Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. (3) Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl dichlorosilane must be stored to avoid contact with water, since violent reactions occur once hydrogen chloride is produced. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl dichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl dichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl dichlorosilane. Wherever methyl dichlorosilane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl dichlorosilane requires a shipping label of “DANGEROUS WHEN WET, CORROSIVE, FLAMMABLE LIQUID.” It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in dry lime, dry sand, soda ash, or a similar material and deposit in sealed containers. Following cleanup, neutralize spill area by flushing with large quantities of water and then treat spill area with sodium bicarbonate. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

When spilled in water

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 1.6/2.5

Fire Extinguishing: Methyl dichlorosilane is a flammable liquid and may ignite in air. Use dry chemical or CO_2 extinguishers. *Do not use water*. Fire may restart after it has been extinguished. Poisonous gases, including hydrogen chloride, silicon oxides, and phosgene, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: See “Spill Handling.”

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4,4′-Methylenebis (2-chloroaniline) is a yellow to light gray-tan pellet and is also available in liquid form. Molecular weight = 267.17; Specific gravity (H_2O:1) = 1.44; Freezing/Melting point = 99−110°C; Vapor pressure = 0.00001 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. 4,4′-Methylenebis(2-chloroaniline) is used as a curing agent in the polyurethane industry for isocyanate containing polymers and in the production of solid elastomeric parts. Other uses are in the manufacture of cross-linked urethane foams used in automobile seats and safety padded dashboards; it is also used in the manufacture of gun mounts, jet engine turbine blades, radar systems, and components in home appliances.

Incompatibilities: Reacts with chemically active metals (e.g., potassium, sodium, magnesium, and zinc). May ignite on contact with cellulose nitrate of high-surface area. Incompatible with acrolein, acrylonitrile, *tert*-butyl nitroacetylene, ethylene oxide, isopropyl chlorocarbonate, maleic anhydride, triisobutylaluminum.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.003 mg/m^3 TWA [skin]; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.01 ppm/0.11 mg/m^3 TWA; Suspected Human Carcinogen [skin] BEI issued.

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 1 ppm

PAC-2: 7.5 ppm

PAC-3: 40 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 0.02 ppm (0.22 mg/m^3), [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.02 ppm (0.22 mg/m^3), [skin], carcinogen, 1993; Finland: TWA 0.02 ppm (0.2 mg/m^3); STEL 0.06 ppm, [skin], 1993; Finland: TWA 0.02 ppm (0.2 mg/m^3); STEL 0.06 ppm, carcinogen, 1999; France: VME 0.02 ppm (0.22 mg/m^3), carcinogen, 1999; Japan: 0.005 mg/m^3, [skin], 2A carcinogen, 1999; the Netherlands: MAC-TGG 0.02 mg/m^3, 2003; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.0 mg/m^3, carcinogen, 1999; United Kingdom: TWA 0.005 mg/m^3, [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Several states have set guidelines or standards for MOCA in ambient air[60] ranging from zero (Nevada and North Dakota) to 0.015 $\mu g/m^3$ (Connecticut) to 0.55 $\mu g/m^3$ (Pennsylvania) to 1.0 $\mu g/m^3$ (Rhode Island) to 2.2 $\mu g/m^3$ (Virginia).

Determination in Air: Use NIOSH Analytical Method #8302, MBOCA in urine; OSHA Analytical Method 24; ID-71.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.94.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: 4,4′-Methylenebis(2-chloroaniline) can affect you when breathed in and by passing through your skin. 4,4′-Methylenebis(2-chloroaniline) is a carcinogen; handle with extreme caution. Exposure can interfere with the ability of the blood to carry oxygen causing headaches, dizziness, nausea, and a bluish color to the skin and lips. High levels can cause trouble breathing, collapse, and death. Contact can irritate the eyes. High or repeated exposures may affect the kidneys, cause a low blood count, and cause bloody urine.

Long Term Exposure: May cause methemoglobinemia, anemia, kidney irritation. A potential occupational carcinogen. May affect the kidneys.

Points of Attack: Liver, blood, kidneys. Cancer site in animals: liver, lung, and bladder tumors.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood methemoglobin level. Complete blood count. Kidney function tests. Preplacement and periodic examinations should include a history of exposure to other carcinogens, alcohol and smoking habits, use of medications, and family history. Special attention should be given to liver size and function and to any changes in lung symptoms or X-rays.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to Physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: Saranex™ coated suits, Barricade™ coated suits. **4 h**: 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. 4,4′-Methylenebis(2-chloroaniline) must be stored to avoid contact with chemically active metals (such as potassium, sodium, magnesium and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of “POISONOUS/TOXIC MATERIALS.” They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including chlorine and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23; R36/37/39; R42/43; Safety phrases: S1/2; S26; S28; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: DMDI is a clear, colorless to light-yellow liquid. Molecular weight = 262.39; Specific gravity (H_2O:1) = 1.07 at 25°C; Freezing/Melting point = 19−23°C; Vapor pressure = 0.001 mmHg at 20°C; Flash point ≥202°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Insoluble in water; reactive.

Potential Exposure: Compound Description: Primary Irritant. Those involved in the manufacture of this compound or its use in the production of light-stable, non-yellowing polyurethane resins.

Incompatibilities: Violent reaction with alcohols, glycols. May slowly polymerize if heated above 122°F/50°C. Incompatible with moisture, heat, air, amines, amides, strong alkalis, and chemically active metals. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.73 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.01 ppm/0.11 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.005 ppm/0.054 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 0.005 ppm

PAC-1: 0.005 ppm

PAC-2: 0.01 ppm

PAC-3: 0.15 ppm

Belgium: TWA 0.005 ppm (0.054 mg/m^3), 1993; Denmark TWA 0.005 ppm (0.054 mg/m^3), 1999; Norway: TWA 0.005 ppm (0.05 mg/m^3), 1999; Sweden: TWA 0.005 ppm; STEL 0.01 ppm, 1999; United Kingdom: TWA 0.02 mg (NCO)/m^3; STEL 0.07 mg[NCO]/m^3, 2000; the Netherlands: MAC 0.1 1 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.005 ppm. Several states have set guidelines or standards for ambient air[60] ranging from 0.8 μg/m^3 (Virginia) to 1.1 μg/m^3 (North Dakota) to 0−3.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5525; OSHA Analytical Method PV-2092.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylene bis(4-cyclohexylisocyanate) can affect you when breathed in. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs, causing a buildup of fluid (pulmonary edema). This can cause death. Contact can irritate and burn the eyes, causing permanent damage. Skin contact can cause blisters.

Long Term Exposure: Methylenebis(4-cyclohexylisocyanate) can cause an asthma-like allergy to develop. Future exposures can cause asthma attacks with shortness of breath, wheezing, cough, and/or chest tightness. Repeated exposures may permanently damage the lungs.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal at first if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 0.1 ppm:* Sa (APF = 10) (any supplied-air respirator).* *Up to 0.25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode.)* *Up to 0.5 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front-or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Methylene bis(4-cyclohexylisocyanate) must be stored to avoid contact with alcohols, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from moisture, heat, air, amines, strong bases, and chemically active metals.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Dampen spilled solid material with 60−70% ethanol to avoid airborne dust. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material, and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylene bis(4-cyclohexylisocyanate) may burn, but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers. Poisonous gases, including hydrogen cyanide, ammonia, nitriles, and oxides of nitrogen, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4,4′-Methylenebis(*N,N*-dimethyl)benzenamine is a yellow crystalline compound. Molecular weight = 254.41; Boiling point = 390°C; Freezing/Melting point = 90−91°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: 4,4′-methylenebis(N,N-dimethyl) benzenamine is used as an intermediate in dye manufacture and as an analytical reagent in the determination of lead.

Incompatibilities: Strong acids, oxidizers, acid chlorides, acid anhydrides.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: Carcinogen Category 2.

The state of North Dakota has set a guideline of zero concentration for ambient air.[60]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: 4,4′-Methylenebis(*N,N*′-dimethyl) aniline can affect you when breathed in and by passing through your skin. 4,4′-Methylenebis(*N,N*-dimethyl)aniline is a carcinogen; handle with extreme caution. High exposure can interfere with the ability of the blood to carry oxygen (a condition called methemoglobinemia). This can cause headaches, dizziness, weakness, and a bluish color to the skin and lips. Higher levels can cause trouble breathing, collapse, and death.

Long Term Exposure: May be a carcinogen. It has been shown to cause liver and thyroid cancer in animals.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: blood test for methemoglobin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Methylenebis(*N,N*-dimethyl)benzenamine. Wear protective gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Respirator Selection: At any exposure level, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air-respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. 4,4′-Methylenebis(*N*,*N*-dimethyl)benzenamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s. require the label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group 1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, alcohol, or polymer foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: IARC: Human Inadequate Data, animal No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1999; EPA: Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R20; R36/37/38; R40;R42/43; R48/20; Safety phrases: S1/2; S23; S23; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MDI is a white to light-yellow, odorless flakes. A liquid above 37°C. Molecular weight = 250.27; Specific gravity (H_2O:1) = 1.23 (solid at 25°C); 1.19 (liquid at 50°C); Boiling point = 313.9°C at 5 mmHg; Freezing/

Melting point = 37.2°C; Vapor pressure = 0.0000005 mmHg at 20°C; Flash point = 198.9°C (cc); Autoignition temperature = 240°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Slightly soluble in water (reaction).

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. MDI is used in the production of polyurethane foams and plastics, polyurethane coatings, elastomers, and thermoplastic resins.

Incompatibilities: Violent reaction with oxidizers, strong alkalis, acids, alcohols, ammonia, amines, amides, glycols, caprolactum. Unstable above 100°F/38°C. Polymerizes at temperatures above 204°C. Reacts readily with water to form insoluble polyureas. Attacks some plastics, rubber, and coatings. Reacts with moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.24 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.02 ppm/0.2 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.005 ppm/0.05 mg/m^3 TWA; 0.2 mg/m^3/ 0.020 ppm/10 min, Ceiling Concentration.

ACGIH TLV®[1]: 0.005 ppm TWA, measured as inhalable fraction and vapor [skin]; BEI_A issued as Acetylcholinesterase-inhibiting pesticides.

NIOSH IDLH: 75 mg/m^3.

Protective Action Criteria (PAC)*

TEEL-0: 0.051 mg/m^3

DFG MAK: 0.05 mg/m^3, inhalable fraction; danger of sensitization of the airways and skin; Peak Limitation Category I(1); a momentary value of 0.1 mg/m^3 should not be exceeded; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 10 μg[4,4′-Diaminodiphenylmetane]/dL creatinine in urine/end-of-shift.

Austria: MAK 0.005 ppm (0.05 mg/m^3), Suspected: carcinogen, 1999; Belgium TWA 0.005 ppm (0.051 mg/m^3); STEL 0.02 ppm, 1993; Denmark TWA 0.005 ppm (0.05 mg/m^3), 1999; France: VME 0.01 ppm (0.1 mg/m^3), VLE 0.02 ppm (0.2 mg/m^3), 1999; Hungary TWA 0.05 mg/m^3; STEL 0.1 mg/m^3, 1993; Japan 0.05 mg/m^3, 1999; the Netherlands: MAC-TGG 0.05 mg/m^3, 2003; the Philippines: TWA 0.02 ppm (0.2 mg/m^3), 1993; Poland: MAC (TWA) 0.05 mg/m^3, MAC 0.2 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3 [skin] 1993; Sweden: NGV 0.005 ppm, TGV 0.01 ppm, 1999; Switzerland: MAK- week 5 ppm (15 mg/m^3); STEL 25 ppm (75 mg/m^3), 1999; Thailand TWA 0.02 ppm (0.2 mg/m^3), 1993; United Kingdom TWA 0.02 mg[NCO]/m^3; STEL 0.07 mg[NCO]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.005 ppm. Several states have set guidelines or standards for MDI in ambient air[60] ranging from 0.2 μg/m^3 (Rhode Island) to 0.67 μg/m^3 (New York) to 1.0 μg/m^3 (Connecticut) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (North Dakota and South Carolina) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5521, #5522, #5525; OSHA Analytical Method 18, 33, 47.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* A lacrimator. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Vapors are irritating at 0.001−0.026 ppm and may cause shortness of breath, asthma, sore throat, coughing, wheezing, chest tightness, depression, headache, nasal discharge, and insomnia. May cause allergic respiratory reactions. Symptoms may be delayed up to 8 h after exposure. *Skin:* Causes irritation, redness, and pain. May cause a rash. Irritation begins at levels of 0.05−0.1 ppm. May adhere firmly to skin. Attempts to remove it may increase or produce irritation. *Eyes:* Irritation at 0.05−0.1 ppm causing redness, pain, and blurred vision. *Ingestion:* Causes abdominal spasms and vomiting.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated or prolonged inhalation exposure may cause asthma-like allergy. Prolonged exposure may lead to permanent breathing or respiratory problems.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); red blood cells/count; sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Evaluation by a qualified allergist. Preplacement and periodic medical examinations should include chest X-ray, pulmonary function tests, and an evaluation of any respiratory disease or history of allergy. Periodic pulmonary function tests may be useful in detecting the onset of pulmonary sensitization.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Responder™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *0.5 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBA (any self-contained breathing apparatus). *1.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *2.5 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *75 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store at temperatures indicated on labels, separately from acids, bases, amines, alcohols and ammonia, and with ventilation along the floor. Since MDI will react with moisture in the air, the storage area should be a dry place, away from all sources of fire or ignition.

Shipping: Toxic solids, organic, n.o.s. compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use carbon dioxide, dry chemical, or halons. In case of large fires, water spray may be used to cool drums, taking care to prevent direct contact between water and MDI. Poisonous gases, including nitrogen oxides and hydrogen cyanide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methylene bromide is a colorless liquid with a sweet, pleasant odor. Molecular weight = 173.85; Boiling point = 96−97°C; Freezing/Melting point = −53°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Mutagen; Human Data. Methylene bromide is used as a solvent and as a chemical intermediate.

Incompatibilities: Mixture with potassium forms a shock-sensitive explosive. Incompatible with oxidizers, aluminum, magnesium. The substance decomposes on contact with hot surfaces producing hydrogen bromide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 30 ppm

PAC-2: 200 ppm

PAC-3: 1250 ppm

Russia: STEL: 10 mg/m^3, 1993.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Methylene bromide can affect you when breathed in. Contact can irritate the eyes and skin. May affect the nervous system and blood, resulting in impaired functions and formation of carboxyhemoglobinemia. Exposure can cause you to feel dizzy, lightheaded and to pass out. High levels can cause death. Methylene bromide can cause the heart to beat irregularly or stop. This can cause death.

Long Term Exposure: Repeated skin contact can cause dryness and itching; removal of the skin's natural oils. May cause liver and kidney damage.

Points of Attack: Blood, kidneys, liver, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Serum bromine level. Carboxyhemoglobin level. Holter monitor (a special 24-h EKG to look for irregular heartbeat).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl alcohol is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methylene bromide, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed container in a well-ventilated area away from potential high heat sources. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a

hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methylene bromide may burn but does not readily ignite. Poisonous gases, including bromine and bromide, are produced in fire. Use dry chemical, carbon dioxide, alcohol, or polymer foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8010 (5); 8240 (5).

Safe Drinking Water Act: MCL, 0.005 mg/L; MCLG, zero; Regulated chemical (47 FR 9352).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 4/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R40; Safety phrases: S2; S23; S24/25; S36/37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Methylene chloride is a nonflammable, colorless liquid with a chloroform-like odor. A gas above 40°C/104°F. The odor is noticeable at 250 ppm. However, this level substantially exceeds the OSHA STEL and must not be relied upon as an adequate warning of unsafe concentrations. Molecular weight = 84.93; Specific gravity (H_2O:1) = 1.33; Boiling point = 40°C; Freezing/Melting point = −95°C; Relative vapor density (air = 1) = 2.91; Vapor pressure = 350 mmHg; Autoignition temperature = 556°C. Explosive limits: LEL = 13%; UEL = 23%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water; solubility = 2%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive

Effector; Human Data; Primary Irritant. Methylene chloride is used mainly as a low-temperature extractant of substances which are adversely affected by high temperature. It can be used as a solvent for oil, fats, waxes, bitumen, cellulose acetate, and esters. It is also used as a paint remover, as a degreaser, and in aerosol propellants.

Incompatibilities: Incompatible with strong oxidizers, caustics, chemically active metals, such as aluminum, magnesium powders, potassium, lithium, and sodium, and concentrated nitric acid causing fire and explosion hazard. Contact with hot surfaces or flames causes decomposition producing fumes of hydrogen chloride and phosgene gas. Attacks some forms of plastics, rubber, and coatings. Attacks metals in the presence of moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.47 mg/m^3 at 25°C & 1 atm.

OSHA PEL 25 ppm TWA; 125 ppm STEL, a potential occupational carcinogen, see 29CFR1910.1052; for Construction see 56FR57036.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 50 ppm/174 mg/m^3 TWA; BEI: 0.2 mg [dichloromethane]/L in urine/end-of-shift; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: potential occupational carcinogen, 2300 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 25 ppm

PAC-1: **200** ppm

PAC-2: **560** ppm

PAC-3: **6900** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 100 ppm/350 mg/m^3; BAT: 5% [CO-Hb] in blood, at end-of-shift; 1 mg[dichloromethane]/L in blood/end-of-shift; Carcinogen Category 3A.

Australia: TWA 100 ppm (350 mg/m^3), carcinogen, 1993; Austria: MAK 100 ppm (360 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (174 mg/m^3), carcinogen, 1993; Denmark: TWA 35 ppm (122 mg/m^3), [skin], 1999; Finland: TWA 100 ppm (350 mg/m^3); STEL 250 ppm (870 mg/m^3), 1999; France: VME 50 ppm (180 mg/m^3), VLE 100 ppm, continuous carcinogen, 1999; Hungary: STEL 10 mg/m^3, carcinogen, 1993; the Netherlands: MAC-TGG 350 mg/m^3, 2003; Norway: TWA 35 ppm (125 mg/m^3), 1999; the Philippines: TWA 500 ppm (1740 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; STEL 50 mg/m^3, 1999; Russia: TWA 100 ppm; STEL 50 mg/m^3, 1993; Sweden: NGV 35 ppm (120 mg/m^3), KTV 70 ppm (250 mg/m^3), [skin] 1999; Switzerland: MAK-W 100 ppm (360 mg/m^3), KZG-W 500 ppm (1800 mg/m^3), 1999; Thailand: TWA 500 mg/m^3; STEL 1000 mg/m^3, 1993; Turkey: TWA 500 ppm (1740 mg/m^3), 1993; United Kingdom: TWA 100 ppm (350 mg/m^3); STEL 300 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans; the Czech Republic: TWA 500 mg/m^3; Standards for methylene chloride in ambient air in residential areas have been set by Russia[43] at 8.8 mg/m^3 on a momentary basis and by the Czech Republic[35] at 3.0 mg/m^3 on a momentary basis and 1.0 mg/m^3 on a daily average basis. Several states have set guidelines or standards for methylene chloride in ambient air[60] ranging from 0.2 μg/m^3 (Rhode Island) to 2.4 μg/m^3 (Massachusetts and North Carolina) to 55.55 μg/m^3 (Kansas) to 1,167 μg/m^3 (New York) to 3500 μg/m^3 (South Dakota) to 3500−17,400 μg/m^3 (North Dakota) to 58,000 μg/m^3 (Virginia) to 7000 μg/m^3 (Connecticut) to 8333 μg/m^3 (Pennsylvania) to 8700 μg/m^3 (Indiana) to 8750 μg/m^3 (South Carolina).

Determination in Air: *Use* NIOSH Analytical Method #1005, Methylene chloride; #3800, Organic and Inorganic Gases, #2549, Volatile organic compounds; OSHA Analytical Methods 59 and 80.

Permissible Concentration in Water: *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 results at a level of 1.9 μg/L.[6] A lifetime health advisory could not be calculated by EPA.[48] Several states have set standards and guidelines for methylene chloride in drinking water[61] ranging from standards of 2 μg/L (New Jersey) to 100 μg/L (New Mexico) and guidelines of 4.7 μg/L (Arizona) to 25 μg/L (Connecticut) to 40 μg/L (California) to 48 μg/L (Minnesota and Vermont) to 50 μg/L (Kansas) to 150 μg/L (Maine). Russia set a MAC[35] of 7.5 mg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method 601) or gas chromatography, plus mass spectrometry (EPA Method #624). Octanol−water coefficient: Log K_{ow} = 1.25

Routes of Entry: Inhalation of vapors, percutaneous absorption of liquid, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the blood, causing the formation of methemoglobin and carboxyhemoglobin. Exposure can cause irregular heartbeat or cause heart to stop. This can cause death. *Inhalation:* Levels of 300−700 ppm for 3−5 hours has caused slight loss of muscle control and coordination. Effects of high concentrations include headaches, stupor, dizziness, fatigue, drunken behavior, chest pain, arm and leg pains, loss of feeling, loss of appetite, hot flashes and death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Contact is painful and highly irritating if confined on the skin by gloves or clothing. Absorbed slowly through the skin to cause symptoms listed under inhalation. *Eyes:* May cause pain, irritation, burns, and permanent damage. *Ingestion:* The liquid may cause chemical pneumonitis. Accidental ingestion of paint removers containing methylene chloride as the main ingredient have reportedly caused headache, nausea, vomiting, visual disturbance, presence of blood in the urine, and unconsciousness.

Note: Methylene chloride is changed to carbon monoxide in the human body. This is a particularly hazardous condition for those who have a history of heart trouble or those who are also exposed to carbon monoxide. See "Carbon monoxide" Fact Sheet. These persons should take extra precautions.

Long Term Exposure: Repeated or prolonged skin contact may cause drying and cracking. May be carcinogenic to humans. It has been shown to cause liver and lung cancer in animals. May affect the central nervous system and liver, causing degenerative brain disease and enlargement of the liver. See symptoms as above. Prolonged exposure can cause changes in blood, hallucinations, and decreased response to visual and auditory stimulation. Most of the effects will disappear after exposure stops. Methylene chloride caused genetic effects in certain bacteria and caused birth defects in chickens. In laboratory studies, methylene chloride has also been shown to cause tumors in mice and rats. Whether methylene chloride causes birth defects or tumors in humans is not known.

Points of Attack: Eyes, skin, cardiovascular system, central nervous system. Cancer site in animals: lung, liver, salivary and mammary gland.

Medical Surveillance: OSHA mandates the following tests: laboratory surveillance; carboxyhemoglobin; electrocardiogram (resting); hematocrit; liver function tests; cholesterol level. NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), carboxyhemoglobin; whole blood (chemical/metabolite), carboxyhemoglobin, end-of-shift; whole blood (chemical/metabolite), carboxyhemoglobin, prior to next shift; whole blood (chemical/metabolite), end-of-shift; complete blood count; expired air, expired air, end-of-shift; liver function tests; urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heartbeat. Blood carboxyhemoglobin (this must be done within a few hours after exposure). Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves, Responder™ suits, Trellchem™ HPS suits; Trychem 1000™ suits. **4 h**: Teflon™ gloves, suits, boots; Barricade™ coated suits 4,4′-Methylenedianiline 101-77-9 Prevent skin contact. **8 h**: 4H™ and Silver Shield™ gloves. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methylene chloride must be stored to avoid contact with strong oxidizers (such as perchlorates, peroxides, chlorates, nitrates, or permanganates), strong caustics, and chemically active metals (such as aluminum, magnesium powder, sodium, potassium, or lithium) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is not combustible, but may form a flammable mixture with air. Use an extinguishing agent suitable for surrounding fire. Poisonous gases, including carbon monoxide, hydrogen chloride, and phosgene, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel; care must be exercised to assure complete combustion to prevent the formation of phosgene; an acid scrubber is necessary to remove the halo acids produced.

Methyl ethyl ether M:0910

Molecular Formula: C_3H_8O

Synonyms: Ether, ethyl methyl; Ethane, methoxy-; Ethyl methyl ether; Methane, ethoxy; Methoxyethane

CAS Registry Number: 540-67-0

RTECS® Number: KO0260000

UN/NA & ERG Number: UN1039/115

EC Number: None found.

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl Ethyl Ether is a colorless liquid or gas at room temperature. Molecular weight = 60.11; Boiling point = 11°C; Flash point = − 37°C; Autoignition temperature = 190°C. Explosive limits: LEL = 2.0%; UEL = 10.1%; Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1. Soluble in water.

Potential Exposure: Used as a medicine and as an anesthetic.

Incompatibilities: Violent reaction with strong oxidizers, sulfuric and nitric acids. May be able to form explosive peroxides on standing.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the skin, eyes, and nose. Inhalation can cause lightheadedness and can reduce concentration. Higher levels of exposure may cause unconsciousness and even death.

Long Term Exposure: Repeated contact may cause skin dryness and cracking. Prolonged high exposure may affect the brain.

Points of Attack: Brain, skin.

Medical Surveillance: Evaluate for brain effect, such as memory, concentration, sleeping patterns and mood, headache, and fatigue. Positive and borderline individuals should be referred for neuropsychological testing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with methyl ethyl ether you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Ethyl methyl ether requires a shipping label of “FLAMMABLE GAS.” It falls in Hazard Class 2.1.

Spill Handling: *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Gas: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Liquid:* This chemical is a combustible liquid. Poisonous gases are produced in fire. Use alcohol foam extinguishers. Water may not be effective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Gas: Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MEK is a clear, colorless liquid with a fragrant, mint-like, moderately sharp odor. The odor threshold in air is 5.4 ppm. Molecular weight = 72.12; Specific gravity (H_2O:1) = 0.81; Boiling point = 79.4°C; Freezing/Melting point = −86.1°C; Vapor pressure = 78 mmHg at 20°C; Flash point = −9°C (cc); Autoignition temperature = 505°C. Explosive limits: LEL = 1.4% at 93°C; UEL = 11.4% at 93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Soluble in water; solubility = 28%.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. MEK is used as a solvent in nitrocellulose coating and vinyl film manufacture; in smokeless powder manufacture; in cements and adhesives; and in the dewaxing of lubricating oils. It is also an intermediate in drug manufacture.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers, amines, ammonia, inorganic acids, caustics, isocyanates, pyridines. Incompatible with potassium *tert*-butoxide, 2-propanol, chlorosulfonic acid, oleum. Attacks some plastics.

PAC-3: 4000 ppm.

DFG MAK: 200 ppm/590 mg/m^3 [skin]; Peak Limitation Category I(1); Pregnancy Risk Group C; BAT: 5 mg/m^3 in urine, at end-of-shift.

Australia: TWA 150 ppm (445 mg/m^3); STEL 300 ppm, 1993; Austria: MAK 200 ppm (590 mg/m^3), 1999; Belgium: TWA 200 ppm (590 mg/m^3); STEL 300 ppm (885 mg/m^3), 1993; Denmark: TWA 50 ppm (145 mg/m^3), [skin], 1999; Finland: STEL 100 ppm, 1993; France: VME 200 ppm (600 mg/m^3), 1999; Hungary: TWA 200 mg/m^3; STEL 600 mg/m^3, 1993; India: TWA 200 ppm (590 mg/m^3); STEL 300 ppm (885 mg/m^3), 1993; the Netherlands: MAC-TGG 590 mg/m^3, [skin], 2003; Norway: TWA 75 ppm (220 mg/m^3), 1999; the Philippines: TWA 200 ppm (590 mg/m^3), 1993; Poland: MAC (TWA) 200 mg/m^3, MAC (STEL) 850 mg/m^3, 1999; Russia: TWA 200 ppm; STEL 200 mg/m^3, 1993; Sweden: NGV 50 ppm (150 mg/m^3), KTV 100 ppm (300 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (590 mg/m^3), KZG-V 400 ppm (1180 mg/m^3), 1999; Turkey: TWA 200 ppm (590 mg/m^3), 1993; United Kingdom: TWA 200 ppm (600 mg/m^3), STE 300 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 300 ppm. The Czech Republic: (ambient air in residential areas) have been set[35] at 0.3 mg/m^3 on a momentary and a daily average basis; Russia (in ambient air in residential areas): 0.1 mg/m^3 on a momentary basis. Several states have set guidelines or standards for methyl ethyl ketone in ambient air[60] ranging from 0.16 mg/m^3 (Massachusetts) to 1.967 mg/m^3 (New York) to 3.7−88.5 mg/m^3 (North Carolina) to 5.9 mg/m^3 (Florida) to 5.9−8.85 mg/m^3 (North Dakota) to 9.8 mg/m^3 (Virginia) to 11.8 mg/m^3 (Connecticut and South Dakota) to 14.048 mg/m^3 (Nevada) to 14.75 mg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method #2500, Methyl ethyl ketone; #2555; #3800; #8002 in blood; #2549 Volatile organic compounds; OSHA Analytical Methods 16, 84, and 1004.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes. The EPA[48] has set a lifetime health advisory at 170 μg/L. Several states have set guidelines for methyl ethyl ketone in drinking water[61] ranging from 60 μg/L (Massachusetts) to 170 μg/L (Arizona) to 172 μg/L (Minnesota) to 270 μg/L (New Jersey)[59] to 750 μg/L (Maine) to 1000 μg/L (Connecticut).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.29$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and the respiratory tract. May affect the central nervous system. *Inhalation:* Human exposures to levels of 350 ppm caused irritation of the nose and throat. Exposure can cause dizziness, lightheadedness, headache, nausea, blurred vision. Numbness in fingers, arms, and legs, accompanied by headache, nausea, vomiting, and fainting have occurred after exposure to levels of 300−600 ppm. *Skin:* Contact can irritate the skin causing rash and burning feeling. Liquid is absorbed readily and may cause numbing of fingers and arms. *Eyes:* Contact can irritate and cause burns and permanent damage. Exposure to levels of 200 ppm produced irritation. *Ingestion:* Can cause irritation of the mouth, throat, and stomach, the severity of which will be dependent upon amount swallowed. Symptoms of poisoning include nausea, vomiting, stomach pain, and diarrhea. Death can occur from ingestion of as little as 1 oz.

Long Term Exposure: Repeated exposure can cause drying and cracking of the skin. Has been implicated in certain nervous system and brain disorders characterized by weakness, fatigue, sleep disturbances, reduced coordination, heaviness in chest, and numbness of hands and feet. These symptoms may develop after 1 year of exposure to vapor concentrations of 50−200 ppm. Improvement is gradual and may take years after exposure is discontinued. Animal tests show that this chemical is a teratogen in animals and possibly causes toxic effects upon human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift. If symptoms develop, or overexposure is suspected, examination of the nervous system is recommended. Special tests for nerve damage, called nerve conduction studies, may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber and chlorobutyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: *Up to 3000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrOv (APF = 10) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions: NIOSH*: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl ethyl ketone must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flame. Sources of ignition, such as smoking and open flames, are prohibited where methyl ethyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of methyl ethyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl ethyl ketone.

Shipping: This compound requires a shipping label: "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.[22]

Methyl ethyl ketoneperoxide M:0930

Molecular Formula: $C_8H_{16}O_4$
Synonyms: 2-Butanone, peroxide; Butanox®; Hi-Point 90; Ketonox; Luperox®; Lupersol; MEKP; MEK peroxide; Methyl ethyl ketone hydroperoxide; NCI-C55447; Peroxido de metil etil cetona (Spanish); Quickset extra; Sprayset MEKP; the rmacure
CAS Registry Number: 1338-23-4
RTECS® Number: EL9450000
UN/NA & ERG Number: UN3101/146; UN3105/145; UN3107/145
EC Number: 215-661-2

Regulatory Authority and Advisory Bodies
Highly Reactive Substance and Explosive (World Bank).[15]
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).
US EPA Hazardous Waste Number (RCRA No.): U160.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Reportable Quantity (RQ): 10 lb (4.54 kg).
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MEKP, an organic peroxide, is a colorless liquid. Molecular weight = 176.24; Specific gravity (H_2O:1) = 1.12 at 15°C; Boiling point = (decomposes) 117.8°C; Freezing/Melting point = about 60°C. Flash point = 52−93°C (oc) 60% MEKP.[52] Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Human Data; Primary Irritant. MEKP is used as a curing agent for thermosetting polyester resins and as a crosslinking agent and catalyst in the production of other polymers.

Incompatibilities: Forms explosive mixture with air (flash point varies). MEKP may exist in several different structures; decomposition temperatures may vary. Pure substance is shock-sensitive. Explosive decomposition above 176°F/80°C (also reported at 230°F/110°C). Keep away from sources of ignition, heat, sunlight. A strong oxidizer. Violent reaction with strong acids, strong bases, reducing agents, combustible substances, organic materials, chemical accelerants, oxides of heavy metals, salts, trace contaminants, amines. May accumulate static electrical charges and cause ignition of its vapors. Commercial product is diluted with 40% dimethyl phthalate, cyclohexane peroxide, or diallyl phthalate to reduce sensitivity to shock.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 7.21 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 0.2 ppm/1.5 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: 0.2 ppm/1.5 mg/m^3 Ceiling Concentration.
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 3 ppm
PAC-2: 20 ppm
PAC-3: 20 ppm
DFG MAK: Produces very severe skin effects. See Section X(a).
Australia: TWA 0.2 ppm (1.5 mg/m^3), 1993; Belgium: STEL 0.2 ppm (1.5 mg/m^3), 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: STEL 0.2 ppm (1.5 mg/m^3), [skin], 1999; France: VLE 0.2 ppm (1.5 mg/m^3), 1999; Norway: TWA 1 mg/m^3, 1999; the Netherlands: MAC 1.5 mg/m^3, 2003; Switzerland: MAK-W 0.2 ppm (1.5 mg/m^3), 1999; United Kingdom: STEL 0.2 ppm (1.5 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.2 ppm. Several states have set guidelines or standards for MEK peroxide in ambient air[60] ranging from 11.0 μg/m^3 (Virginia) to 15.0 μg/m^3 (North Dakota) to 30.0 μg/m^3 (Connecticut and South Dakota) to 36.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3508; OSHA Analytical Method 77.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Methyl ethyl ketone peroxide can affect you when breathed in and by passing through your skin. Contact can irritate the skin, and can cause burn and permanently damage the eyes. Exposure can irritate the nose and throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Methyl ethyl ketone peroxide may affect the liver and kidneys. May cause lung irritation and bronchitis. May cause skin allergy.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function test. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber, Neoprene, and Viton™ are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.2 ppm*, use an NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use an NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive mode.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Methyl ethyl ketone peroxide must be stored to avoid contact with heat, shock, and organics since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from organics. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl ethyl ketone peroxide. Sources of ignition, such as smoking and open flames, are prohibited where methyl ethyl ketone peroxide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Wherever methyl ethyl ketone peroxide is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Shipment of methyl ethyl ketone peroxide, in solution, with >9% by mass active oxygen is FORBIDDEN by any means. Solutions containing less than 9% active oxygen require a shipping label of "ORGANIC PEROXIDE." They fall in DOT Hazard Class 5.2 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. MEKP may be destroyed by adding 20% NaOH solution slowly in a quantity about 10 times the weight of MEKP. Incineration is recommended if NaOH treatment is not used. See the Sax (1985) reference cited below for details.

EC Number: 203-250-0
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: 2-Methyl-5-ethyl pyridine is a colorless liquid with a sharp, aromatic odor. Molecular weight = 121.20; Boiling point = 128°C; Flash point = 39°C; also listed at 68°C; Autoignition temperature = 538°C. Explosive limits: LEL = 1.1%; UEL = 6.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water.
Potential Exposure: In the manufacture of nicotinic acid, vinylpyridine monomer; as intermediates for insecticides, germicides, and textile chemicals.
Incompatibilities: Strong oxidizers, strong acids, aldehydes, strong bases, acid chlorides, chloroformates, isocyanates, phenols, cresols.
Permissible Exposure Limits in Air
No TEEL available.
Russia: MAC 2 mg/m^3.[43]
Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, nausea, vomiting, and diarrhea. Moderately toxic by oral and dermal routes.
Long Term Exposure: May affect the central nervous system causing muscle weakness, loss of coordination, and loss of consciousness.
Points of Attack: Lungs, nervous system.
Medical Surveillance: Consider chest X-ray following acute overexposure. Examination of the nervous system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be

equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, alcohol or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyleugenol M:0945

Molecular Formula: $C_{11}H_{14}O_2$

Synonyms: 4-Allyl-1,2-dimethoxybenzene; 1-Allyl-3,4-dimethoxybenzene; 4-Allylveratrole; Benzene, 4-Allyl-1,2-dimethoxy-; Chavibetol methyl ether; 1,2-Dimethoxy-4-allylbenzene; 3,4-Dimethoxyallylbenzene; 1-(3,4-Dimethoxyphenyl)-2-propene; 3-(3,4-Dimethoxyphenyl) propene; 1,2-Dimethoxy-4-(2-propenyl)benzene; Eugenol methyl ether; 1,3,4-Eugenol methyl ether; Eugenyl methyl ether; Methyl eugenol ether; *o*-Methyleugenol; Veratrole, 4-allyl-; Veratrole methyl ether

CAS Registry Number: 93-15-2

RTECS$^{®}$Number: CY2450000

UN/NA & ERG Number: UN2810

EC Number: 202-223-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical: Cancer 11/16/2001.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R36/38; R40; R42/43; Safety phrases: S2; S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Clear colorless to pale yellow liquid. Spicy, earthy odor. Bitter burning taste. This chemical is combustible. Molecular weight = 178.23; Specific gravity = 1.0396 at 20°C; Vapor density = >1.0; Boiling point = 249°C; 254.7°C at 760 mmHg; Melting point = −4°C; Vapor pressure = 0.02 mmHg at 20°C; 1 mmHg at 85°C; Flash point = 99°C; 109°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability 1; Reactivity 0. Practically insoluble in water; solubility = <1 mg/mL at 66°F; 500 mg/L.

Potential Exposure: Agricultural Chemical and Pesticide; Tumorigen; Mutagen; Primary Irritant. Methyleugenol is a naturally occurring substance found in the essential oils of several plant species. Methyleugenol is used as a flavoring agent in jellies, baked goods, nonalcoholic beverages, chewing gum, candy, pudding, relish, and ice cream. Methyleugenol has been used as an anesthetic in rodents. It is also used as an insect attractant in combination with insecticides.[NTP 2000]

Incompatibilities: When heated to decomposition, it emits acrid smoke, irritating fumes, and toxic fumes of carbon monoxide and carbon dioxide. Methyleugenol is incompatible with strong oxidizers; contact with reducing agents may cause the release of hydrogen gas.

Permissible Exposure Limits in Air: No OELs or TEEL available.

Determination in Air: No NIOSH or OSHA method available.

Permissible Concentration in Water: Not found.

Determination in Water: Bluegill (*Lepomis macrochirus*) $LC_{50} = 8233\ \mu g/L$, Moderately Toxic; Rainbow trout, donaldson trout (*Oncorhynchus mykiss*) $LC_{50} = 6450\ \mu g/L$, Moderately Toxic; octanol−water partition coefficient: Log $K_{ow} = 3.0-3.5$. Organic carbon−water partition coefficient: Log $K_{oc} = 2.7$.

Routes of Entry: Skin, eyes, inhalation, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: This compound is a primary irritant and sensitizer and may cause contact dermatitis. Symptoms of exposure to this compound include nausea, vomiting, diarrhea, circulatory collapse, dizziness, rapid and shallow breathing, unconsciousness, convulsions, abdominal burning, dysuria, hematuria, tachycardia, bronchial irritation, anuria, pulmonary edema, bronchial pneumonia, and renal damage. LD_{50} = (oral-rat) 810 mg/kg; LC_{50} = (inhal.-rat) = >4800 mg/m^3.

Long Term Exposure: This compound may be irritating to the skin and eyes.

Points of Attack: Liver, kidneys, skin, respiratory tract.

Medical Surveillance: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin or respiratory tract allergy.

First Aid: *Eyes*: Consideration should be given to the skin, eyes, and respiratory tract (lung function tests) in any placement or periodic examinations. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin or respiratory tract allergy.

Personal Protective Methods: Wear protective eyeglasses or chemical safety goggles as described in OSHA regulations 29CFR1910.133 or European Standard EN166. Recommended gloves: Ansell 5.109 (Latex); thickness: 0.18 mm; Breakthrough time: *15 min*; Edmont 29-870 (Neoprene); thickness: 0.51 mm; Breakthrough time: *135 min*; North Model F-091 (Viton); thickness: 0.41 mm; Breakthrough time: *480 min*.

Respirator Selection: Follow the regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA- or European Standard EN 149-approved respirator; or follow regulations in OSHA 29CFR1910.134 or European Standard EN 149. Use a NIOSH/MSHA- or European Standard EN 149-approved respirator; or use an approved half face respirator equipped with an organic vapor/acid gas cartridge (specific for organic vapors, HCl, acid gas, and SO_2) with a dust/mist filter.

Storage: Color Code—Green: General storage may be used. You should protect this material from exposure to light, and store it under ambient temperatures.

Shipping: Not regulated.

Spill Handling: First remove all sources of ignition. Then, use absorbent paper to pick up all liquid spill material. All contaminated clothing and absorbent paper should be sealed in a vapor-tight plastic bag for eventual disposal. Solvent wash all contaminated surfaces with 60−70% ethanol followed by washing with a soap and water solution. Do not reenter the contaminated area until the safety officer (or other responsible person) has verified that the area has been properly cleaned.

Fire Extinguishing: Wear a self-contained breathing apparatus in pressure-demand, NIOSH/MSHA- or European Standard EN 149-approved respirator, and full protective gear. During a fire or heated to decomposition, irritating and highly toxic gases may be generated and it emits acrid smoke, irritating fumes, and toxic fumes of carbon monoxide and carbon dioxide. Use water spray to keep fire-exposed containers cool. Containers may explode in the heat of a fire. Extinguishing media; cool containers with flooding quantities of water until well after fire is out. Fires involving this material can be controlled with a dry chemical, carbon dioxide, or Halon extinguisher. A water spray may also be used.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl formate M:0950

Molecular Formula: $C_2H_4O_2$

Common Formula: $HCOOCH_3$

Synonyms: Formiate de methyle (French); Formiato de metilo (Spanish); Formic acid, methyl ester; Methyle (formiate de) (French); Methylformiat (German); Methyl methanoate

CAS Registry Number: 107-31-3

RTECS® Number: LQ8925000

UN/NA & ERG Number: UN1243/129

EC Number: 203-481-7 [*Annex I Index No.*: 607-014-00-1]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F+, Xn; Risk phrases: R12; R20/22; R36/37; Safety phrases: S2; S9; S16; S24; S26; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl formate is a colorless liquid with a pleasant odor. Odor threshold = 2000 ppm. Molecular weight = 60.06; Specific gravity (H_2O:1) = 0.98; Boiling point = 3.7°C; Freezing/Melting point = − 100°C; Vapor pressure = 476 mmHg at 20°C; Flash point = − 18.9°C; Autoignition temperature = 449°C. Explosive limits: LEL = 4.5%; UEL = 23.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Soluble in water; solubility = 30%.

Potential Exposure: Compound Description: Agricultural Chemical. Methyl formate is used as a solvent, as an intermediate in pharmaceutical manufacture, and as a fumigant.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers. Reacts slowly with water to form methanol and formic acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.46 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/250 mg/m^3 TWA.

NIOSH REL: 100 ppm/250 mg/m^3 TWA; 150 ppm/375 mg/m^3 STEL.

ACGIH TLV®[1]: 100 ppm/246 mg/m^3 TWA; 150 ppm/368 mg/m^3 STEL.

NIOSH IDLH: 4500 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 150 ppm

PAC-2: 750 ppm

PAC-3: 4500 ppm

DFG MAK: 50 ppm/120 mg/m^3 TWA; Peak Limitation Category II(4); [skin]; Pregnancy Risk Group C.

Australia: TWA 100 ppm (250 mg/m^3); STEL 150 ppm, 1993; Austria: MAK 100 ppm (250 mg/m^3), 1999; Belgium: TWA 100 ppm (246 mg/m^3); STEL 150 ppm (369 mg/m^3), 1993; Denmark: TWA 100 ppm (250 mg/m^3), 1999; Finland: TWA 100 ppm (250 mg/m^3); STEL 150 ppm (375 mg/m^3), 1999; France: VME 100 ppm (250 mg/m^3), 1999; the Netherlands: MAC-TGG 250 mg/m^3, 2003; Sweden: TWA 100 ppm (250 mg/m^3); STEL 150 ppm (350 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (250 mg/m^3), KZG-W 200 ppm (500 mg/m^3), 1999; Turkey: TWA 100 ppm (250 mg/m^3), 1993; United Kingdom: TWA 100 ppm (250 mg/m^3); STEL 150 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 150 ppm. Several states have set guidelines or standards for methyl formate in ambient air[60] ranging from 2.50−3.75 mg/m^3 (North Dakota) to 4.2 mg/m^3 (Virginia) to 5.0 mg/m^3 (Connecticut) to 5.952 mg/m^3 (Nevada).

Determination in Air: Use NIOSH (II-5) Method #S-291. OSHA Analytical Method PV-2041.

