 1993; Switzerland: MAK-W 0.5 ppm (1.3 mg/m^3), KZG-W 1 ppm (2.6 mg/m^3), 1999; Thailand: TWA 10 ppm (25 mg/m^3), 1993; Turkey: TWA 10 ppm (25 mg/m^3), 1993; United Kingdom: TWA 0.5 ppm (1.3 mg/m^3); STEL 2 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm. Several states have set guidelines or standards for ethyl mercaptan in ambient air[60] ranging from 3.3 μg/m^3 (New York) to 10.0 μg/m^3 (Florida, North Dakota, South Carolina) to 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada) to 100.0 μg/m^3 (North Carolina).

Determination in Air: Collection filter (special); workup with hydrochloric acid/1,2-dichloroethane; analysis with gas chromatography/flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #2542.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested a permissible ambient goal or 13.8 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.5.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause skin and eye irritation. Inhalation can irritate the respiratory tract and pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headaches, nausea, vomiting, diarrhea, muscle weakness, and tiredness. May affect the central nervous system, causing convulsions and respiratory failure. High levels may cause dizziness, lightheadedness, coma, and death.

Long Term Exposure: Repeated exposure can cause lung irritation and bronchitis. May cause liver and kidney damage. Repeated or long-term exposure may damage the red blood cells, causing anemia.

Points of Attack: Eyes, respiratory system, liver, kidneys, blood.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood cell count (CBC). Liver and kidney function tests. Consider chest X-ray following acute overexposure. NIOSH lists the following tests: Blood Gas Analysis, electrocardiogram, expired air, pulmonary function tests, sputum cytology, white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of saltwater and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. **4 h:** Teflon™ gloves, suits, boots. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *500 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away

from ignition sources and corrosive and reactive materials. Prior to working with ethyl mercaptan you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and acids. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Use self-contained breathing apparatus during cleanup.[57] Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or liquid. Poisonous gases, including sulfur oxides and carbon monoxide, are produced in fire.

Liquid: Use dry chemical, carbon dioxide, halon, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (1093°C) followed by scrubbing with a caustic solution.[22]

Ethyl mercuric chloride E:0750

Molecular Formula: C_2H_5ClHg

Common Formula: C_2H_5HgCl

Synonyms: Ceresan; Chloroethyl mercury; EMC; Ethylmercuric chloride; Ethylmercury chloride; Granosan®; Granozan

CAS Registry Number: 107-27-7

RTECS® Number: OV9800000

UN/NA & ERG Number: UN2025 (mercury compounds, solid, n.o.s.)/151; UN2777 (mercury-based pesticides, solid, toxic)/151

EC Number: 203-478-0 [*Annex I Index No.:* 080-00-2-6]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section. California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R6; R26; R48/23; R50/53; Safety phrases: S53; S45; S60; S61 *as mercury*.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl mercuric chloride, an alkyl-organo mercury compound, is silvery white, forming leaf-like crystals. Molecular weight = 265.11; Freezing/Melting point = 192°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Organometallic, Mutagen. It is used as an organic fungicide for seed treatment.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg/m^3 STEL [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.0132 mg/m^3

PAC-1: 0.0396 mg/m^3

PAC-2: 2.64 mg/m^3

PAC-3: 2.64 mg/m^3

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3.

NIOSH IDLH: 2 mg[Hg]/m^3.

Russia[43] set a MAC of 0.005 mg/m^3 in work-place air and a MAC of 0.0009 mg/m^3 for ambient air in residential areas on a momentary basis and 0.0001 mg/m^3 on an average daily basis.

Determination in Air: No test available.

Permissible Concentration in Water: A severe marine pollutant. A MAC in water bodies used for domestic purposes has been set by Russia[43] at 0.0001 mg/L.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ethyl mercuric chloride is an extremely toxic chemical that can cause permanent brain damage weeks after exposure with little or no warning during exposure. LD_{50} = (oral-rat) 40 mg/kg. Severe poisoning can cause death. It enters the body through the lungs, skin, and contaminated hands. Poisoning causes a "pins and needles" feeling, becoming clumsy and weak; hearing loss; abnormal walking; tremors, personality changes and other brain damage. Eye contact may cause severe irritation.

Long Term Exposure: Ethyl mercuric chloride should be handled as a teratogen—with extreme caution. It may cause mutations. Handle with extreme caution. Mercury accumulates in the body. May cause kidney damage. It can take months or years for the body to get rid of excess mercury.

Points of Attack: Eyes, skin. central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: NIOSH lists the following tests: body hair/nail; whole blood (chemical/metabolite); neurologic examination/electromyography. Before first exposure and every 6−12 months after, a complete medical history and exam is strongly recommended, with examination of the nervous system including handwriting. Visual exam, including "visual field" exam. Hearing tests. Test for mercury in hair and blood. After suspected illness or overexposure, repeat these tests promptly, again in 4−6 weeks and then as recommended by your doctor. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate [CAS: 134-72-5].

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m^3*: Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m^3*: SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates).

Shipping: This material falls in the class of mercury-based pesticides, solid, toxic and requires a shipping label of “POISONOUS/TOXIC MATERIALS.” This compound falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressant or special vacuums. Kits specific for cleanup of mercury spills should be available. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

US EPA Hazardous Waste Number (RCRA No.): U118.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.14; Nonwastewater (mg/kg), 160.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8015 (10); 8240 (5).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R36/37/38; R43; Safety phrases: S2; S9; S16; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl methacrylate is a colorless liquid. Molecular weight = 114.16; Boiling point = 115−120°C; Freezing/Melting point ≤−75°C; Flash point = 20°C; Autoignition temperature = 393°C. Explosive limits: LEL = 1.8%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Primary Irritant. This chemical is used in manufacture of coatings, resins, and laquers. Widely known as “Plexiglass” (in the polymer form), ethyl methacrylate is used to make polymers, which in turn are used for building, automotive, aerospace, and furniture industries. It is also used by dentists as dental plates, artificial teeth, and orthopedic cement.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, amines, oxidizers. Corrodes some metals. Unless inhibited, violent polymerization can occur from heat, sunlight, and contact with strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 50 ppm
PAC-1: 150 ppm
PAC-2: 750 ppm
PAC-3: 750 ppm

DFG MAK: [skin] danger of skin sensitization.

Denmark: TWA 50 ppm (235 mg/m^3), 1999; Norway: TWA 50 ppm (250 mg/m^3), 1999; Russia: STEL 50 mg/m^3, 1993; Sweden: NGV 50 ppm (250 mg/m^3), KTV 75 ppm

(350 mg/m^3), 1999; the Netherlands: MAC-TGG 48 mg/m^3, 2003.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: A lacrimator. Exposure can irritate the eyes, skin, and respiratory tract. Very high vapor levels could cause you to feel dizzy, lightheaded, and even to pass out. Contact can irritate the eyes and skin.

Long Term Exposure: Repeated or prolonged contact with skin may cause allergy with rash and itching. May damage the nervous system. There is limited evidence that ethyl methacrylate may damage the developing fetus.

Points of Attack: Skin, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. There is evidence that fluorinated ethylene propylene materials offer protection from ethyl methacrylate for up to 3 h. Polyvinyl alcohol is also among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to ethyl methacrylate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Sources of ignition, such as smoking and open flames, are prohibited where ethyl methacrylate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl methacrylate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl methacrylate.

Shipping: This compound (stabilized) requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl methacrylate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA

1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NTP: Reasonably anticipated to be a human carcinogen; OSHA: possible select carcinogen.

US EPA Hazardous Waste Number (RCRA No.): U119.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 1 lb (0.454 kg).

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl methanesulfonate is a clear liquid. Molecular weight = 124.15; Boiling point = 213°C; Vapor pressure = 0.33 mmHg at 25°C; Flash point = 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Soluble in water; solubility = 50 g/L at 27°C.

Potential Exposure: It was considered as a possible human male contraceptive. Also considered as a reversible male hemosterilant for insects and mammalian pests. Used as a research tool for mutagenesis and carcinogenesis studies.

Incompatibilities: Acids, acid fumes; nitrates.

Permissible Exposure Limits in Air

Temporary Emergency Exposure Limits (DOE)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 150 mg/m^3

Determination in Air: No test available.

Permissible Concentration in Water: Octanol−water coefficient: Log $K_{ow} = 0.091$.

Harmful Effects and Symptoms

Irritation of skin, eyes, and mucous membranes; sores and burns. $LD_{50} = 470$ mg/kg.

Long Term Exposure: A carcinogen in animals. A Mutagen; Reproductive Effector.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place or a refrigerator away from acids and acid fumes. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound may be classified as an irritating agent and requires a shipping label of "POISONOUS/TOXIC MATERIALS."

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Land spill:* Build dikes to contain the flow of spilled compound and fire-fighting water, if any. Absorb the compound on bentonite, sawdust, clay, or carbon. Alternatively, add a 5% solution of sodium hydroxide. Collect the waste in barrels for later disposal or treatment. *Spill on water body:* If the spill occurs on a large flowing water body, add a 5% solution of sodium hydroxide. Collect the waste in barrels for later disposal or treatment. In case of spill on nonflowing small water body, add 5% caustic followed by carbon adsorption or biological treatment depending on the end uses of the water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nonaqueous wastes may be treated in an incinerator, boiler, or cement kiln where temperature and residence time are in excess of 1000°C and 25 s, respectively. Alternatively, the nonaqueous wastes may be disposed of in an RCRA-approved landfill. The detoxified aqueous waste may be treated using biological wastewater methods or disposed of through deep-well injection. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN1993/128

EC Number: 202-885-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 4-Ethylmorpholine is a colorless liquid with an ammonia-like odor. Molecular weight = 115.20; Specific gravity (H_2O:1) = 0.90; Boiling point = 138.3°C; Freezing/Melting point = −62.8°C; Vapor pressure = 6.2 mmHg at 20°C; Flash point = 32.2°C (oc); Autoignition temperature = 275°C. Explosive limits: LEL = 0.9%; UEL = 4.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Mutagen. Primary Irritant. This material is used as a catalyst in polyurethane foam production. It is a solvent for dyes and resins. It is used as an intermediate in surfactant, dye, pharmaceutical, and rubber chemical manufacture.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong acids, strong oxidizers. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.71 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm/94 mg/m^3 TWA [skin].

NIOSH REL: 5 ppm/23 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 5 ppm/24 mg/m^3 TWA [skin].

NIOSH IDLH: 100 ppm.

No TEEL available.

Australia: TWA 5 ppm (23 mg/m^3), [skin], 1993; Belgium: TWA 5 ppm (24 mg/m^3), [skin], 1993; Denmark: TWA 5 ppm (23.5 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (47 mg/m^3); STEL 10 ppm (50 mg/m^3), [skin], 1999; France: VME 5 ppm (23 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 23 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (23 mg/m^3), 1999; Russia: STEL 5 mg/m^3, [skin], 1993; Sweden: NGV 5 ppm (25 mg/m^3), KTV 10 ppm (50 mg/m^3), [skin], 1999; Switzerland: MAK-W 20 ppm (70 mg/m^3), KZG-W 40 ppm (140 mg/m^3), [skin], 1999; United Kingdom: TWA 5 ppm (24 mg/m^3); STEL 20 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV®: TWA 5 ppm [skin]. Several states have set guidelines or standards for *n*-ethylmorpholine in ambient air[60] ranging from 230 μg/m^3 (North Dakota) to 400 μg/m^3 (Virginia) to 460 μg/m^3 (Connecticut) to 548 μg/m^3 (Nevada).

Determination in Air: Adsorption on Si gel, workup with H_2SO_4 using ultrasonics; analysis by gas chromatography/flame ionization. See NIOSH (II-3) Method #S-146.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can irritate and burn the skin and eyes. Exposure to high concentration of the vapor can cause drowsiness, foggy vision, visual disturbance, corneal edema, blue−gray vision, seeing colored halos around light.

Long Term Exposure: Unknown at this time.

Points of Attack: Respiratory system, eyes, skin.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 50 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator). *Up to 100 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, strong oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers Store in a refrigerator under an inert atmosphere for prolonged storage.

Shipping: Flammable liquids, n.o.s., require a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and nitrogen oxides, are produced in fire. Water may be ineffective. Alcohol foam is recommended.[17] Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

New Jersey Department of Health and Senior Services. (December 2006). *Hazardous Substances Fact Sheet: n-Ethyl Morpholine*. Trenton, NJ

Ethyl phenyl dichlorosilane E:0790

Molecular Formula: $C_8H_{10}Cl_2Si$

Common Formula: $C_2H_5(C_6H_5)SiCl_2$

Synonyms: Dichloroethyl phenylsilane; Ethylphenyldichlorosilane

CAS Registry Number: 1125-27-5

RTECS® Number: VV3270000

UN/NA & ERG Number: UN2435/156

EC Number: 214-407-8

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl phenyl dichlorosilane is a colorless liquid. Fumes in humid air. Molecular weight = 205.17; Boiling point = 149°C; Flash point = 104°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Reactive with water.

Potential Exposure: Used in the manufacture of silicone polymers.

Incompatibilities: Forms explosive mixture with air. Contact with oxidizers, combustible materials, strong bases, can cause a fire or explosion hazard. Contact with water, steam, moisture forms corrosive chloride gases, including hydrogen chloride. Attacks most metals. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, nose, and throat. It is a corrosive chemical and contact can cause severe skin and eye burns leading to permanent eye damage. High levels can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Very irritating substances may affect the lungs.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl phenyl dichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operate in pressure-demand or other positive-pressure mode.

Storage: Ethyl phenyl dichlorosilane must be stored to avoid contact with water, steam, oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), and combustible materials (such as wood, paper, and oil) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames, are prohibited where ethyl phenyl dichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.7/1.2

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phenol and chlorine, are produced in fire. Use dry chemical or carbon dioxide. *Do not use water* or foam extinguishers. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

1-Ethyl piperidine E:0800

Molecular Formula: $C_7H_{15}N$
Common Formula: $C_2H_5(C_5H_9NH)$
Synonyms: *n*-Aethylpiperidin (German); Piperidine, 1-ethyl
CAS Registry Number: 766-09-6
RTECS® Number: IN0250000
UN/NA & ERG Number: UN2386/132
EC Number: 212-161-6

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl piperidine is a flammable liquid. Molecular weight = 113.21; Boiling point = 128°C; Melting point = < -49°C; Flash point = 19°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water; solubility = 35 g/L at 25°C.

Potential Exposure: Used in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers; or acids can cause fire and explosion hazard. Incompatible with carbon dioxide.

Determination in Air: No test available.

Permissible Concentration in Water: Octanol−water coefficient: Log $K_{ow} = 2$.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation. Passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: 1-Ethyl piperidine can affect you when breathed in and by passing through your skin. Contact can cause severe eye burns, leading to permanent damage and can irritate the skin. Exposure can irritate the nose and throat. High exposure can cause increased blood pressure and heart rate; weakness and shortness of breath. Higher levels may cause seizures or death.

Long Term Exposure: Can cause lung irritation. Bronchitis may develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to 1-ethyl piperidine, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a MSHA/NIOS-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine), acids (such as hydrochloric, sulfuric, and nitric), and carbon dioxide. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3, 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Water may be ineffective. Alcohol foam is recommended.[17] Keep 1-ethyl piperidine out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, carbon dioxide, carbon monoxide, are produced in fire. Use dry chemical, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

2-Ethyl-3-propyl acrolein E:0810

Molecular Formula: $C_8H_{14}O$

Synonyms: 2-Ethyl-2-hexenal; 2-Ethylhexenal; α-Ethyl-β-*n*-propylacrolein; 2-Ethyl-3-propyl acrolein

CAS Registry Number: 645-62-5

RTECS® Number: MP6300000

UN/NA & ERG Number: UN1993/128

EC Number: 211-448-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2-Ethyl-3-propyl acrolein is a colorless or yellowish liquid with a sharp, powerful, irritating odor. Molecular weight = 126.22; Boiling point = 175°C; Freezing/Melting point = 100°C; Flash point = 68°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Slightly soluble in water.

Potential Exposure: Those workers involved in organic synthesis operations and use of this material as a warning agent.

Incompatibilities: Strong oxidizers, acids, caustics, ammonia, amines.

Permissible Exposure Limits in Air

Russia[43] set a MAC of 3 mg/m^3 in work-place air.

Harmful Effects and Symptoms

Short Term Exposure: This chemical is an irritant, a moderate inhalative and ingestive toxin; and is slightly toxic (LD_{50} = (oral-rat) 3000 mg/kg). It irritates eyes, skin, and mucous membranes. Causes smarting of the skin and first-degree burns on short exposure. May cause second-degree burns on long exposure.

Long Term Exposure: Very irritating substances may cause lung irritation and bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in cool, dry place and protect from air.

Shipping: DOT[19] has no specific citation for the material.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam (recommended) extinguishers. Vapors are heavier than air and will collect in low areas.

Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, or dissolve in flammable solvent and spray into incinerator containing afterburner.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20; R36/37; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl silicate is a colorless, flammable liquid with a sharp odor detectable at 85 ppm. Molecular weight = 208.37; Boiling point = 168.9°C; Specific gravity (H_2O:1) = 0.93 at 25°C; Freezing/Melting point = −82.8°C; Vapor pressure = 1 mmHg at 20°C; Flash point = 54°C (cc). Explosive limits: LEL = 1.3%; UEL = 23%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slowly hydrolyzes in water.

Potential Exposure: Compound Description: Primary Irritant. Ethyl silicate is used as a binder in the production of cases and molds for investment casting of metals. The next largest application is in corrosion-resistant coatings; primarily as a binder for zinc dust paints. Miscellaneous uses include the protection of white-light bulbs; the preparation of soluble silicas; catalyst preparation and regeneration; and as a crosslinker and intermediate in the production of silicones.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers, strong acids, water.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/850 mg/m^3 TWA.

NIOSH REL: 10 ppm/85 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/85 mg/m^3 TWA.

DFG MAK: 10 ppm/86 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

NIOSH IDLH: 700 ppm.

Australia: TWA 10 ppm (85 mg/m^3), 1993; Austria: MAK 20 ppm (170 mg/m^3), 1999; Belgium: TWA 10 ppm (85 mg/m^3), 1993; Denmark: TWA 10 ppm (85 mg/m^3), 1999; Finland: TWA 10 ppm (85 mg/m^3); STEL 20 ppm (170 mg/m^3), 1999; France: VME 10 ppm (85 mg/m^3), 1999; Japan: 10 ppm (85 mg/m^3), 1999; the Netherlands: MAC-TGG 85 mg/m^3, 2003; Norway: TWA 10 ppm (85 mg/m^3), 1999; the Philippines: TWA 100 ppm (850 mg/m^3), 1993; Poland: MAC (TWA) 80 mg/m^3, MAC (STEL) 250 mg/m^3, 1999; Russia: STEL 20 mg/m^3, 1993; Switzerland: MAK-W 10 ppm (85 mg/m^3), 1999; Turkey: TWA 100 ppm (850 mg/m^3), 1993; United Kingdom: TWA 10 ppm (87 mg/m^3); STEL 30 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm.

Determination in Air: XAD-2® (tube); adsorption on resin, workup with CS_2, analysis by gas chromatography/flame ionization. NIOSH II,[3] Method S-264.

Routes of Entry: Inhalation of vapor, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Skin or eye contact can cause severe irritation or burns. The vapor can irritate the nose, eyes, throat, and bronchial tubes, causing cough and difficulty in breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated skin contact can cause drying and cracking. Exposure can affect the nervous system causing tremors, weakness, dizziness, and unconsciousness. High or repeated exposure may damage the liver, kidneys, lungs, and red blood cells.

Points of Attack: Eyes, respiratory system, liver, kidneys, blood, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Kidney and liver function test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Remove clothing immediately if wet or contaminated to avoid flammability hazard. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *100 ppm:* Sa (APF = 10) (any supplied-air respirator). *250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *500 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *700 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Ethyl silicate (a silane) must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from water. Sources of ignition, such as smoking and open flames, are prohibited where ethyl silicate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of ethyl silicate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl silicate.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep ethyl silicate out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and silicon oxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a more flammable solvent.

Ethyl thiocyanate E:0830

Molecular Formula: C_3H_5NS

Common Formula: C_2H_5SCN

Synonyms: Aethylrhodanid (German); Ethyl rhodanate; Ethyl sulfocyanate; Thiocyanatoethane; Thiocyanic acid, ethyl ester

CAS Registry Number: 542-90-5

RTECS® Number: XK9900000

UN/NA & ERG Number: UN1992/131; UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

UN/NA & ERG Number: 542-90-5

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg).

Reportable Quantity (RQ): 10,000 lb (4540 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ethyl thiocyanate is a liquid. Onion-like odor. Molecular weight = 87.15; Boiling point = 146°C; Freezing/Melting point = −86°C; Flash point 42°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used as an agricultural insecticide.

Incompatibilities: Contact with chlorates, nitrates, nitric acid, organic peroxides, peroxides, may cause a violent reaction.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 20 mg/m^3

PAC-1: 60 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 100 mg/m^3

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: The ingestion of a concentrated solution may lead to vomiting. The principal systemic reaction is probably one of central nervous depression, interrupted by periods of restlessness; abnormally fast and deep respiratory movements and convulsions. Death is usually due to respiratory arrest from paralysis of the medullary centers. In nonfatal cases injures to the liver and kidneys may appear. LD_{50} = (oral-rat) 200 mg/kg.

Long Term Exposure: Prolonged absorption may produce various skin eruptions, runny nose, and occasionally dizziness, cramps, nausea, vomiting, and mild or severe disturbances of the nervous system.

Points of Attack: Nervous system, liver, kidneys.

Medical Surveillance: Liver function tests. Kidney function tests. Examination of the nervous system.

First Aid: Treatment is as for aliphatic thiocyanates. Because cyanide is probably largely responsible for poisoning, antidotal measures against cyanide should be instituted promptly, for including moving the victim to fresh air. Call emergency medical care. If not breathing, give artificial respiration. IF breathing is difficult, give oxygen. In case of contact with material, immediately flush skin or eyes with running water for at least 15 min. Speed in removing material from skin is of extreme importance. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, chlorates, nitrates, nitric acid. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This material may be classified as Flammable liquids, toxic, n.o.s. This class requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. For *large spills*, dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen and sulfur oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Ethyl trichlorosilane E:0840

Molecular Formula: $C_2H_5Cl_3Si$

Synonyms: Ethyl silicon trichloride; Ethyl trichloroethylsilane; Ethyl trichlorosilane; Ethyltrichlorosilane; Silane, trichloroethyl-; Silicane, trichloroethyl-; Trichloroethylsilicane

CAS Registry Number: 115-21-9

RTECS® Number: VV4200000

UN/NA & ERG Number: UN1196/155

EC Number: 204-072-6

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

EPCRA Section 304 Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ethyl trichlorosilane is a colorless liquid with an irritating odor. Molecular weight = 163.51; Specific gravity (H_2O:1) = 1.24 at 25°C; Boiling point = 98°C; Freezing/Melting point = −106°C; Flash point = 22°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩ (water reactive).

Potential Exposure: Compound Description: Organometallic, Primary Irritant. Used in the manufacture of silicone polymers.

Incompatibilities: Forms explosive mixture with air. Contact with water, steam, or moisture forms toxic and corrosive hydrogen chloride. Contact with strong oxidizers or strong bases may cause a violent reaction. Corrodes most common metals.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)*
TEEL-0: 0.2 ppm
PAC-1: **0.60** ppm
PAC-2: **7.3** ppm
PAC-3: **33** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact with the eyes causes irritation, pain, swelling; corneal erosion and blindness may result. Contact with the skin causes dermatitis (red, inflamed skin), severe burns, pain, and shock generally follow dermal exposure. Acute inhalation exposure may result in sneezing, choking, laryngitis, dyspnea (shortness of breath), respiratory tact irritation, and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa, pulmonary edema, chronic bronchitis, and pneumonia may also occur. If ingested, symptoms include increased salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion.

Long Term Exposure: May cause kidney damage. Highly irritating substances can cause lung irritation and bronchitis.

Points of Attack: Lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. Kidney function tests. If symptom develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to ethyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Ethyl trichlorosilane must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, steam, and moisture because toxic and corrosive chloride gases, including hydrogen chloride, can be produced. Sources of ignition, such as smoking and open flames, are prohibited where ethyl trichlorosilane is handled, used, or stored. Where possible, automatically pump liquid from drums or other storage containers to process containers. Metal containers involving the transfer of 5 gallons or more of ethyl trichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl trichlorosilane. Protect containers from physical damage.

Shipping: Ethylphenyldichlorosilane requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors; do not get water inside container. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

When spilled in water

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.7/2.7

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including phosgene, are produced in fire. Use dry chemical, CO_2, or foam extinguishers. *Do not use water*. Vapor explosion hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Stay away from ends of tanks. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Listed on the TSCA inventory.

Canada: WHMIS category D2B; on DSL List.

European/International Regulations: Hazard Symbol: Xn, Xi; Risk phrases: R22; R36/37/38; R42/43; Safety phrases: S2; S24/25; S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Depending on age and exposure to air, clear, colorless to pale yellow to amber-colored liquid.

Combustible. Odor is spicy, clove-like; woody; pungent, warm, spicy, clove-like taste. Molecular weight = 164.201; Vapor density = >1.0; Specific gravity = 1.0652 at 20°C; Boiling point = 254°C at 760 mmHg; Freezing/Melting point = −9.2 to −9.1°C at 760.00 mmHg; Vapor pressure = 0.01 mmHg at 20°C; 0.0226 mmHg at 25°C[HSDB]; Flash point = 104°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1; Flammability 1; Reactivity 0. Moderate water solubility = 2460 mg/L at 25°C.

Potential Exposure: Used in cosmetics; as a flavor and fragrance agent; herbicide; dog and cat repellent; insecticide; insect repellent.

Incompatibilities: Eugenol may decompose on exposure to light. Incompatible with strong alkalis, strong oxidizers, including ferric chloride and permanganates, iron, and zinc.

Permissible Exposure Limits in Air

No OELs or TEEL available.

Determination in Air: No NIOSH or OSHA method available.

Permissible Concentration in Water: Not found.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.27$.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Symptoms of exposure include severe irritation of all tissues, dysuria, hematuria, tachycardia, pulmonary edema, potential circulatory collapse, bronchial pneumonia, abortion, unconsciousness.

Short Term Exposure: This compound is a primary irritant and sensitizer and can cause contact dermatitis. Irritation of the skin, eyes, and respiratory tract can occur. *Ingestion*: May cause gastroenteritis, vomiting, and gastric secretion glycoprotein (mucin) and may be accompanied by abdominal pain, nausea, diarrhea, and convulsions; large intake can cause gastrointestinal and liver damage. *Inhalation*: May cause bronchial irritation, dizziness, rapid and shallow breathing, pulmonary edema, a medical emergency that can be delayed. *Skin*: Contact may cause inflammation. Prolonged skin contact may cause skin sensitization and allergic dermatitis. *Eyes*: Contact may cause burns. LD_{50} = (oral-rat) 1930 mg/kg.

Long Term Exposure: This compound may be harmful by ingestion or inhalation. It is a primary irritant and sensitizer. Prolonged or repeated skin contact may cause allergic dermatitis. Capable of causing irreversible renal damage.

Points of Attack: Liver, kidneys.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing may help diagnose skin or respiratory tract allergy. Liver and kidney function tests.

First Aid: *Eyes*: Check the victim for contact lenses and remove. Flush victim's eyes with water or normal saline solution for 20−30 min, lifting lower and upper eyelids occasionally. Remove contaminated clothing and shoes.Get medical attention immediately. Do not put any ointments, oils, or medication in the victim's eyes without specific instructions from a physician. Immediately transport the victim after flushing eyes to a hospital even if no symptoms (such as redness or irritation) develop. *Skin*: Immediately flood affected skin with water and wash for at least 15 min. Remove and isolate all contaminated clothing. Gently wash all affected skin areas thoroughly with soap and water. If symptoms such as redness or irritation develop, immediately call a physician. Transport the victim to a hospital for treatment. *Inhalation*: Remove victim to fresh air. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical attention immediately. *Ingestion*: *Do not induce vomiting*. If the victim is conscious and not convulsing, give large amount of water to dilute the chemical. Never give anything by mouth to an unconscious person. If symptoms (such as wheezing, coughing, shortness of breath, or burning in the mouth, throat, or chest) develop, call a physician. In all cases get medical attention immediately. If the victim is convulsing or unconscious, do not give anything by mouth, ensure that the victim's airway is open and lay the victim on his/her side with the head lower than the body.

Personal Protective Methods: Wear protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Recommended gloves: Ansell 5.109 (Latex); thickness: 0.18 mm; Breakthrough time: *15 min*; Edmont 29-870 (Neoprene); thickness: 0.51 mm; Breakthrough time: *135 min*; North Model F-091 (Viton); thickness: 0.41 mm; Breakthrough time: *480 min*.

Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA- or European Standard EN 149-approved respirator; or use a NIOSH/MSHA- or European Standard EN 149-approved half face respirrator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas, and SO_2) with a dust/mist filter.

Storage: Color Code—Green: General storage may be used. Store in cool, dry place in tightly sealed containers, in a refrigerator under an inert gas. Protect this chemical from heat and exposure to light. Shelf Life: 2 years or longer if properly stored.

Shipping: Not regulated.

Spill Handling: First remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. All contaminated clothing and absorbent paper should be sealed in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: When heated to decomposition, it emits acrid smoke, irritating fumes, and toxic fumes of carbon monoxide and carbon dioxide. Fires involving this material can be controlled with a dry chemical, carbon dioxide, or Halon extinguisher. A water spray may also be used.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies
US EPA, FIFRA 1998 Status of Pesticides: Supported.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).
Reportable Quantity (RQ): 10 lb (04.54 kg).
Marine Pollutant (49CFR, Subchapter 172.101, Appendix B).
US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.
European/International Regulations: Hazard Symbol: T+, N; Risk phrases R24; R28; R50/53; Safety phrases: S1/2; S23−S28; S36/37; SS45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Fenamiphos is an off-white to tan, waxy solid. Found commercially as a granular ingredient (5−15%) or in an emulsifiable concentrate (400 g/L). Molecular weight = 303.39; Freezing/Melting point = 40°C (technical grade) and 49.4°C (pure compound); Vapor pressure = 1×10^{-6} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.03%.
Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector. Those involved in the manufacture, formulation, or application of this nematocide.
Incompatibilities: May hydrolyze under alkaline conditions. Keep away from moisture.
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 0.1 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 0.05 mg/m^3 TWA inhalable fraction and vapor [skin]; *not classifiable as a human carcinogen*; BEI_A issued for acetylcholinesterase-inhibiting pesticides.
Protective Action Criteria (PAC)
TEEL-0: 0.05 mg/m^3
PAC-1: 0.15 mg/m^3
PAC-2: 0.9 mg/m^3
PAC-3: 40 mg/m^3
Australia: TWA 0.1 mg/m^3, [skin], 1993; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Switzerland: MAK-(week) 0.1 mg/m^3, [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for fenamiphos in ambient air[60] ranging from 1.0 $\mu g/m^3$ (North Dakota) to 1.6 $\mu g/m^3$ (Virginia) to 2.0 $\mu g/m^3$ (Connecticut).
Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.
Permissible Concentration in Water: A long-term health advisory set by EPA is 18 μg/L and a lifetime health advisory is 9 μg/L.
Determination in Water: Fish Tox = 0.33001000 ppb MATC (EXTRA HIGH). Octanol−water coefficient: Log $K_{ow} = 3.3$.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: This is a highly toxic chemical (the LD_{50} for rats is 8 mg/kg). It is a cholinesterase inhibitor with effects typical of such compounds. Acute exposure to fenamiphos may produce the following signs and symptoms: pinpoint pupils, blurred vision, headaches, dizziness, muscle spasm, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may increase following oral exposure or decrease following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is highly toxic orally, by inhalation, and by absorption through the skin. Death may occur from respiratory failure. Human Tox = 2.00000 ppb (HIGH).
Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Organophosphates may damage the

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00006-0

nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear solvent-resistant gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Wear air-tight gas-proof goggles and face shield, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This material falls under Organophosphorus pesticides, solid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including oxides of nitrogen, phosphorus, and sulfur, are produced in fire. This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive-pressure breathing apparatus and special protective clothing. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US EPA Gene-Tox Program, Negative: Rodent dominant lethal; Host-mediated assay; Inconclusive: *D. melanogaster* sex-linked lethal.