Determination in Water: Octanol−water coefficient: Log $K_{\mathrm{ow}} = -0.2$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Methyl formate can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. Higher levels can irritate the lungs and cause a buildup of fluid (pulmonary edema). This can cause death. High levels attack the nervous system and cause you to become dizzy, lightheaded; and may cause unconsciousness and death.

Long Term Exposure: Prolonged or repeated contact can cause cracking and drying of the skin. Repeated exposure can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Eyes, lungs, central nervous system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* Sa (APF = 10) (any supplied-air respirator). *2500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *4500 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl formate must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, chlorine dioxide, nitrates, and permanganates, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl formate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl formate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl formate. Wherever methyl formate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; atomizing in a suitable combustion chamber.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical: Cancer (methyl hydrazine and its salts) 7/1/92.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl hydrazine is a fuming, colorless liquid with an ammonia-like odor. The odor threshold is 1.3−1.7 ppm. Molecular weight = 46.09; Specific gravity (H_2O:1) = 0.87 at 25°C; Boiling point = 87.8°C; Freezing/Melting point = −52.2°C; Vapor pressure = 38 mmHg at 20°C; Flash point = −8.3°C; Autoignition temperature = 194°C. Explosive limits: LEL = 2.5%; UEL = 92.0%.[17] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 2. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. MMH has been used as the propellant in liquid propellant rockets; it is also used as a solvent and as an organic intermediate.

Incompatibilities: Forms explosive mixture with air. Highly reactive reducing agent and a medium strong base. May explode if heated or when in contact with metal oxides. Violent reaction with strong oxidizers, such as fluorine, chlorine, combustibles, nitric acid, hydrogen peroxide. Incompatible with acids, alcohols, glycols, isocyanates, phenols, cresols, porous materials, such as earth, asbestos, wood, and cloth. Oxides of iron or copper, manganese, lead, copper, or their alloys can lead to fire and explosions. Attacks cork, some plastics, coatings, and rubber.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.89 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.2 ppm/0.35 mg/m^3 Ceiling Concentration [skin].

NIOSH REL: 0.04 ppm/0.08 mg/m^3 [120 min] Ceiling Concentration; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.01 ppm/0.019 mg/m^3 [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: potential occupational carcinogen 20 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.01 ppm

PAC-1: 0.2 ppm

PAC-2: **0.9** ppm

PAC-3: **2.7** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] danger of skin sensitization.

Australia: TWA 0.2 ppm (0.35 mg/m^3), [skin], carcinogen, 1993; Belgium: STEL 0.2 ppm (0.38 mg/m^3), [skin], Carcinogen 1993; Denmark: TWA 0.04 ppm (0.08 mg/m^3), [skin], 1999; Finland: STEL 0.2 ppm (0.35 mg/m^3), [skin], 1999; France: VME 0.2 ppm (0.35 mg/m^3), 1999; Norway: TWA 0.08 mg/m^3, 1999; the Netherlands: MAC 0.35 mg/m^3, [skin], 2003; Poland: MAC (TWA) 0.02 mg/m^3, MAC (STEL) 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.2 ppm (0.35 mg/m^3), [skin], 1999; Thailand: TWA 0.2 ppm (0.35 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for methyl hydrazine in ambient air[60] ranging from zero (Maryland, North Dakota, and Texas) to 0.88 μg/m^3 (Pennsylvania) to 1.17 μg/m^3 (New York) to 1.75 μg/m^3 (South Carolina) to 3.5 μg/m^3 (Virginia) to 8.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3510.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 5 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log K_{ow} = −1.03.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, respiratory tract; and if ingested, may cause permanent damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system, liver, and blood, causing excitability, vomiting, tremors, convulsions, formation of methemoglobin, and death. Exposure at high concentrations may result in death. The effects may be delayed. Symptoms of acute exposure to methyl hydrazine may include facial numbness, facial swelling, and increased salivation. Headache, twitching, seizure, convulsions, and coma may also occur. Gastrointestinal signs and symptoms include anorexia, nausea, and vomiting. Methyl hydrazine is toxic to the liver, ruptures red blood cells; and may cause kidney damage. Methyl hydrazine vapors are extremely toxic and the liquid is corrosive to skin. Methyl hydrazine is the strongest convulsant and the most toxic of methyl-substituted hydrazine derivatives. It is more toxic than hydrazine. At high doses, it is a strong central nervous system poison.

Long Term Exposure: May damage the liver, kidneys, and blood, resulting in formation of methemoglobin. This substance causes liver cancer in animals and is possibly carcinogenic to humans.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, blood, cardiovascular system. Cancer site in animals: lung, liver, blood vessels, and intestine.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; pulmonary function tests. Before beginning employment and at regular times after that, the following is recommended: complete blood count. If symptoms develop or overexposure has occurred, the following may be useful: consider lung function tests, especially if lung symptoms are present. Test for kidney and liver function. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: Responder™ suits; Trychem 1000™ suits. Also, Viton™, chlorobutyl rubber, and CR-39® may offer some protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl hydrazine must be stored to avoid contact with oxides of iron and copper; manganese, lead, and copper alloys; porous materials (such as earth, asbestos, wood, and cloth); oxidizers (such as perchlorates, hydrogen peroxide, chlorates, nitrates, permanganates); and fuming nitric acid since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and sparks. Sources of ignition, such as smoking and open flames, are prohibited where methyl hydrazine is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl hydrazine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl hydrazine. Wherever methyl hydrazine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances
Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.4/0.6

Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 1.5/2.4

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. For small fires, use dry chemical, carbon dioxide, water spray, and alcohol foam. For large fires, use water spray, fog, or foam. Keep unnecessary people away and isolate the hazardous area. Stay upwind and keep out of low-lying areas. Fire exposed containers should be kept cool with water. Use water spray to disperse vapors and protect responders attempting to stop a leak which has not ignited. Move container from fire area if it can be done without risk. Wear positive pressure breathing apparatus and special (full) protective clothing. No skin surface should be exposed. See "Isolation Distances" above. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. There are two alternatives[24]: Dilute with water, neutralize with sulfuric acid, then flush to sewer with large volumes of water or incinerate with added flammable solvent in furnace equipped with afterburner and alkaline scrubber.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl iodide is a colorless liquid with a pungent, ether-like odor. Turns yellow, red, or brown on exposure to light and moisture. Molecular weight = 141.94; Specific gravity (H_2O:1) = 2.28; Boiling point = 42.8°C; Vapor pressure = 400 mmHg; Freezing/Melting point = − 66.7°C. It is noncombustible. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 1%.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Methyl iodide is used in fire extinguishers; as an intermediate in the manufacture of pharmaceuticals and some pesticides.

Incompatibilities: Violent reaction with strong oxidizers, strong bases, trialkylphosphines, silver chlorite, oxygen, sodium. Decomposes at 270°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.80 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/28 mg/m^3 TWA [skin].

NIOSH REL: 2 ppm/10 mg/m^3 TWA [skin]; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 2 ppm/12 mg/m^3 TWA [skin].

NIOSH IDLH: potential occupational carcinogen 100 ppm.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 25 ppm

PAC-2: 50 ppm

PAC-3: 125 ppm

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 2 ppm (10 mg/m^3), [skin], carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 2 ppm (12 mg/m^3), [skin], Carcinogen 1993; Denmark: TWA 1 ppm (5.6 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (28 mg/m^3); STEL 10 ppm (56 mg/m^3), [skin], 1999; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 10 mg/m^3, [skin], 2003; Poland: MAC (TWA) 10 mg/m^3; MAC (STEL) 30 mg/m^3, 1999; Sweden: NGV 1 ppm (6 mg/m^3), KTV 5 ppm (30 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-W 0.3 ppm (2 mg/m^3), [skin], carcinogen, 1999; United Kingdom: TWA 2 ppm (12 mg/m^3), [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm [skin].

Determination in Air: Use NIOSH Analytical Method #1014.[18]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.63.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Methyl iodide can affect you when breathed in and by passing through your skin. Methyl iodide is a carcinogen; handle with extreme caution. Contact can irritate the eyes and cause severe skin burns. It can cause brain damage leading to disorientation and psychotic behavior. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may cause nausea, vomiting, diarrhea, dizziness, slurred speech, visual disturbances, irritability, loss of muscle control, drowsiness, delirium, serious mental disorders, coma, and death.

Long Term Exposure: Can cause lung irritation and bronchitis. May cause kidney damage. May affect the brain leading to disorientation and personality changes. Exposure can cause nausea, vomiting, vertigo (an illusion of movement), ataxia, slurred speech, drowsiness, dermatitis. A potential occupational carcinogen.

Points of Attack: Eyes, skin, respiratory system, kidneys, central nervous system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests; kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider urine test for iodine. Consider chest X-ray after acute overexposure. Evaluate for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: Viton™ gloves, suits; Responder™ suits; Trychem 1000™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.5/0.8

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Methyl iodide itself does not burn. Poisonous gases, including iodine, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 203-737-8 [*Annex I Index No.*: 606-026-00-4]
Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20; Safety phrases: S2; S23; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MIAK is a colorless liquid with a pleasant, fruity odor. Molecular weight = 114.21; Specific gravity (H_2O:1) = 0.81; Boiling point = 144°C; Freezing/Melting point = − 74°C; Vapor pressure = 5 mmHg at 20°C; Flash point = 36.1°C (cc); Autoignition temperature = 191°C. Explosive limits: LEL = 1.0% at 93.3°C; UEL = 8.2% at 93.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: Compound Description: Agricultural Chemical; Primary Irritant. MIAK is used as a solvent for cellulose esters, acrylics, and vinyl copolymers.

Incompatibilities: Reacts violently with strong oxidizers, strong bases, amines, and isocyanates. Attacks some plastic.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/475 mg/m^3 TWA.
NIOSH REL: 50 ppm/240 mg/m^3 TWA.
ACGIH TLV®[1]: 50 ppm/234 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 100 ppm
PAC-1: 150 ppm
PAC-2: 1500 ppm
PAC-3: 1500 ppm

DFG MAK: 10 ppm/47 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Pregnancy Risk Group D.

Australia: TWA 50 ppm (240 mg/m^3), 1993; Belgium: TWA 50 ppm (234 mg/m^3), 1993; Denmark: TWA 50 ppm (230 mg/m^3), 1999; Finland: TWA 50 ppm (230 mg/m^3); STEL 75 ppm (350 mg/m^3), 1999; France: VME 50 ppm (240 mg/m^3), 1999; Norway: TWA 25 ppm (115 mg/m^3), 1999; Sweden: TWA 25 ppm (120 mg/m^3); STEL 50 ppm (250 mg/m^3), 1999; the Netherlands: MAC-TGG 233 mg/m^3, 2003; United Kingdom: TWA 50 ppm (237 mg/m^3); STEL 100 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 50 ppm. In addition, Several states have set guidelines or standards for MIAK in ambient air[60] ranging from 2.4 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 4.6 mg/m^3 (Connecticut) to 5.714 mg/m^3 (Nevada).

Determination in Air: OSHA Analytical Method PV-2042.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.72 (estimated).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl isoamyl ketone can affect you when breathed in and by passing through your skin. Exposure can cause you to become dizzy, lightheaded, and to pass out. Contact can irritate the eyes and skin. Repeated exposure can cause a skin rash. Methyl isoamyl ketone vapors can irritate the nose and throat. MIAK may affect the kidneys.

Long Term Exposure: Skin contact causes skin rash and drying and cracking. High exposures may cause liver damage and may affect the kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: NIOSH: *Up to 500 ppm*: CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa* (APF = 10) (any supplied-air respirator). *Up to 1250 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 2500 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 5000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong oxidizers (such as chlorine, bromine, and fluorine), reducing agents, and aldehydes. Sources of ignition, such as smoking and open flames, are prohibited where methyl isoamyl ketone is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl isoamyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Shipping: 5-Methylhexan-2-one compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi; Risk phrases: R10; R37; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MIBC is a colorless liquid with a mild odor. The odor threshold is 0.52 ppm. Molecular weight = 102.20; Specific gravity (H_2O:1) = 0.81; Boiling point = 132.8°C; Freezing/Melting point = − 90°C; Vapor pressure = 3 mmHg at 20°C; Flash point = 41°C. The explosive limits are LEL = 1.0%; UEL = 5.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: MIBC is used as a solvent; in the formulation of brake fluids; as an intermediate in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Contact with alkali metals produces hydrogen gas. Incompatible with strong oxidizers, strong acids, caustics, aliphatic amines, isocyanates.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.18 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/100 mg/m^3 TWA [skin].

NIOSH REL: 25 ppm/100 mg/m^3 TWA; 40 ppm/165 mg/m^3 STEL [skin].

NIOSH IDLH: 400 ppm.

No TEEL available.

DFG MAK: 20 ppm/85 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

Australia: TWA 25 ppm (100 mg/m^3); STEL 40 ppm, [skin], 1993; Austria: MAK 25 ppm (50 mg/m^3), [skin], 1999; Belgium: TWA 25 ppm (104 mg/m^3); STEL 40 ppm, [skin] 1999; Denmark: TWA 25 ppm (100 mg/m^3), [skin], 1999; Finland: TWA 25 ppm (100 mg/m^3); STEL 40 ppm (170 mg/m^3), [skin], 1999; France: VME 25 ppm (100 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 100 mg/m^3, [skin], 2003; Russia: STEL 10 mg/m^3, [skin], 1993; Poland: MAC (TWA) 100 mg/m^3; MAC (STEL) 160 mg/m^3, 1999; Switzerland: TWA 25 ppm (100 mg/m^3); STEL 125 ppm, [skin], 1993; Switzerland: MAK-W 25 ppm (100 mg/m^3), KZG-W 125 ppm (500 mg/m^3), [skin], 1999; United Kingdom: TWA 25 ppm (106 mg/m^3); STEL 40 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 40 ppm [skin]. North Dakota has set a guideline of 1.0−1.65 mg/m^3 for MIBC in ambient air.[60]

Determination in Air: Use NIOSH Analytical Method #1402, alcohols II; #1405; OSHA Analytical Method 7.[18]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.4.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: MIBC can affect you when breathed in and by passing through your skin. Breathing the vapor can irritate the eyes, nose, and throat. Contact with the liquid can burn the eyes and can irritate the skin. Exposure to high concentrations can cause you to feel dizzy, lightheaded, and to pass out.

Long Term Exposure: Long-term contact can cause drying and cracking of the skin.

Points of Attack: Eyes, skin, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), expired air, pulmonary function tests; urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite) end-of-work-week.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *250 ppm:* Sa (APF = 10) (any supplied-air respirator). *400 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv

(APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl amyl alcohol must be stored to avoid contact with peroxides, chlorates, perchlorates, permanganates, and nitrates since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl amyl alcohol is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; other, more flammable solvent may be added.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Available data are inadequate for an assessment of human carcinogenic potential.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

US EPA Hazardous Waste Number (RCRA No.): U161.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.14; Nonwastewater (mg/kg), 33.

Safe Drinking Water Act: Priority List (55 FR 1470).

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xn; Risk phrases: R11; R20; R36/37; R66; Safety phrases: S2; S9; S16; S29 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MIBK is a colorless liquid with a pleasant, sweet, fruity odor. The odor threshold is 0.88 ppm. Molecular weight = 100.18; Specific gravity (H_2O:1) = 0.80; Boiling point = 116.7°C; Freezing/Melting point = −84.4°C; Vapor pressure = 16 mmHg at 20°C; Flash point = 18°C; Autoignition temperature: 450°C. Explosive limits: LEL = 1.2% at 93°C; UEL = 8.0% at 93°C. Hazard Identification (based on NFPA-704 M Rating

System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water; solubility = 2%.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Human Data; Primary Irritant. MIBK is used as a solvent; a denaturant; and as an extractant; in the manufacture of methyl amyl alcohol; as a solvent in paints, varnishes, and lacquers; as an alcohol denaturant; as a solvent in uranium extraction from fission products.

Incompatibilities: Able to form unstable and explosive peroxides on contact with air. Reacts violently with strong oxidizers, potassium *tert*-butoxide, strong acids, aliphatic amines, reducing agents.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.10 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/410 mg/m^3 TWA.

NIOSH REL: 50 ppm/205 mg/m^3 TWA; 75 ppm/300 mg/m^3 STEL.

ACGIH TLV®[1]: 20 ppm/82 mg/m^3 TWA; 75 ppm/307 mg/m^3 STEL; BEI issued.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 75 ppm

PAC-2: 75 ppm

PAC-3: 500 ppm

DFG MAK: 20 ppm/83 mg/m^3 Peak Limitation Category I (2) [skin]; Pregnancy Risk Group C; BAT: 3.5 mg[hexone]/L in urine/end-of-shift.

Compound Description: Tumorigen; Reproductive Effector; Human Data; Primary Irritant.

Austria: MAK 100 ppm (400 mg/m^3), 1999; Denmark: TWA 25 ppm (100 mg/m^3), [skin], 1999; France: VME 50 ppm (205 mg/m^3), 1999; Japan: 50 ppm (105 mg/m^3), [skin], 1999; Norway: TWA 25 ppm (105 mg/m^3), 1999; Poland: MAC (TWA) 200 mg/m^3; MAC (STEL) 300 mg/m^3, 1999; Sweden: NGV 25 ppm (100 mg/m^3), KTV 50 ppm (200 mg/m^3), 1999; the Netherlands: MAC-TGG 104 mg/m^3, 2003. For ambient air in residential areas: The Czech Republic[35]: MAC of 0.2 mg/m^3 both on a momentary and a daily average basis; Russia[35]: MAC of 0.1 mg/m^3 on a once daily basis. Several states have set guidelines or standards for MIBK in ambient air[60] ranging from 0.28 mg/m^3 (Massachusetts) to 0.683 mg/m^3 (New York) to 2.05 mg/m^3 (Florida, North Dakota, South Carolina) to 2.50 mg/m^3 to 3.4 mg/m^3 (Virginia) to 4.1 mg/m^3 (Connecticut) to 4.76 mg/m^3 (Nevada) to 30.8 mg/m^3 (North Carolina).

Determination in Air: Charcoal adsorption, workup with CS_2; analysis by gas chromatography/flame ionization. See NIOSH (I) Method #1300, Ketones; #2555; OSHA Analytical Method 1004.[18]

Permissible Concentration in Water: The state of Massachusetts has set[61] a guideline of 40 μg/L (0.04 mg/L) for MIBK in drinking water. Russia has set a limit of 0.2 mg/L in surface water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl isobutyl ketone can affect you when breathed in. Exposure to high concentrations can cause you to feel dizzy and lightheaded, and to pass out. Breathing the vapor may cause loss of appetite, nausea, vomiting, and diarrhea. Contact or the vapor can irritate the eyes, nose, mouth, throat. Contact can irritate the skin. Ingestion caused chemical pneumonitis.

Long Term Exposure: Long-term exposure may damage the liver and kidneys. Repeated or prolonged contact with skin may cause drying and cracking.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and styrene−butadiene rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl isobutyl ketone must be stored to avoid contact with strong oxidizers because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, and flames. Sources of ignition, such as smoking and open flames, are prohibited where methyl isobutyl ketone is used, handled, or stored in a manner that could crate a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of methyl isobutyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl isobutyl ketone.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.[22]

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl isocyanate is a colorless liquid with a sharp odor which is a lachrymator (causes tears). Molecular weight = 57.06; Specific gravity (H_2O:1) = 0.96; Boiling point = 38.8−40°C; Freezing/Melting point = −45°C; Vapor pressure = 348 mmHg at 20°C; Flash point = −7°C; Autoignition temperature = 534°C. Explosive limits: LEL = 5.3%; UEL = 26°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 2. Reacts with water; solubility = 10% at 15°C.

Potential Exposure: Methyl isocyanate is used in carbamates and as chemical intermediate; in the manufacture of a wide variety of pesticides; in the production of polyurethane foams and plastics. A release of this chemical was involved in the world's largest chemical accident, causing the death of thousands of industrial workers in 1984 in Bhopal, India.

Incompatibilities: Rapid reaction in the presence of acid, alkalis, amine, iron, tin, copper, their salts, or their catalysts (such as triphenylarsenic oxide, triethylphosphine, and tributyltin oxide). Exothermic reaction with water, producing carbon dioxide, highly flammable and air-reactive methylamine, dimethylurea, and/or trimethyl biuret. The reaction with water is slow at ≤20°C but violent at elevated temperatures and/or in the presence of acids and bases. Elevated temperatures may cause polymerization; usually contains inhibitors to prevent polymerization. Reacts with water, acids, alcohols, glycols, amines, amides, ammonia, caprolactum, caustics, strong oxidizers. Attacks some plastics, rubber, or coatings. Attacks some forms of plastic, rubber, and coatings.

Permissible Exposure Limits in Air

Austria: MAK 0.01 ppm (0.025 mg/m^3), 1999; Belgium: TWA 0.02 ppm (0.047 mg/m^3), [skin], 1993; Denmark: TWA 0.01 ppm (0.03 mg/m^3), [skin], 1999; France: VME 0.02 ppm (0.05 mg/m^3), [skin], 1999; Hungary: TWA 0.05 mg/m^3; STEL 0.06 mg/m^3, [skin], 1993; Norway: TWA 0.005 ppm (0.015 mg/m^3), 1999; the Netherlands: MAC-TGG 0.05 mg/m^3, [skin], 2003; Russia: STEL 0.05 mg/m^3, [skin], 1993; Sweden: TWA 0.005 ppm, ceiling 0.01 ppm, 1999; Switzerland: MAK-W 0.01 ppm (0.025 mg/m^3), KZG-W 0.02 ppm (0.05 mg/m^3), 1999; United Kingdom: TWA 0.02 mg[NCO]/m^3; STEL 0.07 mg [NCO]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.02 ppm [skin]. Several states have set guidelines or standards for methyl isocyanate in ambient air[60] ranging from 0.17 μg/m^3 (New York) to 0.5 μg/m^3 (North Dakota) to 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (Connecticut and South Dakota).

Determination in Air: Use OSHA Analytical Method 54.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Corrosive to the respiratory tract. Causes irritation of eyes, nose, throat, and lungs, bronchitis, cough, shortness of breath, increased secretions, chest pain, difficulty in breathing, and increased blood acidity. Allergic reactions may occur and trigger asthmatic response in sensitized individuals. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Results of human volunteer experiments indicate the exposure for 1−5 min at 0.4 ppm causes no irritation of eyes, nose, or throat; at 2 ppm, irritation and tearing; at 4 ppm, stronger symptoms; and at 21 ppm exposure is unbearable; NIOSH reports that 3 ppm is immediately dangerous to life and health (IDLH). Improvement will occur in a few days if the dose is very low, and proper supportive therapy is given. At higher doses and longer durations of exposure, death may be immediate or delayed more than a month. *Skin:* Corrosive. Extremely irritating; can cause chemical burns. *Eyes:* Corrosive to the eyes. Levels of 2 ppm may cause irritation and tearing. Ulceration has occurred at high levels.

Very high levels may lead to permanent damage and blindness. *Ingestion:* Corrosive; causes vomiting, diarrhea, and abdominal pain.

Long Term Exposure: May cause allergic sensitization of skin and respiratory tract. Subsequent exposure even at extremely low levels may cause asthma attacks. May cause chronic lung disease and increased susceptibility to lung infection. May affect the lungs, causing tissue lesions. Exposure may cause miscarriages among pregnant women.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal at first if person is not having an attack at the time. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: Warning: Effects may be delayed for up to 15 h. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: Prevent skin contact. **8 h**: polyvinyl alcohol gloves; Barricade™ coated suits; Responder™ suits, Trellchem™ HPS suits; Trychem 1000™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.2 ppm:* Sa (APF = 10) (any supplied-air respirator). *0.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *1 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *3 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl isocyanate must be stored to avoid contact with water, acid, alkali, amines; or iron, tin, copper (or their salts); and certain other catalysts since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water or heat. Sources of ignition, such as smoking and open flames, are prohibited where methyl isocyanate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl isocyanate should be grounded and bonded. Drums must be quipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl isocyanate. Wherever methyl isocyanate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. For spills up to 5 gallons, cover with 6 in. of activated carbon for each 1 in. of liquid depth and let stand. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Do not use water* or wet method. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.1/1.8
Night 3.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0+/11.0+
Night 7.0+/11.0+

Fire Extinguishing: This chemical is a flammable liquid. Use dry chemical, carbon dioxide, or alcohol foam. *Do not use water*. Material is extremely hazardous to health but areas may be entered with extreme care. Full protective clothing, including self-contained breathing apparatus (coat, pants, gloves, boots, and bands around legs, arms, and waist), should be provided. No skin surface should be exposed. Poisonous gases, including hydrogen cyanide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Stay away from ends of tanks. Do not get water inside container. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Spray cooling water on containers that are exposed to flames until well after fire is out. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration in the presence of a flammable solvent.[22] A flue gas scrubber is recommended as well.

Methyl isopropyl ketone M:1020

Molecular Formula: $C_5H_{10}O$

Common Formula: $CH_3COCH(CH_3)_2$

Synonyms: 2-Acetyl propane; Isopropyl methyl ketone; 3-Methyl-2-butanone; 3-Methyl butan-2-one; MIPK

CAS Registry Number: 563-80-4

RTECS® Number: EL9100000

UN/NA & ERG Number: UN2397/127

EC Number: 209-264-3 [*Annex I Index No.:* 606-007-00-0]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F; Risk phrases: R11; Safety phrases: S2; S9; S16; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MIPK is a colorless liquid with an acetone-like odor. Molecular weight = 86.15; Specific gravity (H_2O:1) = 0.81; Boiling point = 93°C. Freezing point = − 92°C; Vapor pressure = 42 mmHg at 20°C; Flash point = 6°C; Autoignition temperature = 475°C. Explosive limits: LEL = 1.2%; UEL = 8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water; solubility = 0.5% at 20°C.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. This ketone is used as a solvent for nitrocellulose lacquers.

Incompatibilities: Violent reaction with oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 200 ppm/705 mg/m^3 TWA.

ACGIH TLV®[1]: 200 ppm/705 mg/m^3 TWA; Notice of intended change: 20 ppm.

Protective Action Criteria (PAC)

TEEL-0: 200 ppm

PAC-1: 200 ppm

PAC-2: 200 ppm

PAC-3: 600 ppm

Australia: TWA 200 ppm (705 mg/m^3), 1993; Belgium: TWA 200 ppm (705 mg/m^3), 1993; Denmark: TWA 200 ppm (705 mg/m^3), 1999; Finland: TWA 200 ppm (700 mg/m^3); STEL 250 ppm (875 mg/m^3), 1999; France: VME 200 ppm (705 mg/m^3), 1999; Norway: TWA 100 ppm (350 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (720 mg/m^3), 1999; the Netherlands: MAC-TGG 705 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 200 ppm. Several states have set guidelines or standards for MIPK in ambient air[60] ranging from 7.05 mg/m^3 (North Dakota) to 11.75 mg/m^3 (Virginia) to 14.1 mg/m^3 (Connecticut) to 16.786 mg/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Routes of Entry: Inhalation of vapor, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye, nose, throat, and skin irritation. In high concentrations, narcosis may be produced with symptoms of headache, nausea, vomiting, lightheadedness, dizziness, a lack of coordination, narcosis, and unconsciousness.

Long Term Exposure: Removes the skin's natural oils; causes drying and cracking.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.

Respirator Selection: Where there is potential for exposures *over 200 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with an organic vapor cartridge/canister. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from aldehydes. Sources of ignition, such as smoking and open flames, are prohibited where methyl isopropyl ketone is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only non-sparking tools and equipment, especially when opening and closing containers of methyl isopropyl ketone. Wherever methyl isopropyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

EC Number: 209-132-5 [*Annex I Index No.:* 615-002-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R23/25; R34; R43; R50/53; Safety phrases: S1/2; S36/37; S38; S45; S60, S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Methyl isothiocyanate is a crystalline solid with a horseradish odor. Molecular weight = 73.12; Boiling point = 119°C; Freezing/Melting point = 35−36°C; Flash point = 32°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: It is used as a soil fumigant. A mixture of methyl isothiocyanate and chlorinated C-3 hydrocarbons is used as a soil fumigant for control of weeds, fungi, insects, and nematodes.

Incompatibilities: Unstable and reactive; sensitive to oxygen and to light. Incompatible with oxidizers, strong acids, alcohols, strong bases, amines, water, heat, and cold. Attacks iron, zinc, and other metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 33 mg/m^3

PAC-3: 500 mg/m^3

Russia[43] set a MAC of 0.1 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Highly irritating to the eyes, skin, and mucous membranes. Coughing, wheezing, and/or shortness of breath and other symptoms of extreme pulmonary irritation would be expected if vapors are inhaled. Very high exposures may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause headache, dizziness, depression, seizures, and even loss of consciousness. This material is very toxic; probable human oral lethal dose is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 70-kg (150 lb) person. Human oral minimum lethal dose: approximately 1 g/kg.

Long Term Exposure: May cause skin allergy and bronchitis. May affect the thyroid gland.

Points of Attack: Lungs, skin, thyroid.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Evaluation of thyroid function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyl isothiocyanate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where methyl isothiocyanate is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I. This material carries a plus sign (+), indicating that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and wash area following cleanup. Ventilate and wash spill areas when cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.5/0.8

Fire Extinguishing: Methyl isothiocyanate is a flammable solid. Poisonous gases are produced in fire, including cyanides, sulfur oxides, and nitrogen oxides. Use dry chemical, CO_2, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

DFG MAK: 0.5 ppm/1.0 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Australia: TWA 0.5 ppm (1 mg/m^3), 1993; Austria: MAK 0.5 ppm (1 mg/m^3), 1999; Belgium: TWA 0.5 ppm (0.98 mg/m^3), 1993; Denmark: TWA 0.5 ppm (1 mg/m^3), 1999; Finland: TWA 0.5 ppm (1 mg/m^3); STEL 1.5 ppm (3 mg/m^3), 1999; France: VME 0.5 ppm (1 mg/m^3), 1999; Hungary: STEL 1 mg/m^3, 1993; the Netherlands:

MAC-TGG 1 mg/m^3, 2003; Norway: TWA 0.5 ppm (1 mg/m^3), 1999; the Philippines: TWA 10 ppm (20 mg/m^3), 1993; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 2 mg/m^3, 1999; Russia: STEL 0.8 mg/m^3, 1993; Sweden: NGV 1 ppm, 1999; Switzerland: MAK-W 0.5 ppm (1 mg/m^3), KZG-W 1 ppm (2 mg/m^3), 1999; Thailand: TWA 10 ppm (20 mg/m^3), 1993; Turkey: TWA 10 ppm (20 mg/m^3), 1993; United Kingdom: TWA 0.5 ppm (1 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm. Russia[43] set a MAC of 9×10^{-6} mg/m^3 in ambient air in residential areas on a momentary basis. Several states have set guidelines or standards for methyl mercaptan in ambient air[60] ranging from 3.3 μg/m^3 (New York) to 10 μg/m^3 (Florida, North Dakota, South Carolina) to 16 μg/m^3 (Virginia) to 20 μg/m^3 (Connecticut) to 24 μg/m^3 (Nevada) to 50 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2542, Mercaptans; OSHA Analytical Method 26.

Permissible Concentration in Water: EPA[32] has suggested a permissible ambient goal of 13.8 μg/L based on health effects. Russia[43] set a MAC of 0.2 μg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact can cause frostbite. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system. Signs and symptoms of acute exposure to methyl mercaptan may include fever, cough, shortness of breath, a feeling of tightness and burning in the chest, respiratory distress, respiratory paralysis, and respiratory failure/collapse. Headache, loss of the sense of smell, dizziness, staggering gait, and heightened emotions may occur. Gastrointestinal symptoms include difficulty in swallowing, redness of the tongue and pharynx, nausea, vomiting, abdominal pain, and diarrhea. Urinary disturbances may also be found.

Long Term Exposure: May cause liver and kidney damage. Repeated exposure may cause bronchitis. Memory loss, damage to the central and peripheral nervous systems, tremor, convulsions, and coma may also occur. May affect the blood cell causing anemia.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys, central nervous system, blood.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver function tests. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid: **8 h:** Barricade™ coated suits; Responder™ suits; Trychem 1000™ suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear the proper chemical goggles (indirect vent, impact and slash resistant with liquids; nonvented, impact resistant with fumes, gases, or vapors) and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *12.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *25 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl mercaptan must be stored to avoid contact with water, steam, or strong acids (such as hydrochloric, sulfuric, and nitric) because toxic flammable vapors will be released. It should not contact oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat or sparks. Sources of ignition, such as smoking and open flames, are prohibited where methyl mercaptan is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyl mercaptan should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl mercaptan. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Methyl mercaptan requires a shipping label of “POISON GAS, FLAMMABLE GAS.” It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to “knock down” vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.8/1.2
Night 2.6/4.1

Fire Extinguishing: Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Evacuate area endangered by gas. See isolation distances above. Combustion produces irritating sulfur dioxide. Very dangerous when exposed to heat, flame, or oxidizers. On decomposition it emits highly toxic fumes of sulfur oxides. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in

OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration followed by effective scrubbing of the effluent gas.

EC Number: 207-935-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as mercury and compounds.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

California Proposition 65 Chemical: Cancer 5/1/96; Developmental/Reproductive toxin 7/1/87.

California Proposition 65 Developmental/Reproductive toxin (mercury and mercury compounds) 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as mercury compounds.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as mercury compounds, including inorganic mercury compounds, alkyl mercury compounds and alkyloxylalkyl and aryl mercury compounds).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methylmercuric dicyanamide is a crystalline solid. Molecular weight = 298.72; Freezing/Melting point = 156°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This material is used as a fungicide, a seed, soil, and turf treatment especially for cereals, sorghum, sugar beets, cotton, and flax. Not registered as a pesticide in the United States.

Permissible Exposure Limits in Air: As organo mercury compound.

OSHA PEL: 0.01 mg[Hg]/m^3 TWA; 0.04 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.01 mg[organomercury]/m^3 TWA; 0.03 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg[Hg]/m^3 TWA; 0.03 mg/m^3 STEL [skin].

NIOSH IDLH: 2 mg[Hg]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0149 mg/m^3

PAC-1: 0.0447 mg/m^3

PAC-2: 2.98 mg/m^3

PAC-3: 2.98 mg/m^3

DFG MAK: 0.01 mg[Hg]/m^3 [skin] Danger of skin sensitization; Carcinogen Category 3.

In addition, North Dakota has set a guideline of 1−3 μg/m^3 for alkyl mercury compounds in ambient air.[60]

Determination in Air: No method available.

Permissible Concentration in Water: *Methylmercury: To protect freshwater aquatic life:* 0.016 μg/L as a 24-h average, never to exceed 8.8 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 2.8 μg/L. *To protect human health:* 0.2 μg/L.[6]

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Alkyl mercury compounds are primary skin irritants and may cause dermatitis. When deposited on the skin, they give no warning, and if contact is maintained, can cause second-degree burns and blisters. Sensitization may occur. In the case of ingestion there is nausea and abdominal pain. Vomiting and diarrhea may occur. Burning or prickling of the lips, tongue, and extremities. The patient may be confused, hallucinated, and irritated; have disturbed sleep; loss of muscular coordination; and memory loss. Visual fields may narrow concentrically; emotional instability may occur as well as inability to concentrate, with stupor and coma. Methylmercuric dicyanamide is extremely toxic to humans. The probable lethal dose for humans is 5−50 mg/kg of body weight (between 7 drops and 1 teaspoon for a 150-lb person). Humans may be poisoned by feeding on the flesh of animals that have ingested this fungicide. Eating treated seeds may also cause poisoning. The poisoning may show delayed manifestations on the nervous system. Patients frequently become gradually worse after their illness is recognized and exposure is stopped.

Long Term Exposure: Repeated or prolonged contact with skin may result in dermatitis (red inflamed skin). Repeated or prolonged exposure may cause death by hypovolemic shock, nephrotic syndrome, or kidney failure. The central nervous system, including the brain, is the principal target tissue for this group of toxic compounds. Severe poisoning may produce irreversible brain damage resulting in loss of higher functions. The effects of chronic poisoning with alkyl mercury compounds are progressive. In the early stages, there are fine tremors of the hands, and in some cases, of the face and arms. With continued exposure, tremors may become coarse and convulsive; scanning speech with moderate slurring and difficulty in pronunciation may also occur. The worker may then develop an unsteady gait of a spastic nature which can progress to severe ataxia of the arms and legs. Sensory disturbances, including tunnel vision, blindness, and deafness, are also common. A late symptom, constriction of the visual fields, is rarely reversible and may be associated with loss of understanding and reason which makes the victim completely out of touch with his environment. Severe cerebral effects have been seen in infants born to mothers who had eaten large amounts of methylmercury-contaminated fish.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended: eye examination. Consider lung function tests for persons with frequent exposure. Examination of the nervous system. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider nerve conduction tests, urinary enzymes and neurobehavioral test. After suspected illness or overexposure, repeat the tests above and get a blood test for mercury. Examination of the central nervous system and kidneys. Consideration should be given to the possible effects on the fetus of alkyl mercury exposure in the mother. Constriction of visual fields may be a useful diagnostic sign. Blood and urine levels of mercury have been studied, especially in the case of methylmercury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m^3:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m^3:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Mercury-based pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete.

It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. Fire and runoff from fire control water may produce irritating or poisonous gases of mercury and nitrogen oxides. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl methacrylate is a colorless liquid with an acrid, fruity odor. The odor threshold is 0.05−0.083 ppm. Molecular weight = 100.13; Specific gravity (H_2O:1) = 0.94; Boiling point = 100°C; Freezing/Melting point = −48°C; Vapor pressure = 29 mmHg at 20°C; Flash point = 10°C; Autoignition temperature = 421°C. Explosive limits: LEL = 1.7%; UEL = 8.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble in water; solubility = 1.5%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Virtually all of the methyl methacrylate monomer produced is used in the production of polymers, such as surface coating resins, plastics (Plexiglas® and Lucite®), ion exchange resins, and plastic dentures.

Incompatibilities: Reacts in air to form a heat-sensitive explosive product at 60°C. Incompatible with nitrates, oxidizers, peroxides, strong acids, strong alkalis, oxidizers, reducing agents, amines, moisture. Contact with benzoyl peroxide may cause ignition, fire, and explosion. May polymerize if subjected to heat, polymerization catalysts (e.g. azoisobutyronitrile, dibenzoyl peroxide, di-*tert*-butyl peroxide, propionaldehyde), strong oxidizers, or ultraviolet light. Usually contains an inhibitor, such as hydroquinone.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.09 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 100 ppm/410 mg/m^3 TWA.
NIOSH REL: 100 ppm/410 mg/m^3 TWA.
ACGIH TLV®[1]: 50 ppm/205 mg/m^3 TWA; 100 ppm/410 mg/m^3 STEL, sensitizer, not classifiable as a human carcinogen.
NIOSH IDLH: 1000 ppm.

DFG MAK: 50 ppm/210 mg/m^3 TWA; Peak Limitation Category I(2); danger of skin sensitization; Pregnancy Risk Group C.
Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant.
Australia: TWA 100 ppm (410 mg/m^3), 1993; Austria: MAK 50 ppm (210 mg/m^3), 1999; Belgium: TWA 100 ppm (410 mg/m^3), 1993; Finland: TWA 100 ppm (410 mg/m^3); STEL 150 ppm (615 mg/m^3), 1999; France: VME 100 ppm (410 mg/m^3), VLE 200 ppm (820 mg/m^3), 1999; Hungary: TWA 50 mg/m^3; STEL 150 mg/m^3, 1993; the Netherlands: MAC-TGG 40 mg/m^3, 2003; the Philippines: TWA 100 ppm (410 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3; MAC (STEL) 400 mg/m^3, 1999; Russia: STEL 10 mg/m^3, 1993; Sweden: NGV 50 ppm (200 mg/m^3), KTV 150 ppm (600 mg/m^3), [skin], 1999; Switzerland: MAK-W 50 ppm (210 mg/m^3), KZG-W 100 ppm (420 mg/m^3), 1999; United Kingdom: TWA 50 ppm (208 mg/m^3); STEL 100 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm. Russia has set a MAC value of 0.1 mg/m^3 for ambient air in residential areas on a momentary basis and also on a daily average basis. Several states have set guidelines or standards for methyl methacrylate in ambient air[60] ranging from 7.0 μg/m^3 (Massachusetts) to 1367 μg/m^3 (New York) to 4100 μg/m^3 (Florida and North Dakota) to 6800 μg/m^3 (Virginia) to 8200 μg/m^3 (Connecticut) to 9742 μg/m^3 (Nevada) to 10,250 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #2537, Methyl methacrylate; OSHA Analytical Method 94.

Permissible Concentration in Water: A limit in drinking water has been set by Russia[43] at 0.01 mg/L. Maine[61] has set a guideline of 200 μg/L for methyl methacrylate in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate eyes and skin. Inhalation irritates the respiratory tract. High exposure can cause dizziness, lightheadedness narcosis, and unconsciousness.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Repeated or prolonged inhalation exposure may cause asthma. May affect the central nervous system and the peripheral nervous system. May affect the kidneys and liver. May damage the developing fetus.

Points of Attack: Central nervous system, kidneys, liver, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: polyvinyl alcohol gloves; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; Trellchem™ HPS suits. **4 h**: Teflon™ gloves, suits, boots. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl methacrylate must be stored to avoid contact with oxidizers (such as nitrates, permanganates, perchlorates, chlorates, and peroxides), strong alkalis (such as sodium hydroxide and potassium hydroxide), and strong acids (such as nitric acid, hydrochloric acid, and sulfuric acid) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from light, heat, and ionizing radiation because methyl methacrylate will react and release heat quickly causing an explosion. Store and use with an appropriate inhibitor. Lack of an appropriate inhibitor may cause an explosive reaction.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration may be allowed.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] [methyl parathion (emulsifiable concentrates (EC) at/or >19.5% active ingredient and dusts at/or >1.5% active ingredient)].

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R5; R10; R24; R26/28; R48/22; R50/53; Safety phrases: S1/2; S22-; S28; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Methyl parathion is a white to yellow-brown, crystalline solid with a garlic odor. Molecular weight = 263.22; Specific gravity (H_2O:1) = 1.36; Boiling point = 147.8; Freezing/Melting point = 37.2°C. The commercial product in xylene is a tan liquid (80% methyl parathion/20% xylene); Vapor pressure = 0.00001 mmHg at 20°C; Flash point = 46°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 2. Slightly soluble in water; solubility = 0.006% at 25°C.

Potential Exposure: A severely hazardous pesticide formulation. Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. This material is used as an insecticide on over 50 crops, primarily cotton, and on several ornamentals.

Incompatibilities: Incompatible with oxidizers, strong bases, heat. Mixtures with magnesium, or endrin may be violent or explosive. Slightly decomposed by acid solutions. Rapidly decomposed by alkalis. Explosive risk when heated above 50°C. The liquid xylene solution decomposes violently at 120°C.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.2 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.2 mg/m^3 TWA, measured as inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI$_A$ issued as Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)*

TEEL-0: 0.02 mg/m^3

PAC-1: 0.06 mg/m^3

PAC-2: **1.2** mg/m^3

PAC-3: **3.5** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.2 mg/m^3, [skin], 1993; Belgium: TWA 0.2 mg/m^3, [skin], 1993; Denmark: TWA 0.2 mg/m^3, [skin], 1999; Finland: TWA 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1999; France: VME 0.2 mg/m^3, [skin], 1999; Hungary: TWA 0.1 mg/m^3; STEL 0.2 mg/m^3, [skin], 1993; Norway: TWA 0.2 mg/m^3, 1999; the Netherlands: MAC-TGG 0.2 mg/m^3, [skin], 2003; Russia: STEL 0.1 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.2 mg/m^3, [skin], 1999;

United Kingdom: LTEL 0.2 mg/m^3; STEL 0.6 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia set a MAC of 0.008 mg/m^3 for ambient air in residential areas on a once daily basis. Several states have set guidelines or standards for methyl parathion in ambient air[60] ranging from 2.0 μg/m^3 (North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2112, Methyl parathion.

Permissible Concentration in Water: Russia set a MAC of 0.02 mg/L in water bodies used for domestic purposes. Two states have set a guideline of 30 μg/L for methyl parathion in drinking water—California and Kansas.[61] A lifetime health advisory of 2 μg/L has been developed by EPA.

Determination in Water: Fish Tox = 5.59677000 ppb (HIGH). Octanol−water coefficient: Log $K_{ow} = 2.7$ (pure); 2.04 (V).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl parathion may affect the nervous system, causing convulsions, respiratory failure, and possible death. A cholinesterase inhibitor. Acute exposure to parathion-methyl may produce the following symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. High exposure may result in death. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. Because this is a mutagen, handle it as a possible carcinogen—with extreme caution. Methyl parathion may damage the developing fetus. This material is extremely toxic; the probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. Human Tox = 2.00000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause personality changes, depression, anxiety, irritability. May cause liver damage. May damage the developing fetus.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects of exposure may be delayed. Medical monitoring is advised.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *2 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *10 mg/m^3*: CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge (s) in combination with an N100, R100, or P100 filter] or

GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *200 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: PD, PP (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from heat sources since violent reactions may occur. See incompatible material listed above. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1. Methyl parathion, solid and liquid, carry the symbol "D." The letter "D" identifies proper shipping names that are appropriate for describing materials for *domestic* transportation but may be inappropriate for international transportation under the provisions of international regulations (e.g., IMO, ICAO). An alternate proper shipping name may be selected when either domestic or international transportation is involved. Methyl parathion, solid, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II. Methyl parathion, liquid, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate and wash area of spill or leak after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Often available and used in a flammable liquid solution. Poisonous gases, including nitrogen oxides, sulfur oxide, and phosphorus oxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors from the liquid are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration (816°C, 0.5 s minimum for primary combustion; 1204°C, 1.0 s for secondary combustion) with adequate scrubbing and ash disposal facilities. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl phenkapton is a liquid product. Molecular weight = 349.25. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0.

Potential Exposure: This material is an acaricide, insecticide. Not registered as a pesticide in the United States.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 11 mg/m^3

PAC-3: 100 mg/m^3

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry containers and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Fire Extinguishing: This material may burn but does not ignite readily. Poisonous gases, including sulfur oxide, phosphorus oxide, and chlorine, are produced in fire. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move containers from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Methyl phosphonicdichloride M:1090

Molecular Formula: CH_3Cl_2OP

Common Formula: CH_3POCl_2

Synonyms: Dicloruro de metilfosfonico (Spanish); Methyl phosphonothioic dichloride, anhydrous; Phosphonic dichloride

CAS Registry Number: 676-97-1
RTECS® Number: TA1840000
UN/NA & ERG Number: UN9206/137
EC Number: 211-634-4
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl phosphonic dichloride is a low melting solid or colorless liquid. Molecular weight = 132.91; Boiling point = 162°C; Freezing/Melting point = 32°C; Flash point = $\geq 50°C$ (oc). Mixes violently with water.

Potential Exposure: Used as a chemical intermediate in pesticide manufacture.

Incompatibilities: Reacts violently with water, alcohols, forming hydrochloric acid/hydrogen chloride vapor. The reaction may be violent. Corrodes metals. Incompatible with strong oxidizers, alcohols, bases (including amines). May react violently, possibly explosively, when mixed with ethers and trace amounts of metal salts.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.06 mg/m^3
PAC-1: 0.2 mg/m^3
PAC-2: 3.14 mg/m^3
PAC-3: 15 mg/m^3

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Poisonous if inhaled or swallowed. Highly corrosive. Contact causes severe burns to skin and eyes. May cause permanent damage. Inhalation causes irritation. High levels of exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation or bronchitis to develop.

Points of Attack: Lungs, eyes, skin.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Keep victim quiet and maintain normal body temperature. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, CORROSIVE." It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not breathe vapors. Do not get water inside container; stop leak if you can do so without risk. Do not touch spilled material. Use water spray to reduce vapors but do not put water on leak or spill area. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Dike spill for later disposal; do not apply water unless directed to do so. Clean up only under supervision of an expert. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a

hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.4/0.6

Fire Extinguishing: This material may burn but does not ignite readily. *Small fires:* dry chemical or carbon dioxide. *Large fires:* flood fire area with water from a distance. Do not get solid stream of water on spilled material or inside open containers. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. Poisonous gases, including hydrogen chloride and sulfur dioxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F; Xn; Risk phrases: R11; R20; Safety phrases: S2; S16; S24; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyl propionate is a colorless liquid with a sweet, fruity, rum-like odor. Molecular weight = 88.12; Boiling point = 80°C; Freezing/Melting point = −87°C; Flash point = −2°C; Autoignition temperature = 469°C. Explosive limits: LEL = 2.5%; UEL = 13.0%; Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Natural Product; Primary Irritant. Used as a solvent; and in making paints, lacquers, and varnishes. Also, used in flavorings and fragrances.

Incompatibilities: Forms explosive mixture with air. Violent reactions with strong oxidizers, strong acids, strong bases. Keep away from heat and moisture.

Permissible Exposure Limits in Air

No TEEL available.

Russia: STEL 10 mg/m^3, 1993.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause skin and eye irritation.

Long Term Exposure: Repeated high exposures may cause dizziness, lightheadedness, loss of coordination, and difficult breathing.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl propionate you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, strong bases. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyl propionate reqires a label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl propyl ether is a clear, highly flammable, peroxidizable liquid. Molecular weight = 74.14; Boiling point = 39°C; Flash point $\leq -20°C$. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0.

Potential Exposure: Used to make other chemicals.

Incompatibilities: Forms explosive mixture with air. May be able to form unstable and explosive peroxides. Violent reaction with strong oxidizers. Incompatible with strong acids.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Air: No methods listed.
Routes of Entry: Inhalation, eye and/or skin contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation causes coughing and wheezing. High exposure can cause loss of appetite, headache, dizziness, followed by sleepiness and loss of consciousness.
Long Term Exposure: Causes drying and cracking of the skin.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyl propyl ether you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, heat, flames. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.
Shipping: Methyl propyl ether requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.
Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: MPK is a colorless to water-white liquid with a strong odor resembling acetone and ether. The odor threshold is 7.7 ppm. Molecular weight = 86.15; Specific gravity (H_2O:1) = 0.81; Boiling point = 102°C; Freezing/Melting point = − 78°C; Vapor pressure = 27 mmHg at 20°C; Flash point = 7°C (cc); Autoignition temperature = 452°C. Explosive limits: LEL = 1.5%; UEL = 8.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 6%.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. MPK is used as a solvent; as a synthetic food flavoring agent; and in organic synthesis; as a solvent replacement for diethyl ketone and acetone.

Incompatibilities: Reacts violently with strong oxidants, strong bases, amines, and isocyanates. Attacks some plastics.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.52 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 200 ppm/700 mg/m^3 TWA.

Determination in Air: Use NIOSH Analytical Method #1300, Ketones, #2555 Ketones I.[18]

Determination in Water: Octanol−water coefficient: Log K_{ow} = <1.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Methyl propyl ketone can affect you when breathed in and by passing through your skin. Exposure to the vapor can irritate the eyes, nose, throat, and lungs. Skin exposure to the liquid can cause a rash or burning feelings on contact. Contact irritates the eyes. Inhalation causes coughing, wheezing, and/or shortness of breath. Exposure to high concentrations can cause you to feel dizzy and lightheaded and to pass out.

Long Term Exposure: Long-term exposure can cause drying and cracking of the skin. Can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Lungs, skin.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1500 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl propyl ketone must be stored to avoid contact with oxidizers since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat, sparks, or flame. Sources of ignition, such as smoking and open flames, are prohibited where methyl propyl ketone is handled, used, or stored. Metal containers used in the transfer of 5 gallons or more of methyl propyl ketone should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyl propyl ketone. Wherever methyl propyl ketone is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Methyl propyl ketone is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Methyl silicate M:1230

Molecular Formula: $C_4H_{12}O_4Si$

Common Formula: $(CH_3O)_4Si$

Synonyms: Methyl orthosilicate; Silicid acid, tetramethyl ester; Tetramethoxysilane; Tetramethyl ester of silicic acid; Tetramethyl silicate

CAS Registry Number: 681-84-5

RTECS® Number: VV9800000

UN/NA & ERG Number: UN2606/155

EC Number: 211-656-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl silicate is a liquid. Molecular weight = 152.25; Specific gravity (H_2O:1) = 1.02; Boiling point = 121°C; Freezing/Melting point = −2°C; Vapor pressure = 12 mmHg at 25°C; Flash point = 20°C (cc). Insoluble in water.

Potential Exposure: Methyl silicate is used in coating screens of television picture tubes. It may be used in mold binders and in corrosion-resistant coatings, as well as in catalyst preparation and as a silicone intermediate.

Incompatibilities: Incompatible with oxidizers, water, moisture. Violent reaction with metal hexafluorides of rhenium, molybdenum, and tungsten.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.23 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/6 mg/m^3 TWA.

ACGIH TLV®[1]: 1 ppm/6 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.91 ppm

PAC-1: 0.91 ppm

PAC-2: **0.91** ppm

PAC-3: **1.4** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Danger of skin sensitization.

Australia: TWA 1 ppm (6 mg/m^3), 1993; Belgium: TWA 1 ppm (6 mg/m^3), 1993; Denmark: TWA 1 ppm (6 mg/m^3), 1999; Finland: TWA 5 ppm (30 mg/m^3), STEL 10 ppm (60 mg/m^3), 1999; France: VME 1 ppm (6 mg/m^3), 1999; Japan: 1 ppm (6 mg/m^3), 1999; Norway: TWA 1 ppm (6 mg/m^3), 1999; the Netherlands: MAC-TGG 6 mg/m^3, 2003; United Kingdom: TWA 1 ppm (6.3 mg/m^3), STEL 5 ppm (32 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Methyl silicate can affect you when breathed in. Severely irritates and burns the eyes and skin. Exposure to the vapor can cause severe eye damage and cause permanent blindness. This can occur up to 12 h after exposure has ceased, even if no irritation is noticed at the time. Inhalation irritates the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure to high levels can damage the lungs and kidneys.

Long Term Exposure: May cause kidney damage. Can irritate the lungs and may cause bronchitis to develop.

Points of Attack: Eyes, respiratory system, kidneys, liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: examination of the eyes and vision; kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 ppm* to liquid methyl silicate, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Where there is potential for high exposures, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and moisture. Sources of ignition, such as smoking and open flames, are prohibited where methyl silicate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Methyl orthosilicate requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including silicon oxide, are produced in fire. Use dry chemical, carbon dioxide, alcohol or polymer foam extinguishers. *Do not use water.* Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 202-705-0 [*Annex I Index No.:* 601-027-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: Carcinogenesis studies; on test (prechronic studies), October 2000.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R10; R36/37; R51/53; Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Methylstyrene is a colorless liquid with a characteristic odor. Molecular weight = 118.19; Specific gravity (H_2O:1) = 0.91; Boiling point = 165.6°C; Freezing/Melting point = −23.3°C; Vapor pressure = 2 mmHg at 20°C; Flash point = 54°C; Autoignition temperature = 574°C. Explosive limits: LEL = 1.9%; UEL = 6.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Methylstyrene is used as an additive, a plasticizer, and as a copolymer; used in the production of modified polyester and alkyd resin formulations.

Incompatibilities: Incompatible with oxidizers, peroxides, halogens, catalysts for vinyl or ionic polymers; aluminum, iron chloride; copper. Methylstyrene may polymerize. Usually contains an inhibitor, such as *tert*-butyl catechol.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.83 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/480 mg/m^3 Ceiling Concentration.

NIOSH REL: 50 ppm/240 mg/m^3 TWA; 100 ppm/485 mg/m^3 STEL.

ACGIH TLV®[1]: 10 ppm/48 mg/m^3 TWA, confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 700 ppm.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 100 ppm

PAC-2: 100 ppm

PAC-3: 700 ppm

DFG MAK: 50 ppm/250 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant.

Australia: TWA 50 ppm (240 mg/m^3); STEL 100 ppm, 1993; Austria: MAK 100 ppm (480 mg/m^3), 1999; Belgium: TWA 50 ppm (242 mg/m^3); STEL 100 ppm (484 mg/m^3), 1993; Denmark: TWA 50 ppm (240 mg/m^3), 1999; Finland: TWA 100 ppm (480 mg/m^3); STEL 150 ppm (720 mg/m^3), 1999; France: VME 50 ppm (240 mg/m^3), 1999; Norway: TWA 50 ppm (240 mg/m^3), 1999; the Netherlands: MAC-TGG 240 mg/m^3, 2003; Switzerland: MAK-W 50 ppm (240 mg/m^3), 1999; Thailand: TWA 100 ppm (480 mg/m^3), 1993; United Kingdom: STEL 100 ppm (491 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm. Russia[43] set a MAC of 0.04 mg/m^3 (40 μg/m^3) for ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for methylstyrene in ambient air[60] ranging from 2.4−4.85 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 4.8 mg/m^3 (Connecticut) to 5.714 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method 1501, aromatic hydrocarbons; OSHA Analytical Method 7.[18]

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.4$.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes, skin, and the respiratory tract. Prolonged skin contact causes a burning sensation, redness, and blisters. Exposure can cause headache, dizziness, lightheadedness, and difficult breathing.

Long Term Exposure: Repeated or prolonged contact with skin may cause skin sensitization and allergy with itching and skin rash. May affect the central nervous system, kidneys, and liver. May cause brain effects or damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, and kidneys.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite). Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Evaluate for brain effects. Evaluate nervous system. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)]; Sa (APF = 10) (any supplied-air respirator). *700 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Isopropenylbenzene requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible and reactive liquid. Poisonous gases are produced in fire. Water may be ineffective. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, often by admixture with a more flammable solvent.[24]

Methyltetrahydrofuran M:1250

Molecular Formula: $C_5H_{10}O$

Synonyms: Furan, tetrahydromethyl-; 2-Methyl-tetrahydrofuran; Methyltetrahydrofuran, 2-

CAS Registry Number: 96-47-9; 25265-68-3

RTECS® Number: LU6208000

UN/NA & ERG Number: UN2536/127

EC Number: 246-769-8

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 2—Water polluting (*CAS: 96-47-9*).

Description: Methyltetrahydrofuran is a colorless liquid with an ether-like odor. Boiling point = 80°C; Freezing/Melting point = − 136°C; Flash point = − 11°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Used as a chemical intermediate and a solvent.

Incompatibilities: Strong oxidizers may cause fire and explosion.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

96-47-9

TEEL-0: 6 ppm

PAC-1: 15 ppm

PAC-2: 125 ppm

PAC-3: 600 ppm

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the skin and eyes. Irritates the respiratory tract.

Long Term Exposure: Closely related chemicals affect the nervous system although it is not known whether this chemical has this effect.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with methyltetrahydrofuran you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Methyltetrahydrofuran requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reference

New Jersey Department of Health and Senior Services. (June 1999). *Hazardous Substances Fact Sheet:* Methyltetrahydrofuran. Trenton, NJ

Methyl thiocyanate M:1260

Molecular Formula: C_2H_3NS

Common Formula: CH_3CNS

Synonyms: Methyl rhodanate; Methylrhodanid (German); Methyl sulfocyanate; Methylthiokyanat; Thiocyanic acid, methyl ester

CAS Registry Number: 556-64-9

RTECS® Number: XL1575000

UN/NA & ERG Number: UN2810/153

EC Number: 209-134-6

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 20,000.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 20,000 lb (9080 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10,000 lb (4540 kg).

Reportable Quantity (RQ): 10,000 lb (4540 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Methyl thiocyanate is a colorless liquid with an onion-like odor. Molecular weight = 73.12; Boiling point = 130−133°C; Freezing/Melting point = −51°C. Very slightly soluble in water.

Potential Exposure: It is used as an agricultural insecticide, a fumigant, and as a research chemical. No evidence of commercial production in the United States.

Incompatibilities: Incompatible with nitric acid. Violent reactions have occurred when mixed with chlorates, nitrates, nitric acid, peroxides, potassium chlorate, and sodium chlorate.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 28.4 mg/m^3
PAC-3: 4 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Prolonged skin absorption may produce various eruptions, runny nose, dizziness, cramps, nausea, vomiting, and mild or severe disturbances of the nervous system. This material is highly toxic if ingested. The ingestion of a concentrated solution may lead to vomiting. The principal systemic reaction is probably one of central nervous system depression, interrupted by periods of restlessness; abnormally fast and deep respiratory movements and convulsions. Death is usually due to respiratory arrest from paralysis of the medullary centers.

Long Term Exposure: May cause injury to the liver and kidneys.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note: Because cyanide is probably largely responsible for poisonings, antidotal measures against cyanide should be instituted promptly. Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *(for cyanides) Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Toxic liquid, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Small fires: dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases, including nitrogen oxides, sulfur oxides, are produced in fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Methyltrichlorosilane M:1280

Molecular Formula: CH_3Cl_3Si

Synonyms: Methylsilicochloroform; Methylsilyl trichloride; KA 13; LS 40 (silane); Methylsilicon trichloride; Trichloromethylsilicon; Silane, trichloromethyl-; Trichloromethylsilane

CAS Registry Number: 75-79-6; *(alt.)* 175446-71-6

RTECS® Number: VV4550000

UN/NA & ERG Number: UN1250/155

EC Number: 200-902-6 [*Annex I Index No.:* 014-004-00-5]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 500 lb (227 kg).

US EPA Hazardous Waste Number (RCRA No.): U164.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; 14; R36/37/38; Safety phrases: S2; S26; S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Methyltrichlorosilane is a colorless liquid with a sharp hydrochloric acid-like odor. Molecular weight = 149.48; Boiling point = 66°C; Freezing/Melting point = −90°C; Vapor pressure = 146.7 mmHg at 18°C; Flash point = − 6.2°C; − 8°C (cc); Autoignition temperature ≥404°C. Explosive limits: LEL = 7.6%; UEL ≥20%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts with water.

Potential Exposure: Compound Description: Primary Irritant. Methyltrichlorosilane is used as an intermediate to make silicones; for making water repellants, electrical insulation, heat-resistant paints, and other products.

Incompatibilities: Water, steam, acids, alkalis, chemically active metals (potassium, sodium, magnesium, and zinc). Reacts violently with strong oxidizers. Reacts violently with water, moisture, and alkalis producing hydrogen chloride. Attacks metals, such as aluminum, magnesium.

Permissible Exposure Limits in Air

AIHA WEEL: 1 ppm, Ceiling Concentration.

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.60** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: If the eyes have come in contact with methyltrichlorosilane, then irritation, pain, swelling, corneal erosion, and blindness may result. Dermatitis (red, inflamed skin), severe burns, pain, and shock generally follow dermal exposure. As with other chlorosilanes, acute exposures may be highly toxic and may cause death or permanent injury after very short exposures to small quantities. Skin contact may produce severe burns with pain and risk of secondary infections. Ingestion may produce oral, esophageal, and stomach burns; intensity will vary from mild to very severe; gastrointestinal damage is rare but may occur. Signs and symptoms of acute ingestion of methyltrichlorosilane may include excessive salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of methyltrichlorosilane. Acute inhalation exposure may result in hoarseness, laryngitis, a feeling of suffocation, dyspnea (shortness of breath), choking, respiratory tact irritation, chest pain. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Sneezing, bleeding of the nose and gums, and ulceration of the nasal and oral mucosa may also occur.

Long Term Exposure: Highly irritating material; may affect the lungs, and bronchitis may develop. Renal toxicity has been observed in animals.

Points of Attack: Lungs, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure, kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to methyltrichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyltrichlorosilane must be stored to avoid contact with water, acids, chemically active metals (such as potassium, sodium, magnesium, and zinc), and alkalis since violent reactions occur and hydrogen chloride is produced. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where methyltrichlorosilane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of methyltrichlorosilane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of methyltrichlorosilane. Wherever methyltrichlorosilane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills can be neutralized by flushing with large quantities of water followed by treatment with sodium bicarbonate. Provide adequate protection against generated hydrogen chloride. Do not allow water to get into container since resulting pressure could cause container to rupture. Protect against potentially violent reaction with water. Avoid breathing vapors and contact with skin. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)
when spilled in water
First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3
Large spills (From a large package or from many small packages)
First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.3/2.0

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Dry chemical or carbon dioxide may be used for small fires. *Do not use water* or hydrous agents. However, water may be used for large fires if firefighters are protected from violent reactions of methyltrichlorosilane with water. Water may be used to keep containers cool. Self-contained breathing apparatus is required as combustion/decomposition yields acid gases/pulmonary irritants. Corrosion-resistant protective clothing, as well as appropriate foot, hand, arm, head, eye, and face protection are required where contact is possible. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Methyl vinyl ketone M:1290

Molecular Formula: C_4H_6O
Common Formula: $CH_2{=}CHCOCH_3$
Synonyms: Acetyl ethylene; 3-Butene-2-one; Methylene acetone; Methyl-vinyl-cetone (French); Methylvinylketon (German); Metil vinil cetona (Spanish); MVK; γ-Oxo-α-butylene; Vinyl methyl ketone
CAS Registry Number: 78-94-4
RTECS® Number: EM9800000
UN/NA & ERG Number: UN1251 (stabilized)/131
EC Number: 201-160-6

Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10 lb (4.54 kg).
Reportable Quantity (RQ): 10 lb (4.54 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Methyl vinyl ketone is a colorless liquid with a pungent odor. The odor threshold is 0.5 mg/m^3. Molecular weight = 70.01; Boiling point = 81°C; Flash point = −7°C; Autoignition temperature = 491°C. Explosive limits: LEL = 2.1%; UEL = 15.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Methyl vinyl ketone is used as an alkylating agent, a starting material for plastics; and an intermediate in the synthesis of steroids and vitamin A.

Incompatibilities: Forms explosive mixture with air. Heat or shock may cause explosive polymerization. Violent reaction with strong oxidizers.

Permissible Exposure Limits in Air
ACGIH TLV®[1]: 0.2 ppm/0.6 mg/m^3 [skin] danger of skin sensitization, Ceiling Concentration.
Protective Action Criteria (PAC)*
TEEL-0: 0.05 ppm
PAC-1: **0.17** ppm
PAC-2: **1.2** ppm
PAC-3: **2.4** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: [skin] danger of skin sensitization.
Russia: STEL 0.1 mg/m^3, [skin], 1993.

Routes of Entry: Inhalation, ingestion, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Warning*: Methyl vinyl ketone is easily absorbed through the skin, causing general poisoning;

inhalation has central nervous system depressant effects. It is irritating to mucous membranes and respiratory tract and to the skin; it is a lachrymator and can cause eye injury. Liquid or high concentration of vapors causes blistering of the skin. Similar to other ketones, it can cause sore throat, sneezing, coughing, and salivation. Inhalation may cause nausea and vomiting; inhalation of high concentrations can cause headache, dizziness, fainting, tremor, uncoordination, lowered body temperature, depressed respiratory and heart rate, gasping, coma, and death. Direct aspiration of liquid into lungs can cause chemical pneumonia.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: For emergency situations, wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Protect against physical damage. Outside or detached storage is preferred. Inside storage should be in a standard flammable liquids storage room. Separate from oxidizing materials. MVK vapors are uninhibited and may form polymers in the flame arresters of storage tanks, resulting in stoppage of vent.

Shipping: Methyl vinyl ketone, stabilized, requires a shipping label of “POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID, CORROSIVE.” It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 48-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 1.0/1.5
Night 2.3./3.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0 + /11.0 +
Night 7.0 + /11.0 +

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, alcohol foam, or carbon dioxide. Water spray may be ineffective as an extinguishing agent. *Small fires:* dry chemical, carbon dioxide, and foam. *Large fires:* fog or foam. Move container form fire area if you can do so without risk. Dike fire control water for later disposal; do not scatter the material. Spray cooling water on containers that are exposed to flames until well after fire is out. Wear positive pressure breathing apparatus and special protective clothing. *See above for isolation distances.* Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

2-Methyl-5-vinylpyridine M:1300

Molecular Formula: C_8H_9N

Synonyms: 5-Ethenyl-2-methylpyridine; MVP; 5-Vinyl-2-picoline

CAS Registry Number: 140-76-1

RTECS® Number: UT2975000

UN/NA & ERG Number: UN3073 (stabilized)/131

EC Number: 205-432-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Methyl-5-vinylpyridine is a clear to faintly opalescent liquid. Molecular weight = 119.18; Boiling point = 181°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0; Flash point = 74°C.

Potential Exposure: 2-Methyl-5-vinylpyridine is used as a monomer for resins, oil additive, ore flotation agent, and dye acceptor.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 1.9 mg/m^3

PAC-3: 40 mg/m^3

Russia[43] set a MAC of 2.0 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is poisonous by ingestion, inhalation, and absorption through the skin. Vapors may cause dizziness or suffocation.

Long Term Exposure: May cause liver and kidney damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Vinylpyridines require a label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID, CORROSIVE." They fall in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Metolachlor M:1310

Molecular Formula: $C_{15}H_{22}ClNO_2$

Synonyms: 2-Aethyl-6-methyl-*N*-(1-methyl-2-methoxyaethyl)-chloracetanilid (German); Bicep; CGA-24705; α-Chlor-6′-aethyl-*N*-(2-methoxy-1-methylaethyl)-acet-*o*-toluidin (German); 2-Chloro-6′-ethyl-*N*-(2-methoxy-1-methylethyl)acet-*o*-toluidide; α-Chloro-2′-ethyl-6′-methyl-*N*-(1-methyl-2-methoxyethyl)-acetanilide; 2-Chloro-*N*-(2-ethyl-6-methylphenyl)-*N*-(2-methoxy-1-methylethyl) acetamide; 2-Chloro-*N*-(6-ethyl-*o*-tolyl)-*N*-(2-methoxy-1-methylethyl)-acetamide; Codal®; Cotoran® Multi®; Dual®; 2-Ethyl-6-methyl-1-*N*-(2-methoxy-1-methylethyl)chloroacetanilide; Metelilachlor; Milocep; Ontrack 8E®; Primagram®; Primextra®

CAS Registry Number: 51218-45-2; *(alt.)* 63150-68-5; *(alt.)* 94449-58-8

RTECS® Number: AN3430000

UN/NA & ERG Number: UN2902 (Pesticides, liquid, toxic, n.o.s.)/151

EC Number: 257-060-8

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Possible Human Carcinogen.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Metolachlor is a colorless or tan to brown, oily liquid with a slightly sweet odor. Molecular weight = 283.83; Boiling point = 100°C at 0.001 mmHg. It is stable to about 300°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant. It is a selective herbicide used for weed control in corn and for controlling grasses in a variety of crops including cotton and peanuts.

Incompatibilities: Oxidizers, strong acids, nitrates.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: The US EPA has set a lifetime health advisory of 10 μg/L. Several states have set guidelines for metolachlor in drinking water ranging from 1.0 μg/L (Illinois) to 17.5 μg/L (Kansas) to 25 μ/mL (Wisconsin).

Determination in Water: Extraction with methylene chloride followed by separation by gas chromatography and measurement using a nitrogen-phosphorus detector. Fish Tox = 1117.14617000 ppb (VERY LOW).

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. The acute oral LD_{50} for rats is 2780 mg/kg (slightly toxic). Signs of human intoxication from metolachlor and/or its formulations (presumably following acute deliberate or accidental exposures) include abdominal cramps, anemia, ataxia, dark urine, methemoglobinemia, cyanosis, hypothermia, collapse, convulsions, diarrhea, gastrointestinal irritation, jaundice, weakness, nausea, shock, sweating, vomiting, CNS depression, dizziness, dyspnea, liver damage, nephritis, cardiovascular failure, skin irritation, dermatitis, sensitization dermatitis, eye and mucous membrane irriation, corneal opacity, and adverse reproductive effects. Human Tox = 100.00000 ppb (VERY LOW).

Long Term Exposure: May cause tumors.

Points of Attack: Blood.

Medical Surveillance: Test for methemoglobinemia. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Pesticides, liquid, toxic, n.o.s. require the label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides and chlorine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P190.

Superfund/EPCRA [40CFR 302 and 355, F R: 8/16/06,Vol 71, No. 158] Reportable Quantity (RQ): 1000 lb (454 kg).

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R51/53 Safety phrases: S2; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Metolcarb is a colorless crystalline solid. Molecular weight = 165.21; Freezing/Melting point = 74−75°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Metolcarb is an insecticide used for the control of rice leafhoppers, plant-hoppers, codling moth, citrus mealy bug, onion thrips, fruit flies, bollworms, and aphids. Not registered as a pesticide in the United States.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 4.8 mg/m^3

PAC-3: 200 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Metolcarb is a carbamate insecticide. Signs and symptoms of poisoning by carbamates are similar to those for organic phosphorus compounds. Symptoms of poisoning by organic phosphorus compounds include headache, giddiness, nervousness, blurred vision, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, myosis, tearing, salivation and other excessive respiratory tract secretion, vomiting, cyanosis, uncontrollable muscle twitches followed by muscular weakness, convulsions, coma, loss of reflexes, and loss of muscular control. Metolcarb exhibits high oral and skin toxicity, and moderate inhalation toxicity. Some carbamates appear to be carcinogenic, teratogenic, and/or mutagenic. Carbamates are cholinesterase inhibitors.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Carefully observe victim since effects may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a

full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Carbamate pesticides, solid, toxic, require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Solid carbamate pesticides may burn but do not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, and foam. For large fires, use water spray, fog, or foam. Dike fire control water for later disposal. Stay upwind and keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 244-209-7 [*Annex I Index No.:* 606-034-00-8]

Regulatory Authority and Advisory Bodies

EPA: Not Classifiable as to human carcinogenicity.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Safe Drinking Water Act: Priority List (55 FR 1470).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: 22; R50/53; Safety phrases: S2; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Metribuzin is a colorless crystalline solid with a mild sulfurous odor; Freezing/Melting point = 125−127°C; Vapor pressure = 4×10^{-7} mmHg. Slightly soluble in water. Available in different concentrations (4%, 50%, 75%).

Potential Exposure: Those involved in manufacture, formulation, and application of this herbicide.

Incompatibilities: None reported.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: 5 mg/m^3 TWA, not classifiable as a human carcinogen.

No TEEL available.

Guidelines or standards for metribuzin in ambient air[60] have been set by several states ranging from 50 μg/m^3 (North Dakota) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No method available.

Permissible Concentration in Water: The US EPA has set a lifetime health advisory of 175 μg/L. Several states have set guidelines for metribuzin in drinking water[61] ranging from 1.0 μg/L (Illinois) to 25 μg/L (Wisconsin) to 175 μg/L (Kansas).

Determination in Water: Solvent extraction with methylene chloride followed by exchange to acetone; separation by gas chromatography and measurement with a thermionic bead detector. Fish Tox = 7683.76758000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Metribuzin can affect you when breathed in and by passing through your skin. Acute poisoning can cause difficult breathing and drowsiness. High exposures may cause upset stomach, fatigue, and depression of the central nervous system, causing poor coordination, tremors, and weakness. Human Tox = 200.00000 ppb (VERY LOW).

Long Term Exposure: Repeated or high exposure may cause liver enzyme changes, goiter, and may affect thyroid function.

Points of Attack: Central nervous system, thyroid, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: thyroid function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a pesticide cartridge. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, dry area.

Shipping: Triazine pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Metribuzin itself does not burn. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Synonyms: Acromona; Anagiardil; Atrivyl; Bayer 5360; Bexon; Clont; Cont; Danizol; Deflamon-wirkstoff; Efloran; Elyzol; Entizol; 1-(β-Ethylol)-2-methyl-5-nitro-3-azapyrrole; Eumin; Flagemona; Flagesol; Flagil; Flagyl; Giatricol; Gineflavir; 1-(β-Hydroxyethyl)-2-methyl-5-nitroimidazole; 1-(2-Hydroxy-1-ethyl)-2-methyl-5-nitroimidazole; 1-(2-Hydroxyethyl)-2-methyl-5-nitroimidazole; 1-Hydroxyethyl-2-methyl-5-nitroimidazole; Klion; Meronidal; 2-Methyl-1-(2-hydroxyethyl)-5-nitroimidazole; 2-Methyl-3-(2-hydroxyethyl)-4-nitroimidazole; Metronidaz; Metronidazol; Metronidazolo; Monagyl; Nalox; Neo-Tric; NIDA; Novonidazol; NSC-50364; Orvagil; 1-(β-Oxyethyl)-2-methyl-5-nitroimidazole; RP 8823; Sanatrichom; SC 10295; Trichazol; Trichocide; Trichomol; Trichomonacid "Pharmachim"; Trichopol; Tricom; Tricowas B; Trikojol; Trimeks; Trivazol; Vagilen; Vagimid; Vertisal

CAS Registry Number: 443-48-1

RTECS® Number: NI5600000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 207-136-1

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; NTP: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Metronidazole is an odorless, white, yellow, or cream-colored crystalline solid. Darkens on exposure to light. Molecular weight = 171.18; Freezing/Melting point = 158−160°C. Soluble in water.

Potential Exposure: Metronidazole is an orally administered drug for the treatment of infections due to *entamoeba histolytica*, *trichomonas vaginalis*, *giardia lamblia* and has also been used for treating Vincent's infection. It can be used as a trichomonacide in veterinary medicine. One firm has petitioned EPA to use metronidazole as a disinfectant for cooling tower water.

Permissible Exposure Limits in Air

No standards or TEEL available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = <-0.1$.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include headache, anorexia, nausea, occasional vomiting, diarrhea, and rash.

Long Term Exposure: There is evidence that this substance is carcinogenic in animals. Possibly carcinogenic to humans.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Dampen spilled material with water to avoid dust. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 232-095-1 [*Annex I Index No.:* 015-020-00-5]

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (India, Norway) (UN).[13]

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Very Toxic Substance (World Bank).[15]

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S23; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Mevinphos is a pale yellow to orange high-boiling liquid with a weak odor. The carrier solvent may change the physical properties listed here. Molecular weight = 224.17; Specific gravity (H_2O:1) = 1.25; Boiling point = decomposes; Freezing/Melting point = 7°C (*trans*-); 21°C (*cis*-); Vapor pressure: 0.0001 mmHg at 20°C; Flash point = 30°C (oc); 79.5°C (oc).[ICSC] Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water. Commercial product is a mixture of the *cis*- and *trans*-isomers. Insecticide that may be absorbed on a dry carrier.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Human Data. Those engaged in the manufacture, formulation, and application of this contact and systemic insecticide and acaricide.

Incompatibilities: Decomposes in heat (below boiling point at 300°C) producing phosphoric acid and phosphorus oxides fumes. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Corrosive to cast iron, some stainless steels, and brass. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.17 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.1 mg/m^3 TWA [skin].

NIOSH REL: 0.01 ppm/0.1 mg/m^3 TWA; 0.03 ppm/0.3 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.01 mg/m^3 measured as inhalable fraction and vapor TWA [skin]; not classifiable as a human carcinogen; BEI_A issued as Acetylcholinesterase-inhibiting pesticides.

NIOSH IDLH: 4 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.01 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 36.6 mg/m^3

DFG MAK: 0.01 ppm/0.093 mg/m^3 TWA; Peak Limitation Category II(2) [skin].

Arab Republic of Egypt: TWA 0.01 ppm (0.1 mg/m^3) [skin] 1993; Australia: TWA 0.01 ppm (0.1 mg/m^3); STEL 0.03 ppm [skin] 1993; Austria: MAK 0.01 ppm (0.1 mg/m^3) [skin] 1999; Belgium: TWA 0.01 ppm (0.09 mg/m^3); STEL 0.03 ppm [skin] 1993; Denmark: TWA 0.01 ppm (0.1 mg/m^3) [skin] 1999; Finland: TWA 0.001 ppm, 1999; France: VME 0.01 ppm (0.1 mg/m^3) [skin] 1999; the Netherlands: MAC-TGG 0.1 mg/m^3 [skin] 2003; Norway: TWA 25 ppm (125 mg/m^3), 1999; the Philippines: TWA 0.1 mg/m^3 [skin] 1993; Switzerland: MAK-W 0.01 ppm (0.1 mg/m^3) [skin] 1999; Thailand: TWA 0.1 mg/m^3, 1993; United Kingdom: TWA 0.01 ppm (0.09 mg/m^3); STEL 0.03 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.27 mg/m^3 (skin). Several states have set guidelines or standards for mevinphos in ambient air[60] ranging from 1−3 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: No criteria set. This chemical is highly toxic to aquatic life.

Determination in Water: Fish Tox = 0.96183000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Short Term Exposure: Cholinesterase inhibitor. Mevinphos may affect the nervous system, causing convulsions, respiratory failure. This material is super toxic; the probable oral lethal dose for humans is less than 5 mg/kg or a taste (less than 7 drops) for a 150-lb person. It has direct and immediate effects whether it is swallowed, inhaled, or absorbed through the skin. Symptoms include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, dizziness, runny nose, tightness in the chest, blurring and dimming of vision, slurring of speech, twitching of muscles, mental confusion, disorientation, troubled breathing, blueing of skin, convulsions, coma, and death. Human Tox = 1.75000 ppb (HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: NIOSH lists the following tests: Blood serum; Cholinesterase, Blood Serum, Red blood cells/count. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.1 ppm:* Sa (APF = 10) (any supplied-air respirator). *0.25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *0.5 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *4 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mevinphos is 50% hydrolyzed in aqueous solutions at an unspecified temperature in 1.4 h at pH 11, 35 days at pH 7, and 120 days at pH 6. Decomposition is rapidly accomplished by lime sulfur. Mevinphos may also be incinerated. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Description: Mexacarbate is an odorless, white to tan crystalline solid. Molecular weight = 222.32; Freezing/Melting point = 85°C; Vapor pressure = 0.1 mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: It is an insecticide for nonagricultural uses, e.g., lawn and turf, flowers, gardens, vines, forest lands, woody shrubs and trees; and also a molluscicide. It is not produced or used commercially in the United States.

Incompatibilities: Alkalis, strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2.5 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 14 mg/m^3

PAC-3: 14 mg/m^3

Determination in Water: Fish Tox = 31.03658000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin, and/or contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Extremely toxic: probable oral lethal dose for humans is 5−50 mg/kg, between 7 drops and 1 teaspoonful for a 70-kg person (150 lb). Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Contact may cause burns to skin and eyes. Symptoms of carbamate poisoning resemble those of parathion. This material is similar to carbaryl; symptoms of carbaryl exposure include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, sweating, lassitude, and weakness. Runny nose and sensation of tightness in chest may occur with inhalation exposures. Blurring or dimness of vision, tearing, eye muscle spasm, loss of muscle coordination, slurring of speech, and twitching of muscles may also occur.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. Mexacarbate may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in a cool, dry place or a refrigerator.

Shipping: Carbamate pesticide, solid, toxic, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Mica M:1370

Molecular Formula: $Al_6H_4K_2O_{24}Si_6$

Common Formula: $K_2Al_4(Al_2Si_6O_{20})(OH)_4$

Synonyms: Amber mica; Biotite; Fluorophlogopite; Lepidolite; Margarite; Mica silicate; Muscovite; Phlogopite; Roscoelite, suzorite mica; Zimmwaldite

CAS Registry Number: 12001-26-2

RTECS® Number: VV8760000

UN/NA & ERG Number: Not regulated.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Description: Mica (Muscovite) takes the form of a colorless, odorless solid that separates into flakes or thin sheets of hydrous silicates. Molecular weight = 797 (approx.); Specific gravity (H_2O:1) = 2.6−3.2. Insoluble in water.

Potential Exposure: Mica is used as reinforcing filler for plastics, substitute for asbestos; for insulation in electrical equipment; used in the manufacture of roofing shingles, wallpaper, and paint.

Incompatibilities: Silicates react with lithium.

Permissible Exposure Limits in Air

OSHA PEL: 20 mppcf, $<$1% crystalline silica TWA.

NIOSH REL: 3 mg/m^3 respirable dust; containing <1% quartz TWA.
ACGIH TLV®[1]: 3 mg/m^3 respirable fraction TWA.
NIOSH IDLH: 1500 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 3 mg/m^3
PAC-1: 9 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 500 mg/m^3
Australia: TWA 2.5 mg/m^3, 1993; Belgium: TWA 3 mg/m^3, 1993; Switzerland: MAK-W 3 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3 (total dust); MAC-TGG 2.5 mg/m^3 (respirable dust), 2003; United Kingdom: TWA 10 mg/m^3, total inhalable dust; TWA 0.8 mg/m^3, respirable dust, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 3 mg/m^3, respirable fraction.

Determination in Air: Use NIOSH Analytical Method (IV) #0600, Particulates NOR (respiratory).

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Unknown at this time.

Long Term Exposure: Pneumoconiosis, cough, dyspnea, weakness, weight loss. Repeated heavy exposure can irritate the lungs. After years of high exposure, lung scarring (fibrosis) may result. This causes an abnormal chest X-ray and may cause cough and a shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: lung function tests; chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 15 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *Up to 30 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 75 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 150 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F APF = 50 (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Mica silica itself does not burn. Poisonous gases are produced in fire. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill.

Michlers ketone M:1380

Molecular Formula: $C_{17}H_{20}N_2O$
Common Formula: $(CH_3)_2N\text{-}C_6H_4\text{-}CO\text{-}C_6H_4\text{-}N(CH_3)_2$
Synonyms: Benzophenone, 4,4′-bis(dimethylamino)-; *p*,*p*′-Bis(dimethylamino)benzophenone; 4,4′-Bis(dimethylamino) benzophenone; Bis(4-dimethylaminophenyl) ketone; Bis[*p*-(*N*,*N*-dimethylamino)phenyl] ketone; Cetona de michler (Spanish); Methanone, bis[4-(dimethylamino)phenyl]-; *p*,*p*′-Michler's ketone; NCI-C02006; *N*,*N*,*N*′,*N*′-Tetramethyl-4,4′-diaminobenzophenone; Tetramethyldiaminobenzophenone
CAS Registry Number: 90-94-8
RTECS® Number: DJ0250000
UN/NA & ERG Number: UN1602 (Dye intermediate, liquid, toxic, n.o.s.)/151
EC Number: 202-027-5 [*Annex I Index No.:* 606-073-00-0]
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B; NTP: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Studies (feed); clear evidence: rat, mouse, 1979.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer 1/1/88.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R41; R68; Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Michler's ketone is a blue powder or white to green-colored leaflet material. Molecular weight = 268.37; Boiling point ≥360°C (decomposition); Freezing/Melting point = 172−176°C; Flash point = 220°C; Autoignition temperature = 480°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.
Potential Exposure: Mutagen. Animal Carcinogen. Michler's ketone is a dye intermediate and derivative of dimethylaniline. It is also used in antifreeze formulations, cosmetics, cleaning compounds, heat transfer fluids; as a chemical intermediate in the synthesis of at least 13 dyes and pigments, especially auramine derivatives.
Incompatibilities: Ketones can react violently with oxidizers and strong reducing agents, aldehydes, nitric acid. Contact with hydrogen peroxide may form heat- and shock-sensitive explosives.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3.5 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 40 mg/m^3
DFG MAK: Carcinogen Category 2.
Routes of Entry: Inhalation and skin adsorption.
Harmful Effects and Symptoms
Irritates the eyes, skin, and mucous membranes. Absorbed through the skin.
Short Term Exposure: May have a narcotic or an anesthetic effect.
Points of Attack: Gastrointestinal or liver cancer.
Long Term Exposure: A potential occupational carcinogen.
First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 78-173, *Ketones*.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and

storage. Store in a refrigerator or a cool, dry place away from peroxides, aldehydes, strong acids. Where possible, automatically pump liquid from drums or other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dye intermediates, liquid, toxic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Mineral oil M:1385

Synonyms: Adepsine oil; Heavy mineral oil mist; Mist of white mineral oil; Cutting oil; Heat-treating oil; Hydraulic oil; Cable oil; Lubricating oil; Paraffin oil mist; White mineral oil mist

CAS Registry Number: 8012-95-1; *(alt.)* 39355-35-6; *(alt.)* 79956-36-8; *(alt.)* 83046-05-3

RTECS® Number: PY8030000

EC Number: 232-384-2 (paraffin oils)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC (*highly refined*): Human No Adequate Data, Animal No Evidence, *not classifiable as carcinogenic to humans*, Group 3; IARC (*untreated and poorly refined*): Human Sufficient Evidence; Animal Limited Evidence, *carcinogenic to humans*, Group 1; NTP (*untreated and poorly refined*): Known to be a human carcinogen.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Mineral oil mist is a colorless, oily liquid aerosol dispersed in air with an odor like burned lubricating oil. The odor threshold is 1.0 ppm. Specific gravity (H_2O:1) = 0.865 at 60°C; Boiling point = 250−360°C; Vapor pressure = <0.5 mmHg at 20°C; Flash point = 193°C; Autoignition temperature = 260−371°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Human Data; Primary Irritant. Mineral oil is used in cosmetics, pharmaceutical bases, food, and fiber production; as carriers and bases; as a lubricating oil; and as a solvent for inks in the printing industry. Oil mist would be encountered in quenching of hot metal parts and in metal machining operations.

Incompatibilities: Strong oxidizers, nitric acid.

Permissible Exposure Limits in Air

As oil mist (mineral)

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA; 10 mg/m^3 STEL.

ACGIH TLV®[1]: 5 mg/m^3 inhalable fraction from highly refined and pure mineral oil, TWA.