US EPA, FIFRA, 1998 Status of Pesticides: RED Completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 1 lb (0.454 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; Safety phrases: S2; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Fenitrothion is a volatile brownish-yellow oil. Molecular weight = 277.25; Boiling point = (decomposes) at 140°C; Freezing/Melting point = 0.28°C; Vapor pressure = 5.3×10^{-5} mbar at 20°C; Flash point = 157°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, and application of this insecticide. It is a selective acaricide and a contact and stomach insecticide. Used to control chewing and sucking insects on rice, orchard fruit, vegetables, cereals, cotton, and in forests. Also protects against flies, mosquitoes, and cockroaches.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

No TEEL available.

Japan: 1 mg/m^3 [skin] 1999; Poland: MAC (TWA) 0.02 mg/m^3, MAC (STEL) 0.1 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3 [skin] 1993. Russia[43] set a MAC of 0.008 mg/m^3 for ambient air in residential areas on a momentary basis and 0.001 mg/m^3 on a daily average basis.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[43] set a MAC of 0.25 mg/L in water bodies for domestic purposes and of zero in water bodies used for fishery purposes.

Determination in Water: Fish Tox = 63.62386000 ppb (INTERMEDIATE). Octanol−water coefficient: Log $K_{ow} = 3.25$.

Routes of Entry: Inhalation, through the skin, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. Nausea is often the first symptom, followed by vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, dizziness, weakness, tightness in the chest, loss of muscle coordination, slurring of speech, muscle twitching (particularly the tongue and eyelid), respiratory difficulty, blurring or dimness of vision, pinpoint pupils, profound weakness, mental confusion, disorientation, and drowsiness. This compound is an organophosphate insecticide. It is a highly toxic cholinesterase inhibitor that acts on the nervous system. Does not cause delayed neurotoxicity and contact produces little irritation. The effects may be delayed. Keep exposed victim under medical observation. Human Tox = 9.10000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions and respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Also consider complete blood count. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Keep victim under medical observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous flow-mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a "POISONOUS/TOXIC MATERIALS" label. They fall in Hazard Class 6.1 and in Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal

environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including oxides of sulfur and phosphorus, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move containers from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (for large amounts); alkaline hydrolysis and landfill (for small amounts).[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S23; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Fensulfothion is a yellow oil. Molecular weight = 308.37; Boiling point = 138−141°C at 0.01 mmHg; Vapor pressure = 0.0001 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Those involved in the manufacture, formulation, or application of this insecticide used to control parasitic, sedentary, and free-living nematodes.

Incompatibilities: Strong oxidizers; may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents, such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA.

ACGIH TLV®[1]: 0.01 mg/m^3 TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI$_A$ issued for Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)
TEEL-0: 0.01 mg/m^3
PAC-1: 0.03 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 12.5 mg/m^3
Australia: TWA 0.1 mg/m^3, 1993; Belgium: TWA 0.1 mg/m^3, 1993; France: VME 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Switzerland: MAK-W 0.1 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for fensulfothion in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 6.96732000 pbb (INTERMEDIATE).

Routes of Entry: Inhalation, through the skin, ingestion. eyes.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin and eyes. Exposure can cause rapid, fatal organophosphate poisoning. The acute oral LD_{50} value for rats is 5−10 mg/kg which is highly to extremely toxic. It is a cholinesterase inhibitor. This material may cause nausea, vomiting, abdominal cramps, diarrhea, headache, giddiness, vertigo, weakness, lack of muscle control, tearing, slurring of speech, difficult breathing, convulsions, excessive salivation, tightness in chest, and death from respiratory arrest. Death results primarily from respiratory arrest stemming from failure of the respiratory center, paralysis of respiratory muscles, and intensive bronchoconstriction. Human Tox = 1.75000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases; strong oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This material is classed as an organophosphorus pesticide, liquid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including oxides of sulfur and phosphorus, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Alkaline hydrolysis.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Fenthion is a colorless liquid (when pure) with a weak, garlic-like odor. The technical grade is a yellow to brown oil. Molecular weight = 278.34; Boiling point = (decomposes) below the BP at 210°C; Freezing/Melting point = 6.1°C; Vapor pressure: 0.0003 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Very slightly soluble in water; solubility = 0.006%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, or application of this agricultural chemical and pesticide; insecticide.

Incompatibilities: Oxidizers, bases, alkaline insecticides.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None. Appendix D (NIOSH Pocket Guide).

ACGIH TLV®[1]: 0.05 mg/m^3 inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued for Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 40 mg/m^3

DFG MAK: 0.2 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(2) [skin].

Australia: TWA 0.2 mg/m^3, [skin], 1993; Austria: MAK 0.2 mg/m^3, [skin], 1999; Belgium: TWA 0.2 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Japan: 0.2 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Poland: MAC (TWA) 0.2 mg/m^3, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for fenthion in ambient air[60] ranging from 2.0 μg/m^3 (North Dakota) to 3.2 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Mexico[35] set a MAC of 0.03 μg/L in coastal waters and of 0.0003 mg/L (0.3 μg/L) in estuaries. Russia[35] set a MAC of 1.0 μg/L in water bodies used for domestic purposes and of zero in water used for fishery purposes.

Determination in Water: Fish Tox = 10.60669000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Fenthion can affect you when breathed in and quickly enters the body by passing through the skin. Fatal poisoning can occur from skin contact. It is highly toxic. It may damage the developing fetus. Exposure can cause rapid fatal organophosphate poisoning with headaches, sweating, nausea and vomiting, muscle twitching, coma, and death. Sometimes effects are delayed for 1–2 days. Poisoning can happen from skin contact, even if no irritation is felt. Human Tox = 4.90000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Fenthion may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If exposure and/or symptoms have occurred, the person should be under medical observation for several days, as some symptoms may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.2 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, alkalies and alkaline pesticides. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This material may be classed under Organophosphorus pesticides, liquid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Fenthion itself does not burn readily. Poisonous gases are produced in fire, including oxides of phosphorus and sulfur. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Hydrolysis and landfill for small quantities; incineration with flue gas scrubbing for large amounts.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Several states have set guidelines or standards for ferbam in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Permissible Concentration in Water: No criteria set. Degradation produces ethylene thiourea.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferbam can affect you when breathed in. Breathing ferbam can irritate the nose and throat. Ferbam can cause skin and eye irritation. High exposure to ferbam may affect the nervous system and thyroid, and causes dizziness, confusion, loss of coordination, seizures, paralysis, and coma.

Long Term Exposure: Repeated or prolonged contact with skin may cause allergy with skin rash and itching. Exposure to ferbam may damage the kidneys and liver. Ferbam may damage the developing fetus.

Points of Attack: Eyes, skin, respiratory system, gastrointestinal tract.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: kidney function tests. Liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *up to 50 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator)*. Up to 100 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *Up to 250 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 500 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100) or SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTiE* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter)*; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 800 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Ferbam is incompatible with strong oxidizers (such as chlorine, bromine, and fluorine). Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong bases and from heat and moisture. Ferbam can decompose upon long-term storage.

Shipping: Dithiocarbamate pesticides, solid, toxic, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ferbam may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Ferbam is hydrolyzed by alkali and is unstable to moisture, lime, and heat. Ferbam can be incinerated.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ferric ammonium citrate F:0140

Molecular Formula: $C_{12}H_{18}FeN_2O_{14}$

Common Formula: $FeC_6H_5O_7 \cdot (NH_4)_2C_6H_5O_7$

Synonyms: Ammonium ferric citrate; Ammonium iron(III) citrate; Citrato ferrico amonico (Spanish); FAC; Ferric ammonium citrate, brown; Ferric ammonium citrate, green; Iron(III) ammonium citrate; Soluble ferric citrate

CAS Registry Number: 1185-57-5

RTECS® Number: GE7540000

DOT ID and ERG Number: UN3077/171

EC Number: 214-686-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ferric ammonium citrate forms reddish brown flakes or grains or a brownish-yellow powder. It has a slight ammonia odor. There is also a green form that is odorless. Molecular weight = 709.44; Specific gravity = 1.8 at 20°C; Boiling point = decomposes. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: Ferric ammonium citrate is used in blueprinting, photography, medical treatment, and as an animal food additive.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg[Fe]/m^3 TWA.

ACGIH TLV®[1]: 1 mg[Fe]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 1.81 mg/m^3

PAC-1: 5.44 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferric ammonium citrate can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Ingestion can cause abdominal pain, diarrhea, and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever."

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye.

Points of Attack: Eyes, skin, respiratory system, liver, gastrointestinal tract.

Medical Surveillance: Liver function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4–12 h following exposure: it may last less than 36 h.

Note to physician: In case of fume inhalation, treat pneumonitis. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light. Sources of ignition, such as smoking and open flames, are prohibited where ferric ammonium citrate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids containing ferric ammonium citrate in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Ferric ammonium citrate may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including ammonia and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ferric ammonium oxalate F:0150

Molecular Formula: $C_6H_{18}FeN_3O_{15}$

Common Formula: $Fe(NH_4)_3(C_2O_4)_3 \cdot 3H_2O$

Synonyms: Ammonium ferric oxalate trihydrate; Ammonium ferrioxalate; Ammonium trioxalatoferrate(3+); Ammonium trioxalatoferrate(III); Ethanedioic acid, ammonium iron(3+) salt; Ethanedioic acid, ammonium iron(III) salt; Oxalato ferrico amonico (Spanish); Oxalic acid, ammonium iron(3+) salt (3: 3:1); Oxalic acid, ammonium iron(III) salt (3: 3:1); Triammonium tris-(ethanedioato(2-)-*o*,*o*′)ferrate(3-1)

CAS Registry Number: 14221-47-7; 2944-67-4

RTECS® Number: LI8932000

DOT ID and ERG Number: Not regulated

EC Number: 238-090-0 (triammonium trioxalatoferrate); 220-952-2 (triammonium iron(3 +) trioxalate)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ferric ammonium oxalate is a green crystalline, solid with a granular or salt-like appearance. Color depends on level of iron present. Molecular weight = 374.06; 428.06. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Ferric ammonium oxalate is used in photography and making blueprints.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg[Fe]/m^3 TWA.

ACGIH TLV®[1]: 1 mg[Fe]/m^3 TWA.

No TEEL available.

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation of dust, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferric ammonium oxalate can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Ingestion can cause abdominal pain, diarrhea, and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever;" irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea; vomiting.

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. May cause fibrosis of the lungs. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, lungs, gastrointestinal tract.

Medical Surveillance: Liver function tests. Kidney function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Ferric chloride F:0160

Molecular Formula: Cl_3Fe

Common Formula: $FeCl_3$

Synonyms: Anhydrous ferric chloride; Chlorure perrique (French); Cloruro ferrico anhidro (Spanish); Flores martis; Iron chloride; Iron(3 +) chloride; Iron(III) chloride; Iron sesquichloride; Iron trichloride; Perchlorure de fer (French); PF etchant

CAS Registry Number: 7705-08-0

RTECS® Number: LJ9100000

UN/NA & ERG Number: UN1773 (anhydrous)/157; UN2582 (solution)/154

EC Number: 231-729-4

Regulatory Authority and Advisory Bodies

FDA—over-the-counter drug.

US EPA Gene-Tox Program, Negative: *B. subtilis* rec assay.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Iron, water-soluble salts, n.o.s.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ferric Chloride is a black-brown, dark-green, or black crystalline solid. Molecular weight = 162.20; Boiling point = decomposes at 315°C; Freezing/Melting point = (decomposes) 316°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water; solubility = 63%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data. Iron chloride is used to treat sewage and industrial waste. It is also used as an etchant for photoengraving and rotogravure, in textiles, photography, as a disinfectant, as a feed additive.

Incompatibilities: Aqueous solutions are a strong acid. Violent reaction with bases, allyl chloride, sulfuric acid, water. Shock- and friction-sensitive explosive material forms with potassium, sodium, and other active metals. Attacks metals when wet.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg[Fe]/m^3 TWA.

ACGIH TLV®[1]: 1 mg[Fe]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 2.9 mg/m^3

PAC-1: 2.9 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation of dust, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferric chloride is corrosive to the eyes, skin, and respiratory tract. Eye contact may cause permanent damage. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause 'metal fume fever;" irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea; vomiting; Ingestion may cause severe irritation to mouth and throat, weak and rapid pulse, low blood-pressure, nausea, bloody vomiting, violent diarrhea, shock, dark purple skin discoloration, and coma. Animal studies suggest that death may result from 2½ oz for a 150-lb person.

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones. Excessive intake of iron compounds may result in increased accumulation of iron in body, especially the liver, spleen, and lymphatic system. Inhalation of iron dusts may cause mottling of the lung. Iron chloride may reduce the fertility of both males and females.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, lungs, gastrointestinal tract.

Medical Surveillance: Liver function tests. Kidney function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, give milk and get medical attention. Do not induce vomiting. The symptoms of metal fume fever may be delayed for 4—12 h following exposure: it may last less than 36 h.

Note to physician: Gastric lavage should be performed followed by saline catharsis and anodyne. Administer deferoxamine, I.V. Watch for late stricture. Serum, plasma, or urinary iron levels may be employed to estimate the amount ingested.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™ and PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powdered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplier-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Iron chloride must be stored in tightly closed containers to avoid contact with sulfuric acid, sodium, potassium, allyl chloride, and water, since violent reactions occur and toxic vapors may be produced.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: *Solution:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Powder (anhydrous): Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Neutralize with lime or soda ash and bury in an approved landfill.[22]

Molecular Formula: C_3FeO_9

Common Formula: $Fe(CO_3)_3$

Synonyms: Ferric(3+) nitrate; Ferric(III) nitrate; Ferric nitrate, Nonhydrate; Iron nitrate; Iron(3+) nitrate, anhydrous; Iron(III) nitrate, anhydrous; Iron trinitrate; Nitrato ferrico (Spanish); Nitric acid, iron(3+) salt; Nitric acid, iron (III) salt

CAS Registry Number: 10421-48-4

RTECS® Number: QU8915000

UN/NA & ERG Number: UN1466/140

EC Number: 233-899-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Iron, water-soluble salts, n.o.s.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ferric nitrate is a pale violet, green, or grayish-white, odorless solid in lumpy crystals (like salt). Molecular weight = 241.88; Boiling point = decomposes; Freezing/Melting point = 35°C; 47°C (nonhydrate). Hazard

Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 3, Oxidizer. Highly soluble in water.

Potential Exposure: It is used in textile dyeing, tanning, and weighting silk.

Incompatibilities: An oxidizer. Keep away from reducing agents, oxidizable materials, and combustibles including metal powders, sulfur, and organic materials. Aqueous solution is corrosive to metals.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg[Fe]/m^3 TWA.

ACGIH TLV®[1]: 1 mg[Fe]/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 4.33 mg/m^3

PAC-1: 40 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 500 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferric nitrate can affect you when breathed in. Exposure can irritate the eyes, nose, throat, and skin. Large amounts of iron in the body can cause nausea, stomach pain, constipation, and black bowel movements. Ingestion can cause abdominal pain, diarrhea, and vomiting. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause “metal fume fever;” irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea; vomiting.

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. May cause lung fibrosis. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, lungs, gastrointestinal tract.

Medical Surveillance: If illness occurs or overexposure is suspected, medical attention is recommended. Blood test for serum iron can detect excess body iron. If increased, consider liver function tests. Examination of the eyes. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organic materials and other combustible materials or aluminum powder. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of “OXIDIZER.” It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including nitrogen oxides, nitric acid. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 233-072-9

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Iron, water-soluble salts, n.o.s.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ferric sulfate is a grayish-white powder or yellow lumpy crystals. Molecular weight = 399.88; Boiling point = (decomposes); Freezing/Melting point = (decomposes) 480°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: This material is used in pigments, textile dyeing, water treatment, and metal pickling.

Incompatibilities: Hydrolyzed slowly in aqueous solution. Incompatible with magnesium, aluminum. Corrosive to copper and its alloys, mild and galvanized steel. Light sensitive.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg[Fe]/m^3 TWA.

ACGIH TLV®[1]: 1 mg[Fe]/m^3 TWA; 0.1 mg/m^3 TWA *as persulfates.*

Protective Action Criteria (PAC)

TEEL-0: 3.58 mg/m^3

PAC-1: 3.58 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 75 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation of nose and throat, coughing and difficulty in breathing. 0.075 mg/m^3 for 2 h did not cause any change in breathing functions. Inhaling iron oxide fumes may cause pneumoconiosis in the lungs. Iron oxide fumes can cause "metal fume fever;" irritation of eyes, skin, mucous membranes; abdominal pain; diarrhea; vomiting. *Skin:* Contact causes irritation. Remove promptly. *Eyes:* Contact causes irritation. *Ingestion:* May cause irritation of mouth and stomach, nausea, vomiting, diarrhea, drowsiness, liver damage, coma, and death. The estimated lethal dose is 30 kg (1 oz).

Long Term Exposure: Excessive intake of iron compounds may result in increased accumulations of iron in the body, especially the liver, spleen, and lymphatic system. May cause nausea, vomiting, stomach pain, constipation, and black bowel movements. Inhalation of iron dusts may cause mottling of the lungs. Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, lungs, gastrointestinal tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for iron level (serum iron). Liver function tests. Lung function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of metal fume fever may be delayed for 4−12 h following exposure: it may last less than 36 h.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m*^{3} of iron, use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light, moisture, aluminum, magnesium, copper and its alloys, zinc, galvanized and mild steels.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids containing ferric sulfate in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including sulfur oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Treat with soda ash or dilute NaOH. Separate any precipitate and landfill. Flush solution to sewer.[22]

Ferrocene F:0190

Molecular Formula: $C_{10}H_{10}Fe$

Synonyms: Biscyclopentadienyl iron; Di-2,4-cyclopentadien-1-yl iron; Dicyclopentadienyl iron; Iron bis(cyclopentadiene); Iron dicyclopentadienyl

CAS Registry Number: 102-54-5

RTECS® Number: LK0700000

UN/NA & ERG Number: UN1325 (flammable solid, organic)/133

EC Number: 203-039-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; category D1B, B4; On DSL List.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Ferrocene, a metallocene, is a bright orange salt-like crystals from alcohol with a camphor odor. Molecular weight = 186.05; Boiling point = 249°C (sublimes); Freezing/Melting point = 173°C. Decomposes at 465°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Organometallic, Mutagen. Used as additive in fuel oil; antiknock agent in gasoline fuel; used in making rubber, silicone resins, high-temperature polymers and lubricants; intermediate for high-temperature polymers; as a smoke suppressant and catalyst.

Incompatibilities: Violent reaction with ammonium perchlorate, tetranitromethane, mercury(II) nitrate. Incomparable with oxidizers. Decomposes at $\geq$465°C.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA (total dust); 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3 TWA (total dust); 5 mg/m^3 TWA, respirable fraction.

ACGIH TLV®[1]: 10 mg/m^3 TWA.

No TEEL available.

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, [skin], 1999; France: VME 10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Switzerland: MAK-W 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3.

Determination in Air: Use OSHA Analytical Method IDI-125G.[58] (Ferrocene is approximately 30% iron). See also NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 530 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory system. Eye contact can cause irritation. Dust may irritate the air passages, with possible cough, phlegm, and tightness in the chest. Dicyclopentadienyl iron is classified as a slightly toxic material, but the toxicological properties have not been extensively investigated. LD_{50} = (oral-rat) 1320 mg/kg (slightly toxic).

Long Term Exposure: There is limited evidence that this chemical may damage the testes. Repeated exposure to iron-containing compounds can damage the liver and other body organs. Heavy or repeated exposure may cause mood changes such as irritability. Repeated exposure may cause lung damage.

Repeated high exposures may cause mood changes such as irritability. Dicyclopentadienyl iron may cause mutations. Exposure may affect liver and lung functions.

Points of Attack: Lungs. In animals: liver, red blood cell, testicular changes. (NIOSH).

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Liver function tests. Lung function tests. Complete blood count (CBC). Serum iron level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. While wearing a filter, cartridge, or canister respirator, if you can smell, taste, or otherwise detect Dicyclopentadienyl iron, or in the case of a full face-piece respirator you experience eye irritation, leave the area immediately. Check to make sure the respirator-to-face seal is still good. If it is, replace the filter, cartridge, or canister. If the seal is no longer good, you may need a new respirator. Be sure to consider all potential exposures in your workplace. You may need a combination of filters, profilers, cartridges, or canisters to protect against different forms of a chemical (such as vapor and mist) or against a mixture of chemicals. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, ammonium perchlorate, tetranitromethane, mercury(II) nitrate, and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Flammable solids, organic, n.o.s. require a shipping label of “FLAMMABLE MATERIALS.” It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Dicyclopentadienyl iron is a flammable solid. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ferrous ammonium sulfate F:0200

Molecular Formula: $Fe_2H_8N_2O_4S$

Common Formula: $Fe_2(NH_4)_2SO_4$; $Fe(NH_4)_2(SO_4)_2 \cdot 6H_2O$; $O_8S_2 \cdot H_8N_2 \cdot Fe$

Synonyms: Ammonium iron sulfate; Ammonium iron sulphate; Iron ammonium sulfate; Iron ammonium sulphate; Mohr’s salt; Sulfato ferroso amonico (Spanish); Sulfuric acid, ammonium iron(2+), salt (2: 2:1); Sulphate ammonium sulfate hexahydrate; Sulphate ammonium sulphate; Sulphate ammonium sulphate hexahydrate

CAS Registry Number: 10045-89-3 (anhydrous); 7783-85-9 (hexahydrate)

RTECS® Number: WS5850000

UN/NA & ERG Number: Not regulated.

EC Number: 233-151-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Iron, water-soluble salts, n.o.s.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (anhydrous).

Description: Ferrous ammonium sulfate is a pale green or blue-green solid (powder or lumpy crystals). Molecular weight = 392.14. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: This substance is used in photography, analytical chemistry, and in dosimeters.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg/m^3 TWA.

ACGIH TLV®[1]: 1 mg/m^3 TWA.

Protective Action Criteria (PAC) 10045-89-3
TEEL-0: 5.09 mg/m^3
PAC-1: 15.3 mg/m^3
PAC-2: 25.4 mg/m^3
PAC-3: 125 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferrous ammonium sulfate can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Large amounts of iron in the body can cause nausea and stomach pain, constipation, and black bowel movements. This is more common with swallowed iron. Repeated high exposures may damage the liver. Exposure may irritate the lungs.

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, gastrointestinal tract.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure has occurred, the following may be useful: blood tests for iron level (serum iron). Liver function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids containing ferrous ammonium sulfate in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Ferrous chloride F:0210

Molecular Formula: Cl_2Fe

Common Formula: $FeCl_2$

Synonyms: Iron(II) chloride (1:2); Iron dichloride; Iron protochloride; Lawrencite; Sulphate chloride tetrahydrate

CAS Registry Number: 7758-94-3

RTECS® Number: NO5400000

UN/NA & ERG Number: NA1759 (corrosive solid)/154

EC Number: 231-843-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Iron, water-soluble salts, n.o.s.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ferrous chloride is a pale greenish salt-like crystal or power. Molecular weight = 126.75; Specific gravity (H_2O:1) = 1.93 at 20°C; Boiling point = 1012°C; Freezing/Melting point = 675.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: It is used in textile dyeing, metallurgy, pharmaceutical industry, and sewage treatment.

Incompatibilities: Solution attacks metals. Contact with ethylene oxide may initiate polymerization. Contact with potassium or sodium forms an impact-sensitive material.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg/m^3 TWA.

ACGIH TLV®[1]: 1 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 2.27 mg/m^3

PAC-1:2.27 mg/m^3

PAC-2: 2.27 mg/m^3

PAC-3: 200 mg/m^3

Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferrous chloride can affect you when breathed in. Repeated or high level exposures may lead to too much iron in the body and possible liver damage. Exposure can irritate the nose and throat. Ferrous chloride is a corrosive chemical and contact can irritate and may burn the eyes and skin.

Long Term Exposure: Prolonged or repeated high exposure may cause liver damage. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, gastrointestinal tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum iron test. Liver function test. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium, sodium metals, or ethylene oxide.

Shipping: Corrosive solids must be labeled “CORROSIVE”, and fall into Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including hydrogen chloride and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*includes heptahydrate*): Hazard Symbol: Xn; Risk phrases: R22; R36/38; Safety phrases: S2; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Ferrous sulfate is a greenish or yellowish solid in fine or lumpy crystals. Molecular weight = 151.91; Freezing/Melting point = 65°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 1. Slowly soluble in water.

Potential Exposure: It is used as a fertilizer, food or feed additive, in herbicides, process engraving, dyeing, and water treatment. A by-product of various chemical and metal-treating operations.

Incompatibilities: Aqueous solution is acidic. Contact with alkalies form iron. Keep away from alkalies, soluble carbonates, gold and silver salts, lead acetate, lime water, potassium iodide, potassium and sodium tartrate, sodium borate, tannin.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 1 mg/m^3 TWA.
ACGIH TLV®[1]: 1 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 2.72 mg/m^3
PAC-1: 8.16 mg/m^3
PAC-2: 13.6 mg/m^3
PAC-3: 50 mg/m^3
Finland: TWA 1 mg[Fe]/m^3, 1999; Norway: TWA 1 mg [Fe]/m^3, 1999; Switzerland: MAK-W 1 mg[Fe]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 mg [Fe]/m^3.

Determination in Air: See NIOSH Analytical Method (IV)s #7300, Elements, #7301, #7303, #9102 or OSHA Analytical Method ID-121, IDI-125G.[58]

Permissible Concentration in Water: Drinking water limits = 0.3 ppm [Fe]. Russia[43] set a MAC of 0.5 mg/L for iron in water bodies used for domestic purposes and a MAC of 0.05 mg/L in sea water bodies used for fishery purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Ferrous sulfate can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. *Ingestion*: Less than 5 g (1/6 oz) can cause drowsiness, irritability, weakness, abdominal pain, nausea, vomiting, and black, bloody stools. Delayed symptoms include fluid in the lungs, liver abnormalities, shock, coma, intestinal blockage, and breakdown of the stomach and intestinal lining. Death has resulted from ingestion of less than an ounce.

Long Term Exposure: Excessive intake of iron compounds may result in increased accumulation of iron in body, especially in the liver, spleen, and lymphatic system. Inhalation of iron dusts may cause mottling of the lungs. Prolonged eye contact can cause a brownish discoloration of the eye. Repeated overexposure may cause kidney stones.

Points of Attack: Eyes, skin, respiratory system, liver, gastrointestinal tract.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: serum iron test. Liver function test. Kidney function tests. For those exposed to this chemical, taking dietary supplements or vitamins containing iron is not recommended without medical advice.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Gastric lavage with large amounts of 5% sodium phosphate or water. Follow this with a large amount of 1% sodium bicarbonate over a 3-h period.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 mg/m^3*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishers suitable for surrounding fire. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Ferrovanadium dust F:0230

Molecular Formula: FeV

Synonyms: Ferro “V”

CAS Registry Number: 12604-58-9

RTECS® Number: LK2900000

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

An OSHA specifically regulated substance.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Ferrovanadium, a noncombustible solid; the dust may be an explosion hazard. It consists of dark, odorless solid particles (*particulate*): dispersed in air. An alloy having the composition of 50–80% vanadium with iron, carbon, trace silicon, manganese, chromium, nickel, etc. Molecular weight = 106.8; Freezing/Melting point = 1482–1521°C; Minimum explosive concentration (MEC) = 1.3 g/m^3.[NIOSH] Insoluble in water.

Potential Exposure: Ferrovanadium is added to steel to produce fineness of grain, toughness, torsion properties, and resistance to high temperatures.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.

NIOSH REL: 1 mg[V]/m^3 TWA; 3 mg[V]/m^3 STEL [REL applies to ferrovanadium, vanadium metal, and vanadium carbide].

ACGIH TLV®[1]: 1 mg[V]/m^3 TWA; 3 mg/m^3 STEL.

NIOSH IDLH: 500 mg/m^3.

No TEEL available for ferrovanadium.

DFG MAK: 1 mg[V]/m^3, inhalable fraction; Carcinogen Category: 2; Germ cell mutagen group: 2; (DFG 2005).

Australia: TWA 1 mg/m^3; STEL 3 mg/m^3 (*dust*), 1993; Austria: MAK 1 mg/m^3, 1999; Belgium: TWA 1 mg/m^3; STEL 3 mg/m^3 (*dust*), 1993; Denmark: TWA 1 mg/m^3 (*dust*), 1999; Finland: TWA 0.5 mg/m^3 (*dust*), 1999; France: VM 0.05 mg[V_2O_5]/m^3, 1999; Japan: 1 mg/m^3 (*dust*), 1999; Norway: TWA 1 mg/m^3, 1999; the Philippines: TWA 1 mg/m^3 (*dust*), 1993; Russia: STEL 1 mg/m^3 (*dust*), 1993; Switzerland: MAK-W 1 mg/m^3 (*dust*), 1999; Turkey: TWA 1 mg/m^3 (*dust*), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 mg/m^3. Several states have set guidelines or standards for ferrovanadium dust in ambient air[60] ranging from 10.0–30.0 μg/m^3 (North Dakota) to 16.0 μg/m^3 (Virginia) 20.0 μg/m^3 (Connecticut) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Methods #ID-121, #ID-125G.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of eyes and respiratory system. Inhalation can cause irritation with coughing and wheezing.

Long Term Exposure: Repeated exposure can cause bronchitis, pneumonitis, with cough, phlegm, and/or shortness of breath.

Points of Attack: Respiratory system, eyes.

Medical Surveillance: Chest X-ray; pulmonary function tests. An OSHA regulated substance. See NIOSH Publication No. 2005-110, December 2004.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof

chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *Up to 10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100. *Up to 25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode)*; or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter).* *Up to 50 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode)*; or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter)*; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry in unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Dust is an explosion hazard. Prior to working with this material, you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Noncombustible solid, but dust may be an explosion hazard. Use extinguishers suitable for metal fires. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal in a sanitary landfill.

Fibrous glass F:0240

Synonyms: Fiber Glas®; Fiberglass; Glass fibers; Glass wool; Manmade mineral fibers; Mineral wool fiber; Synthetic vitreous fibers; Slag wool

CAS Registry Number: 65997-17-3; *(alt.)* 94551-77-6

RTECS® Number: LK3651000

EC Number: 266-046-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (special purpose glass fibers): Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; (*glass filiment; glass wool fibers; rock wool fibers*) Human No Adequate Data; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3; NTP (*synthetic vitreous fibers, glass wool fibers*): Reasonably anticipated to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical (glasswool fibers (airborne particles of respirable size): Cancer 7/1/90.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fibrous glass is the name for a manufactured fiber in which the fiber-forming substance is glass. Glasses are a class of materials made from silicon dioxide with oxides of various metals and other elements that solidify from the molten state without crystallization. Typically, glass filaments >3 μm in diameter or glass "wool" with diameters down to 0.05 μm and length >1 μm. A fiber is considered to be a particle with a length-to-diameter ratio of 3:1 or greater. The volume of small diameter fiber production has not been determined. Fibers with diameters less than 1 μm are estimated to comprise less than 1% of the fibrous glass market. Specific gravity (H_2O:1) = 2.5. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. The major uses of fibrous glass are in thermal, electrical, and acoustical insulation; weatherproofing, plastic reinforcement; filtration media; and in structural and textile materials.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 (total dust) TWA; 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 5 mg/m^3 total fibrous glass or 3 fibers/cc TWA (fibers with diameter ≤3.5 μm and length ≥10 μm).

ACGIH TLV®[1] (*synthetic vitreous fibers, continuous filament glass fibers; synthetic vitreous fibers, glass wool fibers; synthetic vitreous fibers, special purpose glass fibers)*: 1 f/cc, respirable fibers. Confirmed animal carcinogen with unknown relevance to humans.

Continuous filament glass fibers or *special purpose glass fibers*: 1 f/cc, respirable fibers 1 f/cc, respirable fibers length >5 μm; aspect ratio ≥3:1, as determined by the membrane filter method at 400−450 × magnification (4-mm objective), using phase-contrast illumination); not classifiable as a human carcinogen.

No TEEL available.

North Dakota[60] has set a guideline of 0.10 mg/m^3 for fibrous glass dust in ambient air.