NIOSH IDLH: 2500 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; Belgium: TWA 5 mg/m^3; STEL 10 mg/m^3, 1993; Finland: TWA 5 mg/m^3, 1999; Hungary: STEL 5 mg/m^3, carcinogen, 1993; Japan: 3 mg/m^3, Group 1 carcinogen, 1999; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 5 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Sweden: NGV 3 mg/m^3; STEL 5 mg/m^3, 1993; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: LTEL 5 mg/m^3; STEL 10 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 mg/m^3. Several states have set guidelines or standards for mineral oil mist in ambient air[60] ranging from 16.7 μg/m^3 (New York) to 25 μg/m^3 (South Carolina) to 50 μg/m^3 (Florida) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5026, Oil mist, mineral; #5524, Metalworking Fluids

Permissible Concentration in Water: The EEC[35] set a MAC of 10 μg/L in drinking water. Russia set a MAC of 6.5 mg/L in surface water for fishery purposes.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May irritate nose and throat. If taken into lungs may cause coughing and swelling of lung tissue; may cause pneumonia. Similarity to kerosene indicates that headache, nausea, ringing in the ears, weakness, confusion, drowsiness, coma, and death may occur. *Skin:* May cause redness and swelling if not promptly removed. *Eyes:* May cause severe irritation if not promptly removed. *Ingestion:* Will cause burning sensation in mouth, throat, and stomach if swallowed. Vomiting, diarrhea, and belching may follow. If liquid gets into lungs, it may cause rapid breathing, blue skin coloration, rapid heartbeat, and fever with rapid onset of chemical pneumonia and possible secondary infection. Death may result from as little as half a liquid ounce in the absence of lung involvement.

Note: Food grades are highly purified and are of low toxicity.

Long Term Exposure: Prolonged contact may cause skin irritation; acne-like rash may develop. May cause skin allergy with itching and rash. There is some evidence that some substances referred to as "mineral oils" may be carcinogens. However, this information is unclear at this time and mineral oils (except for food grades) should be treated with caution.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Special tests of the sputum to look for oil droplets. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m^3:* 100XQ (APF = 10) [Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators] or Sa (APF = 10) (any supplied-air respirator). *125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *2500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or Planned Entry into Unknown Concentrations or IDLH Conditions* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive

concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Description: Mirex is a snow-white crystalline solid. Molecular weight = 545.50; Boiling point = (decomposes) 485°C; Vapor pressure = 8×10^{-7} mm at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of the insecticide (particularly effective against fire ants). Also used as a fire retardant in plastics. Not produced in the United States but may be found in imported products.

Incompatibilities: Strong oxidizers, dichromates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.1 mg/m^3
PAC-1: 0.3 mg/m^3
PAC-2: 2 mg/m^3
PAC-3: 100 mg/m^3

Several states have set guidelines or standards for mirex in ambient air[60] ranging from zero (Massachusetts) to 0.03 μg/m^3 (New York) to 0.88 μg/m^3 (Pennsylvania) to 4500 μg/m^3 (South Carolina).

Permissible Concentration in Water: 0.001 mg/L for protection of aquatic life (Sax—see reference below).

Determination in Water: Fish Tox = 1.98564000 ppb (HIGH).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Passes through the skin.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Can irritate the respiratory tract. This compound is moderately toxic (the LD_{50} value for rats is 300 mg/kg). *Skin:* Can cause irritation, burning sensation, and rash. *Eyes:* Can cause irritation. *Ingestion:* No cases of human toxicity reported. Possible symptoms include nausea, vomiting, restlessness, tremor, weight loss, nervous system and liver abnormalities, skin rash, and reproductive failure. Exposure can cause nausea and vomiting, headache, dizziness, muscular weakness, fatigue, convulsions, and unconsciousness.

Long Term Exposure: May damage the developing fetus. May cause damage to the testes. May damage the liver and cause anemia. High exposure can cause arrhythmia (irregular heartbeat) and may cause death. Mirex has caused cataracts, liver and thyroid cancer, and birth defects in both rats and mice. Whether it does so in humans is not known.

Points of Attack: Blood, liver, nervous system.

Medical Surveillance: Complete blood count (CBC), liver function tests; EKG, examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Gastric lavage or catharsis may be useful. High urine organic chlorine is indicative of exposure but not of severity.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Pesticide respirators may be used to limit exposure. Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool area in closed containers away from oxidizers and dichromates. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Organochlorine pesticides, solid toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum; do not use wet method. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Mirex is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: High-temperature incineration is recommended. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Mitomycin C M:1400

Molecular Formula: $C_{15}H_{18}N_4O_5$
Synonyms: Ametycin; 7-Amino-9-α-methoxymitosane; 7-Amino-9-α-methoxymitosane; Azirino (2′,3′: 3,4) pyrrolo (1,2-a) indole-4,7-dione, 6-amino-8-([(aminocarbonyl) oxy] methyl)-1,1a, 2,8,8a,8b-hexahydro-8-α-methoxy-5-methyl-, [1aS-(1a-a, 8b, 8a-a, 8ba)]; MIT-C; MITO-C; Mitocin-C; Mitomycin; Mitomycin-C; Mitomycinum; MMC; Mutamycin; Mytomycin; NCI-C04706; NSC 26980
CAS Registry Number: 50-07-7
RTECS® Number: CN0700000
DOT ID and ERG Number: UN3249 (medicine, solid, toxic, n.o.s)/151
EC Number: 200-008-6
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (ipr); clear evidence: rat; no evidence: mouse, 1975.
US EPA Hazardous Waste Number (RCRA No.): U010.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).
Reportable Quantity (RQ): 10 lb (4.54 kg).
California Proposition 65 Chemical: Cancer 4/1/88.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Mitomycin is a blue-violet crystalline solid. Molecular weight = 334.37; Freezing/Melting point = $\geq 360°C$. Soluble in water.
Potential Exposure: This compound is an antitumor antibiotic complex. This drug is usually injected intravenously.
Incompatibilities: Keep away from heat.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 12.5 mg/m^3
PAC-2: 23 mg/m^3
PAC-3: 23 mg/m^3
Routes of Entry: Inhalation. It is not known if this chemical penetrates the unbroken skin.
Harmful Effects and Symptoms
Short Term Exposure: Contact may irritate and damage the eyes. Toxic doses as low as 750 mg/kg have been reported in humans. The major toxic effect is myelosuppression, characterized by marked leukopenia and thrombocytopenia; this may be delayed and cumulative. Interstitial pneumonia and glomerular damage resulting in kidney failure are unusual but well-documented complications. Administration of mitomycin has been recognized as causing pneumonitis, alveolitis, and pulmonary fibrosis. Administration of mitomycin can cause kidney damage. Kidney toxicity was observed in 1−5% of patients. Depressed immune conditions were also noted. Headaches, blurred vision, confusion, drowsiness, fatigue, diarrhea, and pain have been occasionally noted as symptoms of mitomycin exposure. These do not appear to be dose related by intravenous administration. Fever and anorexia occur in 15% of patients. Hair loss, sloughing of skin, and loss of feeling occur in approximately 4% of patients. Labored breathing, cough, and pneumonia occur in some cases. Renal toxicity is sometimes observed.
Long Term Exposure: Causes mutations. Causes cancer in animals. There is limited evidence that Mitomycin C is a teratogen in animals. Can damage the bone marrow and cause kidney damage.
Points of Attack: Blood, kidneys.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: complete blood count and platelet count. Kidney function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposure to mitomycin C, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool,

well-ventilated area away from heat (temperatures over 40°C). If you are required to work in a "sterile" environment, you require special training. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including oxides of nitrogen, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Molybdenum M:1410

Molecular Formula: Mo

Synonyms: Elemental molybdenum; Molybdate; Molybdenum metal

CAS Registry Number: 7439-98-7

RTECS® Number: QA4680000 (elemental)

UN/NA & ERG Number: No citation for metal.

EC Number: 231-107-2

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Molybdenum is a silvery-white metal or dark gray or black powder with a metallic luster. Molecular weight = 95.94; Boiling point = 4825°C; Freezing/Melting point = 2652°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Molybdenite is the only important commercial source. This ore is often associated with copper ore. Molybdenum is insoluble in water and soluble in hot concentrated nitric and sulfuric acid.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector. Most of the molybdenum produced is used in alloys: steel, stainless steel; tool steel; case iron; steel mill rolls; manganese, nickel, chromium, and tungsten. The metal is used in electronic parts (contacts, spark plugs, X-ray tubes, filaments, screens, and grids for radios), induction heating elements, electrodes for glass melting, and metal spraying applications. Molybdenum compounds are utilized as lubricants; as pigments for printing inks; lacquers, paints, for coloring rubber animal fibers, leather, and as a mordant; as catalysts for hydrogenation cracking; alkylation, and reforming in the petroleum industry; in Fischer−Tropsch synthesis; in ammonia production; and in various oxidation−reduction and organic cracking reactions; as a coating for quartz glass; in vitreous enamels to increase adherence to steel; in fertilizers, particularly for legumes; in electroplating to form protective coatings; and in the production of tungsten. Hazardous exposures may occur during high-temperature treatment in the fabrication and production of molybdenum products, spraying applications, or through loss of catalyst. MoO_3 sublimes above 800°C.

Incompatibilities: *Soluble compounds:* alkali metals, sodium, potassium, molten magnesium. *Insoluble compounds:* Violent reaction with oxidizers, nitric acid, sulfuric acid. Forms explosive mixture with potassium nitrate. Metallic Mo is a combustible solid in the form of dust or powder and is potentially explosive.

Permissible Exposure Limits in Air

Mo, Metal and insoluble compounds

OSHA PEL: 15 mg[Mo]/m^3 total dust TWA. [*Note:* The PEL also applies to other insoluble molybdenum compounds (as Mo).]

NIOSH: See Appendix D of the *NIOSH Pocket Guide*.

ACGIH TLV®[1]: 10 mg[Mo]/m^3 inhalable fraction; 3 mg [Mo]/m^3 respirable fraction.

NIOSH IDLH: 5000 mg[Mo]/m^3.
Protective Action Criteria (PAC)
Elemental
TEEL-0: 15 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 500 mg/m^3
Mo, soluble compounds
OSHA PEL: 5 mg[Mo]/m^3 TWA.
NIOSH: See Appendix D of the *NIOSH Pocket Guide*.
ACGIH TLV®[1]: 0.5 mg[Mo]/m^3 respirable fraction TWA confirmed animal carcinogen with unknown relevance to humans.
DFG MAK: No numerical value established. Data may be available; testing for carcinogenic effects.
NIOSH IDLH: 1000 mg[Mo]/m^3.
Russia[43] established a MAC of 2 mg/m^3 for *soluble compounds, aerosol condensates*; 4 mg/m^3 for *soluble compounds as dusts*; MAC of 6 mg/m^3 for *insoluble compounds.* Several states have set guidelines or standards for molybdenum in ambient air[60] ranging from 100−200 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada) to 160 μg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Russia[43] has established a molybdenum limit of 0.5 mg/L in bodies used for domestic purposes. EPA[32] has suggested a permissible ambient goal of 70 μg/L based on health effects.

Determination in Water: With atomic-absorption spectrophotometry, a detection limit of 20 μg/L is attainable by direct aspiration into the flame, necessitating concentration for ordinary determinations. When the graphite furnace is used to increase sample atomization, the detection limit is lowered to 0.5 μg/L or. Neutron activation may be used at even lower detection limits, according to US EPA.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the skin and eyes. Inhalation can irritate the respiratory tract causing coughing and wheezing.

Long Term Exposure: Can cause headache, fatigue, loss of appetite, muscle and joint pain. Uric acid levels may be elevated which can lead to gout. May damage the liver and kidneys. May cause low blood count (anemia). In animals: irritation of eyes, nose, throat; anorexia, diarrhea, weight loss; listlessness; liver, kidney damage. Soluble compounds (e.g., sodium molybdate) and freshly generated molybdenum fumes are considerably more toxic. Inhalation of high concentrations of molybdenum trioxide dust is highly irritating to animals and has caused weight loss, diarrhea, loss of muscular coordination, and a high mortality rate. Molybdenum trioxide dust is more toxic than the fumes. Large oral doses of ammonium molybdate in rabbits caused some fetal deformities.

Points of Attack: *Soluble compounds:* Eyes, respiratory system, kidneys, blood. *Insoluble compounds:* Eyes, respiratory system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests for molybdenum and compounds: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). Preemployment and periodic physical examinations should evaluate any irritant effects to the eyes or respiratory tract and the general health of the worker. Liver and kidney function tests. Complete blood count (CBC). Uric acid level. Molybdenum is considered to be an essential trace element in many species, including humans. However, excessive intake of molybdenum may produce signs of copper deficiency. The normal intake of copper in the diet may be sufficient to combat or prevent systemic toxic effects due to molybdenum poisoning.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection (chemical goggles and face shield unless full face-piece respiratory protection is worn). Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *For Insoluble Compounds:* OSHA *Up to 75 mg/m^3*: Qm* (APF = 25) (any quarter-mask respirator). *Up to 150 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *Up to 375 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 750 mg/m^3:*

100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 5000 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*If not present as a fume.

For Soluble Compounds: *25 mg/m^3*: Qm* (APF = 25) (any quarter-mask respirator). *50 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100*; or Sa* (APF = 10) (any supplied-air respirator). *125 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter).* *250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie* (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Molybdenum must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from bromine, trifluoride, fluorine, chlorine trifluoride, and lead dioxide.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemicals appropriate for extinguishing metal fires, such as dry sand, dolomite, or graphite. *Do not use water*. Poisonous gases are produced in fire. Dust or powdered molybdenum may cause a dust explosion. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery is indicated whenever possible. Processes for recovery of Molybdenum from scrap, flue dusts, spent catalysts, and other industrial wastes have been developed.

PAC-3: 500 mg/m^3

DFG MAK: Carcinogen Category 3B.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: No specific values set for MoO_3; see this section in the entry on "Molybdenum and Compounds."

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of the skin and eyes. Dust or mist can irritate the respiratory tract causing cough and/or tightness in the chest. Can cause anorexia, weight loss, headache, muscle and joint aches, listlessness, hair loss, lack of muscular coordination, diarrhea, liver and kidney damage.

Long Term Exposure: Can irritate the lungs; bronchitis may develop. May cause anemia. May affect the liver and kidneys.

Points of Attack: Lungs, blood, liver and kidneys.

Medical Surveillance: NIOSH lists the following tests for molybdenum and compounds: whole blood (chemical/metabolite); biologic tissue/biopsy; urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: tests for liver and kidney function, complete blood count; uric acid level; lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *For Soluble Compounds: 25 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator).* *50 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100*; or Sa (APF = 10) (any supplied-air respirator).* *125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode)*; or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter).* *250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter)*; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1000 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Molybdenum trioxide must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); alkalis, sodium, potassium, and molten magnesium since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solids, organic, n.o.s. compound require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Molybdenum trioxide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] [monocrotophos and dustable powder formulations containing a combination of monocrotophos (solid pesticide and soluble liquid formulations of the substance that exceed 600 g active ingredient/L)].

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24; R28; R50/53; R68; Safety phrases: S1/2; S36/37; SS45-S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Monocrotophos is a colorless to reddish-brown solid with a mild ester odor. Molecular weight = 223.19; Specific gravity (H_2O:1) = 1.3; Boiling point = 125°C; Freezing/Melting point = 53.9°C (pure); 25−30°C (the reddish brown technical product); Vapor pressure = 7×10^{-6} mm at 20°C; Flash point = >93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water. Commercially available as a water-miscible solution.

Potential Exposure: The liquid form is a severely hazardous pesticide formulation. Those involved in the manufacture, formulation, and application of this insecticide.

Incompatibilities: Alkaline pesticides. Attacks black iron, drum steel, stainless steel, brass.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.25 mg/m^3 TWA.

ACGIH TLV®[1]: 0.05 mg/m^3 TWA, inhalable fraction and vapor; [skin], not classifiable as a human carcinogen; BEI$_A$ releases as Acetylcholinesterase-inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 0.05 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: 0.63 mg/m^3

PAC-3: 25 mg/m^3

Several states have set guidelines or standards for monocrotophos in ambient air[60] ranging from 2.5 μg/m^3 (North Dakota) to 40 μg/m^3 (Virginia) to 5.0 μg/m^3 (Connecticut) to 6.0 μg/m^3 (Nevada). Australia: TWA 0.25 mg/m^3, 1993; Belgium: TWA 0.25 mg/m^3, 1993; Denmark: TWA 0.25 mg/m^3, 1999; France: VME 0.25 mg/m^3 1999; Switzerland: MAK-W 0.25 mg/m^3, 1999; the Netherlands: MAC-TGG 0.25 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides; OSHA Analytical Method PV-2045, Monocrotophos.

Determination in Water: Fish Tox = 728.00039000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Monocrotophos is a highly toxic, direct acting, water-soluble cholinesterase inhibitor which appears to be capable of penetrating through the skin but is excreted rapidly and does not accumulate in the body. Acute exposure to monocrotophos may result in the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) may occur although hypertension (high blood pressure) is not uncommon. Chest pain may be noted. Dyspnea (shortness of breath) may lead to respiratory collapse. Giddiness is common. Monocrotophos acts on the nervous system. Extremely toxic; probable oral lethal dose to humans 5−50 mg/kg or between 7 drops and 1 teaspoon for a 70-kg (150 lb) person. Repeated inhalation or skin contact with this material may, without symptoms, progressively increase susceptibility to poisoning. Monocrotophos may cause mutations. Handle with extreme caution. In animals: possible teratogenic effects. Human Tox = 0.35000 ppb (EXTRA HIGH).

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause personality changes with depression, anxiety, irritability.

Points of Attack: Eyes, respiratory system, central nervous system, cardiovascular system, blood cholinesterase, reproductive system.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, or wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. As with other organophosphorus pesticides, do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills*: take up with vermiculite, dry sand, earth, or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover; move containers from spill area. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. *Large spills*: dike far ahead of spill for later disposal. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid or solid. Like other organophosphorus pesticides, extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and full protective clothing. Poisonous gases, including nitrogen oxides and phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Container may explode in heat of fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be hydrolyzed with water.[22] Incineration in a unit with effluent gas scrubbing is recommended for larger amounts. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human, No Adequate Data; Animal, Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999.

US EPA Gene-Tox Program, Positive: Host-mediated assay.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R10; R20/21/22; R34; Safety phrases: S1/2; S23; S36; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Morpholine is a colorless liquid with a weak ammonia or fish-like odor. The odor threshold is 0.01 ppm. Molecular weight = 87.14; Specific gravity (H_2O:1) = 1.007; Boiling point = 128.9°C; Freezing/Melting point = −5°C; Vapor pressure = 6 mmHg at 20°C; Flash point = 37°C. Autoignition temperature = 310°C. Explosive limits: LEL = 1.4%; UEL = 11.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Morpholine is used as a separating agent for volatile amines; an intermediate for textile lubricants; in the synthesis of rubber accelerators and pharmaceuticals. It is also used as a solvent; as a boiler water additive; and in the formulation of waxes, polishers, and cleaners.

Incompatibilities: Strong acids, strong oxidizers, metals, nitro compounds. Corrosive to metals; attacks copper and its compounds.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.56 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 20 ppm/70 mg/m^3 TWA [skin].

NIOSH REL: 20 ppm/70 mg/m^3 TWA; 30 ppm/105 mg/m^3 STEL [skin].

ACGIH TLV®[1] 20 ppm/71 mg/m^3 TWA [skin].

DFG MAK: 10 ppm/36 mg/m^3 TWA; Peak Limitation Category I(2); [skin]; Pregnancy Risk Group D.

NIOSH IDLH: 1400 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 30 ppm

PAC-2: 30 ppm

PAC-3: 1400 ppm

Australia: TWA 20 ppm (70 mg/m^3); STEL 30 ppm, [skin], 1993; Austria: MAK 20 ppm (70 mg/m^3), [skin], 1999; Belgium: TWA 20 ppm (71 mg/m^3); STEL 30 ppm, [skin] 1999; Denmark: TWA 20 ppm (70 mg/m^3), [skin], 1999; Finland: TWA 20 ppm (70 mg/m^3); STEL 30 ppm (105 mg/m^3), [skin], 1999; France: VME 20 ppm (70 mg/m^3), VLE 30 ppm (105 mg/m^3), 1999; Hungary: STEL 10 mg/m^3, [skin], 1993; Norway: TWA 20 ppm (70 mg/m^3), 1999; the Netherlands: MAC-TGG 36 mg/m^3, [skin], 2003; the Philippines: TWA 20 ppm (70 mg/m^3), [skin], 1993; Poland: MAC (TWA) 70 mg/m^3; MAC (STEL) 100 mg/m^3, 1999; Russia: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 1993; Sweden: NGV 20 ppm (70 mg/m^3), KTV 30 ppm (110 mg/m^3), [skin], 1999; Switzerland: MAK-W 20 ppm (70 mg/m^3), KZG-W 40 ppm (140 mg/m^3), [skin], 1999; United Kingdom: TWA 20 ppm (72 mg/m^3); STEL 30 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia set a MAC of 0.01 mg/m^3 for ambient air in residential areas (10 μg/m^3) on a once-daily basis. Several states have set guidelines or standards for morpholine in ambient air[60] ranging from 0.7−1.05 mg/m^3 (North Dakota) to 1.15 mg/m^3 (Virginia) to 1.4 mg/m^3 (Connecticut) to 1.6667 mg/m^3 (Nevada).

Determination in Air: Use NIOSH (II-3) Method #S-150.

Permissible Concentration in Water: Russia[35][43] set a MAC of 0.04 mg/L for water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.9$.

Routes of Entry: Inhalation, skin absorption, ingestion, and skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance is corrosive to the eyes, skin, and the respiratory tract. Contact can cause redness, swelling, and burns. Exposure can cause corneal (eye) swelling resulting in blurring vision. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Morpholine may damage the liver and kidneys. Can cause a skin rash.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: butyl rubber gloves, suits, boots; 4H™ and Silver Shield™ gloves. Also, polyvinyl alcohol and Viton are among the recommended protective materials. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *550 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *1000 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1400 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Morpholine must be stored to avoid contact with strong acids (such as nitric acid) and strong oxidizers (such as chlorine, chlorine dioxide, bromine, nitrates, and permanganates) since violent reactions occur.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).[22]

Muscimol M:1450

Molecular Formula: $C_4H_6N_2O_2$

Synonyms: Agarin; 5-Aminomethyl-3-hydroxyisoxazole; 5-(Aminomethyl)-3-isoxazolol; 5-(Aminomethyl)-3-(2H)isoxazolone; 5-Hydroxy-5-aminomethylisoxazole; Muscimol

CAS Registry Number: 2763-96-4

RTECS® Number: NY3325000

UN/NA & ERG Number: Not regulated.

EC Number: 220-430-4

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P007.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances, TPQ = 500/10,000 lb (227/4550 kg).

Reportable Quantity (RQ): 1000 lb(455 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Muscimol is a crystalline solid. Molecular weight = 114.12; Freezing/Melting point = 175°C (decomposes).

Potential Exposure: Formerly used as a sedative and as an antiemetic; and for experimental laboratory purposes.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 17 mg/m^3

PAC-3: 20 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Muscimol is a potent central nervous system depressant. Initially, drowsiness, stupor, or sleep is followed by mild nausea and vomiting. Muscle spasms in extremities, various emotional changes and distorted perceptions of space and time, but only rarely hallucinations. This compound is a natural constituent of amanita mushrooms and is extremely toxic. It is a potent central nervous system depressant and is believed to be responsible for most of the nervous system effects that result from eating this mushroom. The lowest toxic dose in humans has been reported at 109 mg/kg.

Long Term Exposure: May be neurotoric.

Points of Attack: Central nervous system.

Medical Surveillance: Examination of the nervous system. Examination for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
US DOT 49CFR172.101, Inhalation Hazard Chemical.
California Proposition 65 Chemical: Cancer 2/27/87.
WGK (German Aquatic Hazard Class): No value assigned (all above CAS numbers).

Description: Mustard gas, a chlorinated sulfur compound (s), is an oily, yellow to black liquid (clear when pure) with a sweet, burnt garlic or horseradish-like odor. The odor threshold for HD is 0.0006 mg/m^3. Molecular weight = 159.08; Specific gravity (H_2O = 1) = 1.27 at 20°C; Volatility = 610 mg/m^3 at 20°C; 920 mg/m^3 at 25°C; Boiling point = (decomposes) 215−217°C; Freezing/Melting point = 13−14°C; Vapor pressure = 0.072 mmHg at 20°C; 0.11 mmHg at 25°C; Vapor density (air = 1) = 5.5; Flash point (ignited by large explosive charges) = 104°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 1₩. Slightly soluble in water (reaction). Soluble in acetone, CH3(C1), tetrachloroethane, ethylbenzoate, and ether. Thickened is essentially the same as HD except for viscosity, which uses HD K125 (acryloid copolymer, 5%) as a thickener. K125 is not known to be hazardous except in a finely-divided, powder form. The viscosity of HD is between 1000 and 1200 centistokes at 25°C.

HT is a mixture of 60% HD and 40% Agent HT [(bis-(2-chloroethylthio ethyl)ether], a closely related vesicant with a lower freezing point). Agent HT is essentially the same as Agent HD, but HT is more stable. HT is a clear, yellowish, highly viscous liquid. It has a longer duration of effectiveness and has a lower garlic-like odor similar to HD. Although volatility is low, vapors can reach hazardous levels in warm weather. Specific gravity (water = 1) = 1.2361 at 25°C; Boiling point: 120°C at 0.02 torr; 174°C at 2.0 torr; Freezing/Melting point = 9.6−9.9°C; 13−14°C[NIOSH]; Volatility (mg/L) = 4.1×10^{-4} at 25°C; Viscosity (centistoke) = 14.7 at 25°C; Vapor pressure = 0.025 mmHg at 0°C; 0.090 mmHg at 30°C. Vapor density (air = 1) = 9.08; Flash point = 100°C. Practically insoluble in water; solubility = 0.8 g/L at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Mustard gas is used as an alkylating agent. It has also been used as a chemical warfare agent, causing delayed casualties. It is a vesicant and blister agent in chemical warfare (especially during World War I, military designation H or HD). Mustard gas is used as a model compound in biological studies. Mustard gas has been tested as an antineoplastic agent, but its clinical use as a tumor inhibitor has been minimal.

Incompatibilities: Sulfur mustard is stable at ambient temperatures. Reacts with oxidizers (vigorous), strong acids, acid fumes, strong alkalis, oxygen, water, steam, and other forms of moisture. On contact with acid or acid fumes, it emits highly toxic fumes of oxides of sulfur and chlorine. Rapidly corrosive to brass at 65°C. Will corrode steel at a rate of 0.0001 in/month at 65°C. Contact with metals may evolve flammable hydrogen gas. HD reacts with water; will hydrolyze, forming HCI and thiodiglycol. When heated to decomposition (between 149°C and 177°C), highly toxic fumes of hydrochloric acid, oxides of sulfur and chlorine are emitted.

Persistence of Chemical Agent: HD: Summer: 3 days to 1 week; Winter: May last for weeks.

Permissible Exposure Limits in Air
IDLH: 0.7 mg/m^3.
STEL: 0.003 mg/m^3.
WPL (Worker population limit): 0.0004 mg/m^3.
GPL (General population limit): 0.00002 mg/m^3.
AEGL (Acute Exposure Guidelines): 0.06 ppm/0.4 mg/m^3 (10 min); 0.001 ppm/0.008 mg/m^3 (8 h).
Protective Action Criteria (PAC) HD, 505-60-2*
TEEL-0: 0.0035 ppm
PAC-1: **0.01** ppm
PAC-2: **0.02** ppm
PAC-3: **0.32** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: [skin] Carcinogen Category 1 as bis(β-chloroethyl)sulfide.
Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000.

Determination in Air: Available monitoring equipment for agent HD is the M8/M9 Detector paper, blue bank tube; M256/M256A1 kits; bubbler. Depot Area Air Monitoring System (DAMMS); automated Continuous Air Monitoring System (ACMS); CAM-M1, Hydrogen Flame Photometric Emission Detector (HYFED); and the Minature Chemical Agent Monitor (MINICAM).

Determination in Water: Ecotoxicology: Log K_{ow} (estimated) = 2.41: Log $K_{benzene-water}$ = 0.15. Bulk mustard can persist for decades in soil or water. When exposed to sea water, mustard forms a thick outer "crust" over a core of mustard which allows the mustard to be brought to the surface where it can injure unsuspecting fishermen, who may snare plastic lumps of mustard gas in their nets. Mustard and a number of its hydrolysis products are oxidized (air, oxygen, hypochlorite, hydrogen peroxide, nitric acid, potassium permanganate, and chromic acid) to give the less toxic sulfoxide and sulfone analogs. Mustard and its hydrolysis products do not significantly degrade in sunlight and are stable at less than 49°C.

Routes of Entry: Ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Sulfur mustard causes severe, delayed burns to the eyes, skin, and respiratory tract. Sulfur mustard damages cells within minutes of contact; however, the onset of pain and other health effects is delayed until hours after exposure. Large exposures to sulfur mustard may be fatal.[CDC]

Short Term Exposure: Contact with the liquid or exposure to high vapor concentrations can cause severe burns and permanent eye damage. There is no pain on contact but hours later redness, swelling, and pain occur. Blindness may result. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. In 1−12 h there may be coughing, swollen eyelids, reddened skin, and severe itching. There may be swelling and destruction of tissue in the respiratory tract and exposed skin. Ingestion may cause nausea and destruction of tissue in the respiratory tract and exposed skin. Ingestion may cause nausea and vomiting. The median lethal dosage is 1500 mg-min/m^3 for inhalation and 10,000 mg-min/m^3 for skin absorption (masked personnel). The median incapacitating dosage is 200 mg-min/m^3 for eye injury and 2000 mg-min/m^3 for skin absorption (masked personnel). Wet skin absorbs more material than dry skin. May cause death or permanent injury after very short exposure to small quantities. It is a blistering gas and is highly irritating to eyes, skin, and lungs. Pulmonary lesions are often fatal. HD is a vesicant (causing blisters) and alkylating agent producing cytotoxic action on the hematopoietic (blood-forming) tissues which are especially sensitive. The rate of detoxification of HD in the body is very slow and repeated exposures produce a cumulative effect. Median doses of HD in humans are: LD_{50} (skin) = 100 mg/kg; ICt_{50} (skin) = 2000 mg-min/m^3 at 21−27°C (humid environment); = 1000 mg-min/m^3 at 32°C (dry environment); ICt_{50} (eyes) = 200 mg-min/m^3; ICt_{50} (inhalation) = 1500 mg-min/m^3 (Ct unchanged with time) LD_{50} (oral-rat) = 0.7 mg/kg. Maximum safe Ct for skin and eyes are 5 and 2 mg-min/m^3, respectively.

Acute physiological action, local: HD affects both the eyes and the skin. *Skin* damage occurs after percutaneous resorption. Being lipid soluble, HD can be reabsorbed into all organs. Skin penetration is rapid without skin irritation. Swelling (blisters) and reddening (erythema) of the skin occurs after a latency period of 4−24 h following the exposure, depending on degree of exposure and individual sensitivity. The skin healing process is very slow. Tender skin, mucous membrane, and perspiration-covered skin are more sensitive to the effects of HD. HD's effect on the skin, however, is less than on the eyes. Local action on the eyes produces severe necrotic damage and loss of eyesight. Exposure of eyes to HD vapor or aerosol produces lacrimation, photophobia, and inflammation of the conjunctiva and cornea.

Acute physiological action, systemic: Occur primarily through inhalation and ingestion. The HD vapor or aerosol is less toxic to the skin or eyes than the liquid form. When inhaled, the upper respiratory tract (nose, throat, trachea) is inflamed after a few hours latency period, accompanied by sneezing, coughing, and bronchitis, loss of appetite, diarrhea, fever, and apathy. Exposure to nearly lethal dose of HD can produce injury to bone marrow, lymph nodes, and spleen, as indicated by a drop in WBC count and, therefore, results in increased susceptibility to local and systemic infections. Ingestion of HD will produce severe stomach pains, vomiting, and bloody stools after a 15- to 20-min latency period.

Long Term Exposure: HD can cause sensitization, chronic bronchitis, and lung impairment (cough, shortness of breath, chest pain); and can cause cancer of the mouth, throat, respiratory tract, skin, and leukemia. It may also cause birth defects. Mustard gas is a carcinogen.

Points of Attack: Lungs, eyes.

Medical Surveillance: Lung function tests. Examination of the eyes, including slit lamp. Consider chest X-ray following acute overexposure.

First Aid: There is no antidote for sulfur mustard toxicity. If this chemical gets into the eyes instantly flush with water. A delay of seconds can cause permanent damage. *Inhalation*: Remove from the source *immediately*. If breathing has stopped, give artificial respiration. If breathing is difficult, administer oxygen. *Seek medical attention immediately*. *Eye contact:* Speed in decontaminating the eyes is absolutely essential. Remove person from the liquid source; flush the eyes immediately with water by tilting the head to the side, pulling the eyelids apart with the fingers, and pouring water slowly into the eyes. Do not cover eyes with bandages but, if necessary, protect eyes by means of dark or opaque goggles. *Transfer the patient to a medical facility immediately. Ingestion:* Do not induce vomiting. Give victim milk to drink. Seek medical attention immediately. *Skin contact:* Don respiratory protective mask and gloves; remove victim from agent source immediately. Flush skin and clothes with solution of sodium hypochlorite or liquid household bleach (see decontamination procedure below) within 1 min. Cut and remove contaminated clothing, flush contaminated skin area again with sodium hypochlorite solution, then wash contaminated skin area with soap and water. If shower facilities are available, wash thoroughly and transfer to medical facility. If the skin becomes contaminated with a thickened agent, blot/wipe off the material immediately with an absorbent pad/paper towel prior to using decontaminating solution.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you do not have the equipment and training, do not enter the hot zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let anything to get into the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Be sure that you have decontaminated the victims as much as you can before they leave the area so that they do not spread the agent. Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes, and other items.

Personal Protective Methods: *Protective gloves, mandatory*: Butyl, toxicological agent, protective gloves (M3, M4, glove set). As a minimum, chemical goggles will be worn. For splash hazards use goggles and face shield. Full protective clothing will consist of the M3 butyl rubber suit with hood, M2A1 butyl boots; M3 gloves; impregnated underwear; M9 series mask and coveralls (if desired); or the Demilitarization Protective Ensemble (DPE). For general lab work, gloves and lab coat shall be worn with M9 or M17 mask readily available. In addition, when handling contaminated lab animals, a daily clean smock, foot covers, and head covers are required. *Ventilation*: Local Exhaust: Mandatory. Must be filtered or scrubbed. *Special:* Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (lfpm) plus or minus 10% with the velocity at any point not deviating from the average face velocity by more than 20%. Laboratory hoods shall be located so that cross-drafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent HD. Other: recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted. Emergency backup power is necessary. Hoods should be tested semi-annually or after modification or maintenance operations. Operations should be performed with 20 cm inside hoods.

Swatch Test Results for Level A Suits and Chemical Protective Gloves for HD (Mustard gas)

Item	**Breakthrough**
25-mil chemical protective gloves	360 min
Kappler Suit Model 42483	150 min
TYCHEM 10,000 Pkg Style No. 12645	330 min
Trellchem HPS suit	>480 min
Ready 1 Limited Use Suit: Model 91	125 min
First Team XE HazMat suit	385 min
Commander Ultrapro Suit, Style 79102	280 min
Kappler Suit Model 50660	435 min
TYCHEM Style No. 11645	>480 min
Trellchem TLU suit	>480 min
Chemturion Suit: Model 13	110 min
Chempruf II BETEX Suit	125 min
Commander Brigade: F91	>480 min

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Do not use chemical cartridge or canister respirators. Less than or equal to 0.003:* Protective mask not required provided that: as an 8-h TWA (a) Continuous real-time monitoring (with alarm capability is conducted in the work area at the 0.003 mg/m^3 level of detection. (b) M9, M17 or M40 mask is available and donned if ceiling concentrations exceed 0.003 mg/m^3. (c) Exposure has been limited to the extent practicable by engineering controls (remote operations, ventilation, and process isolation) or work practices. *If these conditions are not met then the following applies:* full face-piece chemical canister, air-purifying respirators. (The M9, M17, or M40 series or other certified equivalent masks are acceptable for this purpose in conjunction with the M3 toxicological agent protective (TAP) suit for dermal protection.) *Greater than 0.003 as an 8-h TWA*: The Demilitarization Protective Ensemble (DPE), 30 mil, may be used with prior approval from the AMC Field Safety Activity. Use time for the 30 mil DPE must be restricted to 2 h or less. *Note*: When 30 mil DPE is not available, the M9 or M40 series mask with Level A protective ensemble including impregnated innerwear can be used. However, use time shall be restricted to the extent operationally feasible and may not exceed 1 h. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots, respectively, to reduce aspiration.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Stable at ambient temperatures. Decomposition temperature is 149−177°C. Mustard is a persistent agent depending on pH and moisture and has been known to remain active for up to 3 years in soil. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. During handling, the "buddy" (two-man) system will be used. Containers should be periodically inspected for leaks either visually or using a detector kit, prior to transferring the containers from storage to work areas. Stringent control over all personnel handling HD must be exercised. Chemical showers, eyewash stations, and personal cleanliness facilities must be provided. Each worker will wash their hands before meals and shower thoroughly with special attention given to hair, face, neck, and hands using plenty of soap before leaving at the end of the workday. No smoking, eating, or drinking is permitted at the work site. Decontaminating equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. HD should be stored in containers made of glass for Research, Development, Test, and Evaluation (RDTE) for small quantities or one-ton steel containers for large quantities. Agent shall be double-contained in liquid-tight containers when in storage.

Shipping: Toxic liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone B] require a shipping label of "POISONOUS/TOXIC MATERIALS." Bis-(2-chloroethyl) sulfide UN 2810, Inhalation Hazard. It falls in Hazard Class 6.1 and Packing Group III.[NIOSH]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. To clean up a spill, cover with up to 15% calcium hypochloride. Place in container; neutralize after 12 h if necessary. Keep sparks, flames, and other sources of ignition away. Keep material out of water sources and sewers. Attempt to stop leak if it is without hazard. Use water spray to knock down vapors. Avoid breathing vapors and bodily contact with the material. Keep upwind. Wash away any material which may have contacted the body with copious amounts of soap and water. Downwind evacuation must be considered. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

If spills or leaks of THD (Thickened HD) occur, follow the same procedures as those for HD, but dissolve the THD in acetone prior to introducing any decontaminating solution. Containment of THD is generally not necessary. Spilled THD can be carefully scraped off the contaminated surface and placed in a fully removable head drum with a high density, polyethylene lining. The THD can then be decontaminated, after it has been dissolved in acetone, using the same procedures used for HD. Contaminated surfaces should be treated with acetone, then decontaminated using the same procedures as those used for HD. Handling the THD requires careful observation of the "stringers" (elastic, thread-like attachments) formed when the agents are transferred or dispensed. These stringers must be broken cleanly before moving the contaminating device or dispensing device to another location, or unwanted contamination of a working surface will result.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

H, HD, when used as a weapon

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Recommended field procedures (H, HD)*:* The mustard should be contained using vermiculite, diatomaceous earth, clay, or fine sand, and neutralized as soon as possible using copious amounts of 5.25% sodium hypochlorite solution. Scoop all material and place in an approved DOT container. Cover the contents of the drum with decontaminating solution as above. The exterior of the drum shall be decontaminated and then labeled per IAW, EPA, and DOT regulations. All leaking containers shall be over-packed with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of the material used to decontaminate exterior of drum in accordance with IAW, federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If 5.25% Sodium Hypochlorite solution is not available, then the following decontaminates may be used instead and are listed in the order of preference: Calcium Hypochlorite Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]; and Super Tropical Bleach Slurry (STB).

Warning: Pure, undiluted calcium hypochlorite (HTH) will burn on contact with liquid blister agent.

Recommended laboratory procedures: A minimum of 65 g of decontamination fluid per gram of HD is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour if a single phase is obtained. At the end of 24 h, the resulting solution shall be adjusted to a pH between 10 and 11. Test for presence of active chlorine by use of acidic potassium iodide solution to give free iodine color. Place 3 mL of the decontaminate in a test tube. Add several crystals of potassium Iodine and swirl to dissolve. Add 3 mL of 50 wt.% sulfuric acid: water and swirl. IMMEDIATE iodine color indicates the presence of active chlorine. If negative, add additional 5.25% sodium hypochlorite solution to the decontamination solution, wait for 2 h, then test again for active chlorine. Continue procedure until positive chlorine is given by solution. A 10-wt.% calcium hypochlorite (HTH) mixture may be substituted for sodium hypochlorite. Use 65 g of decon/gram of HD and continue the test as described for sodium hypochlorite. Scoop up all material and place in approved DOT containers. Cover the contents of the drum with decontaminating solution as above. The exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label in accordance with IAW, EPA, and DOT regulations. Dispose of the material used to decontaminate exterior of drum in accordance with IAW federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limits. *Note*: Surfaces contaminated with HD, and then rinse decontaminated, may evolve sufficient mustard vapor to produce a physiological response.

Recommended field procedures (HT): HT should be contained using vermiculite, diatomaceous earth, clay, or fine sand, and neutralized as soon as possible using copious amounts of alcoholic caustic, carbonate, or Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)]. Caution must be exercised when using these decontaminates since acetylene will be given off. Household bleach can also be used if accompanied by stirring to allow contact. Scoop up all contaminated material and place in approved DOT containers. Cover the contents with additional decontaminant. All leaking containers will be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate the outside of the container and label according to DOT and EPA requirements. Dispose of the material according to waste disposal methods provided below. Dispose of decontaminate according to federal, state, and local laws. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. *Warning:* Never use dry High Test Hypochlorite (HTH) or Super Tropical Bleach (STB) since they will react violently with HT and may burst into flames.

Recommended laboratory procedures: A minimum of 65 g of decontamination solution per gram of HT is allowed to agitate for a minimum of 1 h. Agitation is not necessary following the first hour if a single phase is obtained. At the end of 24 h, the resulting solution will be adjusted to a pH between 10 and 11. Test for presence of active chlorine by use of acidic potassium iodide solution to give free iodine color. Place 3 mL of the decontaminate in a test tube. Add several crystals of potassium iodine and swirl to dissolve. Add 3 mL of 50 wt.% sulfuric acid: water and swirl. Immediate iodine color shows the presence of active chlorine. If negative, add additional 5.25% sodium hypochlorite solution to the decontamination solution, wait for 2 h, then test again for active chlorine. Continue procedure until positive chlorine is given by solution. Scoop up all material and place in approved DOT containers. Cover the contents with additional decontaminate as above. The exterior of the container will be decontaminated and labeled according to EPA and DOT regulations. All leaking containers will be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label according to EPA and DOT regulations. Dispose of the material according to waste disposal methods provided below. Dispose of decontaminate according to federal, state, and local regulations. Conduct general area monitoring with an approved monitor to confirm that the atmospheric concentrations do not exceed the airborne exposure limits.

A 10-wt.% calcium hypochlorite mixture may be substituted for sodium hypochlorite. Use 65 g of decon/gram of HT and continue the test as described for sodium hypochlorite. *Note:* Surfaces contaminated with HT, then rinse decontaminated, may evolve sufficient HT vapor to produce a physiological response. HT on laboratory glassware may be oxidized by vigorous reaction with concentrated nitric acid.

Waste disposal method: All neutralized material should be collected, contained, and thermally decomposed in EPA-approved incinerators that will filter or scrub toxic by-products from effluent air before discharge to the atmosphere. Any contaminated materials or protective clothing should be decontaminated using HTH or bleach and analyzed to assure it is free of detectable contamination (3 ×) level. Contaminated clothes and personal belongings should be placed in a sealed double bag and placed inside properly labeled drums and held for shipment back to the DA issue point.

Note: Several states define decontaminated surety material as a RCRA hazardous waste.

Fire Extinguishing: This chemical may burn but does not easily ignite. HD will hydrolyze, forming HCI and thiodiglycol. Poisonous gases, including oxides of sulfur and chlorides, are produced in fire. Extinguish with water, foam, dry chemical, or carbon dioxide. Protective clothing and self-contained breathing apparatus are required in the presence of mustard gas. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: All decontaminated material should be collected, contained and chemically decontaminated or thermally decomposed in an EPA-approved incinerator, which will filter or scrub toxic by-products from effluent air before discharge to the atmosphere. Any contaminated protective clothing should be decontaminated using calcium hypochlorite (HTH) or bleach and analyzed to assure it is free of detectable contamination (3X) level.

Contaminated clothes and personal belongings should be placed in a sealed double bag and subsequently placed inside properly labeled drums and held for shipment back to the DA issue point. Decontamination of waste or excess material shall be accomplished in accordance with the procedures outlined above with the following exceptions: (a) HD on laboratory glassware may be oxidized by its vigorous reaction with concentrated nitric acid. (b) Open pit burning or burying of HD or items containing or contaminated with HD in any quantity is prohibited.

Note: Several states define decontaminated surety material as a RCRA Hazardous Waste.

Regulatory Authority and Advisory Bodies
US EPA, FIFRA, 1998 Status of Pesticides: Supported.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).
Reportable Quantity (RQ): 10 lb (4.54 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.
European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R21/22; R36/38; R50; Safety phrases: S2; S36/37; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Naled is a white crystalline solid (when pure) or light straw-colored liquid (above 26.7°C) with a slightly pungent insecticide odor. Molecular weight = 380.80; Specific gravity (H_2O:1) = 1.96 at 25°C; Boiling point = (decomposes) 110°C; Freezing/Melting point = 26.7°C; Vapor pressure = 2×10^{-4} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Insoluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Primary Irritant. Those involved in the manufacture, formulation, and application of this insecticide, fungicide, bactericide, acaricide. Also used in cooling towers, veterinary medicine, pulp and paper mill systems, hospitals, swimming pools, and bathrooms.
Incompatibilities: Incompatible with oxidizers. Hydrolyzed in presence of water. Degraded by sunlight. Decomposes when heated and on contact with acids, acid fumes, bases, producing fumes of hydrogen chloride, hydrogen bromide, phosphorus oxides. Reacts with acids, strong oxidizers in sunlight. Reacts with water. Corrosive to metals. Attacks some plastics, rubber, and coatings.
Permissible Exposure Limits in Air
OSHA PEL: 3 mg/m^3 TWA.
NIOSH REL: 3 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 0.1 mg/m^3 inhalable fraction and vapor [skin, sensitizer]; not classifiable as a human carcinogen; BEI$_A$ issued as Acetylcholinesterase-inhibiting pesticides.
NIOSH IDLH: 200 mg/m^3.
No TEEL available.
DFG MAK: 1 mg/m^3, measured as the inhalable fraction TWA; Peak Limitation Category II(2); [skin] danger of skin sensitization; Pregnancy Risk Group C.
Australia: TWA 3 mg/m^3, [skin], 1993; Austria: MAK 3 mg/m^3, 1999; Belgium: TWA 3 mg/m^3, [skin], 1993; Finland: TWA 3 mg/m^3; STEL 6 mg/m^3, 1999; France: VME 3 mg/m^3, [skin], 1999; Norway: TWA 3 mg/m^3, 1999; the Netherlands: MAC-TGG 3 mg/m^3, 2003; Thailand: TWA 3 mg/m^3, 1993; United Kingdom: TWA 3 mg/m^3; STEL 6 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for dibrom in ambient air[60] ranging from 30 μg/m^3 (North Dakota) to 50 μg/m^3 (Virginia) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada).
Determination in Air: No method available.
Permissible Concentration in Water: Mexico[35] has set maximum permissible concentration values of 3.0 μg/L for coastal waters and 0.03 mg/L (30 μg/L) for estuaries.
Determination in Water: Fish Tox = 10.17349000 ppb (INTERMEDIATE).
Routes of Entry: Inhalation, skin absorption, ingestion, eye and/or skin contact. Absorbed by the skin.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the nervous system causing convulsions, respiratory failure. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. High exposure can result in death. Highly toxic; a probable human lethal dose may be between 1 teaspoon and 1 oz. Human Tox = 14.00000 ppb (INTERMEDIATE).
Long Term Exposure: May cause skin allergy. Cholinesterase inhibitor; cumulative effect is possible. This

DOI: 10.1016/B978-1-4377-7869-4.00013-8

chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, central nervous system, cardiovascular system, skin, eyes, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: cholinesterase: blood plasma, red blood cells/count; cholinesterase: blood serum, red blood cells/count; cholinesterase: red blood cells/count. Before employment and at regular times after that, the above tests are recommended. Cholinesterase levels tests for the enzyme poisoned by this chemical. If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Evaluation by a qualified allergist. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended.

Note to physician: 1−4 mg atropine; maintenance: 2-mg doses at intervals of 15−60 min.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *30 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *75 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *150 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *200 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. It must be stored to avoid contact with strong oxidizers, such as chlorine and chlorine dioxide, since violent reactions occur. Keep away from acids, acid fumes, sunlight, heat, and water.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Naled in Packing Group III.

Spill Handling: *Dry:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is noncombustible. Use agents suitable for surrounding fire. Poisonous gases, including hydrogen chloride, hydrogen bromide, phosphorus oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: This pesticide is more stable to hydrolysis than dichlorvos (50% hydrolysis at pH 9 at 37.5°C in 301 min). It is unstable in alkaline conditions, in presence of iron, and is degraded by sunlight. About 10% hydrolysis per day is obtained in ambient water. Incineration is recommended for large amounts.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*CAS: 8002-05-9*); 1—Slightly water polluting (*CAS: 8030-30-6; 8032-32-4*).

Description: Naphthas derived from both petroleum and coal tar are included in this group. *Petroleum naphthas* are colorless liquids with a gasoline- or kerosene-like odor. A mixture of paraffins (C5−C13) may contain a small amount of aromatic hydrocarbons and are termed "close-cut" fractions. "Medium-range" and "wide-range" fractions are made up of 40−80% aliphatic hydrocarbons, 25−50% naphthenic hydrocarbons, 0−10% benzene, and 0−20% other aromatic hydrocarbons. Molecular weight = (approx.) 99 [petroleum distillates (naphtha)]; Specific gravity (H_2O:1) = 0.63−0.66 [petroleum distillates (naphtha)]; Boiling point = 35−60°C; Freezing/Melting point = −73°C; Vapor pressure = (approx.) 40 mmHg [petroleum distillates (naphtha)]; Flash point = −40 to −66°C [petroleum distillates (naphtha)]; Autoignition temperature = 288°C. Explosive Limits: LEL = 1.1%; UEL = 5.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Insoluble in water.

Coal tar naphtha is a mixture of aromatic hydrocarbons, principally toluene, xylene, and cumene. Coal tar naphtha is a reddish-brown, mobile liquid with an aromatic odor. Shipped as a molten solid. Benzene is present in appreciable amounts in those coal tar naphthas with low boiling points. Molecular weight = (approx.) 110; Specific gravity (H_2O:1) = 0.89−0.97; Boiling point = 160−220°C; Vapor pressure = <5 mmHg at 20°C; Flash point = 38−43°C. Explosive Limits: LEL = 1.0%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): (coal tar) Health 2, Flammability 2, Reactivity 0. Insoluble in water.

VM&P naphtha is a clear to yellowish liquid with a pleasant, aromatic odor: Molecular weight = (approx) 87−114; Specific gravity (H_2O:1) = 0.73−0.76; Boiling point = 100−177°C; Vapor pressure = 2−20 mmHg at 20°C; Flash points = −2 to 29°C; Autoignition temperature = 232°C. Explosive limits: vary somewhat but typical values are LEL = 0.9%; UEL = 6.7%. Hazard Identification (based on NFPA-704 M Rating System): (VM&P) Health 1, Flammability 3, Reactivity 0. See also Stoddard Solvent.

Potential Exposure: Compound Description [*Petroleum distillates (naphtha)*]: Human Data; Primary Irritant; (*coal tar naphtha*) Agricultural Chemical; Tumorigen, Human Data; Primary Irritant; *(VM&P naphtha)* Reproductive Effector; Primary Irritant. Naphthas are used as organic solvents for dissolving or softening rubber, oils, greases, bituminous paints, varnishes, and plastics. The less flammable fractions are used in dry cleaning. The heavy naphthas are used as a vehicle for various pesticides. Coal tar naphthas are used as quick-drying paint solvent, in the manufacture of floor coverings, resin solution, varnish; VM&P naphtha is used as a solvent for lacquers and varnishes and as a rapid-dry paint thinner.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Naphtha, petroleum distillates

Conversion factor: 1 ppm = 4.05 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 500 ppm/2000 mg/m^3 TWA.

NIOSH REL: 350 mg/m^3 TWA; 1800 mg/m^3 [15 min] Ceiling Concentration.

NIOSH IDLH: 1100 ppm [LEL].

Protective Action Criteria (PAC)

Petroleum asphalt 8002-05-9

TEEL-0: 350 mg/m^3

PAC-1: 350 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Naphtha, coal tar

Conversion factor: 1 ppm = 4.50 mg/m^3 (approx.) at 25°C & 1 atm.

OSHA PEL: 100 ppm/400 mg/m^3 TWA.

NIOSH REL: 100 ppm/400 mg/m^3 TWA.

NIOSH IDLH: 1000 ppm [LEL].

Australia: TWA 480 mg/m^3, 1993; Denmark: TWA 25 ppm (145 mg/m^3), 1999; Hungary: TWA 300 mg/m^3; STEL 800 mg/m^3, 1993; the Philippines: TWA 100 ppm (400 mg/m^3), 1993; Poland: MAC (TWA) 300 mg/m^3; MAC (STEL) 900 mg/m^3, 1999; Russia: STEL 100 mg/m^3, 1993; Switzerland: MAK-W 300 mg/m^3 (1100 mg/m^3), 1999; Turkey: TWA 100 ppm (400 mg/m^3), 1993

VM&P naphtha, legroin, paint solvent 8032-32-4:

OSHA PEL: None.

NIOSH REL: 350 mg/m^3 TWA; 1800 mg/m^3 [15 min] Ceiling Concentration.

ACGIH withdrawn; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 75 ppm

PAC-1: 75 ppm

PAC-2: 400 ppm

PAC-3: 1100 ppm

Poland: TWA 500 mg/m^3; STEL 1500 mg/m^3, 1999. In addition, Several states have set guidelines or standards for naphtha in ambient air[60] ranging from zero (Nevada) to 60−27,000 μg/m^3 (Connecticut) to 225 μg/m^3 (Virginia).

64742-89-8 [naphtha (petroleum) light aliphatic; rubber solvent]

Protective Action Criteria (PAC)

TEEL-0: 87.9 ppm

PAC-1: 87.9 ppm

PAC-2: 453 ppm

PAC-3: 1100 ppm

Determination in Air: Use NIOSH Analytical Method (IV) #1550, Naphthas, OSHA Analytical Method 48.

Routes of Entry: Inhalation of vapor, ingestion, skin and/or eye contact. Percutaneous absorption of liquid is important in development of systemic effects if benzene is present.

Harmful Effects and Symptoms

Short Term Exposure: The naphthas are irritating to the skin conjunctiva and the mucous membranes of the upper respiratory tract. Skin "chapping" and photosensitivity may develop after repeated contact with the liquid. If confined against skin by clothing, the naphthas may cause skin burn. Exposure can cause dizziness, lightheadedness, and unconsciousness. Petroleum naphtha has a lower order of toxicity than that derived from coal tar, where the major hazard is brought about by the aromatic hydrocarbon content.

Sufficient quantities of both naphthas cause central nervous system depression. Symptoms include eye irritation followed by headache and nausea. In severe cases, dizziness, convulsions, and unconsciousness occasionally result. Symptoms of anorexia and nervousness have been reported to persist for several months following an acute overexposure, but this appears to be rare. One fraction, hexane, has been reported to have been associated with peripheral neuropathy. If benzene is present, coal tar naphthas may produce blood changes, such as leukopenia, aplastic anemia, or leukemia. The kidneys and spleen have also been affected in animal experiments. At vapor concentrations up to 450 ppm, petroleum naphtha inhalations may produce slight throat irritation. At 880 pm, definite throat irritation is observed. Vapors may also irritate the nose. High concentrations may produce difficulty in breathing, blue coloration of skin, excitement, and dizziness. Inhalation of vapors in the absence of oxygen is immediately life-threatening. A vapor concentration up to 450 ppm causes mild, temporary irritation; at 880 ppm more severe irritation may be experienced. Human Tox = 14.00000 ppb (INTERMEDIATE).

Long Term Exposure: Irritates the eyes and upper respiratory system. Coal tar naphtha may contain benzene, a cancer-causing agent in humans. Exposure may cause nervous system and kidney damage. Some coal tar naphthas contain other substances that can cause blood cell damage. Longer exposure may cause drying and cracking of the skin, and make the skin sunburn more easily. Swallowing the liquid may cause chemical pneumonia.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

Medical Surveillance: Preplacement and periodic medical examinations should include the central nervous system. If benzene exposure is present, workers should have a periodic complete blood count (CBC) including hematocrits, hemoglobin, white blood cell count and differential count, mean corpuscular volume and platelet count, reticulocyte count, serum bilirubin determination, and urinary phenol in the preplacement examination and at 3-month intervals. There are no specific diagnostic tests for naphtha exposure but urinary phenols may indicate exposure to benzene and aromatic hydrocarbons. It should be noted that benzene content of vapor may be higher than predicted by content in the liquid.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get immediate medical attention.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, Neoprene™ rubber, Silvershield™, chlorinated polyethylene, styrene-butadiene rubber, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Coal tar naphthas: Up to 1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Causes eye irritation or damage; may require eye protection.

Petroleum naphtha: NIOSH: *Up to 850 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 1100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode);* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA

(APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

VM & P naphtha: 3500 mg/m^3: CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *8750 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge (s)]. *17,500 mg/m^3:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Naphthas must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames are prohibited where naphthas are handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of naphthas should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of naphtha. Wherever naphtha is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in DOT Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: These chemicals are flammable liquids. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Use water for cooling only. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Naphthalene is a colorless to brown crystalline solid with a characteristic "moth ball" odor. Shipped as a molten solid. Odor threshold = 0.038 ppm. Molecular weight = 128.18; Specific gravity (H_2O:1) = 1.15; Boiling point = 217.8°C; Freezing/Melting point = 74−80°C; Vapor pressure = 0.08 mmHg at 20°C; Flash point = 78.9°C; Autoignition temperature = 540°C. Explosive limits: LEL = 0.9%; UEL = 5.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.003%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Naphthalene is used as a chemical intermediate or feedstock for synthesis of phthalic, anthranilic, hydroxyl (naphthols), amino (naphthylamines), and sulfonic compounds, which are used in the manufacture of various dyes and in the preparation of phthalic anhydride, 1-naphthyl-*N*-methyl carbonate, and β-naphthol. Naphthalene is also used in the manufacture of hydronaphthalenes, synthetic resins, lampblack, smokeless powder, and celluloid. Naphthalene has been used as a moth repellent.

Approximately 100 million people worldwide have G6PD deficiency which would make them more susceptible to hemolytic anemia on exposure to naphthalene. At present, more than 80 variants of this enzyme deficiency have been identified. The incidence of this deficiency is 0.1% in

American and European Caucasians but can range as high as 20% in American blacks and greater than 50% in certain Jewish groups. Newborn infants have a similar sensitivity to the hemolytic effects of naphthalene, even without G6PD deficiency.

Incompatibilities: Violent reactions with chromium(III) oxide, dinitrogen pentoxide, chromic anhydride, and strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 10 ppm/50 mg/m^3 TWA.

NIOSH REL: 10 ppm/50 mg/m^3 TWA; 15 ppm/75 mg/m^3 STEL.

ACGIH TLV®[1]: 10 ppm/52 mg/m^3 TWA; 15 ppm/79 mg/m^3 STEL [skin].

DFG MAK: [skin] Carcinogen Category 3B.

NIOSH IDLH: 250 ppm.

Protective Action Criteria (PAC)

TEEL-0: 10 ppm

PAC-1: 15 ppm

PAC-2: 15 ppm

PAC-3: 250 ppm

Arab Republic of Egypt: TWA 10 ppm (50 mg/m^3), 1993; Austria: MAK 10 ppm (50 mg/m^3), 1999; Belgium: TWA 10 ppm (52 mg/m^3); STEL 15 ppm (79 mg/m^3), 1993; Denmark: TWA 10 ppm (50 mg/m^3), 1999; Finland: TWA 10 ppm (50 mg/m^3); STEL 20 ppm (100 mg/m^3), 1999; France: VME 10 ppm (50 mg/m^3), 1999; Hungary: TWA 40 mg/m^3; STEL 80 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 50 mg/m^3, 2003; Norway: TWA 10 ppm (50 mg/m^3), 1999; the Philippines: TWA 10 ppm (50 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3; MAC (STEL) 75 mg/m^3, 1999; Russia: STEL 20 mg/m^3, 1993; Switzerland: MAK-W 10 ppm (50 mg/m^3), 1999; United Kingdom: TWA 10 ppm (53 mg/m^3); STEL 15 ppm (80 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm [skin]. Russia[43] set a MAC of 0.003 mg/m^3 (3 μg/m^3) in ambient air in residential areas. Several states have set guidelines or standards for naphthalene in ambient air[60] ranging from 14 μg/m^3 (Massachusetts) to 166.7 μg/m^3 (New York) to 500 μg/m^3 (Florida) to 500−750 μg/m^3 (North Dakota) to 800 μg/m^3 (Virginia) to 1000 μg/m^3 (Connecticut) to 1190 μg/m^3 (Nevada) to 1250 μg/m^3 (South Carolina).

Determination in Air: Use NIOSH Analytical Methods #1501; OSHA Analytical Method 35.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 2300 μg/L on an acute toxicity basis and 620 μg/L on a chronic basis. *To protect saltwater aquatic life:* 2350 μg/L on an acute toxicity basis. For the protection of human health from the toxic properties of naphthalene ingested through water and through contaminated aquatic organisms, no ambient water criterion has been set due to insufficient data.[6] Russia[43] set a MAC of 0.004 mg/L in water bodies used for fishery purposes. Kansas has set a guideline of 143 μg/L for naphthalene in drinking water.[61]

Determination in Water: Methylene chloride extraction followed by high-pressure liquid chromatography with fluorescence or UV detection; or gas chromatography (EPA Method 610) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log $K_{ow} = 3.3$.

Routes of Entry: Inhalation of vapor or dust, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. High levels cause headache, fatigue, confusion, excitement, malaise, nausea, and vomiting. *Inhalation:* Levels above 10 ppm may cause headache, nausea, excessive sweating, and vomiting. *Skin:* May cause irritation. If hypersensitive to naphthalene, severe irritation may occur. *Eyes:* Levels above 15 ppm may cause irritation. Direct contact may cause severe irritation, injury to the cornea, and a blurring of vision. *Ingestion:* Ingestion of ½ g (1/60 oz) may cause nausea, vomiting, abdominal pain, irritation of the bladder, and brown or black coloration of the urine. The symptoms usually disappear after a few days. Animal studies indicate that the probable lethal dose for an adult is 5−15 g (1/16−½ oz).

Long Term Exposure: Repeated exposure or ingestion may cause clouding of the eye (cataract). Inhalation of levels above 10 ppm may cause headaches, nausea, vomiting, and a feeling of general discomfort. Chronic skin problems are rare, except in cases of hypersensitivity. May cause skin allergy, kidney, and liver damage. May damage the red blood cells causing anemia.

Points of Attack: Eyes, skin, blood, liver, kidneys, central nervous system.

Medical Surveillance: NIOSH lists the following tests: blood plasma, hemoglobin; complete blood count; liver function tests; red blood cells/count, RBC hemolysis; urine (chemical/metabolite); urine (chemical/metabolite), hemoglobin; urinalysis (routine); white blood cell count/differential. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following is recommended before beginning work and at regular times after that: examination of the eyes and vision. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Complete blood count (CBC). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or any supplied-air respirator.* *Up to 12.5 mg/m^3:* Sa:Cf (any supplied-air respirator operated in a continuous-flow mode)*; or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) 100, or P100 filter) or any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter*; or any self-contained breathing apparatus with a full face-piece; or any supplied-air respirator with a full face-piece. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable storage area. Naphthalene must be stored to avoid contact with chromium(III) oxide, dinitrogen pentoxide, and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames are prohibited where naphthalene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of naphthalene should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Liquid naphthalene must avoid contact with water.

Shipping: Naphthalene, crude or Naphthalene, refined, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep naphthalene out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but is not easily ignited. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Use caution when using water spray or foam directly on molten naphthalene as extensive foaming may occur. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Naphthenic acid N:0130

Molecular Formula: $R_2C\text{-}CR_2\text{-}CR_2\text{-}CR_2\text{-}CR\text{-}(CH_2)_n\text{-}COOH$ (where $n = 2-6$); $CnH_{2n}1COOH$

Synonyms: Acido naftalico (Spanish); Agenap; Agenap HMW-H; Cyclopentane carboxylic acid; Naphid; Sunaptic acid B; Sunaptic acid C

CAS Registry Number: 1338-24-5

RTECS® Number: QK8750000

UN/NA & ERG Number: UN3077/171

EC Number: 215-662-8

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Naphthenic acid is a gold to black, odorless liquid. Molecular weight = (approx.) 200−250 (mixture); Specific gravity (H_2O:1) = 0.982 at 20°C; Boiling point = 132−243°C; Freezing/Melting point = 31°C; Flash point = 149°C (oc). Explosive limits: LEL = 0.9−1%; UEL = unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0; Slightly soluble in water.

Potential Exposure: Used to make metallic naphthenates for paint dryers and cellulose preservatives. It is also used as a solvent, detergent, rubber reclaiming agent. Used in catalysts, cutting oils, drilling compounds, rust inhibitors, surfactants, emulsions, grease, and wood preservatives.

Incompatibilities: Incompatible with sulfuric acid, caustics, ammonia, aliphatic amines, alkanolamines, isocyanates, alkylene oxides, epichlorohydrin, strong oxidizers. Corrosive to metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Lead salt

TEEL-0: 1.25 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 30 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: No method established.

Harmful Effects and Symptoms

Short Term Exposure: Vapors irritate the eyes, skin, and respiratory tract. Contact with the skin causes reddening.

Long Term Exposure: Repeated or prolonged contact causes dry and cracked skin and may cause contact dermatitis. May cause liver and central nervous system damage.

Medical Surveillance: There are no special tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from metals and other incompatible materials listed above. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/22; R50; Safety phrases: S2; S24/25; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 2-Naphthol is a white, crystalline solid with a slight phenolic odor. Darkens in air and on exposure to light. Molecular weight = 144.18; Boiling point = 285−286°C; Freezing/Melting point = 121−123°C; Flash point = 153°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0; (1-naphthol) Health 3, Flammability 1, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen, Primary Irritant. Those involved in rubber antioxidant production, synthesis of dyes, leather processing, fungicides, pharmaceuticals, and perfumes. Used as an antioxidant for fats, oils, as an antiseptic, in insecticides.

Incompatibilities: Oxidizers, iron salts, 2,3-dimethyl-1-phenyl-3-pyrazolin-5-one (antipyrine), camphor, phenol, menthol, urethane.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.0025 mg/m^3

PAC-1: 0.0075 mg/m^3

PAC-2: 0.05 mg/m^3

PAC-3: 500 mg/m^3

Russia: STEL 0.1 mg/m^3, 1993.

Russia[43] set a MAC of 0.006 mg/m^3 in ambient air in residential areas on a momentary basis and 0.003 mg/m^3 on a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 0.4 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin and eyes. Ingestion can cause nephritis, lens opacity, vomiting, diarrhea, abdominal pain, circulatory collapse, convulsion, hemolytic anemia, and death.

Long Term Exposure: May cause kidney damage, anemia. May cause mutations.

Points of Attack: Eyes, skin, blood, liver, kidneys, central nervous system.

Medical Surveillance: Complete blood count (CBC), kidney damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Self-contained breathing apparatus.

Storage: Color Code—Blue (*1-naphthol*): Health Hazard/ Poison: Store in a secure poison location. Color Code—Green (2-naphthol): General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dark place.

Shipping: Toxic solids, organic, n.o.s. compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Mix with flammable solvent and atomize into an incinerator.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U166.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,4-Naphthoquinone is a yellow to greenish-yellow crystalline solid with a pungent odor. Odor threshold = 0.02 ppm. Molecular weight = 158.16; Sublimation point = 100°C; Freezing/Melting point = 123−126°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector. 1,4-Naphthoquinone is used as a polymerization regulator for rubber and polyester resins, in the synthesis of dyes and pharmaceuticals, and as a fungicide and algicide.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 7.5 mg/m^3

PAC-1: 25 mg/m^3

PAC-2: 75 mg/m^3

PAC-3: 75 mg/m^3

Russia: STEL 0.1 mg/m^3, [skin] 1993.

Russia[43] set a MAC of 0.005 mg/m^3 in ambient air in residential areas both on a momentary and a daily average basis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Long Term Exposure: The most consistent findings reported in the literature for health effects of 1,4-naphthoquinone involve hematological changes, irritant and allergenic activity, and inhibition of biochemical oxidation processes. One study found 1,4-naphthoquinone to be oncogenic. Some evidence of inhibition of *in vitro* endocrine function and of nerve activity was reported.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Shipping: Toxic solids, organic, n.o.s. compound require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1, Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: α-Naphthylamine exists as white needle-like crystals which turn red on exposure to air. Has a weak ammonia-like odor. Molecular weight = 143.20; Specific gravity (H_2O:1) = 1.12; Boiling point = 300.6°C; Freezing/Melting point = 44.4°C; Vapor pressure = 1 mmHg at 104°C; Flash point = 157.2°C; Autoignition temperature = 460°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.002%; 1 mg/mL at 20°C.[NTP]

Potential Exposure: Compound Description: Tumorigen, Mutagen. α-Naphthylamine is used as an intermediate in dye production, for manufacturing herbicides and antioxidants, in the manufacture of condensation colors, rubber, and in the synthesis of many chemicals, such as α-naphthol, sodium naphthionate, *o*-naphthionic acid, Neville and Winther's acid, sulfonated naphthylamines, α-naphthylthiourea (a rodenticide), and *N*-phenyl-α-naphthylamine.

Incompatibilities: Oxidizes in air. Incompatible with nitrous acid, oxidizers, nitrates, organic anhydrides, isocyanates, aldehydes.

Permissible Exposure Limits in Air

OSHA: Cancer Suspect Agent, see 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: Confirmed Human Carcinogen.

Protective Action Criteria (PAC)
TEEL-0: 0.6 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 12.5 mg/m^3
PAC-3: 350 mg/m^3

Austria: carcinogen, 1999; Poland: MAC (TWA) 0 mg/m^3, MAC (STEL) 0 mg/m^3, 1999; Sweden: carcinogen, 1993. α-Naphthylamine is included in the Federal standard for carcinogens; all contact with it should be avoided.[63] Several states have set guidelines or standards for 1-naphthylamine in ambient air[60] ranging from zero in South Carolina to 0.03 $\mu g/m^3$ (New York).

Determination in Air: Use NIOSH Analytical Method #5518, Naphthylamines; OSHA Analytical Method 93.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.3.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Percutaneous absorption.

Harmful Effects and Symptoms

Short Term Exposure: 1-Naphthylamine can affect you when breathed in and by passing through your skin. 1-Naphthylamine should be handled as a carcinogen, with extreme caution. High exposure can cause the skin and lips to turn blue. This reduces the ability of the blood cells to carry oxygen to body organs (methemoglobinemia). Higher levels can cause breathing difficulties, collapse, and possible death.

Long Term Exposure: Some related chemicals can damage the liver and/or cause skin allergies. It is not known whether 1-naphthylamine has these effects. A report of excess bladder cancer among individuals who worked with this chemical has been published. This may be due to contamination with 2-naphthylamine, a known human carcinogen.

Points of Attack: Bladder, skin. *Cancer site:* bladder.

Medical Surveillance: OSHA mandates the following tests or information: *Increased Risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking. *NIOSH lists the following tests: *increased risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking, cystoscopy, urinalysis (routine). Before beginning employment and at regular times after that, the following are recommended: urine cytology (a test for abnormal cells in the urine). A urine test for 1-naphthylamine can also be done to determine whether this cancer agent is entering the body. For accuracy, it should be done shortly after exposure. If symptoms develop or overexposure is suspected, the following may be useful: test for methemoglobin (most accurate a few hours after exposure; the blood sample must be promptly tested).

**Code of Federal Regulations. 29 CFR Part 1910.1000. Subpart Z. Air Contaminants.* US Government Printing Office. (July 1, 2004).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd, Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: *alpha*-Naphthylamine requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1-Naphthylamine may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers, however, water or foam may cause frothing. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalyst, or thermal device. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer 2/27/87.
European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: 2-Naphthylamine is a white to red crystal with a faint, aromatic odor. Darkens in air to a reddish-purple color. Molecular weight = 143.20; Specific gravity (H_2O:1) = 1.06 at 97.8°C; Boiling point = 294°C; Freezing/Melting point = 109−110°C; Vapor pressure = 1 mmHg at 104°C; Flash point = 157°C. Soluble in hot water.
Potential Exposure: Compound Description: Tumorigen, Mutagen. 2-Naphthylamine is presently used only for research purposes. It is present as an impurity in α-naphthylamine. It is used as an intermediate in the preparation of other compounds. 2-Naphthylamine was widely used in the manufacture of dyestuffs, as an antioxidant for rubber, and in rubber-coated cables.
Incompatibilities: Strong oxidizers. A weak base. Incompatible with nitrous acid.
Permissible Exposure Limits in Air
OSHA: Cancer Suspect Agent, see 29CFR1910.1003.
NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: Exposure by all routes should be carefully controlled to levels as low as possible; Confirmed Human Carcinogen.
No TEEL available.
DFG MAK: [skin]; Carcinogen Category 1.
Australia: carcinogen, 1993; Austria [skin] carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; France: VME 0.001 ppm (0.005 mg/m^3), continuous; carcinogen, 1993; Poland: MAC (TWA) 0 mg/m^3, MAC (STEL) 0 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: [skin] carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. 2-Naphthylamine is included in the federal standard for carcinogens; all contact with it should be avoided. ACGIH states that β-naphthylamine is a human carcinogen without an assigned TLV. Several states have set guidelines of standards for 2-naphthylamine in ambient air[60] ranging from zero (North Dakota, New York and South Carolina) to 3.0 μg/m^3 (Virginia) to 19.07 μg/m^3 (Pennsylvania).
Determination in Air: Use NIOSH Analytical Method #5518, Naphthylamines; OSHA Analytical Method 93.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient level goal based on health effects of 291 μg/L.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Percutaneous absorption.
Harmful Effects and Symptoms
Short Term Exposure: 2-Naphthylamine is irritating to the eyes and skin; has produced contact dermatitis. High levels

can interfere with the blood's ability to carry oxygen (methemoglobinemia). Higher levels can cause breathing difficulties, collapse, and even death.

Long Term Exposure: 2-Naphthylamine is a known human bladder carcinogen with a latent period of about 16 years. The symptoms are frequent urination, dysuria, and hematuria. Acute poisoning leads to methemoglobinemia or acute hemorrhagic cystitis. 2-Naphthylamine is carcinogenic, producing urinary bladder carcinomas in hamsters, dogs, and nonhuman primates, and hepatomas in mice, after oral administration. Epidemiological studies have shown that occupational exposure to 2-naphthylamine, either alone or when present as an impurity in other compounds, is causally associated with bladder cancer.

Points of Attack: Bladder, skin. *Cancer site:* bladder.

Medical Surveillance: OSHA mandates the following tests or information: *Increased Risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking. *NIOSH lists the following tests: *increased risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking, cystoscopy, urinalysis (routine). Preplacement and periodic examinations should include an evaluation of exposure to other carcinogens, use of alcohol, smoking, and medications, and family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. *Note to physician:* Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store away from heat and light in a refrigerator or a cool, dry place away from incompatible materials. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with 60−70% acetone to avoid airborne dust. Transfer to vapor-tight plastic bags for eventual disposal. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing

apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalyst, or thermal device.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Neochromium trivalene N:0180

Molecular Formula: $CrHO_5S$

Common Formula: $Cr(OH)SO_4$

Synonyms: Basic chromic sulfate; Basic chromic sulphate; Basic chromium sulfate; Basic chromium sulphate; Chromium hydroxide sulfate; Chromium sulfate; Chromium sulfate, basic; Chromium sulphate; Koreon; Monobasic chromium sulfate; Monobasic chromium sulphate; Sulfuric acid, chromium salt, basic

CAS Registry Number: 64093-79-4

RTECS® Number: QO6800000

UN/NA & ERG Number: UN2240/154

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3, 1997; EPA (insoluble salts): Not Classifiable as to human carcinogenicity; Cannot be Determined.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure.

Form R *de minimis* concentration reporting level: Chromium(III) compounds: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as Chromium(III) compounds, n.o.s.; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List as chromium compounds.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Neochromium is a violet or green powder. Molecular weight = 165.07; Boiling point = 98°C; Freezing/Melting point = 67°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Neochromium is used in papermaking, photography, dyeing, printing, and tanning.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[Cr]/m^3 TWA.

NIOSH REL: 0.5 mg[Cr]/m^3 TWA limit exposures to lowest feasible concentration.

ACGIH TLV®[1]: 0.5 mg[Cr]/m^3 TWA; not classifiable as a human carcinogen.

NIOSH IDLH: 25 mg Cr(III)/m^3.

No TEEL available.

DFG MAK: [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric Acid Ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: For the protection of freshwater aquatic life: *Trivalent chromium:* not to exceed e[1.08 In (hardness) + 3.48] μg/L. For the protection of saltwater aquatic life: *Trivalent chromium:* 10,300 μg/L on an acute toxicity basis. *To protect human health: Trivalent chromium:* 170 μg/L; Hexavalent chromium 50 μg/L according to EPA.[6] For chromium, EPA[49] has set a long-term health advisory of 0.84 mg/L for adults and a lifetime health advisory of 0.12 mg/L (120 μg/L). EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set guidelines for chromium in drinking water[61] as 50 μg/L for Maine and 120 μg/L for Minnesota.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Neochromium can affect you when breathed in. Skin and eye contact can cause severe burns. Overexposure can irritate the nose, throat, and bronchial tubes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} (oral-rat) = 1500 mg/kg.

Long Term Exposure: Skin allergy sometimes occurs with itching, redness, and/or an eczema-like rash. If this happens, future contact can trigger symptoms. Breathing neochromium may cause a sore or hole in the nasal septum. Can irritate the lungs; bronchitis may develop. In addition, RTECS[9] states neochromium is tumorigenic, that is, it facilitates the action of known carcinogens.

Points of Attack: Eyes, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. NIOSH lists the following tests [chromium(III) compounds]: whole blood (chemical/metabolite), biologic tissue/biopsy, chest X-ray, pulmonary function tests, red blood cells/count, urine (chemical/metabolite) [end-of-shift] [end-of-shift at end-of-work-week] [end-of-work-week] [pre- and postshift].

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Qm* (APF = 25) (any quarter-mask respirator). *Up to 5 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (any powered air-purifying respirator with a high-efficiency particulate filter). *Up to 25 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (any self-contained breathing apparatus with a full face-piece) or SaF (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dry, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This chemical requires a “CORROSIVE” label. It falls in Hazard Class 8 and Packing Group I.[19]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Neochromium may burn but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including sulfur oxides are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

New Jersey Department of Health and Senior Services. (August 2004). *Hazardous Substances Fact Sheet: Neochromium*. Trenton, NJ

Neon N:0190

Molecular Formula: Ne
Synonyms: Neon, elemental
CAS Registry Number: 7440-01-9
RTECS® Number: QP4450000
UN/NA & ERG Number: UN1065 (compressed); UN1913 (liquid)
EC Number: 231-110-9
Description: Neon is a colorless, odorless, tasteless gas or liquid. Molecular weight = 20.18; Boiling point = −246°C; Freezing/Melting point = −249°C. Slightly soluble in water.
Potential Exposure: Neon is used in photoelectric bulbs and certain light tubes, in the electronic industry, in lasers, in plasma studies, and in other research.
Permissible Exposure Limits in Air
ACGIH TLV®[1]: Simple asphyxiant.
Protective Action Criteria (PAC)
TEEL-0: 65,000 ppm
PAC-1: 65,000 ppm
PAC-2: 230,000 ppm
PAC-3: 400,000 ppm
Australia: asphyxiant, 1993; Belgium: asphyxiant, 1993; Hungary: asphyxiant, 1993; Switzerland: asphyxiant, 1999; United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant. Large amounts of neon will decrease the amount of available oxygen. Oxygen content should be tested to ensure that it is at least 19% by volume.
Routes of Entry: Inhalation.
Harmful Effects and Symptoms
Short Term Exposure: Neon can affect you when breathed in. Exposure can cause you to feel dizzy and lightheaded. Very high levels can cause you to pass out and could cause suffocation from lack of oxygen. Contact with liquefied neon could cause frostbite. Before entering a confined space, be certain that sufficient oxygen exists.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Eye protection is required in laser operations to avoid eye burning. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash (gloves, footwear, headgear) which should be clean, available each day, and put on before work. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues.
Respirator Selection: Exposure to neon is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Storage areas should be dry and well ventilated. Protect cylinders of neon from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.
Shipping: Neon, *compressed,* and Neon, *refrigerated liquid (cryogenic liquid)*, require a shipping label of "NONFLAMMABLE GAS." Both fall in DOT Hazard Class 2.2.
Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas, but containers may explode in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Venting to atmosphere.

Reference

New Jersey Department of Health and Senior Services. (September 2001). *Hazardous Substances Fact Sheet: Neon*. Trenton, NJ

Neopentane N:0200

Molecular Formula: C_5H_{12}

Common Formula: $CH_3C(CH_3)_2CH_3$

Synonyms: 2,2-Dimethylpropane; Dimethylpropane; Neopentane; *tert*-Pentane; Propane, 2,2-dimethyl-; Tetramethylmethane; 1,1,1-Trimethylethane

CAS Registry Number: 463-82-1

RTECS® Number: TY1190000

UN/NA & ERG Number: UN2044/115

EC Number: 207-343-7 [*Annex I Index No.:* 601-005-00-6]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List (neopentane not listed) *n*-pentane Concentration 1%.

European/International Regulations: Hazard Symbol: F +, N; Risk phrases: R12; R51/53; Safety phrases: S2; S9; S16; S33; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Neopentane is a volatile liquid. Molecular weight = 72.17; Boiling point = 9°C; Flash point = (Gas) − 7°C. Explosive limits: LEL = 1.4%; UEL = 7.5%; Autoignition temperature = 450°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 4, Reactivity 0. Insoluble in water.

Potential Exposure: Neopentane is used as a gasoline blending component and for making butyl rubber. A research chemical. Reacts with strong oxidizers, causing fire and explosion hazard. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

OSHA gives limits for *n-pentane* as do several states, but they do not single out "neopentane." *This is shown for reference only.*

OSHA PEL: 1000 ppm/2950 mg/m^3 TWA.

NIOSH REL: 120 ppm/350 mg/m^3 TWA.

ACGIH TLV®[1]: 600 ppm/1770 TWA.

NIOSH IDLH: 1500 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 610 ppm

PAC-1: 610 ppm

PAC-2: 610 ppm

PAC-3: 1500 ppm

DFG MAK: 1000 ppm/3000 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Austria: MAK 600 ppm (1899 mg/m^3), 1999; Denmark: TWA 500 ppm (1500 mg/m^3), 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 600 ppm.

United Kingdom[33] TWA 600 ppm (1800 mg/m^3); STEL of 750 ppm (2250 mg/m^3) (all isomers of pentane).

Determination in Air: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1500, Hydrocarbons.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can cause skin irritation and severe burns with redness, itching. May affect the central nervous systems. Skin contact with the undiluted material for 5 h causes blisters; for 1 h it causes irritation, itching, erythema, pigmentation, swelling, burning, and pain. Skin contact can cause frostbite. Inhalation can cause headache, dizziness, and suffocation. The toxicity is via the inhalation route. It is narcotic in high concentrations. Ingesting the liquid may cause chemical pneumonia (aspiration).

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. See above.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH (as pentane): *1200 ppm:* Sa (APF = 10) (any supplied-air respirator). *1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Pentanes require a label of “FLAMMABLE LIQUID.” They fall in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Nerve agents

Nerve agents consist of a group of very toxic organophosphate chemicals specifically designed for military warfare. Other organophosphate chemicals include commercial insecticides, such as Malathion®. These chemicals all cause similar effects on the human body by disrupting how nerves communicate and control muscles, glands, and organs. Though they cause similar effects, nerve agents are more toxic than commercial insecticides—so smaller amounts can cause effects of concern. Most of the nerve agents exist as liquids but some (such as GB) volatilize into the air on their own. VX is the least likely to become airborne, but in conditions involving explosions, it could vaporize and spread in the air. The major chemical warfare agents in this category and their code names are listed below along with their record number for quick access.

Cyclosarin, agent GF see C:1795.
Sarin, agent GB see S:0130.
Soman, agent GD see S:0565.
Tabun, agent GA see T:0110.
VX, agent VX see V:0250.

Niacinamide N:0210

Molecular Formula: $C_6H_6N_2O$

Synonyms: Acidamide; Nicotimanide; Nicotine acid amide; 3-Pyridine carboxamide; 3-Pyridine carboxylic acid amide; VI-Nicotyl; VI-Nictyl; Vitamin B_3; Vitamin Pp

CAS Registry Number: 98-92-0

RTECS® Number: QS3675000

EC Number: 202-713-4

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Niacinamide is a white crystalline powder or forms colorless needle-like crystals. Molecular weight = 122.14; Boiling point = 155°C; Freezing/Melting point = 129−130°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Highly soluble in water.

Potential Exposure: Compound Description: Mutagen. Used as a dietary supplement and food additive.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 6 mg/m^3
PAC-1: 20 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Ingestion.

Harmful Effects and Symptoms

Short Term Exposure: These symptoms reported from cases of medical treatment or self-prescribed massive vitamin dosage. The sudden onset of nausea, vomiting, and fatigue have been reported following increased dose from 4 to 9 g daily. From animal studies, the lethal human dose has been estimated to be about ½ lb.

Long Term Exposure: The recommended dietary supplement is 10−20 mg per day. This level causes no adverse effects. Levels of 4−9 g/day may cause nausea and vomiting as well as serious changes in liver tissue and enzymes. May cause mutations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol (*powder*): T,N; Risk phrases: R40; R43; R48/23; R52/53; Safety phrases: S2; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*nickel metal; nickel powder, particle size <0.1 mm*); 1—Slightly water polluting (*nickel, particle size >0.1 mm*).

Description: Nickel metal is a hard, ductile, magnetic metal with a silver-white color. Molecular weight = 58.71; Boiling point = 2837°C; Freezing/Melting point = 1555°C. Hazard Identification (based on NFPA-704 M Rating System) (*powder*): Health 2, Flammability 4, Reactivity 1; (*metal*) Health 1, Flammability 0, Reactivity 0. Insoluble in water. It occurs free in meteorites and in ores combined with sulfur, antimony, or arsenic. Processing and refining of nickel is accomplished by either the Oxford (sodium sulfide and electrolysis) or the Mond (nickel carbonyl) processes. In the latter, impure nickel powder is reacted with carbon monoxide to form gaseous nickel carbonyl which is then treated to deposit high-purity metallic nickel.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Nickel is used as an alloy additive in steel manufacture and in the production of coins and other utensils. Nickel forms alloys with copper, manganese, zinc, chromium, iron, molybdenum, etc. Stainless steel is the most widely used nickel alloy. An important nickel−copper alloy is Monel metal, which contains 66% nickel and 32% copper and has excellent corrosion resistance properties. Permanent magnets are alloys chiefly of nickel, cobalt, aluminum, and iron. Elemental nickel is used in electroplating, anodizing aluminum casting operations for machine parts and in coinage, in the manufacture of acid-resisting and magnetic alloys, magnetic tapes, surgical and dental instruments, nickel-cadmium batteries, nickel soaps in crankcase oil, in ground-coat enamels, colored ceramics, and glass. It is used as a catalyst in the hydrogenation synthesis of acrylic esters for plastics. Exposure to nickel may also occur during mining, smelting, and refining operations. The route by which most people in the general population receive the largest portion of daily nickel intake is through food. Based on the available data from composite diet analysis, between 300 and 600 μg nickel/day is ingested. Fecal nickel analysis, a more accurate measure of dietary nickel intake, suggests about 300 μg/day. The highest level of nickel observed in water was 75 μg/L. Average drinking water levels are about 5 μg/L. A typical consumption of 2 L daily would yield an additional 10 μg of nickel, of which up to 1 μg would be absorbed.

Incompatibilities: Nickel dust is a spontaneously flammable solid and a dangerous fire hazard.

Permissible Exposure Limits in Air

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA.

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] (*elemental*): 1.5 mg[Ni]/m^3 inhalable fraction TWA; not suspected as a human carcinogen; (*inorganic, insoluble compounds*) 0.2 mg[Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen; (*inorganic, soluble compounds*) 0.1 mg[Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

NIOSH IDLH: 10 mg[Ni]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 4.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 10 mg/m^3

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1 DFG TRK: 0.50 μg [Ni]/L in urine, after several shifts; Category 1, human carcinogen, as inhalable dusts/aerosols from nickel metal, nickel carbonate arising in production and processing.