Determination in Air: Use NIOSH Analytical Method (IV) #7400, asbestos and other fibers.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Different dimensions of fibrous glass will produce different biologic effects. Large diameter (greater than 3.5 μm) glass fibers have been found to cause skin, eye, and upper respiratory tract irritation, a relatively low frequency of fibrotic changes, and a very slight indication of an excess mortality due to nonmalignant respiratory disease. Smaller diameter (less than 3.5 μm) fibrous glass has not been conclusively related to health effects in humans, but glass fibers of this dimension have only been regularly produced since the 1960s. Smaller diameter fibers have the ability to penetrate the alveoli. This potential is of concern and is the primary reason that fibers 3.5 μm or smaller are subject to special controls. Experimental studies in animals have demonstrated carcinogenic effects with the long (greater than 10 μm) and thin fibers (usually less than 1 μm in diameter). However, these studies were performed by implanting fibrous glass in the pleural or peritoneal cavities. The data from studies with these routes of exposure cannot be directly extrapolated to conditions of human exposure. On the basis of available information, NIOSH does not consider fibrous glass to be a substance that produces cancer as a result of occupational exposure. The data on which to base this conclusion are limited. Fibrous glass does not appear to possess the same potential as asbestos or for causing health hazard. Glass fibers are not usually of the fine submicron diameters as are asbestos fibers, and the concentrations of glass fibers in work-place air are generally orders of magnitude less than for asbestos. In one study, glass fibers were found to be cleared from the lungs more readily than asbestos.

Short Term Exposure: Irritates eyes, skin, nose, throat. Inhalation can cause dyspnea (breathing difficulty).

Long Term Exposure: A suspected carcinogen but there is no consistent evidence of chronic health effects in exposed workers.

Points of Attack: Eyes, skin, respiratory system

Medical Surveillance: NIOSH recommends that workers subject to fibrous glass exposure have comprehensive preplacement medical examinations with emphasis on skin susceptibility and prior exposure in dusty trades. Subsequent annual examinations should give attention to the skin and respiratory system with attention to pulmonary function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, and move to fresh air.

Personal Protective Methods: Protective clothing shall be worn to prevent fibrous glass contact with skin especially hands, arms, neck, and underarms. Safety goggles or face shields and goggles shall be worn during tear-out or blowing operations, or when applying fibrous glass materials overhead. They should be used in all areas where there is a likelihood that airborne glass fibers may contact the eyes. Engineering controls should be used wherever feasible to maintain fibrous glass concentrations at or below the prescribed limits. Respirators should only be used when engineering controls are not feasible; for example, in certain nonstationary operations where permanent controls are not feasible.

Respirator Selection: NIOSH: *up to 5 × REL*: Qm (APF = 25) (any quarter-mask respirator). *Up to 10 × REL:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 × REL:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 50 × REL*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie

(APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1000 × REL:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000): SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. *Dust only*: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

Fire Extinguishing: Noncombustible fibers. Use extinguisher suitable for surrounding fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Fibrous glass waste and scrap should be collected and disposed of in a manner which will minimize its dispersal into the atmosphere. Emphasis should be placed on covering waste containers, proper storage of materials, and collection of fibrous glass dust. Cleanup of fibrous glass dust should be performed using vacuum cleaners or wet cleaning methods. Dry sweeping should not be performed.

Fluenetil F:0250

Molecular Formula: $C_{16}H_{15}FO_2$

Synonyms: (1,1′-Biphenyl)-4-acetic acid, 2-fluoroethyl ester; 4-Biphenylacetic acid, 2-fluoroethyl ester; Fluenyl; β-Fluorethyl 4-biphenylacetate; Lambrol

CAS Registry Number: 4301-50-2

RTECS® Number: DV8335000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: [*Annex I Index No.:* 607-078-00-0]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; Safety phrases: S1/2; S28; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluenetil is a crystalline solid. Molecular weight = 258.31. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: This material has been used as an acaricide and insecticide. Its main use was as a dormant spray for orchard fruit. It is no longer made. Not registered as a pesticide in the United States.

Incompatibilities: Nitrates. Moisture may cause material to hydrolyze.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 3.5 mg/m^3

PAC-2: 6 mg/m^3

PAC-3: 6 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Fluenetil is highly toxic. LD_{50} = (oral-rat) 6 mg/kg.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from nitrates and moisture.

Shipping: Toxic solids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a combustible solid. Poisonous gases, including fluorine, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Fluoboric acid F:0260

Molecular Formula: HBF_4

Synonyms: Acide fluoroborique (French); Acido fluoborico (Spanish); Borate(1-), tetrafluoro-, hydrogen; Borofluoric acid; Fluboric acid; Fluoro-boric acid; Fluoroborsaeure (German); Hydrofluoboric acid; Hydrogen tetrafluoroborate; Kester 5569 Solder-NU; Prepared bath 2137; Starter 2000; Starter 2137; Tetrofluoroboric acid; Tetrofluoro hydrogen borate

CAS Registry Number: 16872-11-0

RTECS$^{®}$ Number: ED2685000

UN/NA & ERG Number: UN1775/154

EC Number: 240-898-3 [*Annex I Index No.:* 009-010-00-X]

Regulatory Authority and Advisory Bodies

Safe Drinking Water Act (as F): Regulated chemical (47 FR 9352); MCL, 4.0 mg/L; MCLG, 4.0 mg/L; SMCL, 2.0 mg/L.

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S26; S27; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Fluoboric acid is a colorless liquid which does not exist as a free, pure substance. Used as an aqueous solution. Molecular weight = 87.82; Boiling point = 130°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Used as a catalyst for acetal synthesis and cellulose esters; a metal surface cleaning agent; an aluminum electrolytic finishing agent; a stripping solution for the removal of solder and plated metals; and an intermediate in making fluoroborate salt.

Incompatibilities: A strong acid. Reacts violently with chemically active metals; strong bases, releasing flammable hydrogen gas.

Permissible Exposure Limits in Air

As inorganic fluoride

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Several states have set guidelines or standards for fluorine in ambient air[60] ranging from zero (North Carolina) to 4.0 μg/m^3 (Connecticut) to 6.7 μg/m^3 (New York) to 20.0 μg/m^3 (Florida) to 30.0 μg/m^3 (Virginia) to 20.0–40.0 μg/m^3 (North Dakota) to 48.0 μg/m^3 (Nevada).

Determination in Air: No tests available.

Permissible Concentration in Water: Russia[43] set a MAC of 1.5 mg/L in water bodies used for domestic purposes. See also the entry on "Fluorides."

Routes of Entry: Inhalation, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Highly corrosive. Contact can cause severe skin burns and eye irritation and burns with possible eye damage. Inhalation can irritate the lungs, causing coughing and shortness of breath. High exposure can cause headache, weakness, convulsions, collapse, and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure can cause nausea, vomiting, diarrhea, loss of appetite and weight, hair loss, skin rash, and bone and teeth changes (fluorosis). May cause kidney damage, anemia, and lung irritation with the possible development of bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system, kidneys, blood.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF

(APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m³:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chemically active metals and strong bases. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This chemical requires a shipping label of "CORROSIVE." DOT/UN Hazard Class 8. Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical powder extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride, fluorine, and boron oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN2767 (Phenyl urea pesticides, solid, toxic)/151

EC Number: 218-500-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human No Adequate Data; Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluometuron is a white crystalline solid often used in liquid solution that may be flammable. Molecular weight = 232.23; Freezing/Melting point = 163−165°C; Vapor pressure = 9.4×10^{-7} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: This material is used as a herbicide.

Incompatibilities: Liquid solutions are incompatible with oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: A no-observed-adverse-effect-level (NOAEL) of 0.0125 mg/kg/day has been calculated by EPA. On this basis a long-term health advisory of 5.3 mg/L and a lifetime health advisory of 0.09 mg/L have been calculated.

Determination in Water: Fish Tox = 77.05449000 ppb (INTERMEDIATE). Octanol−water coefficient: Log $K_{ow} = 2.3$.

Routes of Entry: Inhalation, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Inhalation can irritate the respiratory tract. Symptoms of exposure include increased leukocyte content in circulation of blood. The material is a mild cholinesterase inhibitor. LD_{50} = (oral-rat) 6400 mg/kg (insignificantly toxic). Human Tox = 7.00000 ppb (HIGH).

Long Term Exposure: May cause skin allergy. Mild cholinesterase inhibitor; cumulative effect is possible. Repeated exposure may cause changes in the red blood cell count. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Liver function tests. Complete blood count (CBC). Evaluation by a qualified allergist.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Consult a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the airway is open, lay on side, and keep head lower than body and transport immediately to medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Do not induce vomiting without a physician's advice.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place and protect from exposure to ultraviolet light. Keep liquid away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Phenyl urea pesticides, solid, toxic, require a label of "POISONOUS/TOXIC MATERIALS." The Hazard Class is 6.1.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone and avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment may be used to remove slicks from water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Dry material:* Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen fluoride and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Combustible solution: Poisonous gases, including nitrogen oxides and fluorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Fluoranthene F:0280

Molecular Formula: $C_{16}H_{10}$

Synonyms: 1,2-Benzacenaphthene; Benzo(jk)Fluorene; Fluoranteno (Spanish); Idryl; 1,2-(1,8-Naphthalenediyl) Benzene; 1,2-(1,8-Naphthylene)Benzene

CAS Registry Number: 206-44-0

RTECS® Number: LL4025000

UN/NA & ERG Number: UN3077/171

EC Number: 205-912-4

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human No Adequate Data, animal No Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; EPA: Not Classifiable as to human carcinogenicity.

OSHA, 29CFR1910 Specifically Regulated Chemicals (See CFR 1910.1002) as coal tar pitch volatiles.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants; 40CFR423, Appendix A, Priority Pollutants.

US EPA Hazardous Waste Number (RCRA No.): U120.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.068; Nonwastewater (mg/kg), 3.4.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8100 (200); 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Fluoranthene is a polycyclic hydrocarbon and a colorless crystalline solid. Molecular weight = 202.26; Boiling point = about 375°C; Freezing/Melting point = 111°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Virtually insoluble in water.

Potential Exposure: Fluoranthene, a polynuclear aromatic hydrocarbon (PAH), is produced from the pyrolytic processing of organic raw materials, such as coal and petroleum at high temperatures. It is also known to occur naturally as a product of plant biosynthesis. Fluoranthene is ubiquitous in the environment and has been detected in US atmospheric air, in foreign and domestic drinking waters, and in foodstuffs. It is also present in cigarette smoke. Individuals living in areas which are heavily industrialized, and in which large amounts of fossil fuels are burned, would be expected to have greatest exposure from ambient sources of fluoranthene. In addition, certain occupations (e.g., coke oven workers, steelworkers, roofers, automobile mechanics) would also be expected to have elevated levels of exposure relative to the general population. Exposure to fluoranthene will be considerably increased among tobacco smokers or those who are exposed to smokers in closed environments (i.e., indoors).

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 25 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: Category 1, human carcinogen.
NIOSH IDLH: 80 mg/m^3.

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: The only existing standard which takes fluoranthene into consideration is a drinking water standard for PAHs. The 1970 World Health Organization European Standards for Drinking Water recommends a concentration of PAHs not exceeding 0.2 μg/L. This recommended standard is based upon the analysis of the following six PAHs in drinking water: fluoranthene, Benzo(a) pyrene, Benzo(ghi)perylene, benzo(b)fluoranthene, benzo(k) fluoranthene, and indeno(1,2,3-cd) pyrene.

More recently EPA has established[6] ambient water criteria as follows: *To protect freshwater aquatic life:* 3980 μg/L based on acute toxicity. *To protect saltwater aquatic life:* 40 μg/L based on acute toxicity and 16 μg/L based on chronic toxicity. *To protect human health:* 42 μg/L. Kansas[61] has set a guideline of 0.029 μg/L for fluoranthene in drinking water.

Determination in Water: Methylene chloride extraction followed by high-pressure liquid chromatography with fluorescence as UV detection, or gas chromatography (EPA Method 610), or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Long Term Exposure: There is concern about the toxicity of fluoranthene because it is widespread in the human environment and belongs to a class of compounds (polynuclear aromatic hydrocarbons) that contain numerous potent carcinogens. Experimentally, fluoranthene does not exhibit properties of a mutagen or primary carcinogen but it is a potent co-carciongen. In the laboratory, fluoranthene has also demonstrated toxicity to various freshwater and marine organisms. This finding, coupled with the cocarcinogenic properties of the compound, points out the need to protect humans and aquatic organisms from the potential hazards associated with fluoranthene in water.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of “CLASS 9.” It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Contain and isolate spill to limit spread. Construct clay/bentonite swale to divert uncontaminated portion of watershed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluorene, when pure, is found as dazzling-white flakes or small, crystalline plates. It is fluorescent when impure. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 166.23; Boiling point = 293°C (decomposes); Freezing/Melting point = 116−117°C; Flash point = 151°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Fluorene is used in resins, dyes, and is a chemical intermediate.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.

ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene soluble aerosol); Confirmed Human Carcinogen.

NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.

NIOSH IDLH: 80 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.

Permissible Concentration in Water: In view of the carcinogenicity of polynuclear aromatic hydrocarbons, the concentration in water is preferably zero as noted by EPA.[6]

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Fluorene can irritate and burn the eyes and skin.

Long Term Exposure: No chronic effects are known at this time.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and source of ignition.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Fluorides F:0300

Molecular Formula: F_yM_x

Synonyms: Fluoride(1-); Fluoride ion; Fluoride ion(1-); Perfluoride

CAS Registry Number: 16984-48-8 (fluoride)

RTECS® Number: LM6290000

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Safe Drinking Water Act: Regulated chemical (47 FR 9352); MCL, 4.0 mg/L; MCLG, 4.0 mg/L; SMCL, 2.0 mg/L.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as fluoride compounds.

Note: Several specific fluoride compounds are regulated by US EPA, OSHA and International regulatory bodies.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Of the general formula M_xF_y, appearance, odor and properties vary with specific compounds.

Potential Exposure: Fluorides are used as an electrolyte in aluminum manufacture; a flux in smelting nickel, copper, gold, and silver; as a catalyst for organic reactions, a wood preservative; fluoridation agent for drinking water; a bleaching agent for cane seats; in pesticides, rodenticides, and as a fermentation inhibitor. They are utilized in the manufacture of steel, iron, glass, ceramics, pottery, enamels, in the coagulation of latex, in coatings for welding rods, and in cleaning graphite, metals, windows, and glassware. Exposure to fluorides may also occur during preparation of fertilizer from phosphate rock by addition of sulfuric acid. Air pollution by fluoride dusts and gases has done substantial damage to vegetation and to animals in the vicinity of industrial fluoride sources. However, the contribution of ambient air to human fluoride intake is only a few hundredths of a milligram per day, an amount that is insignificant in comparison with other sources of fluoride. Operations that introduce fluoride dusts and gases into the atmosphere include grinding, drying, and calcining of fluoride-containing minerals; acidulation of the minerals; smelting; electrochemical reduction of metals with fluoride fluxes or melts, as in the aluminum and steel industry; kiln firing of brick and other clay products; and the combustion of coal.

Incompatibilities: Fluorides form explosive gases on contact with strong acids or acid fumes.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration.

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

NIOSH IDLH: 250 mg[F]/m^3.

Australia: TWA 2.5 mg[F]/m^3, 1993; Austria: MAK 2.5 mg [F]/m^3, 1999; Belgium: TWA 2.5 mg[F]/m^3, 1993; Finland: TWA 2.5 mg[F]/m^3, 1999; France: VME 2.5 mg[F]/m^3, 1999; Hungary: TWA 1 mg[F]/m^3; STEL 2 mg[F]/m^3, 1993; Norway: TWA 0.6 mg[F]/m^3, 1999; the Philippines: TWA 2.5 mg[F]/m^3, 1993; Poland: MAC (TWA) 1 mg [HF]/m^3, MAC (STEL) 3 mg[HF]/m^3, 1999; Russia: STEL 0.5 ppm (2.5 mg/m^3), 1993; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 1.8 ppm (1.5 mg[F]/m^3), KZG-W 3.6 ppm (3.0 mg[F]/m^3), 1999; Thailand: TWA 2.5 mg [F]/m^3, 1993; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; LTEL 2.5 mg[F]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Several states have set guidelines or standards for fluorides in ambient air[60] ranging from 2.85 μg/m^3 (Iowa) to 25.0 μg/m^3 (North Dakota) to 34.0 μg/m^3 (Massachusetts) to 40.0 μg/m^3 (Virginia).

Determination in Air: Gaseous fluorides collected by impinger using caustic, particulates by filter. Analysis is by ion-specific electrode per NIOSH Analytical Method 7902.[18]

Permissible Concentration in Water: The EPA has set a standard of 4 mg/L for fluoride[61] and the state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Fluorides can affect you when breathed in. Fluorides can irritate and may damage the eyes. Skin contact can cause irritation, rash, or burning sensation. High repeated exposure can cause nausea, vomiting, loss of appetite, and bone and teeth changes. Extremely high levels could be fatal. Breathing can irritate the nose and throat, and cause nausea, headaches, and nosebleeds. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Very high exposure can cause fluoride poisoning with stomach pain, weakness, convulsions, collapse, and death. These effects do not occur at the level of fluorides used in water for preventing cavities in teeth.

Long Term Exposure: Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite, diarrhea, or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Eyes, respiratory system; central nervous system, skeleton, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with large amounts of soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: In areas with excessive gas or dust levels for any type of fluorine, worker protection should be provided. Respiratory protection by dust masks or gas masks with an appropriate canister or supplied air respirator should be provided. Goggles or full-face masks should be used. In areas where there is a likelihood of splash or spill, acid-resistant clothing including gloves, gauntlets, aprons, boots, goggles, or face shield should be provided to the worker. Personal hygiene should be encouraged, with showering following each shift and before changing to street clothes. Work clothes should be changed following each shift, especially in dusty areas. Attention should be given promptly to any burns from fluorine compounds due to absorption of the fluorine at the burn site and the possibility of developing systemic symptoms from absorption from burn sites.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if* *not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)[†] [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)[†] [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

[†]May need acid gas sorbent.

Storage: Storage color will depend on compound. Prior to working with fluorides you should be trained on its proper handling and storage. Fluorides must be stored to avoid contact with strong acids (i.e., hydrochloric, sulfuric, and nitric) since violent reactions can occur. Fluorides form explosive gases on contact with nitric acid. Store in tightly closed containers in a cool, well-ventilated area away from water.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solid material: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Do not use water*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Reaction of aqueous waste with an excess of lime, followed by lagooning, and either recovery or land disposal of the separated calcium fluoride.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 1000 (≥1.00% concentration); *Theft hazard* 15 (≥6.17% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 1000 lb (454 kg).

US EPA Hazardous Waste Number (RCRA No.): P056.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: O, T + ,C; Risk phrases: R8; R26; R35; Safety phrases: S1/2; S9; S26; S28; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Fluorine is a yellow compressed, gas with a characteristic pungent odor. The odor threshold is 0.035 ppm.[41] Molecular weight = 38.00; Boiling point = −188.3°C; Freezing/Melting point = −219.4°C; Relative vapor density (air = 1): 1.31; Vapor pressure = >1 atm; Vapor pressure = >1 atm at 25°C. Reaction with water.

Potential Exposure: Compound Description: Human Data; Primary Irritant. Elemental fluorine is used in the conversion of uranium tetrafluoride to uranium hexafluoride, in the synthesis of organic and inorganic fluorine compounds, and as an oxidizer in rocket fuel.

Incompatibilities: Water, nitric acid, oxidizers, organic compounds. Reacts violently with reducing agents, ammonia, all combustible materials, metals (except the metal containers in which it is shipped). Reacts violently with H_2O to form hydrofluoric acid and ozone.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.55 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 ppm/0.2 mg/m^3 TWA.

NIOSH REL: 0.1 ppm/0.2 mg/m^3 TWA.

ACGIH TLV®[1]: 1 ppm/1.6 mg/m^3 TWA; 2 ppm/3.1 mg/m^3.

NIOSH IDLH: 2 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 ppm

PAC-1: **1.7** ppm

PAC-2: **5** ppm

PAC-3: **13** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: No numerical value established. Data may be available.

Arab Republic of Egypt: TWA 0.1 ppm (0.2 mg/m^3), 1993; Australia: TWA 1 ppm (2 mg/m^3); STEL 2 ppm, 1993; Austria: MAK 0.1 ppm (0.2 mg/m^3), 1999; Belgium: TWA 1 ppm (1.6 mg/m^3); STEL 2 ppm, 1993; Denmark: TWA 0.1 ppm (0.2 mg/m^3), 1999; Finland: STEL 0.1 ppm (0.26 mg/m^3), 1999; France: VLE 1 ppm (2 mg/m^3), 1999; Hungary: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, 1993; Norway: TWA 0.1 ppm (0.2 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.2 mg/m^3), 1993; Poland: MAC (TWA) 0.05 mg/m^3, MAC (STEL) 0.4 mg/m^3, 1999; Sweden: NGV 0.1 ppm (0.2 mg/m^3), KTV 0.3 ppm (0.5 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.15 mg/m^3), KZG-W 0.2 ppm (0.3 mg/m^3), 1999; Thailand: TWA 0.1 ppm (0.2 mg/m^3), 1993; Turkey: TWA 0.1 ppm (0.2 mg/m^3), 1993; United Kingdom: STEL 1 ppm (1.6 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 2 ppm. Several states have set guidelines or standards for fluorine in ambient air[60] ranging from zero (North Carolina) to 4.0 μg/m^3 (Connecticut) to 6.7 μg/m^3 (New York) to 20.0 μg/m^3 (Florida) to 30.0 μg/m^3 (Virginia) to 20.0−40.0 μg/m^3 (North Dakota) to 48.0 μg/m^3 (Nevada).

Determination in Air: No test available.

Permissible Concentration in Water: Russia[43] set a MAC of 1.5 mg/L in water bodies used for domestic purposes. See also the entry on "fluorides."

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Small amounts of gas in air can have a strong caustic effect on the cornea, eyelids, nose. Inhalation:* Corrosive. Inhalation of fluorine causes coughing, choking, and chills. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. A symptomatic period of 1−2 days followed by fever, cough, tightness in chest, and cyanosis indicate pulmonary edema. Inhalation of extremely high levels may cause suffocation. It is also reported that volunteers exposed to levels of 10 ppm for up to 15 min reported no irritation. Levels of 25−75 ppm caused increasing irritation. Exposure to levels of 100 ppm for 1 min caused strong respiratory irritation. *Skin:* Corrosive to the skin. It is also reported that exposure to levels between 90 and 240 ppm produced slight irritation of the skin and a "sticky" feeling of face. Contact with liquid fluorine may cause chemical burns and frostbite. *Eyes:* Corrosive to the eyes; can lead to permanent eye damage. Contact with the liquid may cause frostbite. It is also reported that mild irritation was reported at exposure to levels of 25 ppm for 5 min. Levels of 100 ppm for 1 min produced marked irritation. *Ingestion:* No reported exposures by this route.

Long Term Exposure: Prolonged exposure can cause fluorine to concentrate in the bones, causing osteosclerosis which may be disabling. The teeth can become mottled. Repeated exposure can cause nosebleeds, nausea, vomiting, loss of appetite, diarrhea, and kidney damage. These effects do not occur when fluorine is used to treat drinking water to prevent cavities. It is also reported that levels of 0.1 ppm intermittently, over a prolonged period produced no ill effects.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. Liver and kidney function tests. DEXA bone density scan (dual energy X-ray absorptiometry).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Prevent skin contact (liquid). **8 h:** Barricade™ coated suits; Responder™ suits. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact-resistant goggles when working with fumes, gases, or vapors. When working with liquids, wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern]; *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); *Up to 5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]; *Up to 250 ppm:* SaF: Pd,Pp (APF = 2000) Any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Danger: Do NOT use a gas mask with activated carbon filters containing activated carbon filters in atmospheres of high concentrations of fluorine gas. The activated carbon may spontaneously ignite.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Fluorine must be stored to avoid contact with most oxidizable materials because it frequently causes them to start on fire. It will frequently ignite bromine, iodine, sulfur, alkaline metals (such as sodium and potassium), and a number of organic chemicals (such as benzene and ethyl alcohol). It should not contact nitric acid because an explosive gas will be produced. Contact with hydrogen or amorphous silicon dioxide will cause an explosion. Store in containers, such as cylinders, in a cool, well-ventilated area away from heat, water, and steam. Heat can cause cylinders to burst. Contact with water or steam can produce heat and corrosive and poisonous gases.

Shipping: Compressed fluorine requires a shipping label of "POISON GAS, OXIDIZER, CORROSIVE." It falls in Hazard Class 2.3, Hazard Zone A. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid fluorine is spilled, clear the area and allow it to evaporate. Vapors are heavier than air and will collect in low areas. *Do not use water* or wet method. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with

time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Fluorine and fluorine, compressed

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.9/3.1

Fire Extinguishing: Nonflammable but reacts chemically with any material capable of burning. Poisonous gases are produced in fire. Fluorine can ignite combustible materials and may increase the severity of an ongoing fire. Use extinguisher appropriate to the burning material. Do not spray water directly on leaking fluorine as poisonous gases are produced. Keep sealed fire-exposed cylinder cool by spraying with water. For small fire, used dry chemical or carbon dioxide. For large fire, use water spray, fog, or foam. For massive fire in cargo area, use unmanned hose holder or monitor nozzles. A few whiffs of the gas or vapor could cause death. Gas, vapor of liquid could be fatal on penetrating the firefighters' normal full protective clothing. Only special protective clothing designed to protect against fluorine should be used; the normal full protective clothing available to the average fire department will not provide adequate protection. Do not direct water onto fluorine leaks as the fire may be intensified. Do *NOT* spray water on leaking cylinder (to prevent corrosion of cylinder). Turn leaking cylinder with the leak up to prevent escape of gas in liquid state.

Disposal Method Suggested: Fluorine can be combusted by means of a fluorine-hydrocarbon air burner followed by a caustic scrubber and stack. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (several countries) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

US EPA Hazardous Waste Number (RCRA No.): P057.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

European/International Regulations: Hazard Symbol: T+; Risk phrases R24; R28; Safety phrases: S1/2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluoroacetamide is a colorless, crystalline solid. Molecular weight = 77.07; Freezing/Melting point = 107−109°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. This material is an organofluorine rodenticide; insecticide proposed mainly for use on fruits to combat scale insects, aphids, and mites. Use is largely restricted to licensed pest control operators.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

No OSHA, NIOSH, or ACGIH standards set for organic fluorides.

Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3.5 mg/m^3
PAC-2: 5.8 mg/m^3
PAC-3: 5.8 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Routes of Entry: Inhalation, skin and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Signs and symptoms may be extremely severe and range from nausea, vomiting, and diarrhea to convulsions, coma, and heart failure. Other symptoms include hyperactivity, respiratory depression, or arrest; cyanosis (blue tint to the skin and mucous membranes); and ventricular fibrillation. This material is super toxic; probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for a 150-lb person. Chemically inhibits oxygen metabolism by cells with critical damage occurring to the heart, brain, and lungs, resulting in heart failure, respiratory arrest, convulsions, and death.

Warning: Effects usually appear within 30 min of exposure but may be delayed as long as 20 h. Caution is advised. Vital signs should be monitored closely.

Points of Attack: Heart, brain, and kidneys.

Medical Surveillance: See entry on "Fluorides."

First Aid: Acute exposure to fluoroacetamide may require decontamination and life support for the victim. Emergency personnel should wear protective clothing appropriate to the type and degree of contamination. Air-purifying or supplied-air respiratory equipment should also be worn, as necessary. Rescue vehicles should carry supplies, such as plastic sheeting and disposable plastic bags to assist in preventing spread of contamination. *Inhalation:* Move victim to fresh air. Evaluate vital signs. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen. Rush to a health-care facility. *Eye Exposure:* Remove any contact lenses at once and flush eyes with lukewarm water for 15 min. *Skin Exposure:* Follow steps under inhalation above. Wash exposed skin areas 3 times with soap and water. Rush to health-care facility. *Ingestion:* Evaluate vital signs, including pulse and respiratory rate, and note any trauma. If no pulse is detected, provide CPR. If not breathing, provide artificial respiration. If breathing is labored, administer oxygen or other respiratory support. Rush to health-care facility. Obtain authorization and/or further instructions from the local hospital for performance of other invasive procedures.

Warning: Effects usually appear within 30 min of exposure but may be delayed as long as 20 h. Caution is advised. Vital signs should be monitored closely.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including fluorine and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Fluoroacetic acid F:0330

Molecular Formula: $C_2H_3FO_2$

Common Formula: FCH_2COOH

Synonyms: Acide monofluoracetique (French); Acido fluoroacetico (Spanish); Cymonic acid; FAA; Fluoroacetate; 2-Fluoroacetic acid; Fluoroethanoic acid; Gifblaar poison; HFA; MFA; Monofluoressigsaeure (German); Monofluoroacetate; Monofluoroacetic acid

CAS Registry Number: 144-49-0

RTECS® Number: AH5950000

UN/NA & ERG Number: UN2642/154

EC Number: 205-631-7 [*Annex I Index No.:* 607-081-00-7]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[13]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R28; R50; Safety phrases: S1/2; S20: S22: S26: S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Fluoroacetic acid is a colorless crystalline solid. Molecular weight = 78.05; Boiling point = 165°C; Freezing/Melting point = 35°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Drug. This material is used as a rodenticide.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.075 mg/m^3

PAC-1: 0.25 mg/m^3

PAC-2: 0.47 mg/m^3

PAC-3: 2 mg/m^3

Permissible Concentration in Water: No standards set for the acid but see the entry for its sodium salt under "Sodium fluoroacetate."

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. The major symptoms of fluoroacetic acid poisoning include severe epileptiform convulsions alternating with coma and depression; death may result from asphyxiation during convulsion or from respiratory failure. Cardiac irregularities, such as ventricular fibrillation and sudden cardiac arrest, nausea, vomiting, excessive salivation, numbness, tingling sensations, epigastric pain, mental apprehension, muscular twitching, low blood pressure, and blurred vision may also occur. This material is very toxic, LD_{50} = (oral-rat) 4.7 mg/kg (extremely toxic), and may affect the cardiovascular system, central nervous system, and kidneys, and may cause cardiac and renal failure. This may cause death.

Long Term Exposure: See information for "Short-Term Exposure."

Points of Attack: Central nervous system, heart, kidneys, lungs.

Medical Surveillance: Kidney function tests. EKG. Lung function tests. Examination of the nervous system. Consider chest X-ray following acute exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. The symptoms of central nervous system, cardiac, and renal failure do not become manifest until a few hours have passed. Specific treatment is necessary in case of poisoning with this substance; the appropriate means with instructions must be available.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material. Stop leak if you can do so without risk. Stay upwind; keep out of low areas. Use water spray to reduce vapors. For *small spills*, take up with sand or other noncombustible absorbent material and place into containers for later disposal. For *large spills*, dike spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Small fires: use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Wear self-contained, positive pressure breathing apparatus and full protective clothing. Move container from fire area. Cool containers that are exposed to flames with water from the side until well after fire is out. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent. Spray the solution into a furnace equipped with an afterburner.[24]

US Environmental Protection Agency. (November 30, 1987). *Chemical Hazard Information Profile: Fluoroacetic Acid*. Washington, DC: Chemical Emergency Preparedness Program

Fluoroacetyl chloride F:0340

Molecular Formula: C_2H_2ClFO

Common Formula: FCH_2COCl

Synonyms: Acetyl chloride, fluoro-; TL 670

CAS Registry Number: 359-06-8

RTECS® Number: AO6825000

UN/NA & ERG Number: UN3123 (Toxic liquids, water-reactive, n.o.s.)/139

EC Number: 206-623-6

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluoroacetyl chloride is a liquid. Molecular weight = 96.49. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 2. Reacts with water.

Potential Exposure: May be used in organic synthesis.

Incompatibilities: Chlorides or fluorides may ignite combustibles (i.e., wood, paper, oil, etc.) or react violently with water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 6 mg/m^3
PAC-2: 10 mg/m^3
PAC-3: 10 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Highly toxic by inhalation. Corrosive to skin and irritating to eyes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic liquids, water-reactive, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS, DANGEROUS WHEN WET." They fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors (may react violently with water). *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a combustible solid and water-reactive. Extinguish with dry chemical, carbon dioxide. Spray cooling water on unopened containers that are exposed to flames until well after fire is out. Move container from fire area if you can do so without risk. Do not get water in container, as material may react violently with water. Poisonous gases are produced in fire, including phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US Environmental Protection Agency. (November 30, 1987). *Chemical Hazard Information Profile: Fluoroacetyl Chloride*. Washington, DC: Chemical Emergency Preparedness Program

Fluorobenzene F:0350

Molecular Formula: C_6H_5F
Synonyms: Benzene fluoride; Benzene, fluoro-; MFB; Monofluorobenzene; Phenyl fluoride
CAS Registry Number: 462-06-6
RTECS® Number: DA0800000
UN/NA & ERG Number: UN2387/130
EC Number: 207-321-7
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Fluorobenzene is a colorless liquid. Molecular weight = 96.11; Boiling point = 85°C; Flash point = −15°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.