Arab Republic of Egypt: TWA 0.1 mg/m^3, 1993; Australia: TWA 1 mg/m^3, 1993; Austria: carcinogen, 1999; Denmark: TWA 0.5 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3 [skin] carcinogen, 1999; France: VME 1 mg/m^3, continuous carcinogen, 1999; Hungary: STEL 0.005 mg[Ni]/m^3, Carcinogen (insoluble compounds), 1993; the Netherlands: MAC-TGG 1 mg/m^3, 2003; the Philippines: TWA 1 mg/m^3, 1993; Poland: MAC (TWA) 0.25 mg/m^3, 1999; Russia: STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.5 mg/m^3 (*dust*), 1999; Switzerland: MAK-W 0.5 mg/m^3, carcinogen, 1999; Thailand: TWA 1 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Russia[35, 43] set a MAC of 0.0002 mg/m^3 in ambient air in residential areas for soluble nickel salts. Various states have set guidelines or standards for nickel in ambient air[60] ranging from 0.002 μg/m^3 (Rhode Island) to 0.002−0.018 μg/m^3 (Massachusetts) to 0.0303 μg/m^3 (Kansas) to 0.13−0.70 μg/m^3 (Montana) to 0.24 μg/m^3 (Pennsylvania) to 0.5 μg/m^3 (North Carolina and South Carolina) to 1.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Nevada) to 3.3 μg/m^3 (New York) to 5.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/perchloric acid ashing); #7301, Elements by ICP (Aqua regia ashing); #7303, Elements by ICP [Hot block (HCl/HNO_3 Digestion)]; #9102, Elements on wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: *To protect freshwater aquatic life:* e[0.76 ln (hardness) +1.06] as a 24-h average, never to exceed e[0.76 ln (hardness) +4.02] at any time. *To protect saltwater aquatic life:* 7.1 μg/L as a 24-h average, never to exceed 140 μg/L. *To protect human health:* 13.4 μg/L.[6] A lifetime health advisory of 150 μg/L has been developed by EPA.[49] Mexico[35] has set a limit of 0.1 mg/L in estuaries and 0.008 mg/L in coastal waters. The Czech Republic[35] has set a limit of 0.1 mg/L in surface waters and 0.05 mg/L in drinking water reserves. States which have set guidelines for nickel in drinking water[61] include Minnesota at 150 μg/L and Kansas at 1000 μg/L.

Determination in Water: Digestion followed by atomic absorption, or by colorimetric (heptoxime) determination, or by inductively coupled plasma (ICP) optical emission spectrometry. This gives total nickel; dissolved nickel may be determined by the same method preceded by 0.45-μm filtration.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel dusts and fumes can affect you when breathed in. Can cause irritation of the eyes and skin. Skin contact may cause skin allergy, with itching, redness and later, rash. Lung allergy occasionally occurs with asthma-type effects. Fumes from heated nickel can cause pneumonia-like illness with cough and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours or days. This can cause death.

Long Term Exposure: May cause skin sensitization and allergy. May cause skin allergy. May cause allergic asthma, pneumonitis. Breathing nickel dust and fume can cause a sore or hole in the nasal septum. May damage the kidneys and affect liver function. Nickel is a carcinogen and may damage the developing fetus. Occupational exposure to nickel refinery dust contains nickel subsulfide and is associated with lung cancer. Handle with extreme caution.

Points of Attack: Nasal cavities, lungs, skin, liver, kidneys. *Cancer site:* lung, throat, and nasal cavity.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray for acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended by NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter.

Storage: Pyrophoric (dry nickel powder, Raney nickel, and nickel catalyst) are fire hazards. Prior to working with these chemicals, you should be trained on its proper handling and storage. Finely divided nickel must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids, fluorine, ammonia, phosphorus, sulfur, selenium, hydrazine, and performic acid. Sources of ignition, such as smoking and open flames, are prohibited where pulverized nickel is handled, used, or stored. Wherever pulverized nickel is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dry powder, in bulk, requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.2 and Packing Group II.

The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20,21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use dry chemicals, sand, water spray, or foam. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep nickel catalyst spills out of confined spaces, such as a sewers, because of the possibility of an explosion or fire. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel dust is flammable. Use dry chemical, soda ash, or lime extinguishers. Poisonous gases are produced in fire, including nickel carbonyl. Dry nickel catalyst may spontaneously ignite and the fire may restart after it has been extinguished. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nickel compounds—encapsulation followed by disposal in a chemical waste landfill. However, nickel from various industrial wastes may also be recovered and recycled as described in the literature.

Nickel ammonium sulfate N:0230

Molecular Formula: $H_{20}N_2NiO_{14}S_2$

Common Formula: $NiSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$

Synonyms: Ammonium disulfatonickelate (II); Ammonium nickel sulfate; Nickel ammonium sulphate; Sulfato de niquel y amonio (Spanish); Sulfuric acid, ammonium nickel (2+) salt (2:2:1); Sulfuric acid, ammonium nickel(II) salt (2:2:1)

CAS Registry Number: 15699-18-0

RTECS® Number: WS6050000

UN/NA & ERG Number: UN3288 (Toxic solid, inorganic, n.o.s.)/151

EC Number: 239-793-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (compounds) *carcinogenic to humans, carcinogenic to humans*, Group 1, 1997; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Water Pollution Standard Proposed (EPA).[6, 49]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as nickel compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR401.15

Section 307 Toxic Pollutants as nickel and compounds; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed, as nickel compounds, n.o.s.
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer (as nickel compounds) 5/7/07.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Nickel ammonium sulfate is a green, odorless powder. Molecular weight = 394.4. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Soluble in water.

Potential Exposure: This material is used in electroplating.

Incompatibilities: Violent reaction with strong acids. Incompatible with nickel nitrate, sulfur, selenium, wood, organics, and other combustibles.

Permissible Exposure Limits in Air

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA.

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] (*inorganic, soluble compounds*) 0.1 mg [Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

NIOSH IDLH: 10 mg[Ni]/m^3.

Protective Action Criteria (PAC)
TEEL-0: 0.489 mg/m^3
PAC-1: 1.47 mg/m^3
PAC-2: 2.5 mg/m^3
PAC-3: 48.9 mg/m^3

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: The EPA[6] has set a limit of 13.4 μg/L to protect human health. A lifetime health advisory of 150 μg/L has more recently been promulgated by EPA.[49] See also this section in the entry on "Nickel and Soluble Compounds."

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel ammonium sulfate can affect you when breathed in. Eye and skin contact may cause irritation and burns. Lung damage may result from a single high exposure or lower repeated exposure. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This is sometimes delayed for 1−2 days after exposure.

Long Term Exposure: Skin contact may cause skin allergy with itching, redness, and later, rash. Lung allergy occasionally occurs, with asthma-type effects. High or repeated lower exposures may cause scarring of the lungs, and may damage the heart, liver, or kidneys.

Points of Attack: Lungs, kidneys, heart, liver, skin.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (person's urine nickel over 100 μg needs medical attention). Lung function tests. Consider chest X-ray following acute overexposure. Liver and kidney function tests. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility for medical observation up to 2 days and tests for urine nickel. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Nickel ammonium sulfate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sulfur.

Shipping: Toxic solid, inorganic, n.o.s. materials require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nickel carbonyl is a colorless, highly volatile, flammable liquid with a musty odor. The odor threshold is 1.3 ppm. It decomposes above room temperature producing carbon monoxide and finely divided nickel. Molecular weight = 170.75; Specific gravity (H_2O:1) = 1.32 at 17°C; Boiling point = 43.3°C; Freezing/Melting point = −19°C; Vapor pressure = 315 mmHg at 20°C; Flash point <−24°C (cc); Autoignition temperature: 60°C. Explosive limits: LEL = 2%; UEL = 34%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 3. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Human Data. Nickel carbonyl is used as an intermediate product in the refining of nickel. The primary use for nickel carbonyl is in the production of nickel by the Mond process. Impure nickel powder is reacted with carbon monoxide to form gaseous nickel carbonyl which is then treated to deposit high-purity metallic nickel and release carbon monoxide. Other uses include gas plating, the production of nickel products, in chemical synthesis as a catalyst, particularly for oxo reactions (addition reaction of hydrogen and carbon monoxide with unsaturated hydrocarbons to form oxygen-function compounds), e.g., synthesis of acrylic esters, and as a reactant.

Incompatibilities: May spontaneously ignite on contact with air. In the presence of air, oxidizes and forms a deposit which becomes peroxidized; this tends to decompose and ignite. May explode when heated above 60°C. Decomposes on contact with acids, producing carbon monoxide. Violent reaction with oxidizers; may cause fire and explosions. Vapor may promote the ignition of mixtures of combustible vapors (such as gasoline) and air. Attacks some plastics, rubber, and coatings. Store under inert gas blanket.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.98 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 0.0001 ppm/0.007 mg[Ni]/m^3 TWA.
NIOSH REL: 0.0001 ppm/0.007 mg[Ni]/m^3 TWA, potential carcinogen, limit occupational exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.05 ppm/0.12 mg[Ni]/m^3 TWA.
NIOSH IDLH: 2 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 0.001 ppm
PAC-1: 0.005 ppm
PAC-2: **0.036** ppm
PAC-3: **0.16** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: [skin] Carcinogen Category 2.
Compound Description: Tumorigen; Reproductive Effector; Human Data.
Arab Republic of Egypt: TWA 0.007 ppm (0.001 mg/m^3), 1993; Australia: TWA 0.05 ppm (0.1 mg/m^3), 1993; Austria: carcinogen, 1999; Belgium: carcinogen, 1993; Denmark: TWA 0.001 ppm (0.007 mg[Ni]/m^3), [skin], 1999; Finland: TWA 0.001 ppm (0.007 mg/m^3); STEL 0.003 ppm, carcinogen, 1999; France: VME 0.05 ppm (0.23 mg[Ni]/m^3), 1999; the Netherlands: MAC-TGG 0.35 mg/m^3, 2003; Japan: 0.001 ppm (0.007 mg/m^3), 1999; Norway: TWA 0.001 ppm (0.007 mg/m^3), 1999; the Philippines: TWA 0.001 ppm (0.007 mg/m^3), 1993; Russia: TWA 0.001 ppm; STEL 0.0005 mg/m^3, carcinogen, 1993; Sweden: NGV 0.001 ppm (0.007 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 0.05 ppm (0.35 mg/m^3), [skin], carcinogen, 1999; Thailand: TWA 0.001 ppm (0.007 mg/m^3), 1993; Turkey: TWA 0.001 ppm (0.007 mg/m^3), 1993; United Kingdom: STEL 0.1 ppm (0.24 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.05 (Ni)ppm. The Czech Republic[35]: TWA 0.01 mg/m^3; ceiling value 0.02 mg/m^3. Several states have set guidelines or standards for nickel carbonyl in ambient air[60] ranging from 1.17 μg/m^3 (New York) to 1.75 μg/m^3 (Connecticut and South Carolina) to 5.0 μg/m^3 (Virginia) to 8.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #6007, Nickel carbonyl. Charcoal tube (low Ni); HNO_3; Graphite furnace atomic absorption spectrometry; NIOSH Analytical Method (IV) #6007.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects.

Routes of Entry: It may be possible for appreciable amounts of the liquid to be absorbed through the skin; also ingestion and eye and skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates and burns the eyes and skin. Irritates the respiratory tract. May affect the central nervous system and the kidneys, causing tissue lesions. Medical observation is advised for 3 days or more; delayed lung effects may occur. Probable oral lethal dose for a human is between 50 and 500 mg/kg, between one teaspoon and 1 oz per 150-lb person. Nickel carbonyl has also been estimated to be lethal in humans at atmospheric exposures of 30 ppm for 20 min. Autopsies show congestion, collapse, and tissue destruction as well as hemorrhage in the brain. Dermatitis, recurrent asthmatic attacks, and increased number of white blood cells (eosinophils) in respiratory tract are acute health hazards. Acute exposure to nickel carbonyl may result in dizziness, giddiness, weakness, convulsions, hallucinations, delirium, nausea, vomiting, and diarrhea. Following inhalation, respiration will initially be rapid, accompanied by a nonproductive cough and followed by pain and tightness in the chest. Pulmonary edema, cerebral edema, and hepatic (liver) degeneration may also occur. Vapor is irritating to the eyes, nose, and throat. Nickel contact dermatitis is the most common reaction to nickel carbonyl. Nickel itch may begin with a burning sensation and itching, often followed by erythema (redness) and nodular eruptions.

Long Term Exposure: Repeated or prolonged inhalation exposure may cause skin and lung sensitization and asthma. A potential occupational carcinogen. In animals: reproductive, teratogenic effects. Permanent lung damage may occur following a single high exposure or lower repeated exposure. High or repeated exposures may cause damage to the heart muscle, liver and/or kidney damage.

Points of Attack: Lungs, paranasal sinus, central nervous system, reproductive system, liver, kidney, heart.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis; blood plasma; chest X-ray, electrocardiogram, expired air, 2H; pulmonary function tests; forced vital capacity, forced expiratory volume (1 s); sputum cytology; urine (chemical/metabolite), urinalysis (routine); white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests. Urine or plasma test for nickel (unexposed persons have urine levels under 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days. Lung function tests. Chest X-ray (persons with urine levels over 100 μg/L need medical observation). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is advised for 3 days or more; delayed lung effects including pulmonary edema may occur.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nickel carbonyl must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric). Sources of ignition, such as smoking and open flames, are prohibited where nickel carbonyl is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of nickel carbonyl should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of nickel carbonyl. Wherever nickel carbonyl is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nickel carbonyl requires a shipping label of "POISONOUS/TOXIC MATERIALS; FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I. A US DOT Severe Marine Pollutant.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.9/1.5
Night 3.1/4.9

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0 + /11.0+
Night 7.0+ /11.0+

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Solid streams of water may be ineffective. Material is too dangerous to health to expose fire fighters. A few whiffs of the vapor could cause death. If liquid or vapor penetrates fire fighter's protective gear it will cause fatality. Normal full protective gear available to the average fire department will not provide adequate inhalation or skin protection. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in admixture with a flammable solvent. Also, nickel carbonyl used in metalizing operations may be recovered and recycled. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases (*7718-54-9*): R49; R61; R23/25; R38; R42/43; R48/23; R68; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (CAS: 7718-54-9).

Description: Nickel chloride appears as green or brown scales, or sparkling golden-yellow powder. Molecular weight = 129.60; Sublimation temperature = 973°C; Freezing/Melting point = 1000°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0; (*hexahydrate*) Health 3, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Nickel chloride is used in electroplating and ink manufacturing.

Incompatibilities: Strong acids, potassium, sulfur. Forms an impact-sensitive mixture with potassium.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg[Ni]/m^3 TWA.

NIOSH REL: 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.1 mg[Ni]/m^3 TWA, inhalable fraction, confirmed human carcinogen.

NIOSH IDLH: 10 mg [Ni]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.221 mg/m^3
PAC-1: 0.221 mg/m^3
PAC-2: 0.221 mg/m^3
PAC-3: 22.1 mg/m^3

Hexahydrate

TEEL-0: 0.405 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 40.5 mg/m^3
PAC-3:40.5 mg/m^3

DFG MAK: Inhalable fraction, sensitization of the respiratory tract and skin, Carcinogen Category 1.

NIOSH IDLH: 10 mg[Ni]/m^3.

Russia set a MAC level of 0.005 mg/m^3 for nickel salts and aerosols.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: The EPA[6] has set a limit of 13.4 μg/L on nickel to protect human health. A lifetime health advisory of 150 μg/L has more recently been promulgated by EPA.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel chloride can affect you when breathed in. Exposure can irritate and inflame the air passages and sinuses, causing cough, phlegm, shortness of breath, and ulceration. Contact can irritate and burn the eyes or skin.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged contact may cause skin sensitization. Repeated or prolonged inhalation exposure may cause asthma-like allergy. Once allergy develops, even low future exposures can trigger symptoms. Repeated exposure can cause lung scarring and may affect the kidneys. Nickel chloride may cause mutations. Handle with extreme caution.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider lung function tests if lung symptoms are present. Kidney function tests. Chest X-ray. Daily testing for urine nickel for several days. Persons with urine nickel over 100 μg/L require immediate medical attention.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Nickel chloride must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from potassium and sulfur. Mixtures of nickel chloride and potassium will produce a strong explosion on impact.

Shipping: Toxic solid, inorganic, n.o.s. materials require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nickel chloride itself may burn but does not easily ignite. Poisonous gases, including chlorine and nickel carbonyl, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recycle or disposal in a chemical waste landfill is recommended.[22]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: (compounds) *carcinogenic to humans, carcinogenic to humans*, Group 1, 1997; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as nickel compounds.

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as nickel and compounds.

US EPA Hazardous Waste Number (RCRA No.): P074.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R49; R32; R42/43; R48/23;R50/53; Safety phrases:S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nickel cyanide is a yellowish-brown plate or powder that may change to a green color by absorbing moisture. It has a weak almond odor like cyanide. Molecular weight = 110.75; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Nickel cyanide is used in metallurgy and electroplating, and in making other chemicals.

Incompatibilities: Acids, active metals. Violent reaction with magnesium. Heat or acid contact can cause release of toxic cyanide.

Permissible Exposure Limits in Air

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA.

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] (*inorganic, soluble compounds*) 0.1 mg[Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

NIOSH IDLH: 10 mg[Ni]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.377 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 18.9 mg/m^3

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.

Russia set a MAC level of 0.005 mg/m^3 for nickel salts and aerosols.

As cyanides

NIOSH recommends a level of 5 mg/m^3 not to be exceeded during any 10-min work period. ACGIH recommends a TWA of 5 mg/m^3.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO$_3$ Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: Again one should consider the restrictions imposed both by nickel and by cyanide. However, the lifetime health advisories developed by EPA[49] are 154 μg/L for cyanide and 150 μg/L for nickel, which are nearly the same.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel cyanide can affect you when breathed in. Eye contact may cause irritation. Skin contact may cause skin allergy, with itching and redness, and later, rash. Fumes can cause pneumonia-like illness, with coughing and/or shortness of breath. Lung damage may result from a single high exposure or lower repeated exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Lung allergy occasionally occurs with asthma-type effect. High or repeated lower exposures may damage the heart, liver, or kidneys.

Long Term Exposure: Lung allergy occasionally occurs with asthma-type effect. Skin contact can cause allergy. High or repeated lower exposures may damage the lungs, with scarring of the lung tissue, and may cause damage to the heart, liver, or kidneys.

Points of Attack: Lungs, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests, urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If

this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility for medical observation up to 2 days and test for urine nickel. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Use amyl nitrate capsules if symptoms develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection:

Nickel: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Cyanides: Up to 25 mg/m^3: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Nickel cyanide must be stored to avoid contact with magnesium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from acids since heat and acids can release toxic cyanide.

Shipping: Nickel cyanide requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nickel cyanide itself does not burn. Poisonous gases, including cyanide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators

recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

TEEL-0: 0.0237 mg/m^3

PAC-1: 0.06 mg/m^3

PAC-2: 0.4 mg/m^3

PAC-3: 15.8 mg/m^3

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: The EPA[6] has set a limit on nickel to protect human health of 13.4 μg/L. A lifetime health advisory of 150 μg/L has more recently been promulgated by EPA.[49]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel hydroxide can affect you when breathed in. Irritates and burns the eyes and skin on contact. Irritates the respiratory tract causing phlegm and/or shortness of breath. Lung damage may result from a single high or lower repeated exposures. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Lung allergy occasionally occurs with asthma-type effects. High or repeated lower exposure may cause lung scarring and may damage the heart, liver, or kidneys. Skin contact may cause skin allergy, with itching, redness, and later rash. Nickel hydroxide is a carcinogen; handle with extreme caution.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function tests. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel levels for several days (persons with urine nickel over 100 μg need medical attention). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers away from strong acids. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substance, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel hydroxide is combustible but not easy to ignite. Use dry chemicals, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nickel, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recover and recycle where possible or dispose of in a chemical waste landfill.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Nickel nitrate is a green powder. Molecular weight = 182.73; Boiling point = 137°C; Freezing/Melting point = 55−57°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3 (Oxidizer). Highly soluble in water.

Potential Exposure: Nickel nitrate is used in electroplating, nickel catalyst production, and in the manufacture of brown ceramic colors.

Incompatibilities: A powerful oxidizer. Incompatible with strong acids, sulfur, combustibles, organics, and other easily oxidizable materials.

Permissible Exposure Limits in Air

OSHA PEL (*elemental, soluble & insoluble compounds*): 1 mg[Ni]/m^3 TWA.

NIOSH REL (*elemental, soluble & insoluble compounds*): 0.015 mg[Ni]/m^3 TWA; A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1] (*inorganic, soluble compounds*) 0.1 mg [Ni]/m^3 inhalable fraction TWA, confirmed human carcinogen.

NIOSH IDLH: 10 mg[Ni]/m^3.

Protective Action Criteria (PAC)

PAC-2: 12.5 mg/m^3

PAC-3: 31.1 mg/m^3

Hexahydrate

TEEL-0: 0.314 mg/m^3

PAC-1: 0.93 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 31 mg/m^3

DFG MAK (*elemental & nickel compounds*): Inhalable fraction, sensitization of the respiratory tract and skin; Carcinogen Category 1; DFG TRK: *As inhalable dusts/aerosols from nickel metal*: 0.50 μg[Ni]/L in urine, after several shifts; Carcinogen Category 1.

Russia set a MAC level of 0.005 mg/m^3 for nickel salts and aerosols.

Determination in Air: Use NIOSH Analytical Method #7300, Elements by ICP (Nitric/Perchloric Acid Ashing); #7301, Elements by ICP (Aqua Regia Ashing); #7303, Elements by ICP [Hot Block (HCl/HNO_3 Digestion)]; #9102, Elements on Wipes; #8310, Metals in urine, #8005, Elements in blood or tissue; OSHA Analytical Methods ID-121 and ID-125G.

Permissible Concentration in Water: The EPA[6] has set a limit to protect human health of 13.4 μg/L. A lifetime health advisory of 150 μg/L has more recently been promulgated by EPA.[49] See also this section in the entry on "Nickel and Soluble Compounds."

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel nitrate can affect you when breathed in. Irritates and burns the eyes and skin. Irritates the respiratory tract causing coughing and phlegm.

Long Term Exposure: Skin contact may cause skin allergy with itching, redness, and rash. Nickel nitrate may cause mutations. There is limited evidence that nickel nitrate may decrease fertility in males. Handle with extreme caution. Exposure may also cause lung allergy (asthma) to nickel. Once allergy asthma develops, even low future exposures can cause symptoms.

Points of Attack: Skin, lungs.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider lung function tests if lung symptoms are present.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel*.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, sulfur, combustibles, organics, or other readily oxidizable materials. Avoid storage on wood floors. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel nitrate is an oxidizer. It increases the flammability of any combustible substance. Extinguish fire using an agent suitable for type of surrounding fire. Nickel nitrate itself does not burn. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Permissible Concentration in Water: The EPA[6] has set a limit to protect human health of 13.4 μg/L. A lifetime health advisory of 150 μg/L has more recently been promulgated by EPA.[49] See also this section in the entry on "Nickel and Soluble Compounds."

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nickel sulfate can affect you when breathed in. It may also cause infertility in males. High or repeated exposures can scar the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy, with itching, redness, and later rash. Repeated or prolonged inhalation exposure may cause asthma-like lung allergy. Lungs may be scarred by repeated or prolonged exposure to the aerosol. Nickel sulfate may cause mutations. Handle with extreme caution. Carcinogenic to humans. Animal tests show that this substance possibly causes toxic effects upon human reproduction. May cause kidney damage.

Points of Attack: Skin, lungs, kidneys.

Medical Surveillance: NIOSH lists the following tests: blood gas analysis; whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; biologic tissue/biopsy; chest X-ray, electrocardiogram, pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; white blood cell count/differential. Before beginning employment and at regular times after that, the following are recommended: lung function test. Urine or plasma test for nickel (unexposed persons have urine levels less than 10 μg/L). If symptoms develop or overexposure is suspected, the following may be useful: daily urine nickel for several days (persons with urine nickel over 100 μg/L need medical attention). Lung function tests. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning including nickel. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #77-164, *Inorganic Nickel.*

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and

storage. Nickel sulfate must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric); wood, and other combustibles, since violent reactions occur. A regulated, marked area should be established where nickel sulfate is handled, used, or stored.

Shipping: Toxic solid, inorganic, n.o.s. materials require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nickel sulfate is not flammable. Use agent suitable for surrounding fire. Poisonous gases, including oxides of sulfur, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Negative: *N. crassa—aneuploidy*; Histidine reversion—Ames test.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Banned or Severely Restricted (in agriculture) (Germany, Hungary) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): No. P075.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Developmental/Reproductive toxin 4/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R25; R27; R51/53; Safety phrases: S1/2; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nicotine is a pale yellow to dark brown, oily liquid with a slight, fishy odor when warm. It is also available as a powder. Molecular weight = 162.23; Specific gravity (H_2O:1) = 1.01; Boiling point = 250°C; Freezing/Melting point = −78.9°C; Vapor pressure = 0.08 mmHg at 20°C; Flash point = 95°C (cc); Autoignition temperature = 240°C. Explosive limits: LEL = 0.7%; UEL = 4.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data; Natural Product. Nicotine is used in some drugs and in tanning. At one time, nicotine was used in the United States as an insecticide and fumigant; however, it is no longer produced or used in the United States for this purpose.

Incompatibilities: Contact with strong oxidizers may be violent. Incompatible with strong acids. Attacks some forms of plastics, rubber, and coatings. Nicotine decomposes on heating, producing nitrogen oxides, carbon monoxide, and other highly toxic fumes.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin].

NIOSH IDLH: 5 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 5 mg/m^3

DFG MAK: [skin]

Arab Republic of Egypt: TWA 0.5 mg/m^3, [skin], 1993; Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: MAK 0.07 ppm, 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; Denmark: TWA 0.5 mg/m^3, [skin], 1999; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, [skin], 2003; Norway: TWA 0.5 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, [skin], 1993; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Switzerland: MAK-W 0.07 ppm (0.5 mg/m^3), KZG-W 0.14 ppm, [skin], 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg/m^3, [skin], 1993; United Kingdom: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg/m^3 [skin]. Several states have set guidelines or standards for nicotine in ambient air[60] ranging from 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2544, #2551.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.17$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Nicotine affects the nervous system and the heart. Exposure to relatively small amounts can rapidly be fatal.[NIOSH]

Short Term Exposure: Irritates the eyes and skin. Even small exposures can cause increased heart rate, increased blood fat levels, and change vital hormone levels. May affect the cardiovascular system and central nervous system, resulting in convulsions and respiratory failure. Nicotine is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for a 70-kg (150 lb) person. It may be assumed that ingestion of 40−60 mg of nicotine is lethal to humans. There is a fundamental difference between acute toxicity from use of nicotine as an insecticide instead of from ingestion and chronic toxicity that may be caused by prolonged exposure to small doses as occurs in smoking. Maternal smoking during pregnancy is associated with increased risk of spontaneous abortion, low birth weight, and stillbirth. Acute exposure to nicotine may result in headache, dizziness, confusion, agitation, restlessness, lethargy, seizures, and coma. Victims may experience hypertension (high blood pressure), tachycardia (rapid heart rate), and tachypnea (rapid respirations), followed by hypotension (low blood pressure), bradycardia (slow heart rate), and respiratory depression. Cardiac arrhythmias may also occur. Gastrointestinal effects include nausea, vomiting, abdominal pain, or burning sensation, and diarrhea. Increased salivation, lacrimation (tearing), and sweating may be noted. High levels, far above the OEL, may result in death.

Long Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction. Nicotine was found as a co-carcinogen in animals.

Points of Attack: Central nervous system, cardiovascular system, lungs, GI tract, reproduction system. Has been shown to be a teratogen in animals; may be a teratogen in humans. Causes fat deposits in the arteries (reducing blood supply to many body organs). This increases the risk of heart attack, stroke, and many other poor circulation problems. Chronic high blood pressure can also result.

Medical Surveillance: NIOSH lists the following tests: blood plasma, during exposure, pre- and postshift, urine (chemical/metabolite). Before beginning employment and at regular times after that, the following is recommended: blood test for nicotine (only accurate shortly after exposure); consider test to evaluate typical exposures as well as for suspected overexposure or if symptoms are present. Even those who have smoked for a long time can reduce the risk of developing health problems by stopping.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Possibility of skin contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *5 mg/m^3:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nicotine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine and fluorine), strong acids (such as hydrochloric, sulfuric and nitric), since violent reactions occur. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nicotine is a combustible liquid. Extinguish with foam, dry chemical, or carbon dioxide extinguishers. Poisonous gases, including oxides of nitrogen and carbon monoxide, are produced in fire. Water may cause frothing if it gets below surface of liquid and turns to steam. However, water fog gently applied to surface will cause frothing which will extinguish the fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: Nicotine sulfate is a white crystalline solid. Molecular weight = 420.58; Autoignition temperature = 244°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector. It is used as an insecticide and in veterinary medicine as an anthelmintic and external parasiticide.
Incompatibilities: Oxidizing materials.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 9 mg/m^3
PAC-2: 9 mg/m^3
PAC-3: 9 mg/m^3
Russia: STEL 0.1 mg/m^3, 1993.
Russia set a MAC in ambient air in residential areas of 0.005 mg/m^3 on a once-daily basis and 0.001 mg/m^3 on a daily average basis.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: The liquid irritates the eyes and skin. Inhalation irritates nose and throat. May affect the central nervous system, causing convulsions and respiratory failure. Exposure at high concentrations may result in death. Onset of acute poisoning is rapid. Symptoms include nausea, salivation, abdominal pain, vomiting, diarrhea, cold sweat, headache, dizziness, disturbed hearing and vision, mental confusion, marked weakness, faintness and prostration, lowered blood pressure, difficult breathing, and weak, rapid and irregular pulse. It is classified as super toxic. Probable oral lethal dose in humans is less than 5 mg/kg (less than 7 drops) for a 70-kg (150 lb) person. Death is possible from respiratory failure caused by paralysis of the respiratory muscles.
Long Term Exposure: Animal tests show that this substance possibly causes toxic effects upon human reproduction.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Solution: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. To clean up, do not touch spilled material; stop leak if possible. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for disposal. *Small dry spill:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: As for nicotine, extinguish with alcohol foam, dry chemical, or carbon dioxide. Large fires can be extinguished with water spray, fog, or foam. Wear positive pressure breathing apparatus and special protective clothing. Dike fire control water; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Carcinogenicity: (Animal Positive) NCI.[9]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 10/5/05; Developmental/Reproductive toxin 4/30/99.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R51/53; Safety phrases: S2; S24; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Nitrapyrin is a colorless crystalline solid with a mild, sweet odor. Molecular weight = 230.90; Freezing/Melting point = 62.8°C; Vapor pressure = 0.0028 mmHg at 22.8°C. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector. Nitrapyrin is used as a fertilizer additive; to stabilize nitrogen.

Incompatibilities: Aluminum, magnesium.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA (total dust); 5 mg/m^3 TWA, respirable fraction.

NIOSH REL: 10 mg/m^3 TWA (total dust); 5 mg/m^3 TWA, respirable fraction TWA; 20 mg/m^3 respirable fraction STEL.

ACGIH TLV®[1]: 10 mg/m^3 TWA; 20 mg/m^3 STEL; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 20 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 400 mg/m^3

Austria: MAK 10 mg/m^3; STEL 20 mg/m^3, 1993; Belgium: TWA 10 mg/m^3; STEL 20 mg/m^3, 1993; France: VME 10 mg/m^3, 1999; Switzerland: MAK-W 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 20 mg/m^3. Several states have set guidelines for nitrapyrin in ambient air[60] ranging from 100 to 200 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Determination in water: Fish Tox = 314.70281000 ppb (LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nitrapyrin can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. High levels may cause you to feel dizzy, lightheaded, and to pass out. Contact can irritate and may damage the eyes and skin. No adverse effects noted in ingestion studies with animals. Human Tox = 210.00000 ppb (VERY LOW).

Long Term Exposure: There may be damage to the liver and kidneys. Repeated exposure to nitrapyrin may cause symptoms of headaches, dizziness, loss of appetite, and trouble sleeping.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from aluminum, magnesium, or their alloys. Do not store in unlined containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nitrapyrin itself does not burn. Poisonous gases, including oxides of nitrogen and chloride ion, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: The manufacturer of this nitrification inhibitor suggests that unwanted quantities can be disposed of by burial in a sanitary landfill. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Nitrates N:0330

Molecular Formula: $N_vM_vO_{vx3}$

Common Formula: $M_v(NO_3)_v$

Synonyms: Vary with specific compounds

CAS Registry Number: 14797-55-8

RTECS® Number: WC5600000 (sodium nitrate)

UN/NA & ERG Number: UN3218 (nitrates, inorganic, aqueous solution, n.o.s.)/140; UN1477 (nitrates, inorganic, n.o.s.)/140

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Nitrate and nitrite:

Safe Drinking Water Act: MCL, 10 mg/L as nitrogen; MCLG, 10 mg/L as nitrogen.

Nitrate compounds (water dissociable).

EPCRA Section 313: Reportable only when in aqueous solution. Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), as nitrates, inorganic, n.o.s.

WGK (German Aquatic Hazard Class): No value assigned (CAS: 14797-55-8). May vary by compound.

Description: Nitrates are salts with varying properties depending on the specific compounds. Organic nitrates are called "nitro" compounds. Hazard Identification (based on NFPA-704 M Rating System): Hazard Identification (based on NFPA-704 M Rating System) (*estimated*): Health 2, Flammability 0, Reactivity 0. Oxidizers.

Potential Exposure: Among the major point sources of nitrogen entry into water bodies are municipal and industrial wastewaters, septic tanks, and feedlot discharges. Diffuse sources of nitrogen include farm-site fertilizer and animal wastes, lawn fertilizer, leachate from waste disposal in dumps or sanitary landfill, atmospheric fallout, nitric oxide and nitrite discharges from automobile exhausts and other combustion processes, and losses from natural sources, such as mineralization of soil organic matter.

Incompatibilities: Nearly all nitrates are powerful oxidizers. Possible violent reactions with reducing agents, combustible materials, organic materials, finely divided (powdered) metals, may form explosive mixtures or cause fire and explosions. Many nitrates are flammable by spontaneous chemical reaction. Some may explode by spontaneous chemical reaction, when exposed to elevating temperatures and/or shock. Some nitrates are high explosives, especially when confined and/or exposed to heat and/or fire.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) *nitrate(s)*

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Permissible Concentration in Water: Nitrite in water at concentrations less than 1000 mg/L is not of serious concern as a direct toxicant. It is a health hazard because of its conversion to nitrite. Nitrite is directly toxic when it reacts with hemoglobin to form methemoglobin which causes methemoglobinemia. It also reacts readily under appropriate conditions with secondary amines and similar nitrogenous compounds to form *N*-nitroso compounds, many of which are potent carcinogens. Epidemiological evidence on the occurrence of methemoglobinemia in infants tends to confirm a value near 10 mg/L nitrate as nitrogen as a maximum concentration level for water with no observed adverse health effects, but there is little margin of safety in this value. The EPA[49] has published a health advisory for nitrate/nitrite which confirms the 10 mg/L level. The state of Maine[61] has set a guideline at 10 mg/L as well. EPA[62] has recently set a guideline for drinking water of 10 mg/L also.

Determination in Water: A variety of methods for determination of nitrate exists, but none is particularly precise, accurate, or sensitive in the milligram per liter concentration range. Further development and standardization of analytical methodology will be required if standard routine determinations are to be considered reliable within the range required for proper control and assessment of health effects.

Most standard procedures for nitrate determination in the milligram per liter range are spectrophotometric. Traditionally, three types of fractions of nitrate have been used as bases: nitration of a phenolic substance to a colored derivative, oxidation of an organic substance to a colored product, and reduction of the nitrate to nitrite or ammonia, followed by reaction of the reduced nitrogenous materials to give colored substances. In addition, direct spectrophotometric determination based on ultraviolet absorption of nitrate at 273 nm is possible and becoming established. Electrochemical determination with the use of a nitrate electrode may also be feasible but is subject to numerous interferences.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: High dosages, if swallowed, may lead to serious and possibly fatal effects. Symptoms of exposure include headache, dizziness, abdominal cramps, vomiting, bloody diarrhea, weakness, convulsions, collapse, and death.

Long Term Exposure: Two health hazards are related to the consumption of water containing large concentrations of nitrate (or nitrite): induction of methemoglobinemia, particularly in infants, and possible formation for carcinogenic nitrosamines. Acute toxicity of nitrate occurs as a result of reduction to nitrite, a process that can occur under specific conditions in the stomach, as well as in the saliva. Nitrite acts in the blood to oxidize the hemoglobin to methemoglobin, which does not perform as an oxygen carrier to the tissues. Consequently, anoxia and death may ensue. According to Sax/Lewis, "... small, repeated doses may lead to weakness, general depression, headache, and mental impairment. Also, there is some implication of increased cancer incidence among those exposed." Acute nitrate toxicity is almost always seen in infants rather than adults. This increased susceptibility of infants has been attributed to high intake per unit weight, to the presence of nitrate-reducing bacteria in the upper gastrointestinal tract, to the condition of the mucosa, and to greater ease of oxidation of fetal hemoglobin."

Points of Attack: Blood.

First Aid: See specific entries.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: See specific entries.

Respirator Selection: See specific entries.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with nitrates chemicals you should be trained on its proper handling and storage. See statement about incompatibilities above and specific entries. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Nitrates, inorganic, n.o.s. and Nitrates, inorganic, aqueous solution, n.o.s. require a shipping label of "OXIDIZER." They fall in DOT Hazard Class 5.1 and Packing Group II or III.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nitrates will increase the activity of an existing fire. Many will explode spontaneously. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *Sodium nitrate:* the material is diluted to the recommended provisional limit in water.

(The pH is adjusted to between 6.5 and 9.1 and then the material can be discharged into sewers or natural streams.)

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Nitric acid is a colorless to light brown fuming liquid with an acrid, suffocating odor. Fuming nitric acid is a reddish fuming liquid. Fumes in moist air. Often used in an aqueous solution. Fuming nitric acid is concentrated nitric acid that contains dissolved nitrogen dioxide. Nitric acid is a solution of nitrogen dioxide, NO_2, in water and so-called fuming nitric acid contains an excess of NO_2 and is yellow to brownish-red in color. Molecular weight = 63.02; Specific gravity (H_2O:1) = 1.50 at 25°C; Boiling point = 82.8°C; Freezing/Melting point = −42°C (monohydrate); −19°C (trihydrate); Vapor pressure = 48 mmHg. Soluble in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data. Nitric acid is the second most important industrial acid and its production represents the sixth largest chemical industry in the United States. Nitric acid is used in chemicals, explosives, fertilizers, steel pickling, metal cleaning. The largest use of nitric acid is in the production of fertilizers. Almost 15% of the production goes into the manufacture of explosives, with the remaining 10% distributed among a variety of uses, such as etching, bright-dipping, electroplating, photoengraving, production of rocket fuel, and pesticide manufacture.

Incompatibilities: A strong oxidizer and strong acid. Reacts violently with combustible and reducing agents, carbides, hydrogen sulfide, turpentine, charcoal, alcohol, powdered metals, strong bases. Heat causes decomposition producing nitrogen oxides. Attacks some plastics. Corrosive to metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.58 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 2 ppm/5 mg/m^3 TWA.

NIOSH REL: 2 ppm/5 mg/m^3 TWA; 4 ppm/10 mg/m^3 STEL.

ACGIH TLV®[1]: 2 ppm/5.2 mg/m^3 TWA; 4 ppm/10 mg/m^3 STEL.

NIOSH IDLH: 25 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.53 ppm

PAC-1: **0.53** ppm

PAC-2: **24** ppm

PAC-3: **92** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/5.2 mg/m^3 TWA; Peak Limitation Category I(1); Pregnancy Risk Group D.

Arab Republic of Egypt: TWA 2 ppm (5 mg/m^3), 1993; Australia: TWA 2 ppm (5 mg/m^3); STEL 4 ppm, 1993;

Austria: MAK 2 ppm (5 mg/m^3), 1999; Belgium: TWA 2 ppm (5.2 mg/m^3); STEL 4 ppm (10 mg/m^3), 1993; Denmark: TWA 2 ppm (5 mg/m^3), 1999; Finland: TWA 2 ppm (5 mg/m^3); STEL 5 ppm (13 mg/m^3), [skin], 1999; France: VME 2 ppm (5 mg/m^3), VLE 5 ppm (10 mg/m^3), 1999; Hungary: STEL 5 mg/m^3, 1993; Japan: 2 ppm (5.2 mg/m^3), 1999; Norway: TWA 2 ppm (5 mg/m^3), 1999; the Philippines: TWA 2 ppm (5 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 10 mg/m^3, 1999; Russia: TWA 2 ppm; STEL 2 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (5 mg/m^3), KTV 5 ppm (13 mg/m^3), 1999; Thailand: TWA 2 ppm (5 mg/m^3), 1993; Turkey: TWA 2 ppm (5 mg/m^3), 1993; United Kingdom: LTEL 2 ppm (5 mg/m^3); STEL 4 ppm (10 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 4 ppm. Russia set a MAC of 0.4 mg/m^3 for nitric acid in ambient air in residential areas on a once-daily basis and 0.15 mg/m^3 on a daily average basis. Several states have set guidelines or standards for nitric acid in ambient air[60] ranging from 50−100 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut, Florida, New York and South Dakota) to 119 μg/m^3 (Nevada) to 125 μg/m^3 (South Carolina) to 1000 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #7903, acids, inorganic; OSHA Analytical Methods ID-127 and ID-165SG.

Permissible Concentration in Water: The EEC set a MAC of 50 mg NO_3/L in drinking water and a guideline level of 25 mg NO_3/L.[35] Russia[43] set a MAC of 0.4 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive if ingested. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This compound is a primary irritant, and causes burns and ulceration of all tissues and membranes that it contacts. This includes burns to the eyes and skin by contact; burns to the mouth, throat, esophagus, and stomach by ingestion; and the entire respiratory tract by inhalation. Circulatory collapse and shock are often the immediate causes of death. The approximate minimum lethal dose is 5 mL for a 150-lb person. Persons with skin, eye, or cardiopulmonary disorders are at a greater risk. Signs and symptoms of acute ingestion of nitric acid may be severe and include increased salivation, intense thirst, difficulty in swallowing, chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion of nitric acid. Acute inhalation exposure may result in sneezing, hoarseness, choking, laryngitis, dyspnea (shortness of breath), respiratory tract irritation, and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa, chronic bronchitis, and pneumonia may also occur. If the eyes have come in contact with nitric acid, irritation, pain, swelling, corneal erosion, and blindness may occur. Dermal exposure may result in severe burns, pain, and dermatitis (red, inflamed skin).

Long Term Exposure: The mists or vapors may cause erosion of the teeth. May affect the lungs.

Points of Attack: Eyes, skin, respiratory system, teeth.

Medical Surveillance: NIOSH recommends that workers subject to nitric acid exposure have comprehensive preplacement and annual medical examinations including a 14″ × 17″ posterior−anterior chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); and a visual examination of the teeth for evidence of dental erosion.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is conscious, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitric acid: Neoprene™ (Up to 30%); Natural rubber or polyvinyl chloride (Up to 70%); Neoprene™/natural rubber or Saranex™ (more than 70%). For fuming nitric acid the following are recommended: Viton™, nitrile, Neoprene™, natural rubber, chlorobutyl, or Neoprene™/natural rubber. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Possibility of skin contact with liquids of $pH < 2.5$ or repeated or prolonged contact with liquids of $pH > 2.5$. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers and eyewash if liquids of $pH < 2.5$ are involved.

Respirator Selection: *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: SCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection. Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Nitric acid must be stored to avoid contact with metallic powders, carbides, hydrogen sulfide, turpentine, or strong bases because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Heat may cause containers to burst and result in an escape of poisonous gases.

Shipping: Nitric acid other than red fuming, with >70% nitric acid or Nitric acid other than red fuming, with not >70% nitric acid require a shipping label of "CORROSIVE." They fall in DOT Hazard Class 8. Packing Groups are as follows: (with >70% nitric acid) is Group I; (with not >70% nitric acid) is Group II.

Nitric acid, red fuming, requires a shipping label of "CORROSIVE, OXIDIZER, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group I. Red fuming nitric acid carries a plus sign (+) symbol, indicating that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Keep unnecessary people away. Do not touch spilled material; stop leak if you can do so without risk. Isolate the hazard area and deny entry. Stay upwind and keep out of low areas. Ventilate closed spaces before entering them. Ventilate area of spill or leak. Remove all ignition sources. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Use water spray to reduce vapors; do not get water inside container. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Flush with copious quantities of water and neutralize with alkaline material (such as soda ash, lime, etc.). Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances (UN 2032 fuming nitric acid)

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

Nitric acid, fuming and red fuming

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 0.7/1.2

Fire Extinguishing: Firefighting gear (including SCBA) may not provide adequate protection. If exposure occurs, remove and isolate gear immediately and thoroughly decontaminate personnel. Nitric acid is noncombustible. However, it can increase the flammability of combustible, organic, and readily oxidizable materials, or even cause ignition of some of these with water. Poisonous gases, including nitrogen oxides, are produced in fire. Use water spray. *Small fires:* water, dry chemical, or soda ash. *Large fires:* flood fire area with water. Move container from fire area if you can do so without risk. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Soda ash-slaked lime is added to form the neutral solution of nitrate of sodium and calcium. This solution can be discharged after dilution with water.[22] Also, nitric acid can be recovered and reused in some cases as with acrylic fiber spin solutions. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Nitric oxide N:0350

Molecular Formula: NO

Synonyms: Bioxyde d'azote (French); Monoxido de nitrogeno (Spanish); Nitric oxide; Nitrogen monoxide; NO (military designation); Oxido nitrico (Spanish); Oxyde nitrique (French); Stickmonoxyd (German)

CAS Registry Number: 10102-43-9; *(alt.)* 51005-21-1; *(alt.)* 90452-29-2; *(alt.)* 90880-94-7

RTECS® Number: QX525000

UN/NA & ERG Number: UN1660/124

EC Number: 233-271-0

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration); *Theft hazard* 15 (≥3.83% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

US EPA Hazardous Waste Number (RCRA No.): P076.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Nitric oxide is a colorless gas with a sharp, sweet odor; brown at high concentration in air. Odor threshold = 0.3−1.0 ppm. Shipped as a nonliquefied compressed gas. Molecular weight = 30.01; Boiling point = −151.6°C; Freezing/Melting point = −163.9°C; Relative vapor density (air = 1) = 1.04; Vapor Pressure = 34.2 atm. Slightly soluble in water; solubility = 5%.