Potential Exposure: Fluorobenzene is used as an insecticide and as a reagent for plastic or resin polymers.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 125 mg/m^3
PAC-1: 350 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Fluorobenzene can irritate the eyes, nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. A closely related chemical, chlorobenzene, can damage the liver and kidneys with high or repeated exposure. It is unknown if fluorobenzene causes these effects. Overexposure could cause headache, nausea, and make you dizzy.

Long Term Exposure: May cause liver and kidney damage. Repeated exposure may damage the lungs and affect the nervous system.

Points of Attack: Lungs, liver, kidney, nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: periodic lung function tests. If symptoms develop or overexposure is suspected, the following may also be useful: tests for kidney and liver function. Examination of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Where there is potential for exposures to fluorobenzene, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Fluorobenzene must be stored to avoid contact with oxidizers since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where fluorobenzene is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of fluorobenzene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of fluorobenzene.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide and fluorine, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Fluorotrichloromethane is a colorless liquid or gas with a chlorinated solvent odor. The odor threshold is 5.0 ppm. Molecular weight = 137.36; Specific gravity (H_2O:1) = 1.47 (Liquid at 23.9°C); Boiling point = 24°C; Freezing/Melting point = − 111°C; Relative vapor density (air = 1) = 4.74; Vapor pressure = 690 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Soluble in water; solubility = 0.1% at 23.9°C.

Potential Exposure: Compound Description: Tumorigen, Human Data; Hormone. This material is used as a refrigerant, aerosol propellant, foaming agent, and as a blowing agent in production of polyurethane foams.

Incompatibilities: Chemically active and powdered metals: aluminum, barium, sodium, potassium, calcium, powdered aluminum, zinc, magnesium.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.62 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/5600 mg/m^3 TWA.

NIOSH REL: 1000 ppm/5600 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 1000 ppm/5620 mg/m^3 Ceiling Concentration, Not Classifiable as a Human carcinogen, *as trichloromonofluoromethane.*

NIOSH IDLH: 2000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 1000 ppm

PAC-2: 1500 ppm

PAC-3: 2000 ppm

DFG MAK: 1000 ppm/5700 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C, *as trichloromonofluoromethane.*

Australia: TWA 1000 ppm (5600 mg/m^3), 1993; Austria: MAK 1000 ppm (5600 mg/m^3), 1999; Belgium: STEL

1000 ppm (5620 mg/m^3), 1993; Denmark: TWA 500 ppm (2810 mg/m^3), 1999; Finland: TWA 1000 ppm (5600 mg/m^3); STEL 1250 ppm (7000 mg/m^3), 1993; Hungary: STEL 40 mg/m^3, 1993; Japan: 1000 ppm (5600 mg/m^3), 1999; Norway: TWA 500 ppm (2800 mg/m^3), 1999; the Philippines: TWA 1000 ppm (5600 mg/m^3), 1993; Poland: MAC (TWA) 500 mg/m^3, MAC 5600 mg/m^3, 1999; Russia: STEL 1000 ppm (1000 mg/m^3), 1993; Sweden: NGV 500 ppm (3000 mg/m^3), KTV 750 ppm (4500 mg/m^3), 1999; Switzerland: MAK-W 1000 ppm (5600 mg/m^3), 1999; Turkey: TWA 1000 ppm (5600 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (5710 mg/m^3); STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 1000 ppm. Russia set a MAC of 100 mg/m^3 in ambient air in residential areas on a once-daily basis and 10 mg/m^3 on a daily average basis. Several states have set guidelines or standards for F-11 in ambient air[60] ranging from 13.0 mg/m^3 (Virginia) to 56.0 mg/m^3 (North Dakota) to 112.0 mg/m^3 (Connecticut) to 133.33 mg/m^3 (Nevada) to 560 mg/m^3 (North Carolina). Beyond this, general concern about destruction of the ozone layer above the earth has prompted restrictions on chlorofluorocarbon use and venting to the atmosphere. Substitute materials are being developed to reduce emissions drastically.

Determination in Air: Charcoal adsorption, workup with CS$_2$, analysis by gas chromatography/flame ionization. See NIOSH Analytical Method (IV) #1006.[18]

Permissible Concentration in Water: For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L. In January 1981 EPA (46FR2266) removed F-11 from the priority toxic pollutant list. Several states have developed guidelines for F-11 in drinking water[61] ranging from 1.0 μg/L (Arizona) to 2300 μg/L (Maine) to 3400 μg/L (California) to 3500 μg/L (Wisconsin) to 8000 μg/L (Kansas) to 8750 μg/L (Maryland).

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{\mathrm{ow}} = 2.5$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin and eyes. Overexposure can cause lightheadedness, dizziness, incoherence, tremors, cardiac arrhythmia, asphyxiation, cardiac arrest. This can occur without other warning symptoms. The liquid may cause frostbite.

Long Term Exposure: Repeated or prolonged contact with skin may cause dryness and cracking. Can irritate the lungs, causing coughing and/or shortness of breath.

Points of Attack: Skin, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider Holter monitor (a special 24-h EKG to look for irregular heartbeat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Trichlorofluoromethane must be stored to avoid contact with chemically active metals, such as aluminum or lithium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Poisonous gases, including hydrogen fluoride, hydrogen chloride, and phosgene, are produced in fire. Use extinguishing agents suitable for surrounding fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

California Proposition 65 Developmental/Reproductive toxin 1/1/89.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fluorouracil is a white crystalline solid which is practically odorless. Molecular weight = 130.09; Freezing/Melting point = 282−283°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: This material is used as an antineoplastic drug, for cancer treatment and as a chemosterilant for insects.

Incompatibilities: Oxidizers, strong bases, heat.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 19 mg/m^3
PAC-3: 100 mg/m^3

Routes of Entry: Ingestion, skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the eyes and skin. Can cause headache, fatigue, dizziness, mental confusion, nausea, vomiting, diarrhea, and abdominal pain. Minimum toxic dose in humans is approximately 450 mg/kg (total dose) over 30 days for the ingested drug. Intravenous minimum toxic dose in humans is a total dose of 6 mg/kg over 3 days. Depression in white blood cells occurred after intravenous administration of a total dose of 480 mg/kg over 32 days. Occasional neuropathy and cardiac toxicity have been reported. Do not use during pregnancy. Patients with impaired hepatic or renal function, with a history of high-dose pelvic irradiation or previous use of alkylating agents, should be treated with extreme caution. Patients with nutritional deficiencies and protein depletion have a reduced tolerance to fluorouracil.

Long Term Exposure: May decrease fertility in males and females. May cause skin allergy. Very high exposure may affect the heart. Loss of appetite and nausea are earliest symptoms, with other symptoms of diarrhea, inflammation or sores in the mouth, gastric burning, and intestinal discomfort. More serious symptoms are due to the suppression of bone marrow, with a decrease in white cell count and blood platelets, and anemia. Hair loss, nail changes, dermatitis, pigmentation, and atrophy of skin also occur. Sunlight can exacerbate these effects.

Points of Attack: Blood, heart, skin.

Medical Surveillance: Complete blood count (CBC), EKG, evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool place, possibly a refrigerator. Store at 59°F–86°F/15°C–30°C. Keep away from oxidizers, strong bases, and heat.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Spill or leak; shut off ignition sources; no flares, smoking, or flames in hazard area. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch spilled material. *Small spills*: Collect powdered material in the most convenient and safe manner and deposit in sealed containers. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, or alcohol, or polymer foam extinguishers. Poisonous gases, including nitrogen oxides, hydrogen fluoride, and carbon monoxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only

respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS® Number: VV8225000

UN/NA & ERG Number: UN1778/154

EC Number: 241-034-8 [*Annex I Index No.*: 009-011-00-5]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Hazard Symbol: C; Risk phrases: R34; Safety phrases: S1/2; S26; S27; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Fluorosilicic acid is a transparent, colorless fuming liquid. Molecular weight = 144.11; Boiling point = about 100°C (decomposes); Freezing/Melting point ≤ −20°C. It is not flammable. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: A solution of fluorosilicic acid is used for sterilization in the brewing and bottling industry, electrolytic refining of lead, electroplating, hardening cement, and for removing mold and others.

Incompatibilities: The aqueous solution is a strong acid. Reacts with water or steam to produce toxic and corrosive fumes of hydrogen fluoride. Incompatible, and may react violently with bases, aliphatic amines, alkanolamines, alkylene oxides, aromatic amines, amides, ammonia, ammonium hydroxide, calcium oxide, epichlorohydrin, isocyanates, oleum, organic anhydrides, sulfuric acid, strong oxidizers, vinyl acetate, water. Attacks glass, concrete, and ceramics. The anhydrous form dissociates almost instantly into silicon tetrafluoride and hydrogen fluoride.

Permissible Exposure Limits in Air

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA

NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min. Ceiling Concentration

ACGIH TLV®[1]: 2.5 mg[F]/m^3 TWA; not classifiable as a human carcinogen; BEI: 3 mg[F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.

NIOSH IDLH: 250 mg[F]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 3.16 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 316 mg/m^3

DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.

Russia[43] has set MAC values for ambient air in residential areas as 0.03 mg/m^3 on a momentary basis and 0.01 mg/m^3 on a daily average basis.[43]

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Medical observation is recommended. *Inhalation:* May cause difficult breathing and burning of the mouth, throat and nose, which may result in bleeding. These may be felt at 7.5 mg/m^3. Nausea, vomiting, profuse sweating and excess thirst may occur at higher levels. *Ingestion:* Corrosive. Most reported instances of fluoride toxicity are due to accidental ingestion and it is difficult to associate symptoms with dose. 5−40 mg may cause nausea, diarrhea, and vomiting. More severe symptoms of burning and painful abdomen; sores in mouth, throat, and digestive tract; tremors, convulsions, and shock will occur around a dose of 1 g. Death may result in ingestion of 2−5 g.

Long Term Exposure: Fluoride may increase bone density, stimulate new bone growth or cause calcium deposits in ligaments. This may become a problem at levels of 20−50 mg/m^3 or higher. May cause mottling of the bones or teeth at this level, resulting in fluorosis. May cause lung damage.

Points of Attack: Bones, lungs.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential. DEXA bone densitometry scan.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Inject intravenously 10 mL of 10% calcium gluconate solution. Gastric lavage with lime water of 1% calcium chloride.

Personal Protective Methods: Use only with an effective and properly maintained exhaust ventilation or with a fully enclosed process. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Remove any clothing that you think may have become chemically soiled and wash before reuse. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50)† [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry area that is well ventilated. Protect from damage. Avoid acids. Concentrated solution can be stored in glass but lead is preferred.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Enter only with protective clothing and devices. Treat with soda ash or slaked lime. Dilute with water. Use an industrial vacuum cleaner to remove the spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Material itself is not flammable. *Do not use water*. Use CO_2 or dry chemicals on surrounding fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add slowly to a large amount of soda ash in solution.[24] Discharge to sewer with large volumes of water.

Flurazepam F:0390

Molecular Formula: $C_{21}H_{23}ClFN_3O$

Synonyms: 7-Chloro-1-[2-(diethylamino)ethyl]-5-(2-fluorophenyl)-1H-1,4-benzodiazepin-2(3H)-one; Dalmane®; Felmane; Noctosom; Ro-5-6901/3; Stauroderm

CAS Registry Number: 17617-23-1

RTECS® Number: DF2368050

UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151

EC Number: 241-591-7

Regulatory Authority and Advisory Bodies

US Department of Justice controlled substance [CFR 21 Part 1308.4 (Depressants)].

WGK (German Aquatic Hazard Class): No value assigned.

Description: Flurazepam is a pale yellow crystalline solid. Molecular weight = 387.88; Freezing/Melting point = 79.5°C. Solubility in water = 500 mg/L.

Potential Exposure: A Drug. Flurazepam is used as a sedative in capsules or liquid form.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Flurazepam can affect you when breathed in. Flurazepam is used as a medical depressant drug. When taken in that way, it can cause drowsiness and difficulty with coordination, concentration, and balance. It can also cause irritability, anxiety, weakness, headache, upset stomach, and joint pains. Effects may last for 1−3 days. It is not known for certain if these effects occur from occupational exposure. Drinking alcohol after exposure may worsen the symptoms caused by flurazepam. Person taking lithium (a medication), could have a serious reaction with flurazepam exposure.

Long Term Exposure: Exposure to flurazepam may cause jaundice, skin rash, and a low white blood cell count. Similar compounds are known teratogens. Suddenly discontinuing exposure after high exposure for 3 months may cause shakiness, irritability, and convulsions.

Points of Attack: Blood, liver, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood flurazepam level. Complete blood count (CBC). Liver function tests. Evaluation by a qualified allergist.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids.

Skin Contact: Remove contaminated clothing. Wash contaminated skin with water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. If you are required to work in a "sterile" environment you require special training.

Shipping: This material falls into the DOT category of Medicine, solid, toxic, n.o.s. This category requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire, including chlorine, fluorine, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA, FIFRA 1998 Status of Pesticides: Unsupported.

Banned or Severely Restricted (in agriculture) (Malaysia, East Germany) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Note: Classified for restricted use for direct supervision of a certified applicator.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fonofos is a pale yellow liquid with a pungent, mercaptan-like odor. Molecular weight = 246.34; Boiling point = 130°C at 0.1 mm; Freezing/Melting point = 30°C; Vapor pressure = 0.0003 mmHg at 20°C; Flash point = 94°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. Those involved in the manufacture, formulation, and application of this soil insecticide which is used for control of corn rootworms, wireworms, cutworms, symphylans, and other soil pests.

Incompatibilities: Strong acids, alkalies.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.01 mg/m^3 TWA inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI_A issued for acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 1.3 mg/m^3

PAC-3: 200 mg/m^3

Australia: TWA 0.1 mg/m^3, [skin], 1993; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have developed guidelines or standards for fonofos in ambient air[60] ranging from 1.0 $\mu g/m^3$ (North Dakota) to 2.0 $\mu g/m^3$ (Connecticut, Nevada and Virginia).

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: The EPA has developed health advisories for fonofos as follows: long-term health advisory is 70 μg/L and lifetime health advisory is 14 μg/L (See "References" below).

Determination in Water: Fish Tox = 3.50002000 ppb (HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, vertigo, sensation of tightness in chest, blurring of vision, ocular pain, loss of muscle coordination, slurring of speech, muscle twitching, drowsiness, excessive secretion of respiratory tract mucus, and convulsions. This material is a cholinesterase inhibitor. It can cause severe symptoms and death from respiratory arrest. LD_{50} = (oral-rat) 3 mg/kg (extremely toxic). Exposure above the airborne exposure limit may result in death. The effects may be delayed. Medical observation is recommended. Human Tox (ppb): 10.00000 (INTERMEDIATE).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Fonofos may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, blood cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *0.1 mg/m*^{3}, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool area.

Shipping: Fonofos is an organophosphorus pesticide, liquid, toxic, n.o.s. This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur and phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, fog, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This phosphono compound is reported to be satisfactorily decomposed by hypochlorite. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Formaldehyde is a colorless, pungent gas. The odor threshold is 0.8 ppm.[41] Formalin is an aqueous solution that is 37% formaldehyde by weight; inhibited solutions (added to prevent polymerization) usually contain 6−12% methyl alcohol. Molecular weight = 30.30; Specific gravity (H_2O:1) = 0.78; (formalin) 1.08 at 25°C; Boiling point (gas) = −19.5°C. The 37% commercial solution BP = 101°C; Freezing/Melting point = −92.2°C; Relative vapor density (air = 1) = 1.04; Vapor pressure = >1 atm; Flash point = Flammable gas; (formalin) 85°C; (commercial 37% solution, 15% methanol) 50°C; Autoignition temperature = 430°C. Explosive limits (gas): LEL = 7.0%; UEL = 73.0%. NFPA 704 M Hazard Identification (gas): Health 3, Flammability 4, Reactivity 0; (37% solution, 15% methanol): Health 3, Flammability 2, Reactivity 2. Good solubility in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Formaldehyde has found wide industrial usage as a fungicide, germicide, and in disinfectants and embalming fluids. It is also used in the manufacture of artificial silk and textiles, latex, phenol, urea, thiourea and melamine resins, dyes and inks, cellulose esters and other organic molecules, mirrors, and explosives. It is also used in the paper, photographic, and furniture industries. It is an intermediate in drug manufacture and is a pesticide intermediate.

Incompatibilities: Pure formaldehyde may polymerize unless properly inhibited (usually with methanol). Forms explosive mixture with air. Incompatible with strong acids, amines, strong oxidizers, alkaline materials, nitrogen dioxide, performic acid, phenols, urea. Reaction with hydrochloric acid forms bis-chloromethyl ether, a carcinogen. Formalin is incompatible with strong oxidizers, alkalis, acids, phenols, urea, oxides, isocyanates, caustics, anhydrides.

Permissible Exposure Limits in Air

OSHA PEL: 0.75 ppm TWA; 2 ppm STEL, suspected carcinogen, see 29CFR1910.1048(c).

NIOSH REL: 0.016 ppm TWA; 0.1 ppm Ceiling Concentration [15 min.]; potential carcinogen. Limit exposure to lowest feasible level, See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] 0.3 ppm/0.37 mg/m^3; sensitizer; Ceiling Concentration, Suspected Human Carcinogen.

NIOSH IDLH: 20 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.3 ppm

PAC-1: **0.90** ppm

PAC-2: **14** ppm

PAC-3: **56** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.3 ppm/0.37 mg/m^3 TWA; Peak Limitation Category I(2) a momentary value of 1 ppm/1.2 mg/m^3 should not be exceeded; [skin: danger of sensitization]; Carcinogen Category 4; Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 2 ppm (3 mg/m^3), 1993; Australia: TWA 1 ppm (1.5 mg/m^3); STEL 2 ppm, carcinogen, 1993; Austria: MAK 0.5 ppm (0.6 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 1 ppm (1.2 mg/m^3); STEL 2 ppm, carcinogen, 1993; Denmark: TWA 0.3 ppm (0.4 mg/m^3), 1999; France: VME 0.5 ppm, VLE 1 ppm, carcinogen, 1999; Hungary: STEL 0.6 mg/m^3, carcinogen, 1993; the Netherlands: MAC-TGG 1.5 mg/m^3, 2003; Norway: TWA 0.5 ppm (0.6 mg/m^3), 1999; the Philippines: TWA 5 ppm (6 mg/m^3), 1993; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1 mg/m^3, 1999; Russia: TWA 0.5 ppm; STEL 0.5 mg/m^3, [skin], 1993; Sweden: NGV 0.5 ppm (0.6 mg/m^3), TGV 1 ppm (1.2 mg/m^3), [skin], 1999; Switzerland: MAK-(W) 0.5 ppm (0.6 mg/m^3), KZG-(W) 1 ppm (1.2 mg/m^3), 1999; Thailand: TWA 3 ppm; STEL 5 ppm, 1993; Turkey: TWA 5 ppm (6 mg/m^3), 1993; United Kingdom: TWA 2 ppm (2.5 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.3 ppm (sensitizer). Russia has also set MAC values of 0.035 mg/m^3 for ambient air in residential areas on a momentary basis and 0.012 mg/m^3 on a daily average basis,[43] also cited as 0.003 mg/m^3.[35] Several states have set guidelines or standards for formaldehyde in ambient air[60] ranging from zero (North Carolina and North Dakota) to 0.77 μg/m^3 (Massachusetts) to 5.0 μg/m^3 (New York) to 7.2 μg/m^3 (Pennsylvania) to 7.5 μg/m^3 (South Carolina) to 12.0 μg/m^3 (Connecticut, South Dakota and Virginia) to 18.0 μg/m^3 (Indiana) to 71.0 μg/m^3 (Nevada) to 75.0 μg/m^3 (Washington).

Determination in Air: Use NIOSH (IV), Method #2016, #2541, #3500, #3800. OSHA Analytical Method ID-205, ID-52.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 41.4 μg/L based on health effects. Russia set a MAC of 0.01 mg/L,[43] in water bodies used for domestic purposes also quoted as 0.05 mg/L.[35] Further, they have set a MAC of 0.25 mg/L in water bodies used for fishery purposes. Several states have set guidelines for formaldehyde in drinking water[61] ranging from 0.7 μg/L (New Jersey)[59] to 10.0 μg/L (Maryland) to 30.0 μg/L (California and Maine).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Acute exposure to formaldehyde may result in burns to the skin, eyes, and mucous membranes, lacrimation (tearing), nausea, vomiting (may be bloody), abdominal pain, and diarrhea. Difficulty in breathing, cough, pneumonia, and pulmonary edema may occur. Sensitized people may experience asthmatic reactions, even when exposed briefly. Hypotension (low blood pressure) and hypothermia (reduced body temperature) may precede cardiovascular collapse. Lethargy, dizziness, convulsions, and coma may be noted. Nephritis (inflammation of the kidneys), hematuria (bloody urine), and liver toxicity have been reported. Exposure at concentrations well above the PEL may cause death. The effects may be delayed. *Note:* There is considerable individual variation in sensitivity to formaldehyde.

Inhalation: Irritation of the nose and throat can occur after an exposure of 0.25−0.45 ppm. Levels between 0.4 and 0.8 ppm can give rise to coughing and wheezing, tightness of the chest, and shortness of breath. Sudden exposures to concentrations of 4 ppm may lead to irritation of lung and throat severe enough to give rise to bronchitis and laryngitis. Breathing may be impaired at levels above 100 ppm and serious lung damage may occur at 50 ppm. *Skin:* Direct contact with the liquid can lead to irritation, itching, burning and drying. It is also possible to develop an allergic reaction to the compound following exposure by any route. *Eyes:* Exposure to airborne levels of formaldehyde of 0.4 ppm has brought on tearing and irritation. Small amounts of liquid splashed in the eye can cause damage to the cornea. Eye irritation was reported at levels between 0.05 and 2.0 ppm. *Ingestion:* As little as 1 liquid ounce has resulted in death to humans. Smaller amounts can damage the throat, stomach, and intestine resulting in nausea, vomiting, abdominal pain, and diarrhea. Accidental exposure may also cause loss of consciousness, lowered blood pressure, kidney damage and, if the person is pregnant, the possibility of the fetus being aborted.

Long Term Exposure: Inhalation can result in respiratory congestion with associated coughing and shortness of breath. Repeated skin contact can lead to drying and scaling. Some individuals may experience allergic reactions after initial contact with the chemical. Subsequent contact may cause skin rashes and asthma; and reactions may become more severe if exposure persists. Long-term inhalation of high levels of formaldehyde vapor (14 ppm) in rats resulted in an elevated incidence of cancer of the nose. Genetic damage from exposure has been shown in bacteria and some insects. Whether it affects humans is uncertain. May be carcinogenic to humans.

Points of Attack: Eyes, respiratory system. *Cancer site:* nasal cavity.

Medical Surveillance: OSHA Mandated Medical Tests: pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), forced expiratory flow rate. NIOSH lists the following tests: pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), forced expiratory flow rate; whole blood (chemical/metabolite); chest X-ray; pulmonary function tests: pre- and postshift photopatch testing; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Prevention of intoxication may be easily accomplished by supplying adequate ventilation and protective clothing. Barrier creams may also be helpful. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Formalin (as formaldehyde): Prevent skin contact. **8 h:** butyl rubber (gloves, suits, boots), nitrile rubber (gloves, suits, boots), Viton™ (gloves, suits), Saranex™ coated suits, Barricade™ coated suits; CPF3™ suits; **4 h:** Teflon™ (gloves, suits, boots), 4H™ and Silver Shield™ gloves, Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Formaldehyde (1910.1048)*: *≤7.5 ppm (10 × PEL)*: Full-face-piece respirator with cartridges or canisters specifically approved for protection against formaldehyde. A half-mask respirator with cartridges specifically approved for protection against formaldehyde can be substituted for the full-face-piece respirator providing that effective gas-proof goggles are provided and used in combination with the half-mask respirator. *≤75 ppm (100 × PEL)*: (1) Full-face mask respirator with chin-style or chest- or back-mounted type with industrial size canister specifically approved for protection against formaldehyde or (2) type C supplied-air respirator, demand type or continuous-flow type, with full face-piece, hood, or helmet. *>75 ppm (100 × PEL)* or unknown concentrations (emergencies): (1) Self-contained breathing apparatus with positive-pressure full-face-piece or (2) combination supplied-air, full-face-piece positive-pressure respirator with auxiliary self-contained air supply.

Firefighting: Self-contained breathing apparatus with positive-pressure in full face-piece. *Escape* (1) Self-contained breathing apparatus in demand or pressure-demand mode or (2) full-face mask respirator with chin-style or front- or back-mounted type industrial size canister specifically approved for protection against formaldehyde.

Storage: Color Code-—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Formaldehyde must be stored to avoid contact with oxidizers (such as permanganates, nitrates, peroxides, chlorates, and perchlorates) and alkaline materials since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flames.

Sources of ignition, such as smoking and open flames, are prohibited where formaldehyde is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Where possible, automatically pump liquid from drums or other storage containers to process containers. Procedures for handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Formaldehyde, solutions, with not <25% formaldehyde require a label of "CORROSIVE." Formaldehyde, solutions, flammable, require a label of "CORROSIVE, FLAMMABLE LIQUID." Nonflammable solutions are in Hazard Class 8 and flammable solutions are in Hazard Class 3; both are in Packing Group III.

Spill Handling: Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors; do not get water inside container. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Use fluorocarbon water spray, cellosize, and hycar to diminish vapors. Use sodium carbonate, ammonium hydroxide, or sodium sulfite to neutralize spill. Use universal gel, fly ash, universal sorbent material, or cement powder to absorb the spill. Keep formaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas or a combustible liquid. Poisonous gases are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Do not get water inside container. Spray cooling water on containers exposed to flames until well after fire is out. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in solution of combustible solvent.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Formaldehyde cyanohydrin F:0420

Molecular Formula: C_2H_3NO
Common Formula: $HOCH_2CN$
Synonyms: Cyanomethanol; Formaldehido cianhidrina (Spanish); Glycolonitrile glyconitrile; Glycolic nitrile; α-Hydroxyacetonitrile; 2-Hydroxyacetonitrile; Hydroxyacetonitrile; α-Hydroxymethylcyanide; Hydroxymethylinitrile; Methylene cyanohydrine
CAS Registry Number: 107-16-4
RTECS® Number: AM0350000
UN/NA & ERG Number: UN3276 (nitriles, toxic, n.o.s.)/151; UN2810 (Toxic liquid, organic, n.o.s.)/153
EC Number: 203-469-1
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0892-9040.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).
Reportable Quantity (RQ): 1000 lb (454 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Formaldehyde cyanohydrin is a colorless, odorless oily liquid with a sweetish taste. Molecular weight = 57.06; Boiling point = 186°C (slight decomposition); Freezing/Melting point $\leq -72°C$; Flash point $\geq 93°C$. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 2. Soluble in water.
Potential Exposure: Compound Description: Primary Irritant. This material is used in the manufacture of intermediates in pharmaceutical production and as a component of synthetic resins as a chemical intermediate for organic compounds, and as a solvent.
Incompatibilities: Alkalis and exposure to heat. Traces of alkalis promote violent polymerization.
Permissible Exposure Limits in Air
NIOSH REL: (nitriles) 2 ppm/5 mg/m^3 Ceiling Concentration, not to be exceeded in any 15-min work period.
Protective Action Criteria (PAC)
TEEL-0: 0.125 ppm
PAC-1: 0.35 ppm
PAC-2: 2.57 ppm
PAC-3: 4 ppm
Sweden: NGV 1 ppm (5 mg/m^3), KTV 2 ppm (10 mg/m^3), [skin], 1993; Turkey: TWA 1 ppm (5 mg/m^3); STEL 2 ppm, [skin], 1993.
Determination in Air: No test available.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates eyes, skin, respiratory system. The symptoms are similar to cyanide poisoning. Odor of bitter almonds on patient's breath may or may not be present. Headache, dizziness, weakness, giddiness, confusion, convulsions, vertigo, dyspnea (breathing difficulty), abdominal pain, nausea, and vomiting may follow exposure. Respiration may initially be rapid, then slow and labored, followed by coma and convulsions. This material is extremely toxic. Exposure by any route should be avoided; may have fatal consequences; death from asphyxiation may occur similar to that resulting from hydrogen cyanide.
Long Term Exposure: Repeated exposure may cause personality changes of depression, anxiety, or irritability. Prolonged or repeated exposure may damage the nervous system, affect respiratory system, cardiovascular system.
Points of Attack: Eyes, skin, respiratory system, central nervous system, cardiovascular system.
Medical Surveillance: Blood test for cyanide. Examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. *Speed in removing material from skin is of extreme importance.* Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles.*
Respirator Selection: NIOSH: *up to 20 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 50 ppm:*

Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 100 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 250 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator[52] under an inert atmosphere and away from all alkaline materials. Where possible, automatically pump liquid from storage containers to process containers.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS” It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Build dikes to contain flow as necessary. Use water spray to disperse vapors and dilute standing pools of liquid. Avoid breathing vapors. Keep upwind. Avoid bodily contact with the material. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

Toxic liquid, organic, n.o.s.; when used as a weapon

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.1/1.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 3.0
Night 4.6

Nitriles, toxic, liquid, n.o.s.

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.9

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including cyanides and nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or halon extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RTECS® Number: LQ0525000
EC Number: 200-842-0 [*Annex I Index No.:* 616-052-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: Not listed. Carcinogenesis studies; test completed (peer review), October 2000.

US EPA Gene-Tox Program, Negative: Cell transform.—RLV F344 rat embryo.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (EPA).[32]

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R61; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Formamide is a colorless, viscous liquid with a faint ammonia odor. Molecular weight = 45.05; Specific gravity (H_2O:1) = 1.13; Boiling point = (decomposes) 210.5°C; Freezing/Melting point = 2.5°C; Vapor pressure = 0.1 mmHg at 30°C; Flash point = 154°C.[17] Autoignition temperature ≥500°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Good solubility in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Formamide is a powerful solvent. It is also used as an intermediate in pharmaceutical manufacture. It may be pyrolyzed to give HCN.

Incompatibilities: Forms hydrocyanic acid with water solutions. Hygroscopic (absorbs moisture from air). Incompatible with nonoxidizing mineral acids, strong acids, ammonia, cresols, iodine, isocyanates, oleum, phenols, pyridine, sulfur trioxide, oxidizers, iodine, pyridine. Formamide decomposes on heating at 180°C forming ammonia, water, carbon monoxide, and hydrogen cyanide. Attacks metals, such as aluminum, iron, copper, brass, lead, and natural rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.85 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 10 ppm/15 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 10 ppm/18 mg/m^3 TWA [skin].
Protective Action Criteria (PAC)
TEEL-0: 10 ppm
PAC-1: 20 ppm
PAC-2: 125 ppm
PAC-3: 1250 ppm
DFG MAK: [skin]; No numerical value established.

Australia: TWA 10 ppm (15 mg/m^3), [skin], 1993; Belgium: TWA 10 ppm (18 mg/m^3), [skin], 1993; Finland: TWA 20 ppm (37 mg/m^3); STEL 30 ppm (55 mg/m^3), [skin], 1999; France: VME 20 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 16 mg/m^3, 2003; Norway: TWA 10 ppm (18 mg/m^3), 1999; Russia: STEL 3 mg/m^3, 1993; Switzerland: MAK-W 10 ppm (18 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 ppm [skin]. Several states have set guidelines or standards for formamide in ambient air[60] ranging from 100 μg/m^3 (New York) to 300 μg/m^3 (Florida) to 300−450 μg/m^3 (North Dakota) to 480 μg/m^3 (Virginia) to 600 μg/m^3 (Connecticut) to 714 μg/m^3 (Nevada) to 750 μg/m^3 (South Carolina).

Determination in Air: No test available.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 414 μg/L based on health effects.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Formamide irritates the skin, eyes, and mucous membranes. Contact may cause eye burns. Exposure can cause skin irritation and a rash. May affect the central nervous system.

Long Term Exposure: Formamide may also damage the testes (male reproductive glands). There is limited evidence that formamide is a teratogen in animals and may have toxic effects upon human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system, reproductive system.

Medical Surveillance: There is no special test for this chemical. However if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 20 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and other incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep formamide out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, water spray, or alcohol-resistant foam extinguishers. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in a combustible solvent and dispose by burning in a furnace equipped with an alkali scrubber for the exit gases.[22]

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P198.