Potential Exposure: Nitric oxide is used in the manufacture of nitric acid; it is also used in the bleaching of rayon; it is a raw material for nitrosyl halide preparation.

Incompatibilities: Explosive reaction with nitrogen trichloride, ozone, carbon disulfide, pentacarbonyl iron, chlorine monoxide. Incompatible with halogens, combustibles, metals, oil, alcohols, chlorinated hydrocarbons (e.g., trichloroethylene), reducing agents (such as NH_3), oxygen, fluorine, metals. Reacts with water to form nitric acid. Rapidly converted in air to nitrogen dioxide.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.88 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/30 mg/m^3 TWA.

NIOSH REL: 25 ppm/30 mg/m^3 TWA.

ACGIH TLV®[1]: 25 ppm/31 mg/m^3 TWA; BEI$_M$ issued for Methemoglobin inducers.

NIOSH IDLH: 100 ppm

Protective Action Criteria (PAC)*

TEEL-0: 0.5 ppm

PAC-1: **0.50** ppm

PAC-2: **12** ppm

PAC-3: **20** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.5 ppm/0.63 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Austria: MAK 25 ppm (30 mg/m^3), 1999; Denmark: TWA 25 ppm (30 mg/m^3), 1999; France: VME 25 ppm (30 mg/m^3), 1999; Norway: TWA 25 ppm (30 mg/m^3), 1999; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 10 mg/m^3, 1999;

Sweden: NGV 25 ppm (30 mg/m^3), KTV 50 ppm (60 mg/m^3), 1999; Thailand: TWA 25 ppm (30 mg/m^3), 1993; the Netherlands: MAC-TGG 30 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. Several states have set guidelines or standards for nitric oxide in ambient air[60] ranging from 0.3 mg/m^3 (North Dakota) to 0.5 mg/m^3 (Virginia) to 0.6 mg/m^3 (Connecticut) to 0.714 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #6014, Nitric oxide and nitrogen dioxide, 6014; OSHA Analytical Method #ID-109.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin. Strong respiratory tract irritant. High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia). Nitric oxide forms acids in the respiratory system which are irritating and can cause congestion in the lungs or pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Nitric oxide can cause death or permanent injury after a very short exposure to small quantities. Can cause unconsciousness. Concentrations of 60−150 ppm cause immediate irritation of the nose and throat with coughing and burning in the throat and chest 6−24 h after exposure; labored breathing and unconsciousness may result. Concentrations of 100−150 ppm are dangerous for a short exposure of 30−60 min. Concentrations of 200−700 ppm may be fatal after very short exposure. Nitric oxide can cause death due to blockage of gas exchange in lungs. Initially, symptoms include slight coughing, fatigue, and nausea at high concentrations; coughing, choking, headache, nausea, abdominal pain, and shortness of breath are seen. Latent symptoms are uneasiness, restlessness, rapid and shallow breathing, bluing of skin, lips and fingernail beds, anxiety, mental confusion; and finally loss of consciousness.

Long Term Exposure: Can irritate the lungs; bronchitis may develop. Can cause headache, nausea, vomiting, fatigue, mental confusion, unconsciousness, and death. Increased blood methemoglobin levels.

Points of Attack: Eyes, skin, respiratory system, blood, central nervous system.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, on workers over 40 years, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s). Consider the points of attack in preplacement and periodic physical examinations. Blood methemoglobin levels.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; keep victim under observation. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear nonvented, impact resistant, gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash; pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit.

Respirator Selection: NIOSH/OSH: *1000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Nitric oxide requires a shipping label of "POISON GAS, OXIDIZER, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Nitric oxide or nitric oxide, compressed

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Fire Extinguishing: Nitric oxide itself does not burn. Will react with water or steam to produce heat and corrosive fumes. When heated to decomposition, highly toxic fumes of nitrogen oxides are emitted. May ignite other combustible materials (wood, paper, oil, etc.). Mixture with fuels may explode. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapor explosion and poison hazard indoors, outdoors, or in sewers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with added hydrocarbon fuel, controlled so as to produce elemental nitrogen, CO_2, and water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; Negative: *D. melanogaster* sex-linked lethal.
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical: Cancer 1/1/88.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: Nitrilotriacetic acid is a crystalline compound. Molecular weight = 191.16; Boiling point = 167°C; Freezing/Melting point = 242°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Slightly soluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen. Nitrilotriacetic acid (NTA) was used as a phosphate replacement in laundry detergents in the late 1960s. In 1971, the use of NTA was discontinued. The possibility of resumed use arose in 1980. NTA is now used in laundry detergents in states where phosphates are banned. NTA is also used as a boiler feed-water additive at a maximum use level of 5 ppm of trisodium salt. Currently, the remaining nondetergent uses of NTA are for water treatment, textile treatment; metal plating and cleaning; and pulp and paper processing.
Incompatibilities: Aqueous solution is an acid. Violent reaction with strong bases.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 35 mg/m^3
PAC-1: 100 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: avoid simultaneous exposure to Iron (Fe) compounds.
Permissible Concentration in Water: No criteria set for drinking water; NTA addition to boiler feed-water is limited to 5 ppm by FDA. NTA levels in the US drinking water prior to NTA's discontinued use in detergents was estimated by EPA to have ranged from 0.20 to 24.5 μg/L. NTA is rapidly degraded under aerobic conditions at temperatures above 5°C, and biodegradation does not lead to the formation of persistent intermediates.
Determination in Water: Octanol−water coefficient: Log $K_{ow} = -3.75$.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes and skin. This material is moderately toxic. The LD50 (oral-rat) is 1470 mg/kg.
Long Term Exposure: A Confirmed Human Carcinogen.
First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52] *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered:
At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that

has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or in a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with toluene to avoid dust. Or, use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

5-Nitroacenaphthene N:0370

Molecular Formula: $C_{12}H_9O_2$

Synonyms: 1-Amino-2-methoxy-5-nitrobenzene; 2-Amino-1-methoxy-4-nitrobenzene; 3-Amino-4-methoxynitrobenzene; 2-Amino-4-nitroanisole; *o*-Anisidine nitrate; *o*-Anisidine, 5-nitro-; Azoamine scarlet; Azoamine scarlet K; Azogene Ecarlate R; Azoic diazo component 13 base; Benzenamine, C.I. 37130; Benzenamine, 2-methoxy-5-nitro-; C.I. 37130; C.I. Azoic diazo component 13; Fast scarlet R; 1-Methoxy-2-amino-4-nitrobenzene; 2-Methoxy-5-nitro-; 2-Methoxy-5-nitroaniline; 2-Methoxy-5-nitrobenzenamine; NCI-C01934; 3-Nitro-6-methoxyaniline; 5-Nitro-2-methoxyaniline

CAS Registry Number: 602-87-9

RTECS® Number: AB1060000

EC Number: 210-025-0 [*Annex I Index No.:* 609-037-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Inadequate Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat, 1987

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 4/1/88.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 5-Nitroacenaphthene is a yellow crystalline solid. Molecular weight = 199.22; Freezing/Melting point = 103−104°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: Used in organic synthesis.

Incompatibilities: 5-Nitroacenaphthene is an aromatic hydrocarbon (nitro compound). It may be flammable or explosive. Incompatible with strong oxidizers, alkalis which may increase the thermal sensitivity of the substance.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: Carcinogen Category 2.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: May reduce the blood's ability to carry oxygen (methemoglobinemia) with cyanosis, fatigue, dizziness, headache. May affect the central nervous system.

Long Term Exposure: Little is known aside from the fact that it is a carcinogen. May cause liver and kidney damage. Poisoning may cause anemia, cyanosis, fatigue, insomnia, weight loss.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52] *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™, Silvershield™, Viton™, Viton™/chlorobutyl rubber, chlorinated polyethylene, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with acetone. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Careful incineration in an incinerator equipped with afterburner and scrubbers.[22]

p-Nitroaniline N:0380

RTECS® Number: BY7000000

UN/NA & ERG Number: UN1661/153

EC Number: 202-810-1 [*Annex I Index No.:* 612-012-00-9]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (gavage); equivocal evidence: rat.

US EPA Gene-Tox Program, Negative: Sperm morphology—mouse.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

US EPA Hazardous Waste Number (RCRA No.): P077.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.028; Nonwastewater (mg/kg), 28.

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*all isomers*): Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R52/53; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *p*-Nitroaniline consists of yellow crystals with a pungent, faint ammonia-like odor. Molecular weight = 138.14; Specific gravity (H_2O:1) = 1.42; Boiling point = 332.2°C; Freezing/Melting point = 146.1°C; Vapor pressure = 0.000002 mmHg at 20°C; Flash point = 198.9°C; Autoignition temperature = 510°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. *p*-Nitroaniline is used as an intermediate in the manufacture of dyes, antioxidants, pharmaceuticals, and pesticides.

Incompatibilities: A combustible liquid. A strong oxidizer. Violent reaction with reducing agents, strong acids, combustibles, strong oxidizers. May explode on heating. May result in spontaneous heating of organic materials in the presence of moisture or strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 1 ppm/6 mg/m^3 TWA [skin].

NIOSH REL: 3 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 3 mg/m^3 TWA [skin]; not classifiable as a human carcinogen; BEI$_M$ issued for Methemoglobin inducers.

DFG MAK: [skin]; Carcinogen Category 3A.

NIOSH IDLH: 300 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 6 mg/m^3

PAC-1: 9 mg/m^3

PAC-2: 300 mg/m^3

PAC-3: 300 mg/m^3

Arab Republic of Egypt: TWA 1 ppm (6 mg/m^3), [skin], 1993; Australia: TWA 3 mg/m^3, [skin], 1993; Austria: MAK 1 ppm (6 mg/m^3), [skin], 1999; Belgium: TWA 3 mg/m^3, [skin], 1993; Denmark: TWA 0.5 ppm (3 mg/m^3), [skin], 1999; Finland: TWA 1 ppm (6 mg/m^3); STEL 3 ppm (18 mg/m^3), [skin], 1993; France: VME 3 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 6 mg/m^3, [skin], 2003; Japan: 3 mg/m^3, [skin], 1999; Norway: TWA 1 mg/m^3, 1999; the Philippines: TWA 1 ppm (6 mg/m^3), [skin], 1993; Poland: MAC (TWA) 3 mg/m^3; MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, [skin], 1993; Switzerland: MAK-W 0.5 ppm (3 mg/m^3), [skin], 1999; Turkey: TWA 1 ppm (6 mg/m^3), [skin], 1993; United Kingdom: TWA 6 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for *p*-nitroaniline in ambient air[60] ranging from zero (Connecticut) to 6.0 μg/m^3 (New York) to 7.143 μg/m^3 (Kansas) to 15 μg/m^3 (South Carolina) to 30 μg/m^3 (Florida and North Dakota) to 50 μg/m^3 (Virginia) to 71 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5033.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 2.7.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *p*-Nitroaniline can affect you when breathed in and by passing through your skin. Exposure by skin contact or breathing can interfere with the ability of the blood to carry oxygen (metheglobinemia) and kidney impairment. This can cause headaches, dizziness, cyanosis (a blue color to the skin and lips), trouble breathing, and even collapse and death.

Long Term Exposure: Because this is a mutagen, handle it as a possible cancer-causing substance with extreme caution. May affect the blood, causing the formation of methemoglobin, low blood count (anemia), kidney and liver damage. People with "G-6-P-D deficiency" may be at higher risk for developing health problems following exposure.

Points of Attack: Respiratory system, blood, heart, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Methemoglobin; Complete blood count; liver function tests. Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following is recommended: kidney function tests. Also, tests for the condition called "G-6-P-D deficiency."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobine in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin

contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 30 mg/m^3:* Sa (APF = 10) (any supplied-air respirator).* *Up to 75 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 150 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 300 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp; ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. *p*-Nitroaniline must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates and nitrates), reducers, and strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Wherever *p*-nitroaniline is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nitroanilines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including sulfur dioxide and nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) with scrubbing for nitrogen oxides abatement. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 202-770-5

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse, rat, 1978. 5-Nitro-*o*-anisidine was removed from the NTP 6th Report on Carcinogens as a substance "reasonably anticipated to be a human carcinogen" in 1991, when NTP concluded there was insufficient evidence of carcinogenicity. Delisted from the California Proposition 65 list as of December 8, 2006.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 10/1/89; Delisted 12/8/06.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 5-Nitro-*o*-anisidine is an orange-red crystalline compound. Molecular weight = 168.17; Freezing/Melting point = 118°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0.

Potential Exposure: 5-Nitro-*o*-anisidine is a chemical intermediate in the production of C.I. Pigment red 23, which is used as a colorant for commodities, such as printing inks, interior latex paints; lacquers, rubber, plastics, floor coverings; paper coating; and textiles. It is also used with other C.I. coupling components to produce various hues of red, brown, yellow, and violet on cotton, silk, acetate, and nylon.

Permissible Exposure Limits in Air

No standards or TEEL available.

Incompatibilities: Strong acids, acid chlorides, acid anhydrides, chloroformates.

Permissible Exposure Limits in Air: No OELs have been established, but this chemical can be absorbed through the skin. Several states have set guidelines or standards for 5-nitro-*o*-ansidine in ambient air[60] ranging from zero (North Dakota) to 0.08 μg/m^3 (Rhode Island).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: High levels can interfere with the blood's ability to carry oxygen (methemoglobinemia) causing dizziness, cyanosis. Higher levels can cause trouble breathing, collapse, and even death.

Long Term Exposure: This compound is a proved carcinogen in experimental animals. Related chemicals can cause allergic skin rash, and irritate the nose, throat, and lungs. It is not known whether this substance can cause these effects.

Points of Attack: Blood. *Cancer site:* bladder.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Blood hemoglobin level. Complete blood count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids, acid chlorides, acid anhydrides, and chloroformates. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dye intermediates, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) with scrubbing for nitrogen oxides abatement.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Nitrobenzene is a pale yellow to dark brown oily liquid whose odor resembles bitter almonds (or black paste shoe polish). The odor threshold is 0.044; 0.02 ppm (NJ). Molecular weight = 123.12; Specific gravity (H_2O:1) = 1.20; Boiling point = 210°C; Freezing/Melting point = 5.6°C; Vapor pressure = 0.3 mmHg at 25°C; Flash point = 88°C (cc); Autoignition temperature = 480°C. Explosive limits: LEL = 1.8% at 93°C; UEL: 40%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1. Practically insoluble in water; solubility = 0.2%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Nitrobenzene is used in the manufacture of explosives and aniline dyes and as solvent and intermediate. It is also used in floor polishes, leather dressings and polishing compounds, paint solvents, and to mask other unpleasant odors. Substitution reactions with nitrobenzene are used to form *m*-derivatives. Pregnant women may be especially at risk with respect to nitrobenzene as with many other chemical compounds, due to transplacental passage of the agent. Individuals with glucose-6-phosphate dehydrogenase deficiency may also be special risk groups. Additionally, because alcohol ingestion or chronic alcoholism can lower the lethal or toxic dose of nitrobenzene, individuals consuming alcoholic beverages may be at risk.

Incompatibilities: Concentrated nitric acid, nitrogen tetroxide, caustics, phosphorus pentachloride, chemically active metals, such as tin or zinc. Violent reaction with strong oxidizers and reducing agents. Attacks many plastics. Forms thermally unstable compounds with many organic and inorganic compounds.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.04 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/5 mg/m^3 TWA [skin].

NIOSH REL: 1 ppm/5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 1 ppm TWA [skin]; BEI: 5 mg[total *p*-nitrophenol]/g creatinine in urine/end-of-shift at end-of-work-week; 1.5% methemoglobin in blood, end-of-shift. Confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 2.5 ppm

PAC-2: 19.9 ppm

PAC-3: 200 ppm

DFG MAK: [skin] Carcinogen Category 3B; BAT: 100 μg [Aniline, released from aniline−hemoglobin conjugate]/L in blood, for long-term exposure, after several shifts (sampling time) [skin].

Arab Republic of Egypt: TWA 1 ppm (5 mg/m^3), [skin], 1993; Australia: TWA 1 ppm (5 mg/m^3), [skin], 1993; Austria: MAK 1 ppm (5 mg/m^3), [skin], 1999; Belgium: TWA 1 ppm (5 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (5 mg/m^3), [skin], 1999; Finland: TWA 1 ppm (5 mg/m^3); STEL 3 ppm (15 mg/m^3), [skin], 1999; France: VME 1 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 5 mg/m^3, [skin], 2003; Japan: 1 ppm (5 mg/m^3), [skin], 1999; Norway: TWA 1 ppm (5 mg/m^3), 1999; Poland: MAC (TWA) 3 mg/m^3; MAC (STEL) 10 mg/m^3, 1999; Russia: TWA 1 ppm; STEL 3 mg/m^3, [skin], 1993; Sweden: NGV 1 ppm (5 mg/m^3), KTV 2 ppm (10 mg/m^3), [skin], 1999; Switzerland: MAK-W 1 ppm (5 mg/m^3), KZG-W 2 ppm (10 mg/m^3), [skin], 1999; Turkey: TWA 1 ppm (5 mg/m^3), [skin], 1993; United Kingdom: TWA 1 ppm (5.1 mg/m^3); STEL 2 ppm (10 mg/m^3), [skin], 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic: TWA 1 ppm (5 mg/m^3).[35] Russia[43] has set 0.008 mg/m^3 (8 μg/m^3) as an MAC for ambient air in residential areas. Several states have set guidelines or standards for nitrobenzene in ambient air[60] ranging from 6.8 μg/m^3 (Massachusetts) to 16.7 μg/m^3 (New York) to 25 μg/m^3 (North Carolina and South Carolina) to 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2017. See also Method #2005.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 27,000 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 6680 μg/L on an acute toxicity basis. To protect humans—30 μg/L based on organoleptic considerations and 19,800 μg/L based on toxicity considerations.[6] Guidelines for nitrobenzene in drinking water have been set by Maine at 1.4 μg/L and by Kansas at 5.0 μg/L.[61]

Determination in Water: Methylene chloride extraction followed by exchange to toluene, gas chromatography with flame ionization detection (EPA Method 609) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 1.86.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Penetrates the skin.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Has caused headache and nausea at 3−6 ppm. 40 ppm may cause intoxication. Symptoms due to decreased ability of blood to carry oxygen may include blue coloration of lips, fingernails, and earlobes; headache, dizziness, loss of coordination; labored breathing; rapid heartbeat; vomiting, coma, and death. Symptoms may be delayed up to 4 h. *Skin:* Easily absorbed through the skin and contributes significantly to symptoms listed under inhalation. May also cause irritation and allergic sensitization. Death has been reported from skin absorption. *Eyes:* May cause irritation and damage to the cornea. *Ingestion:* May cause symptoms listed under inhalation and include burning of throat, abdominal pain, bloody diarrhea, and enlarged spleen and liver. Death has resulted from as little as 0.4 mL (0.05 liq. oz), about 8 drops. High levels of exposure can interfere with the blood's ability to carry oxygen (methemoglobinemia). Signs and symptoms of acute exposure to nitrobenzene may be severe and include cyanosis (blue tint to the skin and mucous membranes), tachycardia (rapid heart rate), Hypotension (low blood pressure), and cardiac arrhythmias. Respiratory depression and respiratory failure may also occur. Headache, lethargy, weakness, vertigo (dizziness), severe depression, and coma may be noted. Gastrointestinal symptoms include nausea and vomiting. Urine and vomitus may have the odor of bitter almonds.

Long Term Exposure: Occupational exposure to 40 ppm for 6 months has caused intoxication and anemia. Can cause skin allergy. Can cause jaundice, liver and spleen damage, fatigue, bladder distress, nerve damage. May affect the blood forming organs, causing anemia. Exposure may affect vision (acuity and contraction of fields).

Points of Attack: Blood, liver, kidneys, cardiovascular system, skin.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), carboxyhemoglobin; whole blood (chemical/metabolite), methemoglobin; whole blood (chemical/metabolite), methemoglobin, end-of-shift; complete blood count; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift at end-of-work-week; urine (chemical/metabolite), end-of-work-week. Preemployment and periodic examinations should be concerned particularly with a history of dyscrasias, reactions to medications, alcohol intake, eye disease, skin, and cardiovascular status. Liver and renal functions should be evaluated periodically, as well as blood and general health. Follow methemoglobin levels until normal in all cases of suspected cyanosis. The metabolites in urine, *p*-nitro- and *p*-aminophenol, can be used as evidence of exposure. Liver function tests.

Note: Alcohol ingestion increases the toxic effects of nitrobenzene. Persons with blood, heart, liver or lung diseases should not work with this substance.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Chlorinated polyethylene, polyvinyl alcohol, teflon, Viton™/chlorobutyl, and Silvershield™ are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Nitrobenzene must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and chemically active metals (such as potassium, sodium, magnesium, and zinc) caustic nitrogen tetroxide or silver perchlorate, since violent reactions occur. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) with scrubbing for nitrogen oxides abatement.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R 45; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4-Nitrobiphenyl exists as yellow plates or needles. Molecular weight = 199.22; Boiling point = 340°C; Freezing/Melting point = 113.9°C; Flash point = 143.3°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. 4-Nitrobiphenyl was formerly used in the synthesis of 4-aminodiphenyl. It is presently used only for research purposes; there are no commercial uses.

Incompatibilities: Strong reducers, strong oxidizers.

Permissible Exposure Limits in Air

OSHA: Cancer Suspect Agent [skin], see Code of Federal Regulations 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: [skin] Suspected Human Carcinogen *as 4-nitrodiphenyl.*

NIOSH IDLH: Not determined. Potential occupational carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.25 mg/m^3

PAC-1: 0.75 mg/m^3

PAC-2: 5 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: [skin] Carcinogen Category 2.

Australia: carcinogen, 1993; Austria: [skin], carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; Norway: TWA 0.01 mg/m^3, 1999; Sweden: carcinogen, 1999; Switzerland: [skin], carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Several states have set guidelines or standards for nitrobiphenyl in ambient air[60] ranging from zero (New York, North Dakota, South Carolina, Virginia) to 2.77 μg/m^3 (Pennsylvania).

Determination in Air: Collection on a glass fiber filter in series with silica gel, elution with 2-propanol, analysis by gas chromatography/flame ionization detection; NIOSH (II-4) P&CAM Method #273; OSHA Analytical Method PV-2082.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 890 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.8$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Percutaneous absorption.

Harmful Effects and Symptoms

Short Term Exposure: 4-Nitrobiphenyl can affect you when breathed in and by passing through your skin. Other health effects are not well known at this time, but contact with biphenyls can cause irritation of the skin and eyes; and may cause liver nerve damage, disturbed sleep, headache, lethargy (drowsiness or indifference), dizziness, dyspnea (breathing difficulty), ataxia, weakness, methemoglobinemia, urinary burning, acute hemorrhagic cystitis.

Long Term Exposure: 4-Nitrobiphenyl is a potential occupational carcinogen. Handle with extreme caution. May cause liver damage. Related compounds have caused damage to the nerves of the arms and legs.

Points of Attack: Bladder, blood, liver. Cancer site in animals: bladder.

Medical Surveillance: OSHA mandates tests and information on the following: *Increased Risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking. NIOSH lists the following tests: *increased risk:* reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking, urine (chemical/metabolite) placement, and periodic examinations should include an evaluation of exposure to other carcinogens, as well as an evaluation of smoking, or use of alcohol and medications and of family history. Special attention should be given on a regular basis to urine sediment and cytology. If red cells or positive smears are seen, cystoscopy should be done at once. The general health of exposed persons should also be evaluated in periodic examinations. Liver function tests. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and flame. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (982°C, 2.0 s minimum) with scrubbing for nitrogen oxides abatement.

Nitrocellulose N:0420

Molecular Formula: $C_{12}H_{16}(ONO_2)_4O_6$

Synonyms: Box toe gum; Celloidin; Cellulose nitrate solution; Collodion cotton; Gun cotton; Nitrocellulose; Nitrocellulose gum; Nitrocellulose solution; Nitrocellulose, with plasticizer; Nitrocotton; Nitron; Nixon N/C; NT; Pyroxylin solution; Synpor; Tsapolak 964; Xyloidin

CAS Registry Number: 9004-70-0

RTECS® Number: QW0970000

UN/NA & ERG Number: UN2059 [nitrocellulose, solution, flammable with not >12.6% nitrogen, by mass, and not >55% nitrocellulose]/127; UN2555 [nitrocellulose with water with not <25% water, by mass]/113; UN2556 [nitrocellulose with alcohol with not <25% alcohol by mass, and with not >12.6% nitrogen, by dry mass]/113; UN2557 [nitrocellulose, with not >12.6% nitrogen, by dry mass, or nitrocellulose mixture with pigment or nitrocellulose mixture with plasticizer or nitrocellulose mixture with pigment and plasticizer]/133; UN0340 [Nitrocellulose, dry or wetted with <25% water (or alcohol), by mass]/112; UN0341 [nitrocellulose, unmodified or plasticized with <18% plasticizing substance, by mass]/112; UN0343 [nitrocellulose, plasticized with not <18% plasticizing substance, by mass]/112; UN0342 [nitrocellulose, wetted with not <25% alcohol, by mass]/112; 3270 (Nitrocellulose membrane filters)/133.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard: explosives* 5000 commercial grade); *Theft hazard* 400 (commercial grade).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrocellulose is a pulpy, cotton-like solid, or a colorless liquid solution. Molecular weight = 504.31; Boiling point = about 34°C; Flash point = 13–27°C (wet with alcohol); Autoignition temperature = 170°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 3 (Oxidizer). Insoluble in water.

Potential Exposure: It is used in making explosives, rocket propellants, and celluloid.

Incompatibilities: Strong acids, alkaline materials, oxidizers. Do not allow to become dry. Dry material is a shock-sensitive explosive.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 20 mg/m^3
PAC-1: 60 mg/m^3
PAC-2: 400 mg/m^3
PAC-3: 500 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: Only those associated with the flammable and explosive nature of this flammable and reactive material. However, it may be wetted with alcohol, ether, or other dangerous liquid material that can be irritating to the eyes, nose, and throat. If inhaled will cause dizziness, difficult breathing, or loss of consciousness.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles when working with liquid, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Engineering controls must be effective to ensure that exposure to nitrocellulose does not occur. See respirator for solvent used as a wetting agent.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Nitrocellulose must be stored to avoid contact with oxidizers, strong acids (such as hydrochloric, sulfuric, and nitric) and alkaline materials (such as sodium hydroxide and potassium hydroxide), since violent reactions occur. Store nitrocellulose away from high temperatures and direct sunlight. Do not allow material to become dry. Sources of ignition, such as smoking and open flames, are prohibited where nitrocellulose is handled, used, or stored. Wherever nitrocellulose is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: UN2555, UN2556, and UN2557 require a shipping label of "FLAMMABLE SOLID." They fall in DOT Hazard Class 4.1 and Packing Group II.

UN0342 and UN0343 require a shipping label of "EXPLOSIVE." They fall in DOT Hazard Class 1.3C and Packing Group II.

UN2059 requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group III.

Spill Handling: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Immediately flood spill area with water, collect material, and deposit in sealed containers. Keep nitrocellulose out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing[17]***:*** Presents an unusually severe fire hazard; when dry, ignites readily and burns explosively. Should never be kept for any appreciable time in any dry fibrous state. Unstabilized product decomposes gradually at relatively low temperature, with evolution of copious volumes of toxic and flammable gases and rapid heat generation. In prolonged storage and aging of nitrocellulose plastics, camphor is lost with deterioration and the decomposition temperature may be lowered to 40°C. The resulting flameless decomposition is self-sustaining and accelerative, presenting the added hazard of dangerous pressures in building structures.

Use extreme caution in approaching fires involving this material as it may explode. No attempt should be made to fight advanced fires, except for remote activation of installed fire extinguishing equipment and/or with unmanned fixed turrets and hose nozzles. The surrounding areas should be evacuated. Fires should be approached from upwind and self-contained breathing apparatus used. Since cellulose nitrate supplies its own oxygen, prompt cooling with a large quantity of water is essential; water applied through spray nozzles is effective if fused quickly and in sufficient volume, in a manner to wet the entire exposed surface. Poisonous gases, including oxides of nitrogen (and possibly hydrogen cyanide and carbon monoxide), are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

PAC-3: 100 mg/m^3

DFG MAK: [skin] Carcinogen Category 3B.

Australia: TWA 0.1 ppm (0.6 mg/m^3), [skin], 1993; Austria Suspected: carcinogen, 1999; Belgium: TWA 0.1 ppm (0.64 mg/m^3), [skin], 1993; Denmark: TWA 0.1 ppm (0.64 mg/m^3), [skin], 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3, [skin], 1999; Hungary: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 1993; Japan: 0.1 ppm (0.64 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 1 mg/m^3, [skin], 2003; Norway: TWA 1 mg/m^3, 1999; the Philippines: TWA 1 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 1 mg/m^3, [skin], 1993; Switzerland: MAK-W 1 mg/m^3, KZG-W 2 mg/m^3, [skin], 1999; United Kingdom: TWA 1 mg/m^3; STEL 2 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia[43] set a MAC of 0.004 mg/m^3 in ambient air of residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for 4-chloronitrobenzene in ambient air[60] ranging from 3.3 $\mu g/m^3$ (New York) to 5 $\mu g/m^3$ (South Carolina) to 10 $\mu g/m^3$ (Florida) to 20 $\mu g/m^3$ (Connecticut) to 24 $\mu g/m^3$ (Nevada) to 30 $\mu g/m^3$ (North Dakota) to 50 $\mu g/m^3$ (Virginia) to 83.33 $\mu g/m^3$ (Kansas).

Determination in Air: Use NIOSH Analytical Method (IV) #2005[18], Nitrobenzene.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.4$.

Permissible Concentration in Water: A limit of 0.05 mg/L has been set in the former USSR.[43]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin on contact. Inhalation can cause irritation of the respiratory tract with coughing and wheezing. High levels can interfere with the body's ability to carry oxygen (methemoglobinemia) causing cyanosis, headache, dizziness, fatigue. Can also cause nausea, vomiting, dyspnea. Higher levels can cause trouble breathing, collapse, and death.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Can affect the nervous system. May damage the liver and kidneys. May cause methemoglobinemia, hemoglobinuria, anemia, spleen, bone marrow changes, reproductive effects. Potential occupational carcinogen. In animals: hematuria (blood in the urine).

Points of Attack: Blood, liver, kidneys, cardiovascular system, spleen, bone marrow, reproductive system. Cancer site in animals: vascular and liver.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Methemoglobin; complete blood count. Consider the points of attack in preplacement and periodic physical examinations. Evaluation by a qualified allergist. Liver and kidney function tests. Alcohol consumption may increase liver damage caused by PNCB.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator and protect from shock, heat sources, light, oxidizers, reducing agents, alkalis, and sodium methoxide. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chloronitrobenzenes [meta or para, solid] require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. It does not readily ignite. Use dry chemical, carbon dioxide, water spray; alcohol foam or polymer foam extinguishers. Poisonous gases, including nitrogen oxides and hydrogen chloride, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration (816°C, 0.5 s for primary combustion; 1204°C, 1.0 s for secondary combustion). The formation of elemental chlorine can be prevented through injection of steam or methane into the combustion process. Nitrogen oxides may be abated through the use of thermal or catalytic devices.

Nitrocyclohexane N:0440

Molecular Formula: $C_6H_{11}NO_2$

Synonyms: Cyclohexane, nitro-

CAS Registry Number: 1122-60-7

RTECS® Number: GV6600000

UN/NA & ERG Number: UN2810/153

EC Number: 214-354-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: not listed in Annex I (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrocyclohexane is a highly flammable, colorless liquid. Molecular weight = 129.18; Boiling point = 206°C (decomposition); Freezing/Melting point = −34°C; Flash point = 88°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2 (Oxidizer).

Potential Exposure: Used in organic synthesis.

Incompatibilities: A nitro compound; forms explosive mixture with air. Incompatible with strong oxidizers, alkalis, and metal oxides. This chemical is highly reactive and may be heat- and shock-sensitive and a fire and explosive hazard.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.3 mg/m^3
PAC-1: 0.75 mg/m^3
PAC-2: 1.5 mg/m^3
PAC-3: 60 mg/m^3

Russia[43] set a MAC of 1.0 mg/m^3 in work-place air.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

The LD_{50} = (oral-mouse) 250 mg/kg (moderately toxic).

Short Term Exposure: Insufficient data are available on the effect of this substance on human health; therefore, utmost care must be taken. May be absorbed through the skin. May be an irritant to the eyes, skin, and respiratory system. Similar chemical can cause cyanosis due to formation of methemoglobin.

Long Term Exposure: Similar chemicals can cause kidney and liver damage.

Points of Attack: Most of the above information is based on similar nitro compounds of aromatic hydrocarbons. May cause blood, liver, and kidney effects.

Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended. The following might be considered: blood methemoglobin level, complete blood count (CBC), liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash; pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, alkalis, metal oxides. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic, liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone B] requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if you can do so without risk. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Stay upwind; keep out of low areas. Wear positive pressure breathing apparatus and special protective clothing. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the build-up of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Stay upwind; keep out of low areas. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Inconclusive: Mammalian micronucleus.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20/22; Safety phrases: S2; S9; S25; S41 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Nitroethane is a colorless, oily liquid with a mild, fruity odor. The odor threshold is 163 ppm.[41] Molecular weight = 75.08; Specific gravity (H_2O:1) = 1.05; Boiling point = 113.9°C; Freezing/Melting point = −90°C; Vapor pressure = 21 mmHg at 25°C; Flash point = 28°C. Begins to decompose at 300°C; Autoignition temperature = 414°C. Explosive limits: LEL = 3.4%; UEL = Unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 3. Slightly soluble in water; solubility = 5%.

Potential Exposure: Compound Description: Mutagen; Human Data. Nitroethane is used as solvent for polymers, cellulose esters, vinyl, waxes, fats, dyestuffs, and alkyd resins, as a stabilizer. It has been used as a rocket propellant. It is used as an intermediate in pharmaceutical manufacture and in pesticide manufacture.

Incompatibilities: A nitroparaffin, nitroethane forms explosive mixture with air. Explodes when heated or when shocked; in confined area, with elevated temperatures. A strong reducing agent. Violent reaction with oxidizers, hydrocarbons, other combustibles, amines, metal oxides. Forms shock-sensitive compounds with strong acids, strong alkalis. Attacks some plastics and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 100 ppm/310 mg/m^3 TWA.

NIOSH REL: 100 ppm/310 mg/m^3 TWA.

ACGIH TLV®[1]: 100 ppm/307 mg/m^3 TWA.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 100 ppm

PAC-1: 100 ppm

PAC-2: 200 ppm

PAC-3: 1000 ppm

DFG MAK: 100 ppm/310 mg/m^3 TWA; Peak Limitation Category II(4); Pregnancy Risk Group D.

Australia: TWA 100 ppm (310 mg/m^3), 1993; Austria: MAK 100 ppm (310 mg/m^3), 1999; Belgium: TWA 100 ppm (307 mg/m^3), 1993; Denmark: TWA 100 ppm (310 mg/m^3), 1999; Finland: TWA 100 ppm (310 mg/m^3); STEL 150 ppm (465 mg/m^3), 1999; France: VME 100 ppm (310 mg/m^3), 1999; the Netherlands: MAC-TGG 60 mg/m^3, 2003; the Philippines: TWA 100 ppm (310 mg/m^3), 1993; Poland: MAC (TWA) 30 mg/m^3, MAC (STEL) 240 mg/m^3, 1999; Russia: STEL 30 mg/m^3, 1993; Sweden: TWA 20 ppm (60 mg/m^3); STEL 50 ppm (150 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (310 mg/m^3), 1999; Turkey: TWA 100 ppm (310 mg/m^3), 1993; United Kingdom: TWA 100 ppm (312 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 100 ppm. Several states have set limits in ambient air ranging from 3.1 mg/m^3 (North Dakota) to 5.2 mg/m^3 (Virginia) to 6.2 mg/m^3 (Connecticut) to 7.38 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2526.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 0.18.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. High exposure could cause headache, dizziness, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. LD_{50} = (oral-rat) 250 mg/kg (moderately toxic).

Long Term Exposure: May cause liver and kidney damage. Can cause dermatitis, drying, and cracking skin. Can cause lung irritation; bronchitis may develop.

Points of Attack: Skin, respiratory system, central nervous system, kidneys, liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *1000 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or Sa: Pd,Pp (APF = 1000): ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator away from oxidizers, strong acids, amines, alkalis, hydrocarbons, combustibles, metal oxides, strong bases, and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material, and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Do not use dry chemical powder. Use carbon dioxide, or alcohol, or polymer foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes.[22]

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrofen is a crystalline solid. Molecular weight = 284.10; Freezing/Melting point = 70−71°C; Vapor pressure = 1.2×10^{-7} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Very slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Human Data. Nitrofen is a contact herbicide used for pre- and postemergency control of annual grasses and broadleaf weeds on a variety of food and ornamental crops. Occupational exposure to nitrofen, primarily through inhalation and dermal contact, may occur among workers at production facilities. Field handlers of the herbicide are subject to inhalation exposure during application procedures.

Permissible Exposure Limits in Air

No TEEL available.

Finland: carcinogen, 1999; Russia: STEL 1 mg/m^3, 1993; United Kingdom: carcinogen, TWA 1 ppm (7.1 mg/m^3), 2000. Russia set a MAC of 0.02 mg/m^3 in ambient air in residential areas on a once-daily basis and 0.01 mg/m^3 on an average daily basis. Pennsylvania has set a guideline for nitrofen in ambient air[60] of 0.75 μg/m^3.

Permissible Concentration in Water: Nitrofen presumably falls under the EPA Priority Toxic Pollutant category of haloethers[6] but specific limits have not been set. Russia has set a limit of 4.0 mg/L in surface water.

Determination in water: Fish Tox = 92.54948000 ppb (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Toxic by ingestion. Severe eye irritant. Causes skin irritation on contact. Inhalation can cause irritation to the respiratory tract. May cause difficult breathing; fatigue, and loss of appetite.

Long Term Exposure: Long term exposure may cause damage to the blood cells, causing low white cell (leukocyte) count, reduced hemoglobin, and reduced serum cholinesterase and erythrocyte catalase activities. May cause liver damage. May affect the nervous system.

Points of Attack: Blood, liver, kidneys, nervous system.

Medical Surveillance: Complete blood count (CBC). Liver function tests. Examination of the nervous system and interview for brain effects.

First Aid: *Skin Contact*: Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52]

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower that his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Phenoxy pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid airborne dust. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides and chlorine, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small quantities may be landfilled but large quantities should be incinerated.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Nitrogen N:0470

Molecular Formula: N_2

Synonyms: Liquid nitrogen; Nitrogen, compressed; Nitrogen, cryogenic liquid; Nitrogen gas; Nitrogen, refrigerated liquid

CAS Registry Number: 7727-37-9

RTECS® Number: QW9700000

UN/NA & ERG Number: UN1066 (compressed)/121; UN1977 (refrigerated liquid)/120

EC Number: 231-783-9

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Active registration.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Nitrogen is a nonflammable, stable, odorless, cryogenic liquid or a compressed gas. Molecular weight = 28.02; Boiling point = −196°C; Freezing/Melting point = −210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Nitrogen is present in the air we breathe. Health effects may occur at concentrations above 80%. It has many medical and industrial uses including the quick freezing of food. The gas is used for purging, heat treating, food freezing, annealing, cooling, oil recovery, in the inert blanketing of sensitive materials and as a reactant in chemical synthesis of ammonia.

Incompatibilities: Containers may explode when heated.

Permissible Exposure Limits in Air: Before entering an enclosed space where nitrogen may be present, oxygen content should be tested to ensure that it is at least 19% by volume.

Determination in Air:

OSHA PEL: Simple asphyxiant—inert gases and vapors.

NIOSH REL: Simple asphyxiant—inert gases and vapors.

ACGIH TLV®[1]: Simple asphyxiant.

Protective Action Criteria (PAC)

TEEL-0: 796,000 ppm

PAC-1: 796,000 ppm

PAC-2: 832,000 ppm

PAC-3: 869,000 ppm

United Kingdom: asphyxiant, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Simple asphyxiant: nitrogen is a simple asphyxiant inert gas or vapor; *oxygen* content should be at least 19%.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* No significant toxic effects except as an asphyxiant; that is, it may threaten life if levels are so high as to reduce oxygen levels below 19%. Since nitrogen is odorless, colorless, and tasteless, there may not be adequate warning of high levels. Symptoms of lack of oxygen may include nausea, drowsiness, blue coloration of skin and lips, unconsciousness, and death. *Skin, Eyes, Ingestion:* Liquid may cause frostbite and freezing burns

Long Term Exposure: No information is known at this time.

First Aid: *Inhalation:* Move person to fresh air. Give oxygen or artificial respiration as necessary. *Skin:* Remove liquid-soaked clothing after allowing to thaw. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention. *Eyes:* Seek immediate medical attention if contact with liquid occurs. *Ingestion:* Seek medical attention as necessary.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. If vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Respirator Selection: Exposure to nitrogen is dangerous because it can replace oxygen and lead to suffocation. Only NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus with a full face-piece operated in positive-pressure mode should be used in oxygen-deficient environments.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where nitrogen is handled, used, or stored. Store liquid containers and cylinders in cool, well-ventilated areas. Use only in well-ventilated areas. Cylinders must be secured and protected against damage. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Nitrogen, *compressed*, or nitrogen, *refrigerated liquid [cryogenic liquid]*, requires a shipping label of "NONFLAMMABLE GAS." They fall in DOT Hazard Class 2.2.

Spill Handling: If liquid nitrogen is spilled or leaked, take the following steps: Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate the area of spill or leak. Stop the leak or move the container to a safe area and allow the liquid to evaporate. If nitrogen gas is leaked, take the following steps: Restrict persons not wearing protective equipment from area of leak until cleanup is complete. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak, or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material, and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Nitrogen itself does not burn. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere.

European/International Regulations (*nitrogen dioxide*; *nitrogen tetroxide*): Hazard Symbol: T+, N; Risk phrases: R8; R26; R34; Safety phrases: S1/2; S9; S26; S28; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*nitrogen dioxide, nitrogen tetroxide*).

Description: Nitrogen dioxide (and nitrogen tetroxide, the solid dimer) is a dark brown gas (above 21°C) or a yellow, fuming liquid or colorless solid with a pungent, acrid odor. The solid form is colorless below about −11°C; it is found structurally as N_2O_4. The odor threshold is 5 pm. Molecular weight = 46.01; Specific gravity (H_2O:1) = 1.44 (liquid at 20°C); Boiling point = 21°C; Freezing/Melting point = −9.4°C; Vapor pressure = 720 mmHg. Decomposes at 160°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity ₩ (oxidizer). Decomposes (reacts) with water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Nitrogen dioxide is found in automotive and diesel emissions. Nitrogen dioxide is an industrial chemical used as an intermediate in nitric and sulfuric acid manufacture, in the nitration of organic compounds, and as an oxidizer in liquid propellant rocket fuel combinations. It is also used in fire-fighting, welding, and brazing.

Incompatibilities: A strong oxidizer. Reacts violently with combustible matter, chlorinated hydrocarbons, ammonia, carbon disulfide, reducing materials. Reacts with water, forming nitric acid and nitric oxide. Attacks steel in the presence of moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.88 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/9 mg/m^3 Ceiling Concentration.

NIOSH REL: 1 ppm/1.8 mg/m^3 STEL.