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06, Vol 71, No. 158] Reportable Quantity (RQ): 100 lb (45.4 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant as formetanate.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R26; R28; R43; R50/53; Safety phrases: S1/2; S24; S28; S37/39; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Formetanate hydrochloride is a white or yellowish, crystalline solid or powder with a faint odor. Molecular weight = 257.75; Freezing/Melting point = 200°C–202°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Highly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Food Additive. Those involved in the manufacture, formulation, and application of this plant insecticide, acaricide, and miticide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 3.5 mg/m^3
PAC-1: 10 mg/m^3
PAC-2: 18 mg/m^3
PAC-3: 18 mg/m^3

Routes of Entry: Inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Diarrhea, nausea, vomiting, excessive salivation, headache, pinpoint pupils, and uncoordinated muscle movements are all common symptoms. Extremely toxic to humans. Not absorbed through contact with skin. Inhalation or ingestion may cause poisoning. Inhibits cholinesterase activity; so effects are in relation to action on nervous system and can result in death.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This material falls under Carbamate pesticides, solid, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind and keep out of low areas. Do not touch spilled material or breathe the dust, vapors, or fumes from burning materials. Do not handle broken packages without protective equipment. Wash away any material that may have contacted the body with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire, as the material itself does not burn or burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide, or dry chemical. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

US EPA Hazardous Waste Number (RCRA No.): U123.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R35; Safety phrases: S1/2; S23; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Formic acid is a colorless, flammable, fuming liquid, with a pungent odor. Molecular weight = 46.03; Specific gravity = 1.22 (90% solution); Boiling point = 106.7°C (90% solution); Vapor pressure = 35 mmHg at 20°C; Flash point = 69°C; (90% solution) 50°C; Autoignition temperature = 434°C. Explosive limits: LEL = 18%; UEL = 57%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Formic acid is a strong reducing agent and is used as a decalcifier. It is used in pharmaceuticals, in dyeing textiles and finishing color-fast wool, electroplating, coagulating latex rubber, regeneration old rubber, and dehairing, plumping, and tanning leather. It is also used in the manufacture of acetic acid, airplane dope; allyl alcohol; cellulose formate; phenolic resins; and oxalate; and it is used in the laundry, textile, insecticide, refrigeration, and paper industries as well as in drug manufacture.

Incompatibilities: Forms explosive mixture with air. A medium strong acid and a strong reducing agent. Violent reaction with oxidizers, furfuryl alcohol, hydrogen peroxide, nitromethane. Incompatible with strong acids, bases, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin. Decomposes on heating and on contact with strong acids forming carbon monoxide. Attacks metals such as aluminum, cast iron and steel and also many plastics, rubber and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.88 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/9 mg/m^3 TWA.

NIOSH REL: 5 ppm/9 mg/m^3 TWA.

ACGIH TLV®[1]: 5 ppm/9.4 mg/m^3 TWA; 10 ppm/19 mg/m^3 STEL.

NIOSH IDLH: 30 ppm.

Protective Action Criteria (PAC)*
TEEL-0: 3 ppm
PAC-1: **3** ppm
PAC-2: **25** ppm
PAC-3: **250** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 5 ppm/9.5 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Several states have set guidelines or standards for formic acid in ambient air[60] ranging from 30 μg/m^3 (New York) to 90 μg/m^3 (Florida and North Dakota) to 150 μg/m^3 (Virginia) to 180 μg/m^3 (Connecticut) to 214 μg/m^3 (Nevada) to 225 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2011 or OSHA Analytical Method ID-186 SG.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 124 μg/L based on health effects.

Determination in Water: Octanol−water partition coefficient: Log $P_{ow} = 0.41$.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Formic acid is very corrosive to the eyes, skin, and respiratory tract. *Inhalation:* Workers exposed to 15 ppm experience nausea. Other symptoms include irritation of the nose, throat, and lungs, coughing, runny nose, and tearing eyes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Concentrated solutions may cause severe irritation, burning and blistering. Accidental exposure has resulted in death. *Eyes:* May cause irritation and tearing. Concentrated solutions may cause severe chemical burns. *Ingestion:* Corrosive. May affect the energy metabolism, causing acidosis. May cause salivation, vomiting, burning sensation in the mouth, vomiting of blood, diarrhea, and pain. In severe cases, a person may go into shock and develop difficulty in breathing. Death may result. Animal data suggest that ingestion of about 3 oz may be fatal to a 150-lb individual.

Long Term Exposure: Prolonged or repeated exposure to formic acid may cause skin irritation and allergy with rash and itching. May affect the kidneys. May cause genetic changes in living cells.

Points of Attack: Respiratory system, lungs, skin, kidneys, liver, eyes.

Medical Surveillance: Consideration should be given to possible irritant effects on the skin, eyes, and lungs in any placement or periodic examinations. Lung function tests. Kidney function tests checking for blood and urine. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h:** butyl rubber (gloves, suits, boots), Neoprene™ rubber (gloves, suits, boots), Saranex™ coated suits, Barricade™ coated suits; Responder™ suits, Trellchem HPS™ suits; **4 h:** polyvinyl chloride (gloves, suits, boots), Teflon™ (gloves, suits, boots). Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Keep in sealed containers in well-ventilated area. Protect from heat or flame and materials listed above under "Incompatibilities." Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added solvent.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Formothion is an odorless, yellowish viscous oil or crystalline mass. Molecular weight = 257.28; Freezing/Melting point = 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen. An insecticide and acaricide on crops and ornamentals. It is not produced commercially in the United States at this time.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 0.27 mg/m^3

PAC-3: 500 mg/m^3

Russia[35,43] set a MAC of 0.5 mg/m^3 in work-place air and a MAC of 0.01 mg/m^3 in ambient air in residential areas on a momentary basis and 0.006 mg/m^3 on a daily average basis.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[35,43] set a MAC of 0.004 mg/L in water bodies used for domestic purposes (4 μg/L).

Routes of Entry: Inhalation, absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Early symptoms of poisoning include: headache, dizziness, weakness, perspiring, nausea, vomiting, and sensation of tightness in chest. Chronic low doses may produce symptoms similar to influenza. Formothion is one of the least toxic systemic organophosphates. Formothion is a compound of low to moderate toxicity. It causes the depression of cholinesterase leading to accumulation of acetylcholine in the nervous system, which is believed to be responsible for the symptoms. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, profound weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline materials. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This falls under organophosphorus pesticides, liquid, toxic, n.o.s. This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; keep leak contained, if you can do so without risk. Use water spray to reduce vapor. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel, place material into clean, dry containers and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. When heated to decomposition, it emits very toxic fumes of nitrogen oxides, phosphorus oxides, and sulfur oxides. This compound is an organophosphorus insecticide. Some of these materials may burn but none of them ignite readily. Fire and runoff from fire control water may produce irritating or poisonous gases. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: Hazard Symbol: T+; Risk phrases: R27/28; Safety phrases: S1/2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fosthietan is a pale yellow oil with a mercaptan-like odor. Molecular weight = 241.28; Specific gravity (water = 1) = 1.3 g/cm^3 at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Moderately soluble in water.

Potential Exposure: This material is used as a nematocide and insecticide. Not registered as a pesticide in the United States.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.75 mg/m^3
PAC-1: 2.5 mg/m^3
PAC-2: 4.7 mg/m^3
PAC-3: 4.7 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: LD_{50} = (oral-rat) 4.67 mg/kg. This compound is a liquid organophosphorus insecticide. Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Remove and isolate contaminated clothing and shoes at the site. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline material. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal.

Fire Extinguishing: This chemical may burn but does not ignite readily. Poisonous gases, including nitrogen, phosphorus, and sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R50/53; Safety phrases: S2; S22; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fuberidazole is a crystalline powder. Molecular weight = 184.21; Melting point = 285°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Very slightly soluble in water.

Incompatibilities: Incompatible with acid halides, anhydrides, epoxides, halogenated organics, isocyanates, peroxides, phenols (acidic).

Potential Exposure: Fuberidazole, a benzimidazole, uses include cereal seed dressing and fungicidal, nonmercurial seed dressing with special action against fusarium. Not registered as a pesticide in the United States.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.3 mg/m^3

PAC-3: 12.5 mg/m^3

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Fuberidazole is classified as moderately toxic. Its probable oral lethal dose in humans is 0.5−5 g/kg or between 1 oz and 1 pint for a 70-kg (150-lb) person. LD_{50} = (oral-rat) 1100 mg/kg[9]; LC_{50} = (rat) 0.33 mg/L.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA); or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: A benzimidazole pesticide. Pesticides, solid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a combustible solid. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36; Safety phrases: S2; S26 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Fumaric acid is a colorless to white, odorless crystalline powder. Fruity-acidic taste. Molecular weight = 116.08; Specific gravity (H_2O:1) = 1.625; Sublimation temperature = 200°C; Freezing/Melting point = 287°C; Flash point = 230°C; Autoignition temperature = 737°C; Also listed as >156°F/>69°C; Autoignition temperature (dust cloud) = 740°C. Hazard Ranking (based on NFPA 704 M Hazard Identification): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = <1%.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Fumaric acid is used in production of resins, polyesters, plasticizers, and alkyl surface coatings, as a food additive, as an antioxidant in resins, and to make dyes.

Incompatibilities: Dust cloud from powder or granular form mixed with air can explode. Reacts with strong oxidizers. Incompatible with sulfuric acid, caustics, ammonia, amines, isocyanates, alkylene oxides; epichlorohydrin. Decomposes above 350°C forming irritating fumes of maleic anhydride.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3

PAC-1: 100 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: No test available.

Routes of Entry: Inhalation. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract.

Long Term Exposure: Repeated exposure may cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and incompatible materials listed above.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including maleic anhydride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Furan is a colorless liquid; turns brown on standing. Strong ether-like odor. Molecular weight = 68.08; Boiling point = 32°C; Freezing/Melting point = −85.65°C; Flash point = −36°C. Explosive limits: LEL = 2.3%; UEL = 14.3%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. Furan is used as a chemical intermediate in the production of herbicides and pharmaceuticals; for making tetrahydrofuran; in formation of lacquers; as a solvent for resins in organic synthesis, especially for pyrrole, thiophene.

Incompatibilities: Forms explosive mixture with air. Violent reaction with acids, oxidizers. Unless stabilized with an inhibitor, air exposure forms unstable peroxides.

Permissible Exposure Limits in Air

AIHA WEEL: Worker exposure by all routes should be minimalized to the fullest extent possible.

Protective Action Criteria (PAC)*

TEEL-0: 1.25 ppm

PAC-1: 4 ppm

PAC-2: **6.8** ppm

PAC-3: **19** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

Russia: STEL 0.5 mg/m^3, [skin] 1993.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.2 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.33$.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the skin and eyes. Vapors can irritate the respiratory tract and are a central nervous system depressant. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, dizziness, shortness of breath, unconsciousness, and suffocation. The vapors are narcotic. Acute exposure to furan by inhalation may involve both reversible and irreversible changes. Acute exposure by ingestion or skin absorption, as well as chronic exposure, are associated with high toxicity.

Long Term Exposure: Furan may be a carcinogen since it has been shown to cause cancer of the liver and white blood cells in animals. May cause skin allergy. May damage the liver and kidneys.

Points of Attack: Skin, liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. For emergency situations, wear a positive pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator.[52] Keep in a tightly closed container under an inert atmosphere and protect from light for long-term storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Avoid breathing vapors. Keep upwind. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Shut off ignition sources; no flares, smoking, or flames in hazard area. Stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. The exposure concentration limit of 10 ppm together with the low boiling point of furan requires that adequate ventilation be provided in areas handling this chemical. Establish forced ventilation to keep levels below explosive limit. Contact with liquid must be avoided since this chemical can be absorbed through the skin. Keep furan out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Thorough washing with soap and water followed by prolonged rinsing should be done immediately after accidental contact. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Water may be ineffective. *Small fires:* use dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if this can be accomplished without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fires in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible withdraw from area and let fire burn. Withdraw immediately in case of rising sound from venting safety device or any discoloration of tank due to fire. Isolate for ½ mile in all directions if a tank car or truck is involved. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Furfural is a colorless to yellow aromatic heterocyclic aldehyde with an almond-like odor. Turns amber on exposure to light and air. Molecular weight = 96.09; Boiling point = 161.7°C; Freezing/Melting point = −36.7; Flash point = 60°C; Autoignition temperature = 316°C. Explosive limits: LEL = 2.1%; UEL = 19.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Soluble in water; solubility = 8%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Furfural is used for lube oil refining and butadiene extraction; as a solvent for wood resin, nitrated cotton, cellulose acetate, and gums; in the production of phenolic plastics, thermosetting resins, refined petroleum oils, dyes, and varnishes; in the manufacture of pyromucic acid, vulcanized rubber, insecticides, fungicides, herbicides, germicides, furan derivatives, polymers, and other organic chemicals.

Incompatibilities: Forms explosive mixture with air. Acids and bases can cause polymerization, causing fire or explosion hazard. Reacts violently with oxidants. Incompatible with strong acids; caustics, ammonia, aliphatic amines; alkanolamines, alromatic amines; oxidizers. Attacks many plastics.

Permissible Exposure Limits in Air

OSHA PEL: 5 ppm/20 mg/m^3 TWA [skin].

NIOSH REL: None, see Appendix D.

ACGIH TLV®[1]: 2 ppm/7.9 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans; BEI: 200 mg/g creatinine, end-of-shift; Total fuoric acid in urine.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)*

DFG MAK: [skin] Carcinogen Category 3B.

Australia: TWA 2 ppm (8 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (20 mg/m^3), 1999; Belgium: TWA 2 ppm (7.9 mg/m^3), [skin], 1993; Denmark: TWA 2 ppm (7.9 mg/m^3), [skin], 1999; Finland: TWA 2 ppm (8 mg/m^3), [skin], 1999; France: VLE 2 ppm (8 mg/m^3), 1999; Japan: 2.5 ppm (9.8 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 8 mg/m^3, 2003; Norway: TWA 2 ppm (8 mg/m^3), 1999; the Philippines: TWA 5 ppm (20 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 40 mg/m^3, 1999; Russia: TWA 2.5 ppm; STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (8 mg/m^3), KTV 5 ppm (20 mg/m^3), [skin], 1999; Switzerland: MAK-W 2 ppm (8 mg/m^3), [skin], 1999; Turkey: TWA 5 ppm (20 mg/m^3), [skin], 1993; United Kingdom: TWA 2 ppm (8 mg/m^3); STEL 5 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic: MAC 2.5 ppm. Russia[35, 43] set a MAC of 0.05 mg/m^3 in ambient air of residential areas both on a momentary and on a daily average basis. Several states have set guidelines or standards for furfural in ambient air[60] ranging from 26.7 μg/m^3 (New York) to 80.0 μg/m^3 (Florida) to 160.0 μg/m^3 (Connecticut) to 190 μ/m^3 (Nevada) to 200.0 μg/m^3 (South Carolina) to 80.0−400.0 μg/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #2529 or OSHA Analytical Method 72.

Permissible Concentration in Water: Russia[35,43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation of vapor, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may cause skin irritation, causing rash and a burning sensation. Liquid and concentrated vapor are irritating to the eyes, skin, upper respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Workers chronically exposed to the vapor have had complaints of headache, fatigue, itching of the throat, lacrimation, loss of the sense of taste, numbness of the tongue, and tremor. Occupational overexposure is relatively rare due to the liquid's low vapor pressure, and symptoms usually disappear rapidly after removal from exposure.

Long Term Exposure: Eczematous dermatitis as well as skin sensitization, resulting in allergic contact dermatitis and photosensitivity, may develop following repeated exposure. The substance may have effects on the liver. Furan causes mutations. Repeated exposure may cause loss of taste, numbness of the tongue, and may cause headaches, tiredness, tremors, itchy throat, watery eyes. Long-term exposure may cause skin to sunburn more easily.

Points of Attack: Eyes, respiratory system, skin.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift. For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h:** butyl rubber (gloves, suits, boots), 4H™ and Silver Shield™ gloves; Barricade™ coated suits; CPF3™ suits, Trellchem HPS™ suits; Trychem 1000™ suits; **4 h:** PVA, Saranex™ coated suits. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *50 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or

SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Furfural must be stored to avoid contact with oxidizing materials (such as perchlorates, peroxides, chlorates, nitrates, and permanganates) and strong acids because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where furfural is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. Keep furfural out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R21/22; R23; R36/37; R40; R48/20; Safety phrases: S1/2; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Furfural alcohol is a colorless to amber liquid that darkens on exposure to light. It has a faint, burning odor. Molecular weight = 98.11; Specific gravity

(H_2O:1) = 1.13; Boiling point: 171°C; Melting point: −15°C; Vapor pressure = 6 mmHg at 25°C; Flash point = 65°C (cc); 75°C (oc); Autoignition temperature = 491°C. Explosive limits: LEL = 1.8%; UEL = 16.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Primary Irritant. Used as a starting monomer in the production of furan resins and used to produce tetrahydrofurfural alcohol (THFA).

Incompatibilities: Violent reaction with strong oxidizers. Contact with acids can cause polymerization. Strong reaction with oxidizers. Incompatible with alkaline earth and alkali metals; strong caustics; aliphatic amines; isocyanates, acetaldehyde, benzoyl peroxide; chromic acid, chromium trioxide; cyanoacetic acid; dialkylzincs, dichlorine oxide; ethylene oxide; hydrogen peroxide; isopropyl chlorocarbonate; lithium tetrahydroaluminate; nitric acid; nitrogen dioxide; pentafluoroguanidine, phosphorus pentasulfide; tangerine oil; triethylaluminum, triisobutylaluminum. Attacks some plastics, coatings, and rubber.

Permissible Exposure Limits in Air

OSHA PEL: 50 ppm/200 mg/m^3 TWA [skin].

NIOSH REL: 10 ppm/40 mg/m^3 TWA; 15 ppm/60 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 10 ppm/40 mg/m^3 TWA; 15 ppm/60 mg/m^3 STEL [skin].

NIOSH IDLH: 75 ppm.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 15 ppm

PAC-2: 15 ppm

PAC-3: 75 ppm

DFG MAK: 10 ppm/41 mg/m^3 TWA; Peak Limitation Category I(1) [skin].

Australia: TWA 10 ppm (40 mg/m^3); STEL 15 ppm, [skin], 1993; Austria: MAK 5 ppm (20 mg/m^3), 1999; Belgium: TWA 10 ppm (40 mg/m^3); STEL 15 ppm, [skin], 1993; Denmark: TWA 5 ppm (20 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (20 mg/m^3); STEL 10 ppm (40 mg/m^3), [skin], 1999; France: VME 10 ppm (40 mg/m^3), [skin], 1999; Hungary: STEL 8 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 20 mg/m^3, [skin], 2003; Norway: TWA 5 ppm (20 mg/m^3), 1999; the Philippines: TWA 50 ppm (200 mg/m^3), 1993; Russia: TWA 5 ppm; STEL 0.5 mg/m^3, [skin], 1993; Sweden: NGV 5 ppm (20 mg/m^3), KTV 10 ppm (40 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (40 mg/m^3), [skin], 1999; Turkey: TWA 50 ppm (200 mg/m^3), 1993; United Kingdom: TWA 5 ppm (20 mg/m^3); STEL 15 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm [skin].

Determination in Air: Use NIOSH Analytical Method #2505.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.28$.

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Causes tearing of the eyes, dizziness, nausea, diarrhea, diuresis, vomiting, dermatitis. High exposures may cause respiratory and body temperature depression, with a lowering of consciousness.

Long Term Exposure: Removes the skin's natural oils, causing redness and itching. May affect the central nervous system.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: NIOSH lists the following tests: expired air; pulmonary function tests. Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. **8 h:** 4H™ and Silver Shield™ gloves. Also, safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *75 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Metal containers involving the transfer of 5 gallons or more of ethyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of ethyl acetate. Store in containers that are properly labeled with health hazard information and safe handling procedures. Wherever ethyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Furfuryl alcohol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and any acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where furfuryl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever furfuryl alcohol is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a more flammable solvent.

G

Gallium G:0050

Molecular Formula: Ga
Synonyms: Elemental gallium
CAS Registry Number: 7440-55-3
RTECS® Number: LW8600000
UN/NA & ERG Number: UN2803
EC Number: 231-163-8

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Gallium is a lustrous, silvery liquid, metal or gray solid. Molecular weight = 69.72; Boiling point = 2403°C; Freezing/Melting point = 30°C. Hazard Identification (based on NFPA-704 M Rating System): (metal) Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in preparing semiconductor compounds such as gallium arsenide. Used in light-emitting diodes, batteries, microwave equipment.

Incompatibilities: Violent reaction with acids, halogens.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 10 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 250 mg/m^3

Routes of Entry: Inhalation, ingestion, skin, and/or eyes.

Harmful Effects and Symptoms

Short Term Exposure: Gallium can affect you when breathed in. Gallium is a corrosive chemical and exposure can irritate or burn the eyes, nose, and throat. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Repeated or high exposures can cause metallic taste; nausea, vomiting, skin rash and may damage the kidneys.

Long Term Exposure: May cause kidney damage. Some gallium compounds affect the nervous system. Highly irritating substances, such as gallium, may affect the lungs.

Points of Attack: Kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids. *Skin Contact:* Remove contaminated clothing. Wash contaminated skin with water. *Breathing:* Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If swallowed, do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to solid gallium, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Where there is potential for exposure to liquid gallium or high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in the pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Gallium must be stored to avoid contact with acids and halogens, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. If material or contaminated runoff enters waterways, notify downstream users of potentially

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00007-2

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gallium trichloride G:0075

Molecular Formula: Cl_3Ga

Common Formula: $GaCl_3$

Synonyms: Gallium chloride; Gallium(3 +) chloride; Gallium(III) chloride; Tricloruro de galio (Spanish)

CAS Registry Number: 13450-90-3

RTECS® Number: LW9100000

UN/NA & ERG Number: UN1759 (corrosive solids, n.o.s.)/154

EC Number: 236-610-0

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Gallium trichloride is a colorless solid which forms needle-like crystals. Acidic odor. Molecular weight = 176.03; Boiling point = 201°C; Freezing/Melting point = 77.9°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Moisture sensitive. Extremely soluble in water.

Incompatibilities: Keep away from strong oxidizers, active metals, water.

Potential Exposure: Compound Description: Mutagen. Used as a raw material in the production of metallic gallium; and in the processing of monocrystal, semiconductor compounds.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 6 mg/m^3

PAC-1: 20 mg/m^3

PAC-2: 32 mg/m^3

PAC-3: 100 mg/m^3

Routes of Entry: Inhalation, skin, eyes.

Harmful Effects and Symptoms

Short Term Exposure: May act on skin or mucous membranes. May cause rash and neuritis. Can cause respiratory center paralysis and death in animals.

Points of Attack: Skin.

Medical Surveillance: In view of the toxicity of gallium and its compounds, as shown by experiments, all persons involved in work with these substances should undergo periodic medical examinations, during which special attention should be paid to the condition of the liver, respiratory organs, and skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.[20,21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gasoline G:0100

Molecular Formula: C_5H_{12} to C_9H_{20}

Synonyms: Benzine; Essance (French); Gasolina (Spanish); Motor fuel; Motor spirits; Natural gasoline; Petrol

CAS Registry Number: 8006-61-9; 86290-81-5 [A complex combination of hydrocarbons consisting primarily of paraffins, cycloparaffins, aromatic and olefinic hydrocarbons having carbon numbers predominantly greater than C3 and boiling in the range of 30−260°C/86−500°F].

RTECS® Number: LX3300000

UN/NA & ERG Number: UN1203/128

EC Number: 232-349-1 [*Annex I Index No.:* 649-261-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1989; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (Several States).[61]

California Proposition 65 Chemical: Cancer [Unleaded gasoline (wholly vaporized)] 1/1/88; [Gasoline engine exhaust (condensates/extracts)] 10/1/90.

European/International Regulations (*8006-61-9*): Hazard Symbol: F, Xi; Risk phrases: R11; R36; R657; Safety phrases: S2; S7; S16; S24/25; S26; (*86290-81-5*): European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R46; R65; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (CAS: 86290-81-5).

Description: Gasoline is a highly flammable, mobile liquid with a characteristic odor. A complex mixture of volatile hydrocarbons (paraffins, cycloparaffins, and aromatics). Physical property values may vary depending on grade. The odor threshold is 0.25 ppm.[41] Specific gravity = 0.72−0.76 at 16°C; Boiling point = 38°C; Flash point = −45°C to −38 (depending on octane). Explosive limits: LEL = 1.4%; UE = 7.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Human Data; Primary Irritant. Gasoline is used as a fuel, diluent, and solvent throughout industry.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Incompatible with nitric acid. May accumulate static electrical charges, and may cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.5 mg/m^3 (approx.) at 25°C & 1 atm.

Presently, the composition of gasoline is so varied that a single standard for all types of gasoline is not applicable.[3] It is recommended, however, that atmospheric concentrations should be limited by the aromatic hydrocarbon content.

OSHA PEL: None.

NIOSH REL: Potential occupational carcinogen; See *NIOSH Pocket Guide*, Appendix A; [15 ppm LOQ (*The analytical limit of quantitation)], DHHS #92-100, 1992.

ACGIH TLV®[1]: 300 ppm/890 mg/m^3 TWA; 500 ppm/1480 mg/m^3 STEL; confirmed animal carcinogen with unknown relevance to humans, See *NIOSH Pocket Guide*, Appendix A.

Protective Action Criteria (PAC)*

TEEL-0: 200 ppm

PAC-1: **200** ppm

PAC-2: **1000** ppm
PAC-3: **4000** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Japan; 100 ppm (300 mg/m^3), 1999; Sweden: NGV 200 ppm (800 mg/m^3), KTV 300 ppm (1200 mg/m^3), 1993; Switzerland: MAK week 500 ppm (2000 mg/m^3), 1999; Turkey: TWA 500 ppm (2000 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 500 ppm.

Several states have set guidelines or standards for gasoline in ambient air[60] ranging from 15.0 mg/m^3 (Virginia) to 18.0 mg/m^3 (Connecticut) to 21.429 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #PV2820.

Permissible Concentration in Water: States which have set guidelines for gasoline in drinking water include Rhode Island (zero concentration) and Maine (100 μg/L).

Routes of Entry: Inhalation, percutaneous absorption.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye and skin irritation. Inhalation can cause irritation of the respiratory tract. High levels can cause headache, nausea, dizziness, irregular heartbeat, loss of coordination, seizures, coma, and possible death. *Inhalation:* Nose and throat irritation have been reported after exposure to 900 ppm for 1 h. Drowsiness, dizziness, nausea, and numbness may occur at 1000 ppm after 15 min exposure. In animal studies, death occurred after 30,000 ppm for 5 min. *Skin:* May cause itching and burning of the skin and after a longer exposure, redness and blistering. *Eyes:* Moderate irritation of the eye has been reported after 1 h exposure to 500 ppm. Mild irritation has been reported after an 8 h exposure to 140 ppm. *Ingestion:* Gasoline causes a burning sensation in the mouth, throat, and stomach. Vomiting, diarrhea, drowsiness, and intoxication may follow. As little as 3−4 oz may be fatal. Inhalation of liquid gasoline into the lungs following ingestion or vomiting may result in pulmonary edema (an accumulation of fluid in the lungs and a medical emergency that can be delayed for several hours), rapid breathing or death.

Long Term Exposure: There is evidence that gasoline can cause kidney cancer in animals. Repeated exposure can cause permanent eye damage. Prolonged contact can cause drying of the skin with cracking and rash. Repeated high exposure may damage the lungs; and/or cause brain damage. May cause kidney damage. Gasolines often contain hexane, benzene, and lead. Hexane, a component of gasoline, can produce disturbed sleep; resulting in tremors, numbness of hands and feet, and loss of muscle control. Benzene has been linked to blood disorders in humans, including leukemia. Lead additives can produce nausea, cramps, loss of appetite, sleep problems, headaches, and agitation. See also entries for *tetraethyl lead, benzene, hexane, and ethylene dibromide.*

Points of Attack: Kidneys, skin, eyes, nervous system, brain. Cancer site in animals: liver, kidney.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: urinary lead level. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If swallowed, use gastric lavage (stomach wash) followed by saline catharsis. Get medical attention. Medical observation is recommended for 24−48 h after ingestion, as pulmonary edema may be delayed.

Personal Protective Methods: Barrier creams and impervious gloves. Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h:** nitrile rubber gloves, suits, boots; Viton™ gloves, suits; Barricade™ coated suits; **4 h:** polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash, protective clothing, masks in heavy exposure to vapors.

Respirator Selection: Where there is potential for exposure over 300 ppm, use a NIOSH/MSHA- or European Standard EN149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained

on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Sources of ignition, such as smoking and open flames, are prohibited where gasoline is handled, used, or stored. Metal containers involving the transfer of 1 gallon or more of gasoline should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of gasoline. Wherever gasoline is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Alternatively, gasoline vapors may be recovered from fuel transfer operations by various techniques.

Germanium G:0110

Molecular Formula: Ge

Synonyms: Elemental germanium; Germanium element

CAS Registry Number: 7440-56-4

RTECS® Number: LY5200000 (powder)

UN/NA & ERG Number: UN3089 (metal powder, flammable, n.o.s.)/170; UN1759 (corrosive solid, n.o.s.)/154

EC Number: 231-164-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Germanium is a grayish-white, lustrous, brittle metalloid. The powder is grayish black and odorless. It is never found free and occurs most commonly in argyrodite and germanite. It is generally recovered as a by-product in zinc production, coal processing, or other sources. Molecular weight = 72.59; Boiling point = 2700°C; Melting/Freezing point = 937°C; Specific gravity/density = 5.350 g/cm^3. Insoluble in water.

Potential Exposure: Because of its semiconductor properties, germanium is widely used in the electronic industry in rectifiers, diodes, and transistors. It is alloyed with aluminum, aluminum−magnesium, antimony, bronze, and tin to increase strength, hardness, or corrosion resistance. In the process of alloying germanium and arsenic, arsine may be released; stibine is released from the alloying of germanium and antimony. Germanium is also used in the manufacture of optical glass for infrared applications; red-fluorescing phosphors; and cathodes for electronic valves; and in electroplating; in the hydrogenation of coal; and as a catalyst, particularly at low temperatures. Certain compounds are used medically. Industrial exposures to the dust and fumes of the metal or oxide generally occur during separation and purification of germanium, welding, multiple-zone melting operations; or cutting and grinding of crystals. Germanium tetrahydride (germanium hydride, germane, monogermane) and other hydrides are produced by the action of a reducing acid on a germanium alloy.

Incompatibilities: A strong reducing agent and flammable solid. Finely divided metal is incompatible with oxidizing and nonoxidizing acids, ammonia, bromine, oxidizers, aqua regia, sulfuric acid, carbonates, halogens, nitrates. Explosive reaction or ignition with potassium chlorate, potassium nitrate, chlorine, bromine, oxygen, potassium hydroxide, in the presence of heat. Violent reaction with nitric acid.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.0125 mg/m^3
PAC-1: 0.035 mg/m^3
PAC-2: 0.25 mg/m^3
PAC-3: 500 mg/m^3
Russia[43] set a MAC of 2 mg/m^3 in work-place air.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 8 μg/L based on health effects.

Determination in Water: Germanium may be determined by atomic absorption spectroscopy, emission spectrography, and spectrophotometry with phenylfluorone.

Routes of Entry: Inhalation of gas, vapor, fume, or dust.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of germanium exposure[24] include low temperature, languor, diarrhea, cyanosis, extreme depression of heart and breath, edema, lung hemorrhage, hemorrhage from the small intestinal wall, peritoneal extravasation. The dust of germanium dioxide is irritating to the eyes. Germanium tetrachloride causes irritation of the skin. Germanium tetrachloride is an upper respiratory tract irritant and may cause bronchitis and pneumonitis.

Long Term Exposure: Prolonged exposure to high-level concentrations may result in damage to the liver, kidney, and other organs.

Medical Surveillance: Consider respiratory, liver, and kidney disease in any placement or periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and other incompatibles listed above.

Shipping: Metal powder, flammable, n.o.s. require a label of "SPONTANEOUSLY COMBUSTIBLE." They fall in Hazard Class 4.2 and Packing Group III. Corrosive metals require a shipping label of "CORROSIVE."

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and return to suppliers for reprocessing is preferable.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Germane is a colorless, flammable gas. Molecular weight = 76.62; Specific gravity (H_2O:1) = 1.52; Boiling point = − 88.4°C; Decomposes at 350°C. Freezing/Melting point = − 166.1°C; Relative vapor density (air = 1) = 2.65; Vapor pressure = >1 atm at 25°C; Autoig-nition temperature = <85°C. Flammable Limits in air: pyrophoric. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: This material is used as a doping agent in solid state electronic component manufacture.

Incompatibilities: Pyrophoric; may ignite spontaneously in air. Reacts explosively with bromine. Attacks hydrocarbon and fluorocarbon lubricants.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.13 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.2 ppm/0.6 mg/m^3 TWA.

ACGIH TLV®[1]: 0.2 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.17 ppm

PAC-1: 0.17 ppm

PAC-2: **0.17** ppm

PAC-3: **0.50** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.2 ppm (0.6 mg/m^3), 1993; Belgium: TWA 0.2 ppm (0.63 mg/m^3), 1993; Denmark: TWA 0.2 ppm (0.6 mg/m^3), 1999; Finland: STEL 0.2 ppm (0.6 mg/m^3), 1999; France: VME 0.2 ppm (0.6 mg/m^3), 1999; the Netherlands: MAC-TGG 0.6 mg/m^3, 2003; Norway: TWA 0.2 ppm (0.6 mg/m^3), 1999; Russia: STEL 5 mg/m^3, 1993; United Kingdom: TWA 0.2 ppm (0.64 mg/m^3); STEL 0.6 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 ppm. Several states have set guidelines or standards for germane in ambient air[60] ranging from 6.0 μg/m^3 (North Dakota) to 10.0 μ/m^3 (Virginia) to 12.0 μg/m^3 *(*Connecticut) to 14.0 μ/m^3 (Nevada).

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause headache, giddiness, fainting, nausea, vomiting. Data on toxicity are limited but ACGIH reports that it is between ten hydride (stannone) and arcine in toxicity. Germanium tetrahydride is a toxic hemolytic gas capable of producing kidney damage. This effect is similar to that of arsine and stibine (antimony hydride). One-hour exposure tests on animals yielded the following results: animal rabbit, concentration 100 ppm, effect survived; animal mouse, concentration 150 ppm, effect fatal; animal mouse, concentration 185 ppm, effect fatal; animal guinea pig, concentration 150 ppm, effect sickened; animal guinea pig, concentration 185 ppm, effect fatal. The TWA value was set on the rather arbitrary basis that germane can be considered half as toxic as stibine.[53]

Long Term Exposure: May cause kidney injury. Hemolytic effects.

Points of Attack: Central nervous system, kidneys, blood.

Medical Surveillance: Workers exposed to germane should undergo periodic physical examinations.[30] Kidney function tests. Complete blood count (CBC). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool (below 50°C), well-ventilated area away from bromine. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "POISON GAS, FLAMMABLE GAS." It falls in Hazard Class (Poison A) 2.3.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.8/2.8

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Glucose G:0123

Molecular Formula: $C_6H_{12}O_6$

Synonyms: Corn Sugar; Dextropur; Dextrose, anhydrous; Dextrosol; Glucolin; D-Glucose, anhydrous; D(+)-Glucose; Grape Sugar

CAS Registry Number: 50-99-7

RTECS®Number: LZ6600000

UN/NA & ERG Number: Not regulated.

EC Number: 200-075-1

Regulatory Authority and Advisory Bodies

Listed on the TSCA inventory.

Canada: listed on DSL List; no WHMIS listing.

European/International Regulations: Hazard Symbol: None; Risk phrases: None; Safety phrases: S24/25 (see Appendix 4).

WGK (German Aquatic Class): No value assigned.

Description: A white crystalline solid or granular powder. Odorless. Molecular weight = 180.16; 180.08; Specific Gravity (water = 1) = 1.56; 1.2 at 20°C (estimate)[USCG]; Boiling Point: >100°C at 760.0 mmHg [USCG]; Freezing/Melting Point: 146°C; Refractive index = 1.51 at 142°C; Autoignition temperature = 500°C; Hazard Identification (based on NFPA-704 M Rating System): Health 0; Flammability 1; Reactivity 0. Freely soluble in water.

Potential Exposure: NIOSH compound descriptor: Tumorigen; Mutagen; Reproductive Effector; Human Data. Most dietary carbohydrates contain glucose. Used as a fluid and nutrient replenisher. A precursor to Vitamin C to make other chemicals.

Incompatibilities: Dust may form explosive mixture with air. Dextrose is a weak reducing material; keep away from strong oxidizers, strong acids, halogenated agents, nitrates, and permanganates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.4 mg/m^3
PAC-1: 1.25 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 500 mg/m^3

Determination in Air: No method available from NIOSH or OSHA.

Determination in Water: Ecotoxicity: Log $K_{ow} = -3.26$.

Routes of Entry: Eyes, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Dust may cause skin, eye, or respiratory tract irritation. With a low pH (about 5.8−6.0), may cause eye and skin irritation; respiratory and digestive tract irritation. LD_{50} = (oral, rat) 25,800 mg/kg, low toxicity.

Long Term Exposure: No chronic symptoms found.

First Aid: *Ingestion*: Get medical aid. Do NOT induce vomiting. If conscious and alert, rinse mouth and drink 2−4 cupfuls of milk or water. Get medical aid if irritation or other symptoms occur. *Inhalation:* Remove from exposure to fresh air immediately. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical aid if cough or other symptoms appear. *Skin*: Get medical aid if irritation develops or persists. Wash clothing before reuse. Flush skin with plenty of soap and water. *Eyes*: Gently lift eyelids and flush continuously with water. If irritation develops, get medical aid.

Personal Protective Methods: *Eyes*: Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166. *Skin*: Protective garments not normally required. *Clothing:* Protective garments not normally required.

Respirator Selection: A respiratory protection program that meets OSHA's 29 CFR 1910.134 and ANSI Z88.2 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use.

Storage: Color Code—Green: General storage may be used. Store in a cool, dry, well-ventilated area away from strong oxidizers, strong acids.

Shipping: Not regulated.

Spill Handling: Provide adequate ventilation. Avoid generating dust. Vacuum or sweep up material and place into a suitable disposal container. Clean up spills immediately, using the appropriate protective equipment.

Fire Extinguishing: Thermal decomposition products include carbon dioxide, carbon monoxide, and irritating and toxic fumes and/or gases. For any fire, wear a self-contained breathing apparatus (SCBA) in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Dusts at sufficient concentrations can form explosive mixtures with air. On fire use water spray, dry chemical, carbon dioxide, or appropriate foam.

α(D+) Glucose G:0123

Molecular Formula: $C_6H_{12}O_6$

Synonyms: Dextrose; alpha-Dextrose; Dextrosum; α-D-Glucopyranose; Glucose; Glucose (α-anomer); Glucose, alpha-D-; α-D(+)-Glucose, anhydrous; Glucosum

CAS Registry Number: 492-62-6 (α-anomer); 492-61-5 (β-anomer)

RTECS®Number: LZ6600000

UN/NA & ERG Number: Not regulated.

EC Number: 207-757-8

Regulatory Authority and Advisory Bodies

Canada: listed on DSL List; no WHMIS listing.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R36/37/38; Safety phrases: S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Class): 3—Severe hazard to waters.

Description: (CAS: 492-62-6) A white crystalline solid or granular powder. Odorless. Molecular weight = 180.1572; Density = 1.54 g/cm^3; Freezing/Melting Point: 153−156°C; Hazard Identification (based on NFPA-704 M Rating System): Health 0; Flammability 0; Reactivity 0. Soluble in water; solubility 0.13 g/mL; 91 g/100 mL at 25°C. Little information can be found for the beta-anomer but its description is probably similar.

Potential Exposure: Reagent; used as a research and development chemical; for making antibiotics and other cell culture.

Incompatibilities: Dust may form explosive mixture with air. α-Dextrose is a weak reducing material; keep away from strong oxidizers, strong acids, halogenated agents, nitrates, permanganates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.4 mg/m^3
PAC-1: 1.25 mg/m^3
PAC-2: 7.5 mg/m^3
PAC-3: 500 mg/m^3

Determination in Air: No method available from NIOSH or OSHA.

Routes of Entry: Eyes, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Dust may cause skin, eye, or respiratory tract irritation. May cause eye and skin irritation; respiratory and digestive tract irritation. LD_{50} = (oral, rat) Oral, rat >90 mL/kg.

Long Term Exposure: No chronic symptoms found.

First Aid: *Ingestion*: Get medical aid. Do NOT induce vomiting. If conscious and alert, rinse mouth and drink 2–4 cupfuls of milk or water. Get medical aid if irritation or other symptoms occur. *Inhalation:* Remove from exposure to fresh air immediately. If not breathing, give artificial respiration. If breathing is difficult, give oxygen. Get medical aid if cough or other symptoms appear. *Skin*: Get medical aid if irritation develops or persists. Wash clothing before reuse. Flush skin with plenty of soap and water. *Eyes*: Gently lift eyelids and flush continuously with water. If irritation develops, get medical aid.

Personal Protective Methods: *Eyes*: Wear appropriate protective eyeglasses or chemical safety goggles as described by OSHA's eye and face protection regulations in 29 CFR 1910.133 or European Standard EN166. *Skin*: Protective garments not normally required. *Clothing:* Protective garments not normally required.

Respirator Selection: A respiratory protection program that meets OSHA's 29 CFR 1910.134 and ANSI Z88.2 requirements or European Standard EN 149 must be followed whenever workplace conditions warrant a respirator's use.

Storage: Color Code—Green: General storage may be used. Store in a cool, dry, well-ventilated area away from strong oxidizers, strong acids.

Shipping: Not regulated.

Spill Handling: Provide adequate ventilation. Avoid generating dust. Vacuum or sweep up material and place into a suitable disposal container. Clean up spills immediately, using the appropriate protective equipment.

Fire Extinguishing: Thermal decomposition products include carbon dioxide, carbon monoxide, and irritating and toxic fumes and/or gases. For any fire, wear a self-contained breathing apparatus (SCBA) in pressure-demand, MSHA/NIOSH (approved or equivalent), and full protective gear. Dusts at sufficient concentrations can form explosive mixtures with air. On fire use water spray, dry chemical, carbon dioxide, or appropriate foam.

Disposal Method Suggested: Contact a licensed professional waste disposal service to dispose of this material. Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Glucose oxidase G:0130

Synonyms: Deoxin-1; E.C. 1.1.3.4; Glucose aerodehydrogenase; β-D-Glucose oxidase; Microcide; Notatin; Orylophyline; Oxidase glucose; Penatin

CAS Registry Number: 9001-37-0

RTECS® Number: RQ8452000

EC Number: 232-601-0

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Glucose Oxidase takes the form of amorphous powder or crystals. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Glucose Oxidase is used as a food preservative, as a stabilizer for vitamins and in laboratories.

Permissible Exposure Limits in Air

No standards or TEEL available.

Harmful Effects and Symptoms

Short Term Exposure: Glucose oxidase can affect you when breathed in.

Long Term Exposure: Exposure can cause an asthma-like lung allergy. Once allergy develops, even very small future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and chest tightness. Allergy symptoms can also resemble hay fever, with itching eyes, sneezing, and watery or stuffy nose.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to Glucose oxidase, use a NIOSH/MSHA- or European Standard EN149-approved respirator with a high-efficiency particulate filter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Glucose oxidase should be stored in a freezer.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use extinguishing agent suitable for surrounding fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Glutaraldehyde G:0140

Molecular Formula: $C_5H_8O_2$

Common Formula: $HCO(CH_2)_3CHO$

Synonyms: Cidex; Cudex; 1,3-Diformal propane; Glutamic dialdehyde; Glutaral; Glutard dialdehyde; Glutaric acid dialdehyde; Glutaric dialdehyde; NCI-C55425; 1,5-Pentanedial; Pentanedial; 1,5-Pentanedione; Potentiated acid glutaraldehyde; Sonacide

CAS Registry Number: 111-30-8

RTECS® Number: MA2450000

UN/NA & ERG Number: UN2810/Guide 153

EC Number: 203-856-5 [*Annex I Index No.:* 605-022-00-X]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat.

US EPA Gene-Tox Program, Negative: CHO gene mutation.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/25; R34; R42/43; R50; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Glutaraldehyde is a colorless liquid with a pungent odor, which readily changes to a glossy polymer. The odor threshold is 0.04 ppm (NY) and 0.2 ppm (NJ). Molecular weight = 100.13; Specific gravity (H_2O:1) = 1.10; Boiling point = 100°C; also reported at 187−189°C (decomposes); Freezing/Melting point = − 13.8°C; Vapor pressure = 17 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Glutaraldehyde is used in leather tanning; in embalming fluids; as a germicide; as a cross-linking agent for protein and polyhydroxy materials; as a fixative for tissues; as an intermediate. Buffered solutions are used as antimicrobial agents in hospitals.

Incompatibilities: Water contact forms a polymer solution. A strong reducing agent. Incompatible with strong acids, caustics, ammonia, amines, strong oxidizers. *Note:* Alkaline solutions of glutaraldehyde (i.e., activated glutaraldehyde) react with alcohol, ketones, amines, hydrazines, and proteins.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.09 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.2 ppm/0.8 mg/m^3 Ceiling Concentration.

Note: NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112]; See *NIOSH Pocket Guide*, Appendix C.

ACGIH TLV®[1]: 0.05 ppm/0.2 mg/m^3 Ceiling Concentration, sensitizer, not classifiable as a human carcinogen.

Protective Action Criteria (PAC)*

TEEL-0: 0.05 ppm

PAC-1: 0.2 ppm

PAC-2: **1** ppm

PAC-3: **5** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.05 ppm/0.21 mg/m^3 TWA; Peak Limitation Category I(2) a momentary value of 0.2 mL/m^3/0.83 mg/m^3

should not be exceeded; danger of skin and airway sensitization; Carcinogen Category 4; Pregnancy Risk Group C. Australia: TWA 0.2 ppm (0.7 mg/m^3), 1993; Austria: MAK 0.2 ppm (0.8 mg/m^3), 1999; Belgium: TWA 0.2 mg/m^3; STEL 0.82 mg/m^3, 1993; Denmark: TWA 0.2 ppm (0.8 mg/m^3), 1999; Finland: ceiling 0.1 ppm, 1999; France: VLE 0.2 ppm (0.8 mg/m^3), 1999; the Netherlands: MAC 0.25 mg/m^3, 2003; Norway: TWA 0.2 ppm (0.8 mg/m^3), 1999; Russia: STEL 5 mg/m^3, 1993; Sweden: STEL 0.2 ppm (0.8 mg/m^3), [skin], 1999; Switzerland: MAK-W 0.2 ppm (0.8 mg/m^3), KZG-W 0.4 ppm (1.6 mg/m^3), 1999; United Kingdom: TWA 0.05 ppm (0.2 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.05 ppm (sensitizer). Several states have set guidelines or standards for glutaraldehyde in ambient air[60] ranging from 6.0 $\mu g/m^3$ (Virginia) to 7.0 $\mu g/m^3$ (North Dakota) to 14.0 $\mu g/m^3$ (Connecticut) to 17.0 $\mu g/m^3$ (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2532 or OSHA Analytical Method 64.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.22$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Can be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* 0.3 ppm can cause nose and throat irritation. 0.4 ppm has caused headaches. 0.5 ppm has been described as intolerably irritating. *Skin:* Can cause irritation. Contact with a 5% solution can sensitize the skin and cause an allergic response to subsequent contact of much lower concentrations. *Eyes:* Vapors of a 2% solution (0.4 ppm) have produced irritation. *Ingestion:* Can cause irritation of the mouth and stomach. The LD_{50} oral rat is 134 mg/kg (moderately toxic).

Long Term Exposure: Repeated or prolonged contact with skin may cause chemical sensitization, skin allergy, and asthma. Exposure may cause liver and nervous system damage. Glutaraldehyde may cause mutations, handle with extreme caution. Testing has not been completed to determine the carcinogenicity of glutaraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system, liver, nervous system.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: liver function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h:** butyl rubber gloves, suits, boots; Viton™ gloves, suits; **4 h:** natural rubber gloves; Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; polyvinyl chloride gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.2 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved respirator with an organic vapor cartridge/canister and a dust/mist/fume prefilter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, caustics, ammonia, amines, oxidizers.

Shipping: Glutaraldehyde fits the shipping name of Toxic, liquids, organic, n.o.s. It requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls into Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Glutaraldehyde itself does not burn. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 200-289-5

Regulatory Authority and Advisory Bodies

FDA—over-the-counter and proprietary drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Glycerol is a viscous colorless or pale yellow, odorless, syrupy liquid. Molecular weight = 92.11; Specific gravity (H_2O:1) = 1.26; Boiling point = (decomposes) 290°C; Freezing/Melting point = 17.8°C; Vapor pressure = 0.003 mmHg at 50°C; Flash point = 160°C; also listed at 177°C (oc). Autoignition temperature = 370°C. Explosive limits: LEL = 0.9%; UEL = Unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Glycerol is used as a humectant in tobacco; it is used in cosmetics, antifreezes, and inks. It is used as a fiber lubricant. It is used as a raw material for alkyd resins and in explosives manufacture.

Incompatibilities: Able to polymerize above 300°F/150°C. Incompatible with acetic anhydrides (especially in the presence of a catalyst), strong acids, caustics, aliphatic amines, isocyanates. Strong oxidizers (e.g., chromium trioxide, potassium chlorate, potassium permanganate) can cause fire and explosion hazard. Hygroscopic (i.e., absorbs moisture from the air). Decomposes when heated, producing corrosive gas of acrolein.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 (total dust); 5 mg/m^3, respirable fraction, TWA.

NIOSH REL: None, see Appendix D.

ACGIH TLV®[1]: 10 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 50 mg/m^3, inhalable fraction of the aerosol; Peak Limitation Category I(2); Pregnancy Risk Group C.

Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Finland: TWA 20 mg/m^3, 1999; France: VME

10 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; United Kingdom: TWA 10 mg/m^3, mist, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3. Several states have set guidelines or standards for glycerol in ambient air[60] ranging from 3.0 μg/m^3 (Virginia) to 200.0 μ/m^3 (Florida and New York) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #0500 for total nuisance dust and #0600 for respirable nuisance dust.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = -1.8$.

Harmful Effects and Symptoms

Short Term Exposure: Glycerin can be irritating to the eyes, skin, and respiratory tract. When swallowed, it can cause insomnia, nausea, vomiting, diarrhea, fever, hemoglobinuria, convulsions, and paralysis. Toxic in high concentrations; it is somewhat dehydrating and irritating to exposed tissues. Symptoms include headache, dizziness, insomnia, nausea, vomiting, diarrhea, fever, elevated blood sugar, and diabetic coma; very large doses may cause irritation and dehydration of tissues, hemolysis, renal failure, hemoglobinuria, convulsions, and paralysis.

Long Term Exposure: May cause kidney damage.

Points of Attack: Eyes, skin, respiratory system, kidneys.

Medical Surveillance: Kidney function tests.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20–30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: Prevent skin contact. **8 h:** natural rubber gloves, Neoprene™ rubber gloves, suits, boots; nitrile rubber gloves, suits, boots; **4 h:** 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous and corrosive gases, including acrolein, are produced in fire. Use dry chemical, carbon dioxide, water fog, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank

discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mixture with a more flammable solvent followed by incineration.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, animal Sufficient Evidence, *probably carcinogenic to humans*, Group 2A, 2000; NTP: Reasonably anticipated to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R455; R60; R21/22; R23; R36/37/38; R68; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Glycidol is a colorless liquid. Molecular weight = 74.09; Specific gravity (H_2O:1) = 1.1; Boiling point = (decomposes) 166°C; Freezing/Melting point = −45°C; Vapor pressure = 0.9 mmHg at 20°C; Flash point = 72°C (cc); Autoignition temperature = 415°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Glycidol is used as an intermediate in the synthesis of glycerol, glycidyl ethers, esters, and amines.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers, nitrates. Decomposes on contact (especially in the presence of heat) with strong acids, strong bases, water, metal salts (e.g., aluminum chloride, ferric chloride, tin chloride), or metals (copper, zinc), causing fire and explosion hazard. Contact with barium, lithium, sodium, magnesium, titanium may cause polymerization. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.03 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/150 mg/m^3 TWA.

NIOSH REL: 25 ppm/75 mg/m^3 TWA.

ACGIH TLV®[1]: 2 ppm/6.1 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 150 ppm.

Protective Action Criteria (PAC)

TEEL-0: 2 ppm

PAC-1: 4 ppm

PAC-2: 30 ppm

PAC-3: 150 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 25 ppm (75 mg/m^3), 1993; Austria: MAK 50 ppm (150 mg/m^3), 1999; Belgium: TWA 25 ppm (76 mg/m^3), 1993; Denmark: TWA 0.2 ppm (1 mg/m^3), 1999; Finland: TWA 50 ppm (150 mg/m^3); STEL 75 ppm (225 mg/m^3) [skin] 1999; France: VME 25 ppm (75 mg/m^3), 1999; Norway: TWA 25 ppm (75 mg/m^3), 1999; the Philippines: TWA 50 ppm (150 mg/m^3), 1993; Russia: STEL 5 mg/m^3, 1993; Sweden: NGV 25 ppm (75 mg/m^3), KTV 50 ppm (150 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (75 mg/m^3), KZG-W 50 ppm (150 mg/m^3), 1999; Turkey: TWA 50 ppm (150 mg/m^3), 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for glycidol in ambient air[6] ranging from 750−3000 μg/m^3 (North Dakota) to 1300 μg/m^3 (Virginia) to 1500 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH Analytical Method (IV) #1608[18] or OSHA Analytical Method 7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Glycidol affects you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Vapor exposure can damage vision. Exposure can irritate the eyes, nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High levels can cause you to feel dizzy, lightheaded, confused, excited, to pass out, and even die. May affect the central nervous system.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. It can irritate the lungs; bronchitis may develop. May cause personality changes; depression, anxiety, or irritability. Possibly carcinogenic to humans. Because this is a mutagen, handle it as a possible carcinogen, with extreme caution. May cause sterility in males. Based on animal tests, this substance may have toxic effects on human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system. Cancer site in animals: stomach, brain, and breast.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Examination of the eyes and vision.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 150 ppm:* Sa* (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Glycidol must be stored to avoid contact with strong oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Store in tightly closed containers in a cool, well-ventilated area away from heat. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Glycidol fits the shipping name of Toxic, liquids, organic, n.o.s. It requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls into Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Acrid smoke and Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Concentrated waste containing no peroxides:* discharge liquid at a controlled rate near a pilot flame. *Concentrated waste containing peroxides:* perforation of a container of the waste from a safe distance followed by open burning.

Glycidylaldehyde G:0170

Molecular Formula: $C_3H_4O_2$

Common Formula: $CH_2-(O)-CH-CHO$

Synonyms: Epihydrinaldehyde; Epihydrine aldehyde; 2,3-Epoxy-1-propanal; 2,3-Epoxypropanal; 2,3-Epoxypropionaldehyde; Glycidal; Glycidaldehyde; Oxiranecarboxaldehyde

CAS Registry Number: 765-34-4

RTECS® Number: MB3150000

UN/NA & ERG Number: UN2622/131P

EC Number: 212-143-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: Carcinogenicity: Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U126.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Cancer 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Glycidylaldehyde is a colorless liquid with a pungent, aldehyde-like odor. Molecular weight = 72.07; Boiling point = 112−113°C; Freezing/Melting point = −62°C; Flash point = 31°C. Hazard Identification [NJDHSS]: Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: This material has been used in the finishing of wool and the tanning of leather and surgical sutures in the United Kingdom. It has been tested as a disinfectant.

Incompatibilities: Glycidaldehyde may undergo violent polymerization when subjected to heat, strong sunlight, or contamination. Contact with oxidizers may cause a fire and explosion hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.025 ppm

PAC-1: 0.075 ppm

PAC-2: 0.5 ppm

PAC-3: 40 ppm

Several states have set guidelines or standards for glycidylaldehyde in ambient air[60] ranging from zero (Nevada) to 0.03 μg/m^3 (New York) to 75.0 μg/m^3 (South Carolina).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May be fatal if inhaled, ingested, or absorbed through the skin. Contact can cause severe skin and eye irritation and burns with possible permanent eye damage. Skin burns can be slow healing, followed by pigmentation. Inhalation can cause respiratory tract irritation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May be a carcinogen in humans. May cause skin sensitization and allergy. May cause liver and kidney damage. May affect the nervous system. Can cause lung irritation and bronchitis.

Points of Attack: Eyes, skin, liver, kidneys, nervous system, lungs, mucous membranes.

Medical Surveillance: Liver and kidney function tests. Examination of the nervous system. Evaluation by a qualified allergist. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. *Gloves:* Butyl, PVC, and Silver Shield®/4H®, (4-h breakthrough for aldehydes); *Coveralls:* DuPont Tychem® BR, LV, Responder®, and TK; Kappler® Zytron® 500; and Saint-Gobain ONE Suit® TEC (>8-h breakthrough for aliphatic aldehydes). Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, nitrates, heat, and flames. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use water spray to reduce vapors. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, water spray, fog, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

UN/NA & ERG Number: UN2783 (organophosphorus pesticides, solid, toxic)/152

EC Number: 213-997-4 [*Annex I Index No.*: 607-315-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

NTP: Toxicity studies, Report #TOX-16, October 2000.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R41; R51/53; Safety phrases: S2; S26; S39; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Glyphosate, an organophosphate, is a colorless crystalline powder. Often used as a liquid in a carrier solvent which may change physical and toxicological properties. Molecular weight = 169.09; Freezing/Melting point = (decomposes) 230°C. Soluble in water; solubility = 1.2% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Those involved in the manufacture, formulation, and application of this nonselective, nonresidual preemergence herbicide. Has wide residential use in the United States for the control of weeds.

Incompatibilities: Solutions are corrosive to iron, unlined steel, and galvanized steel, forming a highly combustible or explosive gas mixture. *Do not* store glyphosate in containers made from these materials.

Permissible Exposure Limits in Air: No OELs have been established in the United States for this chemical. Russia has set a ceiling value of 1.5 mg/m^3 in work-place air.[35,43]

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: The US EPA has developed data on Glyphosate including a no-observed-adverse-effects-level (NOAEL) of 10 mg/kg/day. This corresponds to a drinking water equivalent level of 3.5 mg/L from which a lifetime health advisory of 0.7 mg/L was derived. California[61] has set a guideline of 0.5 mg/L for drinking water.

Determination in Water: Analysis of glyphosate is by a high-performance liquid chromatographic (HPLC) method. Human Tox = 700.00000 pbb (VERY LOW). Octanol–water coefficient: Log $K_{ow} = -0.9$.

Routes of Entry: Inhalation, ingestion, through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure to high levels can cause nausea, vomiting, diarrhea, decreased blood pressure, and convulsions. High exposures can cause arrhythmia and possible death. The acute LD_{50} oral for rats is 5600 mg/kg (insignificantly toxic). Human Tox = 700.00000 ppb (Very Low).

Long Term Exposure: May cause liver and kidney damage. It does not seem to exhibit reproductive effects, mutagenicity, or carcinogenicity in animal studies.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase, liver, kidney, heart.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Liver and kidney function tests. Special 24-h EKG (Holter monitor) for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers

Shipping: This is an Organic phosphorus compound, solid, toxic requiring a "POISONOUS/TOXIC MATERIALS" label. It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Solid glyphosate may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Grain dust (oat, wheat, and barley) G:0190

Synonyms: None.

RTECS® Number: MD7900000

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Description: Oats, barley, or wheat dust containing microbial flora and fauna. Grain dust consists of 60−75% organic materials (cereal grains) and 25−40% inorganic materials (soil); and includes fertilizers, pesticides, and microorganism.

Potential Exposure: Grain elevator workers, grain harvesters.

Permissible Exposure Limits in Air

OSHA PEL: 10 mg/m^3 TWA.

NIOSH REL: 4 mg/m^3 TWA.

ACGIH TLV®[1]: 4 mg/m^3 for particulate matter containing no asbestos and $<1\%$ crystalline silica.

No TEEL available.

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, upper respiratory system. Can cause coughing, wheezing.

Long Term Exposure: Impaired lung function, chronic bronchitis; both immediate and delayed asthmatic reactions; grain fever upon exposure to dust concentrations in excess of 15 mg/m^3.[53]

Points of Attack: Respiratory system.

Medical Surveillance: Lung function tests.

First Aid: If this material gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Dust respirator required.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may be a combustible solid depending on specific components of the grain dust including fertilizers, pesticides, and microorganisms. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases may be produced in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Graphite G:0200

Molecular Formula: C

Synonyms: Black lead; Mineral carbon; Plumbago; Silver graphite; Stove black

synthetic: Acheson graphite; Artificial graphite

CAS Registry Number: 7782-42-5 (graphite, natural); 7440-44-0 (carbon, graphite, synthetic); 16291-96-6 (synthetic graphite)

RTECS® Number: MD9659600 (carbon, graphite, natural); FF5250100 (carbon, graphite, synthetic)

UN/NA & ERG Number: Not regulated

EC Number: 231-955-3 (graphite, natural); 231-153-3 (carbon); 240-383-3 (charcoal or synthetic graphite)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Graphite is crystallized carbon and usually appears as soft, black scales. There are two types of graphite, natural and artificial (activated). Natural and synthetic graphite may be mixed with each other or contain other additives. Molecular weight = 12.01; Specific gravity = 2.0−2.25 (natural); 1.5−1.8 (synthetic); Sublimation point = 3652°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Natural graphite is used in foundry facings, steel making lubricants, refractories, crucibles, pencil "lead," paints, pigments, and stove polish. Artificial graphite may be substituted for these uses with the exception of clay crucibles; other types of crucibles may be produced from artificial graphite. Additionally, it may be used as a high temperature lubricant or for electrodes. It is utilized in the electrical industry in electrodes, brushes, contacts, and electronic tube rectifier elements; as a constituent in lubricating oils and greases; to treat friction elements, such as brake linings; to prevent molds from sticking together; and in moderators in nuclear reactors. In addition, concerns have been expressed about synthetic graphite in fibrous form. Those exposed are involved in the production of graphite fibers from pitch or acrylonitrile fibers and the manufacture and use of composites of plastics, metals, or ceramics reinforced with graphite fibers.

Incompatibilities: Graphite is a strong reducing agent and reacts violently with oxidizers, such as fluorine, chlorine trifluoride, potassium peroxide. Forms an explosive mixture with air. May be spontaneously combustible in air.

Permissible Exposure Limits in Air

Graphite, natural

OSHA PEL: 15 mppcf, respirable fraction (based on impinger samples counted by light field techniques) TWA.

NIOSH REL: 2.5 mg/m^3, respirable dust TWA.

ACGIH TLV®[1]: (all forms except graphic fibers) 2 mg/m^3, respirable fraction TWA.

Graphite, synthetic

OSHA PEL: 15 ppm total dust/5 mg/m^3, respirable fraction TWA.

ACGIH TLV®[1]: (all forms except graphic fibers) 2 mg/m^3, respirable fraction TWA.

NIOSH IDLH: 1250 mg/m^3.

Protective Action Criteria (PAC)

Natural and synthetic

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1.5 mg/m^3, respirable fraction; 4 mg/m^3, inhalable fraction; Pregnancy Risk Group C.

Australia: TWA 10 mg/m^3, 1993; Australia: TWA 2.5 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Belgium: TWA 2.5 mg/m^3, 1993; Finland: TWA 5 mg/m^3, 1999; France: VME 2 mg/m^3, 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Sweden: NGV 5 mg/m^3 (*dust*), 1999; Switzerland: MAK-W 2.5 mg/m^3, 1999; United Kingdom: LTEL 5 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®[1]: TWA 2 mg/m^3, respirable fraction.

Determination in Air: Use NIOSH Analytical Methods #0500 or #0600.

Routes of Entry: Inhalation of dust, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Causes upper respiratory irritation.

Long Term Exposure: Lungs may be affected by repeated or prolonged exposure to dusts, resulting in graphite pneumoconiosis. Exposure to natural graphite may produce a progressive and disabling pneumoconiosis similar to anthracosilicosis. Symptoms include headache, coughing, depression, decreased appetite, dyspnea, and the production of black sputum. Some individuals may be asymptomatic for many years then suddenly become disabled. It has not yet been determined whether the free crystalline silica in graphite is solely responsible for development of the disease. There is evidence that artificial graphite may be capable of producing pneumoconiosis.

Points of Attack: Respiratory system, lungs, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash

Respirator Selection: NIOSH: (natural) *Up to 12.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. *62.5 mg/m^3*: PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *1250* mg/m^3: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Carbon (graphite) fibers are difficult to dispose of by incineration. Waste fibers should be packaged and disposed of in a landfill authorized for the disposal of special wastes of this nature, or as otherwise may be required by law. Do not incinerate.

Gum Arabic G:0210

Molecular Formula: None listed.
Synonyms: Acacia; Acacia dealbata gum; Acacia gum; Acacia Senegal; Acacia syrup; Arabic gum; Australian gum; Gum acacia; Gum ovaline; Gum Senegal; Indian gum; NCI-C50748; Senegal gum; Starsol No. 1; Wattle gum
CAS Registry Number: 9000-01-5
RTECS® Number: CE5945000
UN/NA & ERG Number: Not regulated.
EC Number: 232-519-5
Regulatory Authority and Advisory Bodies
WGK (German Aquatic Hazard Class): No value assigned.
Description: Gum arabic is a white or yellowish solid. It has a molecular weight of about 240,000 but no clearly defined structure.[52] It is an exudate from acacia trees. A combustible solid when present as a dust. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0.
Potential Exposure: Compound Description: Mutagen. Primary Irritant, Natural Product; Food Additive; Reproductive Effector. Gum arabic is used in granular or powder form in foods, pharmaceuticals, cosmetics, adhesives, inks, and textile printing.
Incompatibilities: Oxidizers. Aqueous solution is acidic; keep away from bases. It jells or precipitates out of solution on contact with solutions of alcohol, basic lead acetate, borax, ferric salts, gelatin, ammoniated tincture of guaiac, or sodium silicate.[NTP]
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 200 mg/m^3
PAC-1: 500 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3
Determination in Air: No method available.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Unknown at this time.
Long Term Exposure: Exposure can cause an asthma-like lung allergy to develop. Once allergy develops, even very small future exposures can cause attacks with wheezing, coughing, chest tightness, and shortness of breath. Gum arabic can also cause allergy-like symptoms of chronic runny nose and skin allergy with rash.
Points of Attack: Lungs, skin.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Engineering controls should be established to eliminate hazardous exposures to gum arabic. If, however, you experience irritation, discomfort, or sensitization, or *where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved high-efficiency particulate filter. More protection is provided by a full face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Dust is combustible. Sources of ignition, such as smoking and open flames, are prohibited where gum arabic is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

H

Hafnium and compounds H:0100

Molecular Formula: Hf
Synonyms: Celtium; Elemental hafnium; Hafnium metal
CAS Registry Number: 7440-58-6 (metal); 12055-23-1 (oxide)
RTECS® Number: MG4600000
UN/NA & ERG Number: UN1326 (hafnium powder, wet with not <25% water)/170; UN2545(hafnium powder, dry/135
EC Number: 231-166-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Hafnium is a refractory metal which occurs in nature in zirconium minerals. Molecular weight = 178.49; Specific gravity (H_2O:1) = 13.31; Boiling point = 4602°C; Freezing/Melting point = 2227°C; Vapor pressure = 1×10^{-4} mmHg at 20°C. Insoluble in water.

Potential Exposure: Hafnium metal has been used as a control rod material in nuclear reactors. Thus, those engaged in fabrication and machining of such rods may be exposed.

Incompatibilities: Moisture may cause self-ignition or explosions. The powder is highly flammable, a strong reducing agent, and water and air reactive. The powder or dust may spontaneously ignite on contact with air; and at higher temperatures with nitrogen, phosphorous, oxygen, halogens, and sulfur; contact with hot nitric acid; heat, shock, friction, strong oxidizers; or ignition sources may cause explosions.

Permissible Exposure Limits in Air

Note: Also applies to other hafnium compounds (as Hf).
OSHA PEL: 0.5 mg[Hf]/m^3 TWA.
NIOSH REL: 0.5 mg[Hf]/m^3 TWA.
ACGIH TLV®[1]: 0.5 mg[Hf]/m^3 TWA.
NIOSH IDLH: 50 mg [Hf]/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 2.5 mg/m^3
PAC-3: 50 mg/m^3
Oxide
TEEL-0: 0.59 mg/m^3
PAC-1: 1.77 mg/m^3
PAC-2: 3 mg/m^3
PAC-3: 59 mg/m^3

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, 1999; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.5 mg/m^3, 1999; France: VME 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.5 mg/m^3, 1999; Switzerland: MAK-W 0.5 mg/m^3, 1999; United Kingdom: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg[Hf]/m^3. Several states have set guidelines or standards for hafnium in ambient air[60] ranging from 5.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II(5), Method #S-194 or OSHA Analytical Method ID-121.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of eyes, skin, and mucous membranes.

Long Term Exposure: Lungs may be affected by repeated or prolonged exposure. May cause liver damage.

Points of Attack: Eyes, skin, lungs, liver, and mucous membranes.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00008-4

filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m*^{3}*:* Sa:Cf (APF = 25) (any powered, air-purifying respirator with a dust and mist filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m*^{3}*:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100) or SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie* (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 50 mg/m*^{3}*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SaF: Pd,Pp (APF = 2000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe (*dry powder is a strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Dry hafnium powder requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.2 and Packing Group II. Hafnium powder, wetted with not <25% water (a visible excess of water must be present) (a) mechanically produced, particle size <53 μm; (b) chemically produced, particle size <840 μm requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery.

Halothane H:0110

Molecular Formula: $C_2HClBrF_3$

Common Formula: $CF_3CHBrCl$

Synonyms: Anestan; 2-Bromo-2-chloro-1,1,1-trifluoro-; 2-Bromo-2-chloro-1,1,1-trifluoroethane; Chalothane; Ethane, 2-bromo-2-chloro-1,1,1-thrifluoro-; Fluotane; Fluothane; Halotan; Halsan; Narcotane; 1,1,1-Trifluoro-2-bromo-2-chloroethane; 1,1,1-Trifluoro-2-chloro-2-bromoethane; 2,2,2-Trifluoro-1-chloro-1-bromoethane

CAS Registry Number: 151-67-7

RTECS® Number: KH6475000

EC Number: 205-796-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence, Animal Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Halothane is a highly volatile, nonflammable, colorless liquid. Sweet odor. Odor threshold = 33 ppm. Molecular weight = 197.39; Specific gravity (H_2O:1) = 1.87; Boiling point = 50°C; Freezing/Melting point = − 118°C; Relative vapor density (air = 1) = 2.9; Vapor pressure = 244 mmHg@20°C.

Incompatibilities: May attack rubber and some plastics; sensitive to light. Light causes decomposition. May be stabilized with 0.01% thymol.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 2 ppm/16.2 mg/m^3 [60-min exposure to wasted anesthetic gas] Ceiling Concentration.

ACGIH TLV®[1]: 50 ppm/404 mg/m^3 TWA; not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: 5 ppm/41 mg/m^3 TWA; Peak Limitation Category II(8); Pregnancy Risk Group B.

Determination in Air: Use OSHA Analytical Method #29.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.30$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Inhalation can irritate the respiratory tract causing coughing and wheezing. May affect the cardiovascular system with low blood pressure and abnormal heartbeat; and may affect central nervous system. High levels of exposure may cause dizziness, lightheadedness, nausea, vomiting, and very high levels can cause unconsciousness. Medical observation is indicated. *Inhalation:* Exposure to 4000 ppm can cause amnesia and impairment of manual dexterity. Exposure to 10,000 ppm can cause anesthesia. Liver impairment has occurred from use as an anesthetic. *Skin:* Repeated or prolonged application can destroy the skin. Halothane gives rise to only a very low incidence of postoperative nausea and is generally safe, which accounts for its widespread use.

Long Term Exposure: May affect the liver and kidneys. Reported to have caused irregular menstrual period, headache, fatigue, and unconsciousness. Halothane has also been shown to cause birth defects in rats. May cause reproductive toxicity in humans. Experiments in laboratory animals have shown that continuous exposures of 15−50 ppm may cause liver damage.

Points of Attack: Liver, kidneys, skin, respiratory system, cardiovascular system, central nervous system, reproductive system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. EKG. If symptoms develop or overexposure has occurred, repeat these tests. More than light alcohol consumption may exacerbate liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Prevent skin contact. **8 h:** polyvinyl alcohol gloves. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a dark, cool, well-ventilated area, away from direct sunlight, oxidizers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable liquid. Poisonous gases, including hydrogen chloride, hydrogen fluoride, and hydrogen bromide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Helium H:0120

Molecular Formula: He
Synonyms: Helium, elemental
CAS Registry Number: 7440-59-7
RTECS® Number: MH6520000
UN/NA & ERG Number: UN1046 (Helium, compressed)/121; UN1963 [Helium, refrigerated liquid (cryogenic liquid)]/120
EC Number: 231-168-5

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Helium is a colorless, odorless, and tasteless gas. It is nonflammable. Molecular weight = 4.0; Boiling point = −269°C; Freezing/Melting point = − 272°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: It is used in weather balloons and in welding gases. Liquid helium is used as a closed system cooling agent.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: simple asphyxiant.
Protective Action Criteria (PAC)
TEEL-0: 65,000 ppm
PAC-1: 65,000 ppm
PAC-2: 230,000 ppm
PAC-3: 400,000 ppm

No occupational exposure limits have been established for this substance. Large amounts of helium will, however, decrease the amount of available oxygen. Oxygen content should never be below 19%.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Helium can affect you when breathed in. Exposure to high levels can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out and even die due to suffocation from lack of oxygen. Contact with liquid helium can cause frostbite.

Long Term Exposure: Unknown at this time.

First Aid: If frostbite has occurred, seek medical attention immediately; *do not* rub the affected areas or flush them with water. In order to prevent further tissue damage, *do not* attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention promptly. *Breathing:* Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: *Clothing:* Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. *Eye Protection:* Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn.

Respirator Selection: Exposure to helium gas is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in the positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Liquid helium should be stored and transferred under positive pressure to prevent infiltration of air and other gasses. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Helium, compressed, requires a shipping label of “NONFLAMMABLE GAS.” It falls in Hazard Class 2.2. Helium, *refrigerated liquid* (cryogenic liquid), requires a shipping label of “NONFLAMMABLE GAS.” It falls in Hazard Class 2.2.

Spill Handling: If liquid helium is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Stop the leak or move container to a safe area and allow the liquid to evaporate. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty.

Fire Extinguishing: Helium gas may burn but does not readily ignite. Stop flow of gas. Use extinguisher suitable for surrounding fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure

position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Hematite (underground mining)

H:0130

Molecular Formula: Fe_2O_3

Synonyms: Bloodstone; Haematite; Hematite, red; Iron ore; Iron oxide; Red iron ore

CAS Registry Number: 1317-60-8; 1309-37-1 (ferric oxide, Fe_2O_3)

RTECS® Number: MH7600000

EC Number: 215-168-2 (diiron trioxide; protohematite; CAS 1309-37-1)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal No Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; (*underground mining with exposure to radon*) Human Sufficient Evidence (underground mining with exposure to radon), *carcinogenic to humans*, Group 1, 1998.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent. (CAS: 1309-37-1).

Description: Hematite is a noncombustible, black to black-red or brick-red mineral (iron ore) composed mainly of ferric oxide, Fe_2O_3. See also *Iron oxide*.

Potential Exposure: Compound Description: Tumorigen (as Fe_2O_3). Hematite, as an iron ore composed mainly of ferric oxide, is a major source of iron and is used as a pigment for rubber, paints, paper, linoleum, ceramics, dental restoratives, and as a polishing agent for glass and precious metals. It is also used in electrical resistors, semiconductors, magnets, and as a catalyst. Human exposure to hematite from underground hematite mining is principally through inhalation and/or ingestion of dusts. No estimates are available concerning the number of underground miners exposed.

Incompatibilities: Contact with hydrogen peroxide, ethylene oxide, calcium hypochlorite will cause explosion. Violent reaction with powdered aluminum, hydrazine, hydrogen trisulfide.

Permissible Exposure Limits in Air

OSHA PEL: 10 mg[Fe]/m^3 TWA (dust and fume).

ACGIH TLV®[1]: 5 mg[Fe]/m^3 (vapor, dust) TWA; not classifiable as a human carcinogen (2005).

DFG MAK: 1.5 mg[Fe]/m^3 respirable fraction.

Protective Action Criteria (PAC)

Ferric oxide (1309-37-1)

TEEL-0: 10 mg/m^3

PAC-1: 15 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

NIOSH IDLH: 2500 mg[Fe]/m^3.

Arab Republic of Egypt: TWA 3 ppm (5 mg/m^3) (fume), 1993; Australia: TWA 5 mg/m^3 (fume), 1993; Austria: MAK 6 mg/m^3 (*dust*), 1999; Denmark: TWA 3.5 mg[Fe]/m^3, 1999; Finland: TWA 5 ppm (fume), 1999; France: VME 5 mg/m^3 (fume), 1999: MAC-TGG 5 mg[Fe]/m^3, 2003; MAC-TGG 10 mg/m^3, 2003; Norway: TWA 3 mg/m^3, 1999; the Philippines: TWA 10 mg/m^3 (fume), 1993; Poland: MAC (TWA) (fume) 5 mg/m^3, MAC (STEL) 10 mg/m^3, 1999; Sweden: NGV 3.5 mg/m^3 (fume), 1999; Switzerland: MAK-W 6 mg/m^3) (fume), 1999; Thailand: TWA 10 mg/m^3 (fume), 1993; Turkey: TWA 10 mg/m^3 (fume), 1993; United Kingdom: TWA 5 mg[Fe]/m^3; STEL 10 mg[Fe]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The former USSR-UNEP/IRPTC joint project[43] set a MAC of 4 mg/m^3 in workplace air.

Determination in Air: As iron oxide, use NIOSH Analytical Methods #7300, #7301,#7303, #9102; OSHA Analytical Methods ID-121, ID-125G.

Routes of Entry: Dust inhalation.

Harmful Effects and Symptoms

Long Term Exposure: There is sufficient evidence for the carcinogenicity in humans of underground hematite mining (with exposure to radon). Underground hematite miners have a high incidence of lung cancer, whereas surface hematite miners do not. It is not known whether this excess risk may be due to hematite; to radon (a known lung carcinogen); to inhalation of ferric oxide or silica; or to a combination of these or other factors. Some studies of metal workers exposed to ferric oxide dusts have shown an increased incidence of lung cancer, while other studies have not. The influence of factors in the workplace, other than ferric oxide, cannot be eliminated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning, *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol

($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from iron.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *50 mg/m³*: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]. *125 mg/m³*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m³*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *2500 mg/m³*: Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from other storage containers to process containers A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding fires. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Heptachlor H:0140

Molecular Formula: $C_{10}H_5Cl_7$

Synonyms: Aahepta; Agroceres; Arbinex 30TN; 3-Chlorochlordene; Drinox; E 3314; ENT15,152; GPKH; Hepta; Heptachlorane; Heptachlore; Heptachlore (French); 3,4,5,6,7,8,8a-Heptachlorodicyclopentadiene; 3,4,5,6,7,8,8-Heptachlorodicyclopentadiene; 1,4,5,6,7,10,10-Heptachloro-4,7,8,9-tetrahydro-4,7-endomethyleneindene; 1(3a),4,5,6,7,8,8-Heptachloro-3a(1),4,7,7a-tetrahydro-4,7-methanoindene; 1,4,5 ,6,7,8,8a-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene; 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methano-1H-indene; 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanoindene; 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-4,7-methanol-1H-indene; 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7,7a-tetrahydro-4,7-methelene indene; 1,4,5,6,7,8,8-Heptachlor-3a,4,7,7,7a-tetrahydro-4,7-endo-methano inden (German); Heptacloro (Spanish); Heptagran; Heptamul; Heptox; Indene; 4,7-Methanoindene, 1,4,5,6,7,8,8-Heptachloro-3a,4,7,7a-tetrahydro-; NCI-C00180; Rhodiachlor; Velsicol 104

Epoxide: ENT 25,584; Epoxyheptachlor; HCE; 1,4,5,6,7,8,8-Heptachloro-2,3-epoxy-2,3,3a,4,7,7a-hexahydro-4,7-methanoindene; 1,4,5,6,7,8,8-Heptachloro-2,3-epoxy-3a,4,7,7a-tetrahydro-4,7-methanoindan; 2,3,5,6,7,7-Heptachloro-1a,1b,5,5a,6,6a-hexahydro-2,5-methano-2H-indeno (1,2-b)oxirene; Heptaclorepoxido (Spanish); 4,7-Methanoindan, 1,4,5,6,7,8,8-heptachloro-2,3-epoxy-3a, 4,7,7a-tetrahydro; Velsicol 53-CS-17

CAS Registry Number: 76-44-8; *(alt.)* 23720-59-4; *(alt.)* 37229-06-4

RTECS® Number: PC0700000

UN/NA & ERG Number: UN2761/151

EC Number: 200-962-3 [*Annex I Index No.:* 602-046-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat; IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B 1991; EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies; NIOSH: Potential occupational carcinogen.

Persistent Organic Pollutants (UN).

US EPA Gene-Tox Program, Positive/limited: Carcinogenicity—mouse/rat; Inconclusive: Histidine reversion—Ames test; Inconclusive: *D. melanogaster* sex-linked lethal.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (many countries) (UN).[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR 423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92); 40CFR401.15 Section 307 Toxic Pollutants.

US EPA Hazardous Waste Number (RCRA No.): P059; D031.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA Toxicity Characteristic (Section 261.24), Maximum Concentration of Contaminants, regulatory level, 0.008 mg/L.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.0012; Nonwastewater (mg/kg), 0.066.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (0.05); 8270 (10).

Safe Drinking Water Act: MCL, 0.0004 mg/L; MCLG, zero.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

California Proposition 65 Chemical: Cancer 7/1/88.

List of Stockholm Convention POPs: Annex A (Elimination).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R25; R33; R40; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pure heptachlor is a white powder; technical-grade is a tan powder and has a lower level of purity. The technical-grade is the form used most often as a pesticide. Its odor is somewhat like camphor. Heptachlor is both a breakdown product and a component of the pesticide chlordane (approximately 10% by weight). It is a noncombustible solid, but may be dissolved in flammable liquids which may change the physical properties shown here. Molecular weight = 373.30; Boiling point = (decomposes) 145°C; Freezing/Melting point = 95°C (pure); 46–74°C (technical product); Vapor pressure = 0.0004 mmHg[EPA]; 0.0003 mmHg at 25°C[NIOSH]. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.0006%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those involved in the manufacture, formulation, and application of this insecticide for control of cotton boll weevil. Registration of heptachlor-containing pesticides has been canceled by the US EPA with the exception of its use for termite control outside of dwellings by in-ground (subsurface) insertion. Infants have been exposed to heptachlor and heptachlor epoxide through mothers' milk, cows' milk, and commercially prepared baby foods. It appears that infants raised on mothers' milk run a greater risk of ingesting heptachlor epoxide than if they were fed cows' milk and/or commercially prepared baby food. Persons living and working in or near heptachlor-treated areas have a particularly high inhalation exposure potential. Heptachlor has been found in at least 206 of the 1662 current or former EPA National Priorities List (NPL) sites. Heptachlor epoxide has been found in at least 195 NPL sites.

Incompatibilities: Reacts with strong oxidizers. Attacks metal. Forms hydrogen chloride gas with iron and rust above 74°C.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA[skin].

NIOSH REL: 0.5 mg/m^3 TWA[skin]; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.05 mg/m^3 TWA[skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: potential occupational carcinogen, 35 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 35 mg/m^3

DFG MAK: 0.5 mg/m^3, inhalable fraction [skin]; Peak Limitation Category II(2); Pregnancy Risk Category D; Carcinogen Category 4.

Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: MAK 0.5 mg/m^3, [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; Denmark: TWA 0.5 mg/m^3, [skin], 1999; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.05 mg/m^3, [skin], 2003; the Philippines: TWA 0.5 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.5 mg/m^3, [skin], 1999; Turkey:

TWA 1 mg/m^3, [skin], 1993; United Kingdom: LTEL 0.5 mg/m^3; STEL 2 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia has set[35, 43] a much lower limit of 0.01 mg/m^3 in work-place air and values in ambient air of residential areas of 0.001 mg/m^3 on a once daily basis and 0.0002 mg/m^3 on a daily average basis. Several states have set guidelines of standards for heptachlor in ambient air[60] ranging from 0.0068 μg/m^3 (Massachusetts) to 0.18 μg/m^3 (Pennsylvania) to 1.19 μg/m^3 (Kansas) to 1.7 μg/m^3 (New York) to 2.5 μg/m^3 (Connecticut and South Carolina) to 5.0 μg/m^3 (Florida and North Dakota) to 8.0 μg/m^3 (Virginia) to 12.0 μg/m^3 (Nevada).

Determination in Air: Heptachlor or heptachlor epoxide can be detected by smell at around 0.3 mg in a cubic meter of air (0.3 mg/m^3). Use NIOSH II(5), Method #S-287; OSHA Analytical Method 76448.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0038 μg/L as a 24-h average, never to exceed 0.52 μg/L. *To protect saltwater aquatic life:* 0.0036 μg/L as a 24-h average, never to exceed 0.053 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is imposed by a concentration of 2.78 ng/L (0.00278 μg/L).[6] The US EPA has set health advisories[47] for heptachlor and heptachlor epoxide. The lifetime health advisory is 17.5 μg/L for heptachlor and 0.4 μg/L for heptachlor epoxide. Mexico[35] has set limits of 0.018 mg/L (18 μg/L) for both heptachlor and heptachlor epoxide in drinking water; 0.2 μg/L for heptachlor in coastal waters and 2.0 μg/L for heptachlor in estuaries. Russia has set a limit of 50 μg/L of heptachlor in water bodies used for domestic purposes.[35,43] WHO[35] has set a limit of 0.1 μg/L in drinking water for heptachlor. Several states have set guidelines and standards for heptachlor and heptachlor epoxide in drinking water.[61] Illinois has set a standard of 0.1 μg/L for both heptachlor and heptachlor epoxide. Guidelines have been set for heptachlor ranging from 0.02 μg/L (California) to 0.1 μg/L (Minnesota) to 0.104 μg/L (Kansas) to 0.23 μg/L (Maine) to 0.50 μg/L (Arizona). Guidelines have been set for heptachlor epoxide in drinking water[61] ranging from 0.006 μg/L (Kansas and Minnesota) to 0.10 μg/L (California). The EPA has recently[62] proposed drinking water maximum contaminant levels for heptachlor at 0.4 μg/L and heptachlor epoxide at 0.2 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{\text{ow}} = 5.35$. Fish Tox = 0.05276000 ppb MATC (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Heptachlor can cause a feeling of anxiety, headache, dizziness, weakness, a sensation of "pins and needles" on the skin, and muscle twitching. Heptachlor has been demonstrated to be highly toxic to aquatic life; to persist for prolonged periods in the environment; to bioconcentrate in organisms at various trophic levels; and to exhibit carcinogenic activity in mice. Exposure symptoms in animals include tremors, convulsions, and liver damage. The principal metabolite of heptachlor, heptachlor epoxide is more acutely toxic than heptachlor. Human Tox = 0.40000 ppb MCL (EXTRA HIGH).

Long Term Exposure: High or repeated exposure may cause brain damage with personality changes, decreased memory, difficult coordination and concentration. Higher levels can cause tremor, seizures, unconsciousness, and death. This substance is possibly carcinogenic to humans. There is limited evidence that heptachlor may damage the developing fetus. May cause liver and kidney damage.

Points of Attack: Central nervous system, liver. Cancer site in animals: liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Evaluation for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full facepiece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Heptachlor (organochloride pesticides, solid, toxic, n.o.s.) requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including chlorine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s minimum for primary combustion; 1760°C, 1.0 s for secondary combustion) with adequate scrubbing and ash disposal facilities. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Heptachlor epoxide H:0150

Molecular Formula: $C_{10}H_5Cl_7O$

Synonyms: ENT 25,584; Epoxyheptachlor; HCE; 1,4,5,6,7,8,8-Heptachloro-2,3-epoxy-2,3,3a,4,7,7a-hexahydro-4,7-methanoindene; 1,4,5,6,7,8,8-Heptachloro-2,3-epoxy-3a,4,7,7a-tetrahydro-4,7-methanoindan; 2,3,5,6,7,7-Heptachloro-1a,1b,5,5a,6,6a-hexahydro-2,5-methano-2H-indeno (1,2-b) oxirene; Heptaclorepoxido (Spanish); 4,7-Methanoindan, 1,4,5,6,7,8,8-heptachloro-2,3-epoxy-3a, 4,7,7a-tetrahydro; Velsicol 53-CS-17

CAS Registry Number: 1024-57-3

RTECS® Number: PB9450000

UN/NA & ERG Number: UN2761/151

EC Number: 213-831-0 [*Annex I Index No.:* 602-063-00-5]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence, Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B 1991;EPA: Sufficient evidence from animal studies; inadequate evidence or no useful data from epidemiologic studies.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (many countries) (UN).[13]

Carcinogenicity: (Animal Positive) IARC: NCI.[9]

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants; 40CFR401.15 Section 307 Toxic Pollutants as hexachlorocyclohexane.

US EPA Hazardous Waste Number (RCRA No.): D031.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.
RCRA Toxicity Characteristic (Section 261.24), Maximum Concentration of Contaminants, regulatory level, 0.008 mg/L.
RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.016; Nonwastewater (mg/kg), 0.066.
RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8080 (1); 8270 (10).
Safe Drinking Water Act: MCL, 0.0002 mg/L; MCLG, zero.
Reportable Quantity (RQ): 1 lb (0.454 kg).
California Proposition 65 Chemical: Cancer 7/1/88.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R25; R33; R40; R50/53; Safety phrases: S1/2; S36/37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: Like pure heptachlor, heptachlor epoxide is a white powder that does not explode easily. Heptachlor epoxide is an oxidation product of heptachlor formed by plants and animals, including humans, after exposure to heptachlor. About 20% of heptachlor is changed within hours into heptachlor epoxide in the environment and in the body. It is also present as a contaminant in heptachlor. It was not manufactured and was not used as an insecticide like heptachlor. Molecular weight = 389.30; Freezing/Melting point = 160−162°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide. Infants have been exposed to heptachlor and heptachlor epoxide through mothers' milk, cows' milk, and commercially prepared baby foods. It appears that infants raised on mothers' milk run a greater risk of ingesting heptachlor epoxide than if they were fed cows' milk and/or commercially prepared baby food. Persons living and working in or near heptachlor treated areas have a particularly high inhalation exposure potential. Heptachlor epoxide has been found in at least 195 EPA National Priorities List.

Incompatibilities: Melted heptachlor with iron and rust.

Permissible Exposure Limits in Air
See also previous record for "Heptachlor."
ACGIH TLV®[1]: 0.05 mg/m^3 TWA[skin]; confirmed animal carcinogen with unknown relevance to humans.
Protective Action Criteria (PAC)
TEEL-0: 0.05 mg/m^3
PAC-1: 0.15 mg/m^3
PAC-2: 6 mg/m^3
PAC-3: 6 mg/m^3

Determination in Air: Heptachlor or heptachlor epoxide can be detected by smell at around 0.3 mg in a cubic meter of air (0.3 mg/m^3). Use NIOSH II(5), Method #S-287; OSHA Analytical Method 76448.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.0038 μg/L as a 24-h average, never to exceed 0.52 μg/L. *To protect saltwater aquatic life:* 0.0036 μg/L as a 24-h average, never to exceed 0.053 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is imposed by a concentration of 2.78 ng/L (0.00278 μg/L).[6] The US EPA has set health advisories[47] for heptachlor and heptachlor epoxide. The lifetime health advisory is 17.5 μg/L for heptachlor and 0.4 μg/L for heptachlor epoxide. Mexico[35] has set limits of 0.018 mg/L (18 μg/L) for both heptachlor and heptachlor epoxide in drinking water; 0.2 μg/L for heptachlor in coastal waters and 2.0 μg/L for heptachlor in estuaries. Russia has set a limit of 50 μg/L of heptachlor in water bodies used for domestic purposes.[35,43] WHO[35] has set a limit of 0.1 μg/L in drinking water for heptachlor. Several states have set guidelines and standards for heptachlor and heptachlor epoxide in drinking water.[61] Illinois has set a standard of 0.1 μg/L for both heptachlor and heptachlor epoxide. Guidelines have been set for heptachlor ranging from 0.02 μg/L (California) to 0.1 μg/L (Minnesota) to 0.104 μg/L (Kansas) to 0.23 μg/L (Maine) to 0.50 μg/L (Arizona). Guidelines have been set for heptachlor epoxide in drinking water[61] ranging from 0.006 μg/L (Kansas and Minnesota) to 0.10 μg/L (California). The EPA has recently[62] proposed drinking water maximum contaminant levels for heptachlor at 0.4 μg/L and heptachlor epoxide at 0.2 μg/L.

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Heptachlor can cause a feeling of anxiety, headache, dizziness, weakness, a sensation of "pins and needles" on the skin, and muscle twitching. Heptachlor has been demonstrated to be highly toxic to aquatic life; to persist for prolonged periods in the environment; to bioconcentrate in organisms at various trophic levels; and to exhibit carcinogenic activity in mice. Exposure symptoms in animals include tremors, convulsions, and liver damage. The principal metabolite of heptachlor, heptachlor epoxide is more acutely toxic than heptachlor. LD_{50} = (oral-rat) 40 mg/kg.

Long Term Exposure: High or repeated exposure may cause brain damage with personality changes, decreased memory, difficult coordination and concentration. Higher levels can cause tremor, seizures, unconsciousness, and death. This substance is possibly carcinogenic to humans. There is limited evidence that heptachlor may damage the developing fetus. May cause liver and kidney damage.

Points of Attack: Central nervous system, liver. Cancer site in animals: liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Evaluation for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek

medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from ferrous metals. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s minimum for primary combustion; 1760°C, 1.0 s for secondary combustion) with adequate scrubbing and ash disposal facilities. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 205-563-8 [*Annex I Index No.:* 601-008-00-2]
Regulatory Authority and Advisory Bodies
Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: Risk phrases: F, Xn, N; R11; R38; R65; R67; R50/53; Safety phrases: S2; S9; S16; S29; S33; S60; S61; S62 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *n*-Heptane is a clear liquid which is highly flammable and volatile with a mild, gasoline-like odor. The odor threshold is 40−547 ppm; also reported at 230 ppm. Molecular weight = 100.23; Specific gravity (H_2O:1) = 0.68; Boiling point = 98.3°C; Freezing/Melting point = −90.6°C; Vapor pressure = 40 mmHg at 25°C; Flash point = −4°C; Autoignition temperature = 204°C[17]; 285°C. Explosive limits: LEL = 1.1%; UEL = 6.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 0.0003%.

Potential Exposure: Compound Description: Drug; Human Data. *n*-Heptane is used in graphics, textiles, adhesives, and coatings; as an industrial solvent and in the petroleum refining process; as a standard in testing knock of gasoline engines.

Incompatibilities: Forms explosive mixture with air. Strong oxidizers may cause fire and explosions. Attacks some plastics, rubber, and coatings. May accumulate static electric charges that can ignite its vapors.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.10 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 500 ppm/2000 mg/m^3 TWA.
NIOSH REL: 85 ppm/350 mg/m^3 TWA; 440 ppm/1800 mg/m^3 [15 min] Ceiling Concentration.
ACGIH TLV®[1]: 400 ppm/1640 mg/m^3 TWA; 500 ppm/2050 mg/m^3 STEL.
NIOSH IDLH: 750 ppm.
Protective Action Criteria (PAC)
TEEL-0: 400 ppm
PAC-1: 440 ppm
PAC-2: 440 ppm
PAC-3: 750 ppm
DFG MAK: 500 ppm/2100 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.
Australia: TWA 400 ppm (1600 mg/m^3); STEL 500 ppm, 1993; Austria: MAK 500 ppm (2000 mg/m^3), 1999; Belgium: TWA 400 ppm (1640 mg/m^3); STEL 500 ppm, 1993; Denmark: TWA 200 ppm (820 mg/m^3), 1999; Finland: TWA 300 ppm (1200 mg/m^3); STEL 500 ppm (2000 mg/m^3), 1999; France: VME 400 ppm (1600 mg/m^3), 1999; Japan: 200 ppm (820 mg/m^3), 1999; the Netherlands: MAC-TGG 1200 mg/m^3, 2003; Norway: TWA 200 ppm (800 mg/m^3), 1999; the Philippines: TWA 500 ppm (2000 mg/m^3), 1993; Poland: MAC (TWA) 1200 mg/m^3, MAC (STEL) 2000 mg/m^3, 1999; Russia: TWA 200 ppm, 1993; Sweden: NGV 200 ppm (800 mg/m^3), KTV 300 ppm (1200 mg/m^3), 1999; Switzerland: MAK-W 400 ppm (1600 mg/m^3), KZG-W 800 ppm (3200 mg/m^3), 1999; Turkey: TWA 500 ppm (2000 mg/m^3), 1993; United Kingdom: LTEL 400 ppm (1600 mg/m^3); STEL 500 ppm, 1993: Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 500 ppm. Several states have set guidelines or standards for heptane in ambient air[60] ranging from 7.0 mg/m^3 (Connecticut and South Dakota) to 16.0−20.0 mg/m^3 (North Dakota) to 24.5 mg/m^3 (Virginia) to 32.0 mg/m^3 (Florida and New York) to 38.095 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for Hydrocarbons, BP 36−126°C; OSHA Analytical Method 7.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.7$.

Routes of Entry: Inhalation of the vapor, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: *n*-Heptane irritates the eyes, skin, and respiratory tract. A narcotic at high concentrations. *n*-Heptane can cause dermatitis and mucous membrane irritation. Aspiration of the liquid may result in chemical pneumonitis, pulmonary edema, and hemorrhage. Systemic effects may arise without complaints of mucous membrane irritation. Exposure to high concentrations causes narcosis producing vertigo, a lack of coordination; intoxication characterized by hilarity, slight nausea, loss of appetite, and a persisting gasoline taste in the mouth. These effects may be first noticed on entering a contaminated area. *n*-Heptane may cause low order sensitization of the myocardium to epinephrine. Swallowing the liquid may cause chemical pneumonitis.

Long Term Exposure: The liquid defats the skin causing dryness and irritation. May affect the central nervous system, liver. Many petroleum solvents similar to heptane can cause brain damage that can affect memory, concentration, mood, sleep patters.

Points of Attack: Skin, respiratory system, lungs, peripheral nervous system.

Medical Surveillance: Preplacement examinations should evaluate the skin and general health, including respiratory, liver, and kidney function. Interview for brain effects. Consider cerebellar, autonomic and peripheral nervous system evaluation. Refer positive and borderline individuals for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact; **8 h**: nitrile rubber gloves, suits, boots; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *750 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with heptane you should be trained on its proper handling and storage. Before entering confined space where heptane may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind and use water spray to "knock down" vapor. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1-Heptanethiol is a flammable, colorless liquid with a strong odor. Molecular weight = 132.29; Boiling point = 176°C; Freezing/Melting point = −43°C; Flash point = 46°C. Insoluble in water.

Potential Exposure: Used as a chemical intermediate for fuels, dyes, pharmaceuticals, and to make other chemicals.

Incompatibilities: Oxidizers, strong acids, strong bases, alkali metals, and reducing agents.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.5 ppm/2.7 mg/m^3 [15 min] Ceiling Concentration.

No TEEL available.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Exposure can cause headache, dizziness, nausea, and vomiting. High concentrations of mercaptans may cause cold extremities, rapid pulse, increased respiration, drowsiness, cyanosis, and unconsciousness.

Long Term Exposure: Unknown at this time.

Points of Attack: Eyes, skin, respiratory system, central nervous system, blood.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 5 ppm*: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 ppm*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 25 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away

from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Mercaptans, liquid, flammable, toxic, n.o.s. require a label of "FLAMMABLE LIQUID, POISONOUS/ TOXIC MATERIALS." . It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including sulfur oxides, carbon monoxide, and hydrogen sulfide, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

New Jersey Department of Health and Senior Services. (June 1999). *Hazardous Substances Fact Sheet: 1-Heptanethiol*. Trenton, NJ

Heptene H:0180

Molecular Formula: C_7H_{14}

Common Formula: $C_3H_7CH{=}CHC_2H_5$

Synonyms: 1-Ethyl-2-propyl ethylene; *n*-Heptene; 1-Heptene; 1-Heptylene; Heptylene

CAS Registry Number: 592-76-7

RTECS® Number: MU8815000

UN/NA & ERG Number: UN2278/128

EC Number: 209-767-8 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Heptene is a colorless liquid with a mild, gasoline-like odor. Molecular weight = 98.21; Boiling point = 94°C; Flash point $\leq 0°C$; Autoignition temperature = 260°C. Explosive limits: LEL = 1.0%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in use as a plant growth retardant or in organic synthesis.

Incompatibilities: Strong oxidizers can cause a fire and explosion hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1500 ppm

PAC-1: 5000 ppm

PAC-2: 40,000 ppm

PAC-3: 200,000 ppm

Routes of Entry: Inhalation, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Narcotic at higher concentrations; may act as a slight anesthetic. Inhalation can cause coughing, wheezing, and/or shortness of breath. May also act as simple asphyxiant.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately

with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with heptene you should be trained on its proper handling and storage. Before entering confined space where heptene may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Spills on water may be handled with oil skimming equipment and sorbent (polyurethane) foams. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hexachlorobenzene is a solid, crystallizing in needles. Molecular weight = 284.76; Boiling point = 323−326°C; Freezing/Melting point = 231°C; Flash point = 242°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Hexachlorobenzene was used as a fungicide, an additive for pyrotechnic compositions, and as wood preservative. It was used widely as a pesticide to protect seeds of onions and sorghum, wheat, and other grains against fungus until 1965. This material was used to make fireworks, ammunition for military uses, synthetic rubber, as a porosity controller in the manufacture of electrodes, as an intermediate in dye manufacture, in organic synthesis. It is formed as a by-product of making other chemicals, in the waste streams of chloralkali and wood-preserving plants, and when burning municipal waste. Currently, there are no commercial uses of hexachlorobenzene in the United States.

Incompatibilities: Reacts violently with oxidizers, dimethyl formamide above 65°C.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®[1]: 0.002 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.002 mg/m^3

PAC-1: 0.006 mg/m^3

PAC-2: 1.5 mg/m^3

PAC-3: 200 mg/m^3

DFG MAK: [skin]; Carcinogen Category 4; Pregnancy Risk Group D.

France: carcinogen, 1993; the Netherlands: MAC-TGG 0.03 mg/m^3, 2003; Poland: MAC (TWA) 0.5 mg/m^3, 1999; Russia: STEL 0.9 mg/m^3, [skin], 1993; United Kingdom: carcinogen, 2000. Russia set a MAC of 0.013 mg/m^3 in ambient air of residential areas. The Czech Republic[35] has set a TWA in work-place air of 1.0 mg/m^3 and an STEL of 2.0 mg/m^3. Several states have set guidelines or standards for hexachlorobenzene in ambient air[60] ranging from zero in North Dakota to 0.48 ppb (Pennsylvania) to 0.03 μg/m^3 (New York).

Determination in Air: Use NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons.

Permissible Concentration in Water: The US EPA recommended that drinking water should not contain more than 0.05 mg of hexachlorobenzene per liter of water (0.05 mg/L) in water that children drink and should not contain more than 0.2 mg/L in water that adults drink for longer periods (about 7 years). The EPA has set a maximum contamination level (MCL) of 0.001 mg/L in drinking water. Russia set a MAC of 0.05 mg/L in water bodies used for domestic purposes.[35,43] Several states have set guidelines for hexachlorobenzene in drinking water[61] ranging from 0.02 μg/L (Arizona) to 0.20 μg/L (Kansas) to 0.21 μg/L (Minnesota) to 5.4 μg/L (Maine). The World Health Organization (WHO)[35] has set a limit of 0.01 μg/L in drinking water.

Determination in Water: Methylene chloride extraction followed by concentration and gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625). Fish Tox = 1760.07814000 ppb MATC (VERY LOW).

Routes of Entry: Inhalation, ingestion, eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* Coughing, shortness of breath, and labored breathing have been reported from large, unmeasured doses or by decomposition to chlorine. *Skin:* Can cause irritation. Exposure to sunlight with (or soon after) exposure can increase effects. Following this reaction, changes in skin pigment and blistering may follow. Red or dark urine may be noticed. High doses may cause redness, pain, and serious burns. *Eyes:* May cause irritation. Higher doses may cause redness, pain, and blurred vision. *Ingestion:* Headache, dizziness, nausea, vomiting, numbness of hands and arms, apprehension, excitement, tremors, partial paralysis of arms and legs, loss of muscle control, loss of sensory perception, convulsions, and coma may result from high doses. Human Tox = 1.00000 ppb (HIGH).

Long Term Exposure: May affect the lungs, liver, skin, and nervous system. This substance causes cancer in laboratory animals, and may be carcinogenic to humans. May damage the developing fetus. May cause liver, thyroid, kidney, and immune system damage. High, prolonged or repeated exposure may affect the nervous system. Repeated skin exposure can lead to permanent skin changes and increased hair growth. Animal tests show that this substance possibly causes toxic effects upon human reproduction. Ingestion of contaminated grain, estimated at doses of 0.05−0.2 g/day, resulted in porphyria cutanea tarda (PCT) in Turkey, which is characterized by red-colored urine, skin sores, change in skin color, arthritis, and problems of the liver, nervous system, and stomach. The following symptoms were also reported: enlarged livers, porphyria in the blood, loss or appetite, weight loss, and wasting of skeletal muscles. Severe and long-standing poisoning caused abnormal hair growth, loss of vision, wasting of hands, black discoloration, and skin sores which became ulcerated, healing with pigmented scars. Breast-fed children developed “pink-sore,” a condition which was 95% fatal. Toxic effects on blood and active symptoms persisted up to 20 years. Studies in animals show that ingestion of this chemical can damage the liver, thyroid, nervous system, bones, kidneys, blood, immune and endocrine system.

Points of Attack: Liver, skin, thyroid.

Medical Surveillance: Liver function tests. Thyroid function tests. Evaluation by a qualified allergist and/or dermatologist. Iron as a dietary supplement could increase liver damage. consult a physician before taking supplements. Guard against sunlight exposure to contaminated skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For ingestions of less than 10 mg/kg body weight occurring less than an hour before treatment, induce emesis. For ingestions of more than 10 mg/kg body weight occurring less than an hour before treatment, use gastric lavage. For ingestion occurring more than an hour before treatment, use activated charcoal. There is no specific antidote, and supervision for at least 72 h is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, dimethyl formamide, and heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including chlorine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration is most effective at 1300°C and 0.25 s. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hexachlorobutadiene is a clear, colorless liquid with a faint, turpentine-like odor. Molecular weight = 260.74; Specific gravity (H_2O:1) = 1.55; Boiling point = 212°C; Freezing/Melting point = −21.1°C; Vapor pressure = 0.2 mmHg at 20°C; Flash point = 90°C; Autoignition temperature = 610°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Hexachlorobutadiene is used as a solvent, heat-transfer fluid, transformer fluid, hydraulic fluid, as a solvent for elastomers, as a wash liquor for removing higher hydrocarbons.

Incompatibilities: Strong reaction with oxidizers, aluminum powder. Attacks aluminum, some plastics, rubber, and coatings

Permissible Exposure Limits in Air

DFG MAK: [skin]; Carcinogen Category 3B.

Australia: TWA 0.02 ppm (0.24 mg/m^3), [skin], carcinogen, 1993; Austria [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.02 ppm (0.21 mg/m^3), [skin], carcinogen, 1993; Finland: carcinogen, 1999; the Netherlands: MAC-TGG 0.24 mg/m^3, 2003; Norway: TWA 0.02 ppm (0.24 mg/m^3), 1999; Switzerland: MAK-W 0.02 ppm (0.24 mg/m^3), [skin], 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[35, 43] has set a MAC value of 0.001 mg/m^3 for ambient air in residential areas on a momentary basis and 0.0002 mg on a daily average basis. Several states have set guidelines or standards for hexachlorobutadiene in ambient air[60] ranging from zero (North Dakota) to 0.72 μg/m^3 (Pennsylvania) to 0.80 μg/m^3 (New York) to 1.2 μg/m^3 (South Carolina) to 2.4 μg/m^3 (Connecticut, Florida and Virginia) to 6.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2543.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 90 μg/L on an acute toxicity basis and 9.3 μg/L on a chronic basis. *To protect saltwater aquatic life:* 32 μg/L on an acute toxicity basis. *For the protection of human health*: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is imposed by a concentration of 4.47 μg/L.[6] Russia[35,43] set a MAC of 0.01 mg/L in water bodies used for domestic purposes. Kansas and Minnesota have set guidelines of 4.5 μg/L for hexachlorobutadiene in drinking water.[61]

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 4.88.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Hexachlorobutadiene can affect you when breathed in and by passing through your skin. The liquid is corrosive, contact can irritate and burn the skin and eyes. Vapors can irritate the eyes, skin, and respiratory tract.

Long Term Exposure: Hexachlorobutadiene should be handled as a carcinogen—with extreme caution. It may damage the developing fetus. Exposure can cause severe kidney damage. Hexachlorobutadiene may damage the liver. Repeated or prolonged contact may cause skin sensitization and allergy.

Points of Attack: Eyes, skin, respiratory system, kidneys. Cancer site in animals: kidney.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: kidney and liver function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.02 ppm*, use a MSHA/ NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard

EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers A regulated, marked area should be established where hexachlorobutadiene is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is not flammable. Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High temperature incineration with flue gas scrubbing.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Reportable Quantity (RQ): 1 lb (0.454 kg).

Technical grade

California Proposition 65 Chemical: Cancer 10/1/87.

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*gamma*-isomer).

Description: BHC is a white-to-brownish crystalline solid with a musty, phosgene-like odor. Molecular weight = 290.82; Freezing/Melting point = 65°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. BCH consists of eight stereoisomers of which the gamma (γ) isomer is most insecticidally active and hence most important. See also "Lindane."

Potential Exposure: Compound Description: (technical grade) Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; (α-isomer) Agricultural Chemical; Tumorigen, Mutagen, Human Data; (β-isomer) Agricultural Chemical; Tumorigen; Reproductive Effector. The major commercial usage of BHC is based upon its insecticidal properties. α-BCH is used as an Agricultural Chemical; pesticide, pharmaceutical, and veterinary drug. The 7-isomer has the highest acute toxicity, but the other isomers are not without activity. It is generally advantageous to purify the 7-isomer from the less active isomers. The γ-isomer acts on the nervous system of insects, principally at the level of the nerve ganglia. As a result, lindane has been used against insects in a wide range of applications including treatment of animals, buildings, humans for ectoparasites, clothes; water for mosquitoes, living plants, seeds, and soils. Some applications have been abandoned due to excessive residues, e.g., stored foodstuffs. By voluntary action, the principal domestic producer of technical grade BHC requested cancellation of its BHC registrations on September 1, 1976. As of July 21, 1978, all registrants of pesticide products containing BHC voluntarily canceled their registrations or switched their former BHC products to lindane formulations.

Incompatibilities: Decomposes on contact with powdered iron, aluminum, zinc, and on contact with strong bases producing trichlorobenzene.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: as γ-isomer: 0.5 mg/m^3 [skin].

DFG MAK: as γ-isomer: 0.1 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(8) [skin] Carcinogen Category 4; Pregnancy Risk Group C (2006).

Technical grade, mixture of α-BHC (CAS: 319-84-6) and β-BHC (CAS: 319-85-7): 0.1 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(8) [skin].

Protective Action Criteria (PAC)

Determination in Air: Collection by filter/bubbler; workup with isooctane; analysis by gas chromatography/electrolytic conductivity detection; NIOSH Analytical Method (IV) #5502 (γ-isomer).

Permissible Concentration in Water: The EPA has set a limit in drinking water of 0.2 ppb. There are no criteria for the protection of freshwater or saltwater aquatic life from technical BHC (mixed isomers) due to insufficient data. *To protect human health:* preferably zero for technical product. An additional cancer risk of 1 in 100,000 is imposed by a concentration of 0.123 μg/L.[6] Russia[43] set a MAC of 0.02 mg/L in water bodies used for domestic purposes and zero in water bodies used for fishery purposes.

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. May affect the central nervous system, causing convulsions, respiratory failure, and collapse. Effects may be delayed. Exposure may result in death. See also below.

Long Term Exposure: Repeated or prolonged skin contact may cause irritation, redness. The effects of lindane and/or the α-, β-, and δ-isomers of HCH observed in humans are lung irritation, heart disorders, blood disorders, headache, convulsions, and changes in the levels of sex hormones. These effects have occurred in workers exposed to HCH vapors during pesticide formulation and/or in individuals exposed accidentally or intentionally to large amounts of HCH. Exposure to excessive amounts of HCH can also result in death in humans and animals. Convulsions and kidney disease have been reported in animals fed lindane or β-HCH. Liver disease has been reported in animals fed lindane and α-, β-, or technical grade HCH. Longer exposure to lindane and α-, β-, or technical-grade HCH has been reported to result in liver cancer. Reduced ability to fight infection was reported in animals fed lindane and injury to the ovaries and testes was reported in animals exposed to lindane or β-HCH. In animals, there is evidence that oral exposure to lindane during pregnancy results in an increased incidence of fetuses with extra ribs. HCH is processed by the body into other chemical products, some of which probably are responsible for the harmful effects. The Department of Health and Human Services has determined that HCH may reasonably be anticipated to be carcinogenic. Liver cancer has been seen in laboratory rodents that ate HCH for long periods of time.

Points of Attack: Eyes, skin, respiratory system, central nervous system, blood, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests for Lindane: whole blood (chemical/metabolite); blood serum; Complete blood count; urine (chemical/metabolite).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 mg/m^3*: CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 25 mg/m^3*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; GmFOv100 (APF = 50) [or any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 50 mg/m^3:* 100XQ (APF = 10) [any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators]. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkalis, powdered iron, aluminum, and zinc. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound falls under the category of Organochlorine pesticides, solid, toxic, n.o.s. These compounds require a shipping label of "POISONOUS/TOXIC MATERIALS." These fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may be dissolved in flammable liquids. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including phosgene and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: A process has been developed for the destructive pyrolysis of benzene hexachloride at 400−500°C with a catalyst mixture which contains 5−10% of either cupric chloride, ferric chloride, zinc chloride, or aluminum chloride on activated carbon.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T + , N; Risk phrases: R22; R24; R26; R34; R50/53; Safety phrases: S1/2; S25; S39; S45; S53; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hexachlorocyclopentadiene is a pale-yellow to amber-colored, oily liquid with a pungent, unpleasant odor. The odor threshold is 0.15−0.33 ppm. Molecular weight = 272.75; Boiling point = 238.8°C; Freezing/Melting point = −8.9°C; Vapor pressure = 0.08 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1. Slightly soluble in water; solubility = 0.0002% at 25°C (reaction).

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen; Reproductive Effector; Primary Irritant. Hexachlorocyclopentadiene is used to produce the flame retardant chlorendic anhydride, which has applications in polyesters; and to produce chlorendic anhydride and chlorendic acid, which is used as a flame retardant in resins. Hexachlorocyclopentadiene is also used as an intermediate in the production of pesticides, such as aldrin, dieldrin, and endosulfan.

Incompatibilities: Reacts slowly with water to form hydrochloric acid; will corrode iron and most metals in presence of moisture. Explosive hydrogen gas may collect in enclosed spaces in the presence of moisture. Contact with sodium may be explosive.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.01 ppm/0.1 mg/m^3 TWA.
ACGIH TLV®[1]: 0.01 ppm/0.11 mg/m^3 TWA; not classifiable as a human carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 0.01 ppm
PAC-1: 0.025 ppm
PAC-2: 0.15 ppm
PAC-3: 0.15 ppm
DFG MAK: [skin] No numerical value established. Data may be available.
Australia: TWA 001 ppm (0.1 mg/m^3), 1993; Belgium: TWA 0.01 ppm (0.11 mg/m^3), 1993; Denmark: TWA 0.01 ppm (0.1 mg/m^3), 1999; Finland: TWA 0.1 ppm (1 mg/m^3); STEL 0.3 ppm (3 mg/m^3), [skin], 1999; France: VME 0.01 ppm (0.1 mg/m^3), 1999; the Netherlands: MAC-TGG 0.1 1 mg/m^3, 2003; Norway: TWA 0.01 ppm (0.1 mg/m^3), 1999; Russia: STEL 0.01 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for hexachtorocyclopentadiene in ambient air[60] ranging from 0.015 μg/m^3 (Massachusetts) to 0.33 μg/m^3 (New York) to 0.50 μg/m^3 (Indiana and South Carolina) to 0.6−10.0 μg/m^3 (North Carolina) to 1.0 μg/m^3 (Florida and North Dakota) to 2.0 μ/m^3 (Connecticut, Nevada and Virginia).

Determination in Air: Sample collection on Porapak® tube,[2] desorption with hexane and analysis by gas chromatography with electron capture detection. See NIOSH Analytical Method (IV) #2518.[18]

Permissible Concentration in Water: The US EPA regulates HCCPD in water. The MCL is 50 ppb. EPA recommends that exposure in children should not exceed 2 ppm in water for 10-day periods or no more than 0.7 ppm for up to 7 years. EPA requires that spills or accidental releases of 10 lb or more of HCCPD be reported to the EPA. Russia[35, 43] set a MAC of 0.001 mg/L (1 μg/L) in water bodies used for domestic purposes. Kansas has set a guideline of 206 μg/L for drinking water.[61]

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This compound is very toxic and may be fatal if inhaled, swallowed, or absorbed through the skin. Eye contact may result in severe irritation. Contact of liquid with the skin may cause blistering and burning. Inhalation of mist is highly irritating to mucous membranes, causing tearing, sneezing, and salivation. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Headaches and throat irritation have also been reported as a result of exposure to this compound. The probable human lethal dose is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb (70-kg) person. Severe exposure induces pulmonary hyperemia and edema, degenerative and necrotic changes in brain, heart, and adrenal glands; and necrosis of liver and kidney tubules.

Long Term Exposure: May damage the liver, kidneys, nervous system, and heart. Can irritate the lungs. Repeated exposure may cause bronchitis with cough, phlegm, and/or shortness of breath.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: liver and kidney function tests. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: lung, liver, and kidney function tests. Examination of the nervous system. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from the skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber/Neoprene™ and PVC are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.01 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a

NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water. Protect containers from physical damage. In the presence of moisture, hexachlorocyclopentadiene will corrode iron and other metals.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Ventilate area of spill or leak after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (from a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (from a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.3/0.5

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hexachlorocyclopentadiene itself does not burn. Poisonous gases, including chlorine, hydrogen chloride, phosgene, and carbon monoxide, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Hexachloroethane is a white solid with a camphor-like odor. It gradually evaporates when it is exposed to air. Molecular weight = 236.72; Boiling point = (sublimes) at 183−187°C; Freezing/Melting point = (sublimes) 187°C; Vapor pressure = 0.2 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.005% at 25°C.

Incompatibilities: Incompatible with strong oxidizers, strong bases.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector. In the United States, about half of the HCE is used by the military for smoke-producing devices. It is also used to remove air bubbles in melted aluminum. It may be present as an ingredient in some fungicides, insecticides, lubricants, and plastics. It is no longer made in the United States, but it is formed as a by-product in the production of some chemicals. Can be formed by incinerators when materials containing chlorinated hydrocarbons are burned. Some HCE can also be formed when chlorine reacts with carbon compounds in drinking water. As a medicinal, HCE is used as an anthelmintic to treat fascioliasis in sheep and cattle. It is also added to the feed of ruminants, preventing methanogenesis and increasing feed efficiency. HCE is used in metal and alloy production, mainly in refining aluminum alloys. It is also used for removing impurities from molten metals, recovering metals from ores or smelting products and improving the quality of various metals and alloys. HCE is contained in pyrotechnics. It inhibits the explosiveness of methane and the combustion of ammonium perchlorate. Smoke containing HCE is used to extinguish fires. HCE has various applications as a polymer additive. It has flameproofing qualities, increases sensitivity to radiation crosslinking, and is used as a vulcanizing agent. Added to polymer fibers, HCE acts as a swelling agent and increases affinity for dyes.

Incompatibilities: Incompatible with metals, such as aluminum, cadmium, hot iron, mercury, or zinc. Alkalis forms spontaneously explosive chloroacetylene. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.68 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/10 mg/m^3 TWA [skin].

NIOSH REL: NIOSH REL: 1 ppm/10 mg/m^3 TWA [skin]; a potential occupational carcinogen. Limit exposure to lowest feasible concentration, See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 1 ppm/9.7 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: Potential occupational carcinogen 300 ppm.
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 30 ppm
PAC-2: 200 ppm
PAC-3: 300ppm
DFG MAK: 1 ppm/9.8 mg/m^3 TWA; Peak Limitation Category II(2).
Australia: TWA 10 ppm (100 mg/m^3), 1993; Austria: MAK 1 ppm (10 mg/m^3), 1999; Belgium: TWA 1 ppm (9.7 mg/m^3), 1993; Denmark: TWA 1 ppm (10 mg/m^3) [skin] 1999; Finland: TWA 1 ppm (10 mg/m^3), short-term exposure limit 3 ppm (30 mg/m^3) [skin] 1999; France: VME 1 ppm, VLE 10 ppm, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; the Philippines: TWA 1 ppm (10 mg/m^3) [skin] 1993; Poland: MAC (TWA) 10 mg/m^3, MAC (STEL) 30 mg/m^3, 1999; Switzerland: MAK-W 1 ppm (10 mg/m^3) [skin] 1999; United Kingdom: TWA 5 ppm (49 mg/m^3), vapor, 2000; TWA 10 mg/m^3, total inhalable dust; TWA 4 mg/m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for hexachloroethane in ambient air[60] ranging from 0.18 μg/m^3 (Massachusetts) to 50.0 μg/m^3 (Connecticut) to 238.095 μg/m^3 (Kansas) to 1000 μg/m^3 (North Dakota) to 1600 μg/m^3 (Virginia) to 2381 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated; OSHA Analytical Method 7.

Permissible Concentration in Water: The US EPA suggests that water consumed over a lifetime contain no more than 1 part HCE per billion parts of water. (1 ppb). In an older citation, the EPA suggested the following: *To protect freshwater aquatic life:* 118,000 μg/L based on acute toxicity and 20,000 μg/L based on chronic toxicity. *To protect saltwater aquatic life:* 113,000 μg/L based on acute toxicity. *To protect human health:* 9.4 μg/L to keep lifetime cancer risk below 5−10 μg/L.[6] Russia[35,43] set a MAC of 0.01 mg/L (10 μg/L) in water bodies used for domestic purposes. States which have set guidelines for hexachloroethane in drinking water[61] include Kansas (1.9 μg/L) and Minnesota (24.6 μg/L).

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method 612) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate and burn the eyes and skin. Exposure can irritate the respiratory tract. High levels of exposure can cause dizziness, lightheadedness, and unconsciousness. Irritation occurs when there is an excessive amount of hexachloroethane dust in the air or when it is heated and vapors are formed. Hexachloroethane acts primarily as a central nervous system depressant; and in high concentrations it causes tremors and narcosis. It should be noted that the low vapor pressure of this compound as well as its solid state minimize its inhalation hazards.

Long Term Exposure: A potential occupational carcinogen. May cause kidney and liver damage.

Points of Attack: Eyes, skin, respiratory system, kidneys. Cancer site in animals: liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. More than light alcohol consumption can exacerbate liver damage. Sample of blood, urine, or feces can be tested for exposure to HCE. These tests are useful only if exposure occurred 24−48 h prior to testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Hexachloroethane must be stored to avoid contact with hot iron, zinc, aluminum, and alkalis since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in DOT/UN Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Hexachloroethane itself does not burn. Poisonous gases, including phosgene and hydrogen chloride, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Hexachlorophene H:0240

Molecular Formula: $C_{13}H_6Cl_6O_2$

Common Formula: $C_6H(OH)Cl_3CH_2C_6H(OH)Cl_3$

Synonyms: Acigena; AI3-02372; Almederm; AT-17; AT-7; B 32; B&B flea kontroller (for dogs only); Bilevon; Bis(2-hydroxy-3,5, 6-trichlorophenyl)methane; Bis(3,5,6-trichlor *o*-2-hydroxyphenyl)methane; Blockade anti bacterial finish; Brevity blue liquid bacteriostatic scouring cream; Brevity blue liquid sanitizing scouring cream; Compound G-11; Cotofilm; Dermadex; 2,2′-Dihydroxy-3,3′,5,5′,6,6′-hexachlorodiphenylmethane; 2,2′-Dihydroxy-3,5,6,3′,5′,6′-hexachlorodiphenylmethane; Distodin; Enditch pet shampoo; EN-Viron D concentrated phenolic disinfectant; Esaclorofene; Exofene; Fesia-Sin; Fomac; Fostril; G-11; Gamophen; Gamophene; Germa-Medica; HCP; Hexabalm; 2,2′,3,3′,5,5′-Hexachloro-6,6′-dihydroxydiphenylmethane; Hexachlorophane; Hexachlorophen; Hexachlorophene; Hexaclorofeno (Spanish); Hexafen; Hexaphene-LV; Hexide; Hexophene; Hexosan; Hilo cat flea powder; Hilo flea powder; Hilo flea powder with rotenone and dichlorophrene; Isobac; Isobac 20; Methane, bis(2,3,5-trichloro-6-hydroxyphenyl); 2,2′-Methylenebis(3,4,6-trichlorophenol); 2,2′-Methylenebis(3,5,6-trichlorophenol); Nabac; Nabac 25 EC; NCI-C02653; Neosept V; NSC4911; Pedigree dog shampoo bar; Phenol, 2,2′-methylenebis(3,4,6-trichloro)-; Phenol, 2,2′-methylenebis(3,5,6-trichloro-); Phisodan; Phisohex; Ritosept; Septisol; Septofen; Staphene O; Steral; Steraskin; Surgi-Cen; Surgi-Cin; Surofene; Tersaseptic; Trichlorophene; Turgex

CAS Registry Number: 70-30-4; *(alt.)* 8054-98-6; *(alt.)* 139411-96-4

RTECS® Number: SM0700000

UN/NA & ERG Number: UN2875/151

EC Number: 200-733-8 [*Annex I Index No.:* 604-015-00-9]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (feed); no evidence: rat; IARC: Animal Inadequate Data; Human Inadequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1997.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Banned or Severely Restricted (in pharmaceuticals) (UN).[13]

FDA—over-the-counter and proprietary drug.

Reportable Quantity (RQ): 100 lb (45.4 kg).

US EPA Hazardous Waste Number (RCRA No.): U132.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R24/25; R50/53; Safety phrases: S1/2; S20; S37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexachlorophene is a crystalline compound. Molecular weight = 406.89; Freezing/Melting point = 165°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug; Reproductive Effector; Human Data; Primary Irritant. HCP has been used as an antibacterial agent in a wide variety of consumer products, including soaps and deodorants, as a disinfectant. It has also been used as an antifungal agent to treat various citrus fruits and vegetables.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 50 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 150 mg/m^3

Russia: STEL 0.1 mg/m^3, [skin], 1993. Massachusetts[61] has set a guideline of zero for ambient air.

Permissible Concentration in Water: A no-adverse-effect-level in drinking water has been calculated by NAS/NRC as 0.008 mg/L. An ADI was calculated on the basis of the available chronic toxicity data to be 0.0012 mg/kg/day. Russia set a MAC of 0.03 mg/L in water bodies used for domestic purposes. Maine has set a guideline of 2.0 μg/L for drinking water.[61]

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Hexachlorophene may irritate the eyes and skin, and may cause a skin allergy to develop. May cause permanent eye damage. Inhalation can irritate the respiratory tract. May affect the central nervous system, causing dizziness, weakness, convulsions (fits), coma, or death. Exposure can cause loss of appetite, nausea, vomiting, cramps, and diarrhea. LD_{50} = (oral-rat) 56 mg/kg; (oral-mouse) 67 mg/kg.

Long Term Exposure: There is an association between exposure to pregnant women to hexachlorophene and birth defects. There is limited evidence that hexachlorophene is a teratogen in animals. May cause an asthma-like allergy. May cause liver damage. Repeated exposure may cause brain damage leading to paralysis and blindness.

Points of Attack: Nervous system, skin, liver, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system and eye. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. More than light alcohol consumption may exacerbate liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to hexachlorophene, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Hexachlorophene itself does not burn. Extinguish fire using an agent suitable for surrounding fire. Poisonous gases, including chlorine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 (≥15.67% concentration).

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical Developmental/Reproductive toxin (male).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Hexafluoroacetone is a colorless, nonflammable poison gas. Musty odor. Shipped as a liquefied compressed gas. Molecular weight = 163.00; Boiling point = −28 to −26°C; Freezing/Melting point = −122°C; Relative vapor density (air = 1) = 5.76; Vapor pressure = 5.8 atm at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Reacts with water.

Potential Exposure: Compound Description: Reproductive Effector. Hexafluoroacetone is used as a chemical intermediate. A gas at room temperature, it forms various hydrates with water which are used as solvents for resins and polymers. Other derivatives are used to make water repellent coatings for textiles and also to produce polymers.

Incompatibilities: Reacts with water, oxidizers, strong acids. Hygroscopic (i.e., absorbs moisture from the air); reacts with moisture to form a highly acidic sesquihydrate and considerable heat.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.1 ppm/0.7 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 ppm/0.68 mg/m^3 TWA [skin].

Protective Action Criteria (PAC)*

TEEL-0: 0.1 ppm

PAC-1: 0.1 ppm

PAC-2: **0.2** ppm

PAC-3: **80** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Several states have set guidelines or standards for hexafluoroacetone in ambient air[60] ranging from 7.0 $\mu g/m^3$ (North Dakota) to 11.0 $\mu g/m^3$ (Virginia) to 14.0 $\mu g/m^3$ (Connecticut) to 17.0 $\mu g/m^3$ (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, passing through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can severely irritate the eyes, nose, throat, and skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, nausea, vomiting, dizziness, and lightheadedness. Skin or eye contact with the liquid can cause frostbite.