ACGIH TLV®[1]: 3 ppm/5.6 mg/m^3 TWA; 5 ppm/9.4 mg/m^3 STEL, not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method (IV) #6014, Nitric oxide and nitrogen dioxide; OSHA Analytical Methods ID-109 and ID-182.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nitrogen dioxide and its vapors irritate the eyes, skin, and respiratory tract. Inhalation exposure can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Acute exposure to nitrogen dioxide may be severe and result in a weak, rapid pulse; cyanosis (blue tint to the skin and mucous membranes); and circulatory collapse. Cough, dyspnea (shortness of breath), bronchitis, pneumonitis, and pulmonary edema may occur following inhalation exposure. Gastrointestinal symptoms include nausea and abdominal pain. Fatigue, lethargy, restlessness, fever, anxiety, headache, mental confusion, and loss of consciousness may also occur. Contact with the skin and mucous membranes may result in severe irritation and burns. When liquid nitrogen dioxide contacts the skin, frostbite will result. *Inhalation:* 10−20 ppm can cause mild irritation of the nose and throat. 25−50 ppm can cause an inflammation of the lungs, such as bronchitis or pneumonia. Levels above 100 ppm can cause death. Only highly concentrated fumes cause immediate symptoms, such as coughing, choking, headache, nausea, and stomach or chest pain. However, exposures to less concentrated fumes may produce these symptoms after 5−72 h. Rapid and shallow breathing, bluish coloration in skin, and unconsciousness may develop along with lung irritation or congestion. *Skin:* Can cause severe irritation and burns. *Eyes:* Levels of 10−20 ppm can cause irritation. Higher vapor concentration can cause eye injury. Contact with liquid can cause severe chemical burns. *Ingestion:* Can cause burns in mouth, throat, and stomach.

Long Term Exposure: Can cause headache, weakness, loss of sleep and appetite, sores in nose and mouth, nausea, and erosion of teeth. Exposure to 0.4−2.7 ppm for 4−6 years has been associated with emphysema and bronchitis. Genetic changes have been shown in experimental animals; possibly causes toxic effects on human reproduction. Nitrogen dioxide may affect the immune system, resulting in a decreased resistance to infection.

Points of Attack: Respiratory system, lungs, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: Electrocardiogram, expired air, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; white blood cell count/differential. Preplacement and periodic examinations should be concerned particularly with the skin, eyes, and with significant pulmonary and heart diseases. Smoking history should be known. Methemoglobin studies may be of interest if exposure to nitric oxide is present. In the case of nitric acid vapor mist exposure, dental effects may be present.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and do not induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: Inhalation: bronchodilators, decongestants and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis. Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin or eye contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Individuals should be equipped with supplied air respirators with full-face-piece or chemical goggles, and enclosed areas should be properly ventilated before entering. An observer equipped with appropriate respiratory protection should be outside the area and standing by to supply any aid needed. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash, where nitrogen oxides may accumulate (for example, silos).

Respirator Selection: NIOSH: *20 ppm:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Only nonoxidizable sorbents are allowed (NOT charcoal).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Protect containers from physical damage. Store separately from combustible, organic, and readily oxidizable materials. Transfer facilities should be outdoors.

Shipping: Nitrogen dioxide, liquefied, requires a shipping label of "POISON GAS, OXIDIZER." It falls in Hazard Class 2.3 and Packing Group I. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Evacuate area endangered by gas. For water spills, neutralize with agricultural lime (slaked lime), crushed limestone, or sodium bicarbonate. For an air spill, apply water spray or mist to knock down vapors. Vapor knockdown water is corrosive or toxic and should be diked for containment. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Stop leak if you can do so without risk. Use water spray to reduce vapor but do not put water on leak or spill area. Isolate area until gas has dispersed. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

Dinitrogen tetroxide nitrogen dioxide

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400

Then: Protect persons downwind (miles/kilometers)

Day 0.7/1.1

Night 1.9/3.1

Dinitrogen tetroxide and nitric oxide mixture; nitric oxide and dinitrogen tetroxide mixture; nitric oxide and nitrogen dioxide mixture; nitric oxide and nitrogen tetroxide mixture; nitrogen dioxide and nitric oxide mixture; nitrogen tetroxide and nitric oxide mixture

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.1/0.2

Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100

Then: Protect persons downwind (miles/kilometers)

Day 0.4/0.6

Night 1.4/2.3

Fire Extinguishing: NO_2 is nonflammable but supports combustion. Wearing proper equipment, shut off flow of gas. Use water spray to keep containers cool and to also direct escaping gas away from personnel attempting to shut off leak. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Destroy this chemical by incineration with the addition of hydrocarbon fuel, controlled in such a way that combustion products are elemental nitrogen, CO_2, and water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Occupational Exposure to Oxides of Nitrogen. NIOSH Document No. 76-149

World Health Organization. (1977). *Oxides of Nitrogen, Environmental Health Criteria No. 4*. Geneva, Switzerland

Sax, N. I. (Ed.). *Dangerous Properties of Industrial Materials Report*, 1, No. 5, 74−76 (1981) and 5, No. 6, 81−83 (1985)

US Environmental Protection Agency. (November 30, 1987). *Chemical Hazard Information Profile: Nitrogen Dioxide*. Washington, DC: Chemical Emergency Preparedness Program

New York State Department of Health. (March 1986). *Chemical Fact Sheet: Nitrogen Dioxide*. Version 30. Albany, NY: Bureau of Toxic Substance Assessment

Nitrogen oxides N:0490

Molecular Formula: NO (nitric oxide); NO_2 (nitrogen dioxide); N_2O_3 (nitrogen trioxide); N_2O_4 (dinitrogen tetroxide); N_2O_5 (nitrogen pentoxide)

Synonyms: nitrogen oxides; Oxides of nitrogen

CAS Registry Number: 10024-97-2 (nitrous oxide); 10102-43-9 (nitric monoxide); 10544-73-7 (nitrogen trioxide); 10102-03-1 (dinitrogen pentoxide)

UN/NA & ERG Number: UN1660 (nitric oxide)/124; UN2201 (Nitrous oxide, refrigerated liquid)/122; UN2421 (Nitrogen trioxide)/124; UN1067 (dinitrogen tetroxide)/124

EC Number: 233-032-0 (nitrous oxide); 233-271-0 9 (nitrogen monoxide); 234-128-5 (dinitrogen trioxide); 233-264-2 (dinitrogen pentoxide)

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade). (*Nitrogen trioxide*).

See entries for specific compound.

US DOT 49CFR172.101, Inhalation Hazardous Chemical (nitrogen dioxide, nitric oxide, nitrogen tetroxide, nitrogen trioxide).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (for above CAS number except dinitrogen pentoxide; no hazard value assigned).

Description: Nitrogen oxides are colorless (NO, N_2O) to brick red (NO_2) gases with little or no odor or an irritating odor (NO_2). When frozen they appear to be white to bluish-white snow. Molecular weight- = varies by entry; Boiling point = −52°C (*nitric oxide*); 21°C (*nitrogen dioxide*); 47°C (*nitrogen pentoxide*); Freezing/Melting point = −164°C (*nitric oxide*); − 9°C (*nitrogen dioxide*); 30°C (*nitrogen pentoxide*). Hazard Identification (based on NFPA-704 M Rating System) (*nitric oxide*): Health 4, Flammability 0, Reactivity 1; (*nitrogen dioxide*): Health 2, Flammability 0, Reactivity 0. They decompose in water.

Potential Exposure: See entries for specific compound.

Incompatibilities: Stability and reactivity are variable depending on specific compound. All are strong oxidizers that enhance the combustion of easily oxidizer materials, reducing agents, combustibles, organics.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) *see also nitrous oxide* entry

TEEL-0: 50 ppm
PAC-1: 150 ppm
PAC-2: 10,000 ppm
PAC-3: 20,000 ppm

Nitric oxide; nitrogen dioxide; nitrogen tetroxide

TEEL-0: 0.5 ppm
PAC-1: 0.5 ppm
PAC-2: 12 ppm
PAC-3: 20 ppm

Nitrogen trioxide

TEEL-0: 5 ppm
PAC-1: 15 ppm
PAC-2: 100 ppm
PAC-3: 500 ppm

See entries for specific compound. The US EPA has set national ambient air quality standards of 0.05 ppm (100 $\mu g/m^3$) for nitrogen oxides as an annual arithmetic mean value.

Harmful Effects and Symptoms

Short Term Exposure: Serious health hazards. Corrosive to the eyes and skin. Harmful if inhaled. See “Nitric oxide,” “Nitrogen dioxide,” etc.

First Aid: If any of these chemicals gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with nitrogen oxides you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizable materials. Outside or detached storage is preferred. Do not put on wooden floors. See NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers.*

Shipping: See separate entries for specific compound.
See each chemical.

Spill Handling: See "Nitric oxide", "Nitrogen dioxide", etc. Runoff of less volatile nitrogen oxides may contain nitric acid.

Fire Extinguishing: See "Nitric oxide," "Nitrogen dioxide," etc. Nitrogen oxides enhance the activity of an existing fire.

Nitrogen trifluoride N:0500

Molecular Formula: F_3N

Common Formula: NF_3

Synonyms: Nitrogen fluoride; Trifluoramine; Trifluorammonia

CAS Registry Number: 7783-54-2

RTECS® Number: QX1925000

UN/NA & ERG Number: UN2451/122

EC Number: 232-007-1

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitrogen trifluoride is a colorless gas with a moldy odor. Shipped as a nonliquefied compressed gas. Molecular weight = 71.01; Boiling point = −129°C; Freezing/Melting point = −206.7°C; Relative vapor density (air = 1) 2.46 at 20°C; Vapor pressure = >1 atm; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity ₩. Slightly soluble in water (reactive).

Potential Exposure: This material has been used in chemical synthesis and as an oxidizer for high-energy fuels (as an oxidizer in rocket propellant combinations).

Incompatibilities: A powerful oxidizer. Reacts with oil, grease, reducing agents and other oxidizable materials, combustibles, organics, ammonia, carbon monoxide, methane, hydrogen, hydrogen sulfide, activated charcoal, diborane, water.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.90 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/29 mg/m^3 TWA.

NIOSH REL: 10 ppm/29 mg/m^3 TWA.

ACGIH TLV®[1]: 10 ppm/29 mg/m^3 TWA; BEI_M issued for Methemoglobin inducers.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 10 ppm

PAC-1: **200** ppm

PAC-2: **530** ppm

PAC-3: **860** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

United Kingdom: TWA 10 ppm (30 mg/m^3); STEL 15 ppm (44 mg/m^3), 2000; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; the Netherlands: MAC-TGG 29 mg/m^3, 2003. Several states have set guidelines or standards for NF_3 in ambient air[60] ranging from 0.3 mg/m^3 (North Dakota) to 0.5 mg/m^3 (Virginia) to 0.58 mg/m^3 (Connecticut) to 0.714 mg/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Permissible Concentration in Water: Fluoride guidelines are 1.8 mg/L in Arizona, 2.4 mg/L in Maine, and 4.0 mg/L according to EPA.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Insufficient data are available on the effect of this substance on human health; therefore, utmost care must be taken. May be corrosive to eyes, skin, and respiratory tract. In animals: anoxia, cyanosis, methemoglobinemia, weakness, dizziness, headache, liver, kidney injury. (NIOSH).

Long Term Exposure: However, a Japanese source[24] states that NF_3 is corrosive to tissue and that teeth and bones are affected on long inhalation. See also, "Fluoride," above.

Points of Attack: Blood, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), methemoglobin; complete blood count. Liver and kidney function tests. Urine fluoride test (levels above 3–4 mg/L at the end of exposure represent increased exposure).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. No protective devices other than respirators are indicated by NIOSH. Rubber gloves, face shield, and overalls are suggested by others, however.[24] Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic fluorides*.

Respirator Selection: *Up to 100 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 250 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *Up to 500 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or PaprTS (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and cartridge(s) providing protection against the compound of concern]; or *SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or *SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SAF (any supplied-air respirator with a full face-piece). *Up to 1000 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Nitrogen trifluoride, compressed, requires a shipping label of "POISON GAS, OXIDIZER." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place, and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a nonflammable gas. Poisonous gases, including fluorine, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent into large volume of concentrated reducing agent (bisulfites, ferrous salts, or hypo) solution, then neutralize and flush to sewer with large volumes of water.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 commercial grade); *Theft hazard* 400 (commercial grade).

FDA—proprietary drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): P081.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: E, T + , N; Risk phrases: R3; R26/27/28; R33; R51/53; Safety phrases: S1/2; S28; S33; S35; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nitroglycerin is a pale yellow liquid or crystalline solid (below 13°C). Molecular weight = 227.11; Specific gravity (H_2O:1) = 1.6; Boiling point = begins to decompose at 50−60°C; explodes at 261°C; Freezing/Melting point = 13.3°C; Vapor pressure = 0.0003 mmHg at 20°C; Flash point = explodes; Autoignition temperature = 261°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 4. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. An explosive ingredient in dynamite (20−40%) with ethylene glycol dinitrate (80−60%). It is also used in making other explosives, rocket propellants, and medicine (vasodilator).

Incompatibilities: Heat, ozone, shock, acids. An OSHA Class A Explosive (1910.109). Heating may cause violent combustion or explosion. May explosively decompose on shock, friction, or concussion. Reacts with ozone causing explosion hazard.

Permissible Exposure Limits in Air

Several states have set guidelines or standards for nitroglycerin in ambient air[60] ranging from 1.67 μg/m^3 (Nevada) to 5.0 μg/m^3 (Florida, North Dakota and South Carolina) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2507. See also OSHA Analytical Method #43.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nitroglycerin can affect you when breathed and by passing through skin. Irritates the eyes. May affect the cardiovascular system and blood, causing lowered blood pressure, circulatory collapse, and interfere with the blood's ability to carry oxygen resulting in cyanosis, the formation of methemoglobin, trouble breathing, and even death. Exposure can cause headaches, nausea, and lightheadedness.

Long Term Exposure: After repeated exposure to nitroglycerin, a marked tolerance develops. Returning to work after a short absence from exposure can cause headaches and other symptoms, and may lead to sudden death. Angina (chest pain) and heart attacks can occur when exposure stops suddenly. Repeated or prolonged contact may cause skin sensitization and allergy.

Points of Attack: Cardiovascular system, blood, skin, central nervous system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood plasma; complete blood count, electrocardiogram, EKG (immediately, if any chest discomfort is felt). Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document #78-187 *Occupational Exposure to Nitroglycerin and Ethylene Glycol Dinitrate.*

Respirator Selection: NIOSH: *Up to 1 mg/m^3:* Sa (APF = 10) (any supplied-air respirator).* *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 5 mg/m^3:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or *SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 75 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Nitroglycerin must be stored to avoid contact with heat, flames, mechanical shock or ozone, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric). Sources of ignition, such as smoking and open flames, are prohibited where nitroglycerin is handled, used, or stored. Nitroglycerin has a special shipping regulation by DOT and therefore requires specific handling procedures. Metal containers involving the transfer of 5 gallons or more of nitroglycerin should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of nitroglycerin. Wherever nitroglycerin is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Nitroglycerin is often found mixed with ethylene glycol dinitrate. Also see entry on "Ethylene glycol dinitrate."

Shipping: Nitroglycerin, solution in alcohol, with >1% but not >5% nitroglycerin requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Nitroglycerin solution in alcohol with not >1% nitroglycerin requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Nitroglycerin, desensitized with not <40% nonvolatile, water-insoluble phlegmatizer, by mass. It falls in Hazard Class 1.1D (subsidiary hazard: 6.1) and Packing Group II.

Nitroglycerin, solution in alcohol, with >1% but not >10% nitrogylcerin falls in Hazard Class 1.1D.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Do not touch or disturb spilled material. Consult an expert trained for this kind of emergency. Do NOT wash away into sewer (extra personal protection: complete protective clothing including self-contained breathing apparatus). It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive and flammable liquid. In case of fire, evacuate area. Combustion in an enclosed space can result in explosion. Isolate area around fire and call for expert help. Consider letting fire burn. Poisonous gases, including nitrogen oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Do not wash into sewer. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R5; R10; R22; Safety phrases: S2; S41 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Nitromethane is a highly flammable and explosive colorless liquid with a strong, disagreeable odor. The odor threshold is below 200 ppm. Molecular weight = 671.05; Specific gravity (H_2O:1) = 1.14; Boiling point = 101.1°C; Freezing/Melting point = − 28.9°C; Vapor pressure = 28 mmHg at 20°C; Flash point = 35°C (cc); Autoignition temperature = 417°C. Explosive limits: LEL = 7.3%; UEL = 63%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 4 (Possible detonation). Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen. Nitromethane is used in the production of the fumigant, chloropicrin. It is best known as racing car fuel. It is also used as a solvent and as an intermediate in the pharmaceutical industry.

Incompatibilities: May explode from heat, shock, friction, or concussion. Reacts with alkalis, strong acids, metallic oxides. Detonates or reacts violently with strong oxidizers, strong reducing agents, formaldehyde, copper, copper alloys, lead, lead alloys, hydrocarbons, and other combustibles, causing fire and explosion hazard. Forms shock sensitive mixture when contaminated with acids, amines, bases, metal oxides, hydrocarbons, and other combustible materials.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.50 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm/250 mg/m^3 TWA.

NIOSH REL: see *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV®[1]: 20 ppm/50 mg/m^3 TWA, confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 750 ppm.

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 60 ppm

PAC-2: 750 ppm

PAC-3: 750 ppm

DFG MAK: [skin] Carcinogen Category 3B.

Austria: MAK 100 ppm (250 mg/m^3), 1999; Denmark: TWA 100 ppm (250 mg/m^3), 1999; Finland: TWA 100 ppm (250 mg/m^3); STEL 150 ppm (375 mg/m^3), 1999; France: VME 100 ppm (250 mg/m^3), 1999; Norway: TWA 50 ppm (125 mg/m^3), 1999; the Philippines: TWA 100 ppm (250 mg/m^3), 1993; the Netherlands: MAC-TGG 50 mg/m^3, 2003; Sweden: NGV 20 ppm (50 mg/m^3), KTV 50 ppm (125 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (250 mg/m^3), 1999; Turkey: TWA 100 ppm (250 mg/m^3), 1993; United Kingdom: TWA 100 ppm (254 mg/m^3); STEL 150 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for nitromethane in ambient air[60] ranging from 2.5 mg/m^3 (North Dakota) to 4.0 mg/m^3 (Virginia) to 5.0 mg/m^3 (Connecticut) to 5.952 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2527, Nitromethane.

Permissible Concentration in Water: Russia[43] set a MAC of 0.005 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin and eyes on contact. Inhaling nitromethane irritates the nose and throat causing mild pulmonary irritation with coughing and wheezing. May affect the central nervous system, causing CNS depression, weakness, muscular incoordination, convulsions.

Long Term Exposure: Repeated or prolonged contact may cause dry and cracked skin. May affect or damage the peripheral nervous system. May cause kidney and liver damage. May cause anorexia, nausea, vomiting, and diarrhea.

Points of Attack: Eyes, skin, central nervous system, kidneys, liver.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber; Neoprene™, polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: OSHA: *750 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: (1) Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in an explosion-proof refrigerator and protect from heat, oxidizers, strong acids, strong bases, formaldehyde, amines, hydrocarbons, combustibles, metallic oxides, reducing agents, copper and its alloys, lead and its alloys, light. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well first with alcohol, then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Water may be ineffective. Alcohol foam is recommended.[17]

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes.[22]

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations *(p-isomer)*: Hazard Symbol: Xn; Risk phrases: R20/21/22; R33; Safety phrases: S2; S28 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting *(p-isomer)*

Description: There are three isomers of nitrophenol. The isomer of greatest concern, and the subject of *ATSDR Toxicology Profile*, is the *p*-isomer (4-nitrophenol). The meta-form is produced from *m*-nitroaniline, and the *o*- and *p*-isomers are produced by nitration of phenol. They are colorless to slightly yellowish crystals with an aromatic to sweetish odor. Molecular weight = 139.12 (*p*-isomer); Boiling point = (*o*-isomer) 215°C; (*m*-isomer) 194°C; (*p*-isomer) 279°C (decomposes); Freezing/Melting point = (*p*-isomer) 113−115°C (sublimes); (*o*-isomer) 45°C; 97°C (*m*-isomer); Flash point = (*o*-, *m*-) 102°C; (*p*-isomer) 169°C; Autoignition temperature = (*p*-isomer) 283°C. NFPA 704 M Hazard Identification (*m*-, *o*-, *p*-): Health 3, Flammability 1, Reactivity 2. Not soluble in water.

Potential Exposure: Compound Description (*p*-isomer): Agricultural Chemical; Tumorigen, Mutagen. Nitrophenols are used as intermediates in production of dyes, photochemicals, pesticides, pharmaceuticals, and in leather tanning.

Incompatibilities: Nitrophenols are strong oxidizers. Reacts violently with combustible and reducing agents. Contact with potassium hydroxide forms an explosive mixture. May explode on heating.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

o-isomer and m-isomer

TEEL-0: 1.25 mg/m^3
PAC-1: 4 mg/m^3
PAC-2: 30 mg/m^3
PAC-3: 150 mg/m^3

Protective Action Criteria (PAC)

p-isomer 100-02-7 and mixed isomers

TEEL-0: 6 mg/m^3
PAC-1: 20 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 75 mg/m^3

Russia set a MAC for 4-nitrophenols in ambient air in residential areas of 0.003 mg/m^3 on a once-daily basis. Guidelines for *p*-nitrophenol in ambient air[60] have been set by South Carolina at zero and by New York at 0.03 μg/m^3.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 230 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 4580 μg/L on an acute toxicity basis. *To protect humans:* 0.06 μg/L for 2- and 3-nitrophenol and 0.02 mg/L for 4-nitrophenol. In addition, guidelines for nitrophenols in drinking water have been set[61] by Maine at 83 μg/L and by Kansas at 290 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Percutaneous absorption of liquid.

Harmful Effects and Symptoms

Short Term Exposure: Nitrophenols can affect you when breathed in and by passing through your skin. Nitrophenols can irritate and burn the skin and eyes with possible eye damage. Vapors can cause irritation of the respiratory tract with coughing and/or shortness of breath. High levels of vapors may cause metabolism increase and rapid heartbeat. High levels can lower the ability of the blood to carry oxygen (methemoglobinemia), leading to cyanosis (a bluish color to the skin and lips), headaches, dizziness, and collapse. Higher levels can cause death. Exposure can cause headache, upset stomach, dizziness, weakness, confusion, fever, breathing trouble, a slow pulse, fall in blood pressure, convulsions (fits), and death.

Long Term Exposure: Nitrophenols may damage the kidney and liver. Nitrophenols can irritate the lungs; bronchitis may develop. High or repeated exposure may affect the nervous system.

Points of Attack: Liver, kidneys, blood.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: A blood test for methemoglobin level, liver function tests, kidney function tests, nervous system tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is recommended by a manufacturer and other authorities as a protective material. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to nitrophenols, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Nitrophenols must be stored to avoid contact with reducing agents, oxidizers, combustibles, organic materials, and strong bases, since violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nitrophenols (*o-; m-; p-*) require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration—care must be taken to maintain complete combustion at all times. Incineration of large quantities may require scrubbers to control the emission of nitrogen oxides. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R10; R20/21/22; Safety phrases: S2; S9 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 1-Nitropropane is a colorless liquid with a mild, fruity odor. Odor threshold = 140 ppm. Molecular weight = 89.11; Specific gravity (H_2O:1) = 1.00; Boiling point = 131.7°C; Freezing/Melting point = − 107.8°C; Vapor pressure = 8 mmHg at 20°C; Flash point = 35.6°C (cc); Autoignition temperature = 421°C. Explosive limits: LEL = 2.2%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 2. Slightly soluble in water; solubility = 1%. *Note:* Technical products measurably contaminated with 2-Nitropropane.

Potential Exposure: Compound Description: Mutagen, Human Data; Primary Irritant. 1-Nitropropane is used as a solvent for polymers, as a stabilizer, and in organic synthesis. *Note:* Technical products measurably contaminated with 2-Nitropropane, see also “2-Nitropropane.”

Incompatibilities: 1-Nitropropane, a nitroparaffin is incompatible with reducing agents, nitrates, strong bases, amines, strong acids, oxidizers, hydrocarbons and other combustible materials, metal oxides. May explode on heating.

Permissible Exposure Limits in Air

OSHA PEL: 25 ppm/90 mg/m^3 TWA.

NIOSH REL: 25 ppm/90 mg/m^3 TWA.

ACGIH TLV®[1]: 25 ppm/91 mg/m^3 TWA, not classifiable as a human carcinogen.

NIOSH IDLH: 1000 ppm.

Temporary Emergency Exposure Limits (DOE)

TEEL-0: 25 ppm

PAC-1: 75 ppm

PAC-2: 125 ppm

PAC-3: 1000 ppm

DFG MAK: 25 ppm/92 mg/m^3 TWA; Peak Limitation Category I(4); Pregnancy Risk Group D.

Austria: MAK 25 ppm (90 mg/m^3), 1999; Denmark: TWA 5 ppm (18 mg/m^3), 1999; Finland: TWA 25 ppm (90 mg/m^3); STEL 40 ppm (150 mg/m^3), 1999; France: VME 25 ppm (90 mg/m^3), 1999; Norway: TWA 20 ppm (70 mg/m^3), 1999; the Philippines: TWA 25 ppm (90 mg/m^3), 1993; the Netherlands: MAC-TGG 90 mg/m^3, 2003; Switzerland: MAK-W 5 ppm (18 mg/m^3), carcinogen, 1999; Turkey: TWA 25 ppm (90 mg/m^3), 1993; United Kingdom: TWA 25 ppm (93 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for 1-nitropropane in ambient air[60] ranging from 0.3 mg/m^3 (New York) to 0.9 mg/m^3 (Florida and North Dakota) to 1.5 mg/m^3 (Virginia) to 1.8 mg/m^3 (Connecticut) to 2.143 mg/m^3 (Nevada) to 2.25 mg/m^3 (South Carolina).

Determination in Air: Use OSHA Analytical Method 46.

Permissible Concentration in Water: Russia[43] set a MAC of 1.0 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing, wheezing, and/or shortness of breath. High levels can interfere with the ability of the blood to carry oxygen (methemoglobinemia), causing cyanosis, headaches, fatigue, dizziness nausea, vomiting, diarrhea. Higher levels can cause collapse and death.

Long Term Exposure: In animals: liver, kidney damage.

Points of Attack: Eyes, central nervous system, liver, kidneys.

Medical Surveillance: Liver and kidney function tests. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber, Teflon™, and Silvershield™ are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 250 ppm:* Sa (APF = 10) (any supplied-air respirator).* *Up to 625 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode).* *Up to 1000 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 2-Nitropropane is a colorless liquid. The odor threshold is 300 ppm. Molecular weight = 89.11; Specific gravity (H_2O:1) = 0.99; Boiling point = 120.5°C; Freezing/Melting point = −92.8°C; Vapor pressure: 13 mmHg at 20°C; Flash point = 23.9°C; Autoignition temperature = 428°C. Explosive limits: LEL = 2.6%; UEL = 11.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 3, Reactivity 2. Slightly soluble in water; solubility = 2%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. 2-Nitropropane is used as a solvent for polymers, organic compounds; cellulose, esters; gums, vinyl resins; waxes, epoxy resins, fats, dyes, and chlorinated rubber; as a stabilizer. Its combustion properties have made it useful as a rocket propellant and as a gasoline and diesel fuel additive. 2-Nitropropane also has limited use as a paint and varnish remover. It serves as an intermediate in organic synthesis of some pharmaceuticals, dyes, insecticides, and textile chemicals.

Incompatibilities: 1-Nitropropane, a nitroparaffinin, forms explosive mixture with air. Contact with heavy metal oxides may cause decomposition. Mixtures with hydrocarbons are extremely flammable. Attacks some plastics, rubber, and coatings. May explode on heating. Violent reaction with strong bases, strong acids, and metal oxides. Shock-sensitive compounds are formed with acids, amines, inorganic bases, and heavy metal oxides. Incompatible with strong oxidizers, combustible materials. 2-Nitropropane reacts with activated carbon causing decomposition. *This reaction may occur in activated carbon respirator filters.*

Permissible Exposure Limits in Air

OSHA PEL: 25 ppm/90 mg/m^3 TWA

NIOSH REL: A potential occupational carcinogen [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/36 ppm TWA, confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 100 ppm.

Protective Action Criteria (PAC)
TEEL-0: 25 ppm
PAC-1: 25 ppm
PAC-2: 25 ppm
PAC-3: 100 ppm

DFG MAK: [skin] Carcinogen Category 2.

Austria carcinogen, 1999; Denmark: TWA 5 ppm (18 mg/m^3), 1999; France: carcinogen, 1993; Norway: TWA 10 ppm (35 mg/m^3), 1999; the Philippines: TWA 25 ppm (90 mg/m^3), 1993; Sweden: NGV 5 ppm (18 mg/m^3), TGV 10 ppm (35 mg/m^3), 1999; the Netherlands: MAC-TGG 0.036 mg/m^3, 2003; Turkey: TWA 25 ppm (90 mg/m^3), 1993; United Kingdom: TWA 5 ppm (19 mg/m^3), carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Brazil[35] has set a TWA of 20 ppm (70 mg/m^3). Several states have set guidelines or standards for 2-nitropropane in ambient air[60] ranging from zero in North Dakota to 0.2 μg/m^3 (Rhode Island) to 21.67 μg/m^3 (Pennsylvania) to 350 μg/m^3 (Virginia) to 360 μg/m^3 (Connecticut) to 2143 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2528; OSHA Analytical Method 46 (which supercedes Method 15).

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 mg/L.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.9$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The vapor irritates the eyes and respiratory tract. 2-Nitropropane can affect you when breathed in. 2-Nitropropane may cause mutations. Handle with extreme caution. Exposure can cause headaches, dizziness, nausea, vomiting, and diarrhea. At levels, causing these symptoms, severe liver damage can occur that can cause death. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may also damage the kidneys, heart, and may interfere with the ability of the blood to carry oxygen (methemoglobinemia); this can cause weakness, trouble breathing and cyanosis, a bluish color to the skin and lips. Exposure to high levels may cause liver damage. Exposure to very high levels may result in death.

Long Term Exposure: May affect the liver, kidneys, heart, and nervous system. Based on animal tests, this chemical is a potential occupational carcinogen. Animal tests show that this substance may cause mutations and affect human reproduction.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys, liver, heart. Cancer site in animals: liver.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Blood methemoglobin level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber and polyvinyl chloride are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 2-Nitropropane must be stored to avoid contact with strong bases and strong acids (such as hydrochloric, sulfuric, and nitric) and metal oxides, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of 2-nitropropane. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration: large quantities of material may require nitrogen oxide removal by catalytic or scrubbing processes.[22] Dilute with pure kerosene and burn with care as it is potentially explosive. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R de minimis concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-Nitrosodi-*n*-butylamine is a yellow, oily liquid. Molecular weight = 158.28; Boiling point = 235°C; 116°C at 14 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: This chemical is a carcinogenic nitrosamine. It is primarily used in research.

Incompatibilities: Light sensitive.

Permissible Exposure Limits in Air

DFG MAK: [skin] Carcinogen Category 2.

There are no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 27.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the skin and respiratory tract. Some related nitrosamines can cause headaches, abdominal cramps, weakness, and dizziness. It is unknown if this chemical causes all of these same symptoms.

Long Term Exposure: May be a human carcinogen; causes urinary bladder, esophagus, and liver cancer in animals. This chemical is toxic to the fetus and causes fetal death in animals. Repeated exposure may cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Under 40 CFR 261.5 small quantity generators of this waste may qualify for partial exclusion from hazardous waste regulations.

US EPA Hazardous Waste Number (RCRA No.): U174.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.40; Nonwastewater (mg/kg), 28.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 10/1/87.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-Nitrosodiethylamine is a yellow liquid. Molecular weight = 102.16; Boiling point = 177°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: An additive in gasoline and lubricants; an antioxidant and stabilizer in plastics. Used in research.

Incompatibilities: Oxidizers, reducing agents (may form hydrazine), hydrogen bromide. Light sensitive; rapidly decomposes.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin] Carcinogen Category 2.

There are no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH Analytical Method (IV) #2522, Nitrosamines; OSHA Analytical Method 27.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the skin and eyes. The vapors cause respiratory tract irritation.

Long Term Exposure: Potential human carcinogen.

Prolonged or repeated exposure may cause liver damage. May damage the developing fetus.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Plastic, latex, or Neoprene™ gloves may be effective protection. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, dark, well-ventilated area away from light, oxidizers, reducing agents, hydrogen bromide. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R45; R25; R26; R48/25; R51/53; Safety phrases: S48/25; S51/53; S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: N-Nitrosodimethylamine is a yellow oily liquid with a faint, characteristic odor. Molecular weight = 74.10; Boiling point = 152°C; Flash point = 61°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Nitrosodimethylamine was formerly used in the production of rocket fuels. Presently used as an antioxidant, as an additive for lubricants, and as a softener of copolymers. It is used as an intermediate for 1,1-dimethylhydrazine.

Incompatibilities: Oxidants, especially peracids. Sensitive to UV light. Should be stored in dark bottles.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposure of workers to this chemical is to be controlled through the required use of engineering controls, work practice, and personal protective equipment, including respirators. See 29CFR1910.1003.

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration.

ACGIH TLV®[1]: Exposures by all routes should be carefully controlled to levels as low as possible [skin]. Confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 3.5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 19 mg/m^3

PAC-3: 100 mg/m^3

DFG MAK: [skin] Carcinogen Category 2

Austria: carcinogen, 1999; France: carcinogen, 1993; Switzerland: MAK-W 0.001 mg/m^3, carcinogen, 1999; United Kingdom: carcinogen, 2000; the Netherlands: MAC-TGG 0.001 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Methods 6 and 27.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5850 μg/L on an acute toxicity basis for nitrosamines as a class. *To protect saltwater aquatic life:* 3,300,000 μg/L on an acute toxicity basis for nitrosamines as a class. For protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.014 μg/L.[6] The states of Kansas and Minnesota have set guidelines for DMNA in drinking water[61], Kansas at 0.0014 μg/L and Minnesota at 0.014 μg/L.

Determination in Water: Methylene chloride extraction followed by gas chromatography with nitrogen−phosphorus or reductive Hall detectors (EPA Method 607); or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Symptoms of exposure include nausea, vomiting, and malaise. Extremely high toxicity. The lowest lethal oral dose in humans has been reported at 10 mg/kg/80 week intermittent exposure.

Long Term Exposure: Chronic exposure may cause liver disease with jaundice and swelling with low platelet count and cirrhosis. The effects may be delayed. Based on animal tests, this substance may be a potential carcinogen in humans.

Points of Attack: Liver.

Medical Surveillance: OSHA mandates the following tests: *increased risk*: reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking. NIOSH lists the tests: *increased risk*: reduced immunologic competence, steroid treatment, pregnancy, cigarette smoking, liver function tests, pulmonary function tests. Based on human experience and on animal studies, preplacement and periodic examinations should include a history of exposure to other carcinogens, alcohol and smoking habits, medications, and family history. Special attention should be given to liver size and function, and to any changes in lung symptoms or X-rays. Renal function should be followed. Sputum and urine cytology may be useful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for because the symptoms of jaundice may be delayed. Keep victim quiet and maintain normal body temperature.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-facepiece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus). See also Appendix E *NIOSH Pocket Guide*.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator in brown bottles, and protect from oxidizers and prolonged exposure to light. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic, liquids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." *N*-Nitrosodimethylamine falls in DOT Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in celite, vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pour over soda ash, neutralize with HCl, then flush to drain with large volumes of water. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

As nitrosamines:

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as nitrosamines.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *N*-Nitrosodiphenylamine is a yellow to orange-brown crystalline solid. Molecular weight = 198.24; Boiling point = 268°C (estimated); Freezing/Melting point = 67°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. *N*-Nitrosodiphenylamine is not a naturally occurring substance; it is a man-made chemical that is no longer produced in the United States. It was used in the manufacture of plastics, resins, rubber, and synthetic textiles to help control processes involved in making rubber products, such as tires and mechanical goods; however, in the early 1980s, the US manufacturers stopped producing *N*-nitrosodiphenylamine because new and more efficient chemicals were found to replace its uses. In addition, the use of *N*-nitrosodiphenylamine had several undesirable side effects which do not occur with the replacement chemicals.

Incompatibilities: Oxidizing materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 7.5 mg/m^3
PAC-1: 25 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: Carcinogen Category 3 B.

There are no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use OSHA Analytical Method 23.

Permissible Concentration in Water: Russia set a MAC of 0.1 mg/L in surface water. Two states have set guidelines for nitrosodiphenylamine in drinking water.[60] They are Kansas at 71.0 μg/L, and Minnesota at 71.1 μg/L.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Information is not available regarding effects of brief exposures to *N*-nitrosodiphenylamine on human health. Very little is known about the health effects of brief exposures to *N*-nitrosodiphenylamine in experimental animals, other than that relatively high doses by ingestion are required to produce death. It is not known if exposure to *N*-nitrosodiphenylamine by breathing or skin contact can affect the health of humans or animals, but ingestion of *N*-nitrosodiphenylamine has been shown to have adverse health effects in animals. Exposure of humans to *N*-nitrosodiphenylamine should be minimized.

Long Term Exposure: Long-term exposure of experimental animals to *N*-nitrosodiphenylamine by ingestion produced inflammation and cancer of the bladder. It is not known whether these effects or birth defects would occur in humans if they were exposed to *N*-nitrosodiphenylamine.

Points of Attack: Cancer site in animals: bladder.

Medical Surveillance: Although the presence of the chemical in blood and urine can be detected by chemical analysis, this analysis has not been used as a test for human exposure or to predict potential health effects.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52] *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere for prolonged storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep[52]: remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid airborne dust, then transfer material to a suitable container. Ventilate the spill area and use absorbent paper dampened with 60−70% acetone to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Burn in admixture with flammable solvent in furnace equipped with afterburner and scrubber.[22]

EC Number: 205-848-7

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Insufficient Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1982, 1998.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 1/1/88.

European labeling: Hazard symbol: Xn (Harmful); Possible carcinogen; Risk Phrases: R40; Safety Phrases: S36/37; S45; S53 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: TKB is a black powder or a green plate-like material with a bluish luster. Molecular weight = 198.2; Freezing/Melting point = 145°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as a chemical intermediate for dyes and pharmaceuticals, in making monomers, and vulcanizing rubber.

Incompatibilities: Oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 150 mg/m^3

This chemical is a potential occupational carcinogen and all exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Method 27.

Permissible Concentration in Water: Russia set a MAC of 0.1 mg/L in surface water. Two states have set guidelines for nitrosodiphenylamine in drinking water.[60] They are Kansas at 71.0 μg/L and Minnesota at 71.1 μg/L.

Routes of Entry: Inhalation, ingestion, skin and/or eyes. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause eye irritation.

Long Term Exposure: There is limited evidence that this chemical causes bladder cancer in animals.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This material may be classed as an Environmentally hazardous solid, n.o.s. It falls in Hazard Class 9 and "CLASS 9." Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

As nitrosamines:

Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants as nitrosamines.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R51/53; Safety phrases: S53; S45; S61.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-nitrosodi-*N*-propylamine is a yellow liquid. Molecular weight = 198.24; Boiling point = 206°C; Freezing/Melting point = 144°C. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. *N*-nitrosodi-*N*-propylamine is used in the manufacture of plastics, resins, rubber, and synthetic textiles. There is no evidence that *N*-nitrosodi-*N*-propylamine exists naturally in soil, air, food, or water. Small quantities of *N*-nitrosodi-*N*-propylamine are inadvertently produced during some manufacturing processes as an impurity in some commercially available dinitroaniline based weed killers, and during the manufacture of some rubber products. However, according to Sax, some similar *N*-nitroso compounds are formed in the environment and absorbed from precursors in food, water, or air, from tobacco, and from naturally occurring compounds.

Incompatibilities: Oxidizers. Sensitive to UV light.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.06 mg/m^3

PAC-1: 0.2 mg/m^3

PAC-2: 1.25 mg/m^3

PAC-3: 200 mg/m^3

DFG MAK: [skin] Carcinogen Category 2.

There are no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use OSHA Analytical Method 23.

Routes of Entry: *N*-nitrosodi-*N*-propylamine can enter the body by breathing air that contains *N*-nitrosodi-*N*-propylamine or by eating food or drinking water contaminated with *N*-nitrosodi-*N*-propylamine. *N*-Nitrosodi-*N*-propylamine is not likely to get into your body unless you eat certain foods or drink alcoholic beverages, or are exposed to it at a waste disposal site by breathing *N*-nitrosodi-*N*-propylamine vapors. It is not known whether *N*-nitrosodi-*N*-propylamine can enter the body by direct skin contact with wastes, pesticides, or soil containing *N*-nitrosodi-*N*-propylamine. Experiments with animals suggest that if *N*-nitrosodi-*N*-propylamine enters the body, it will be broken down into other compounds and will leave the body in the urine.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. The effects of brief or long-term exposures to *N*-nitrosodi-*N*-propylamine on human health have not been studied in depth. Little is known about the health effects of brief exposures to *N*-nitrosodi-*N*-propylamine in experimental animals except that eating or drinking certain amounts of this chemical can cause liver disease and death.

Long Term Exposure: Long-term exposure of experimental animals to *N*-nitrosodi-*N*-propylamine in food or drinking water produces cancer of the liver, esophagus, and nasal cavities. Although human studies are not available, the animal evidence indicates that it is reasonable to expect that exposure to *N*-nitrosodi-*N*-propylamine by eating or drinking could cause liver disease and cancer in humans. It is not known whether other effects, such as birth defects, occur in animals or could occur in humans if they were exposed to *N*-nitrosodi-*N*-propylamine by eating or drinking.

Points of Attack: Liver.

Medical Surveillance: The presence of *N*-nitrosodi-*N*-propylamine in blood and urine can be detected by chemical analysis, but this analysis is not routinely available and has not been used as a test for human exposure or to predict potential health effects. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece

respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: *N*-Nitrosodi-*N*-propylamine may be destroyed by high temperature incineration in an incinerator equipped with a nitrogen oxide scrubber. Chemical treatment methods may also be used to destroy *N*-nitrosodi-*N*-propylamine. These methods involve (a) denitrosation by reaction with 3% hydrobromic acid in glacial acetic acid; (b) oxidation by reaction with potassium permanganate-sulfuric acid; or (c) extraction of the nitrosamine from the waste using dichloromethane and subsequent reaction with triethyloxonium tetrafluoroborate (TOEF). Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

California Proposition 65 Chemical: Cancer 1/1/87.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-Nitroso-*N*-ethyl urea is a pale yellow, crystalline powder; Freezing/Melting point = 103−104°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used as an anti-cancer drug.

Possible Exposure Limits in Air:

DFG MAK: [skin]

No OELs have been established. However this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause irritation of the eyes and skin. Inhalation can cause respiratory tract irritation. Higher exposure can cause headache, drowsiness, fatigue, weakness, and loss of appetite.

Long Term Exposure: A potential occupational carcinogen. This chemical has been shown to be a teratogen in animals. High or repeated exposure may cause liver damage.

Points of Attack: Liver.

Medical Surveillance: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. A Class I, Type B, biological safety hood should be used for handling and mixing in a laboratory environment. Specific engineering controls are required for drug manufacture by the Food and Drug Administration. See 21CFR210.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer this material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Environmentally hazardous substances, solid, n.o.s. It falls in Hazard Class 9 and “CLASS 9.” Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥ 100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: *N*-Nitrosomethylvinylamine is a yellow liquid. Molecular weight = 86.11. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Decomposes in water.

Potential Exposure: This chemical is not manufactured but occurs as a chemical reaction byproduct found in the dye, automotive, rubber, and leather industries.

Incompatibilities: Strong oxidizers, light.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin].

There are no established numerical OELs. However this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: T-Sorb; Methanol/CH_2C_{l2}; Gas chromatography/Flame ionization detection; NIOSH IV; Method #2522. See also OSHA Analytical Method #27.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skins. Some related nitrosamines can cause headaches, abdominal cramps, weakness, and dizziness. It is unknown if this chemical causes all of these same symptoms.

Long Term Exposure: A potential occupational carcinogen. Has been shown to be a teratogen in animals. May cause liver and kidney damage.

Points of Attack: Liver and kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F

(APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. However, storage is not likely. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, light. Sources of ignition, such as smoking and open flames are prohibited where this chemical is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NTP: Reasonably anticipated to be a human carcinogen.

US EPA Hazardous Waste Number (RCRA No.): U179.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.013; Nonwastewater (mg/kg), 35.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-Nitrosopiperidine is a clear, yellow, oily liquid. Molecular weight = 114.17; Boiling point = 217°C; Flash point = 93°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: It is found in some foods and tobacco smoke. Used as a research chemical.

Incompatibilities: Oxidizers. Light may cause decomposition.

Permissible Exposure Limits in Air

No TEEL available.

DFG MAK: [skin] Carcinogen Category 2.

There are no established numerical OELs. However, this chemical is a carcinogen and exposure should be reduced to the lowest possible level.

Determination in Air: Use NIOSH IV; Method #2522; OSHA Analytical Method 27.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Can irritate and may cause permanent damage to the eyes; inflammation in the pigmented area and damage to the cornea with clouded patches of vision.

Long Term Exposure: A potential carcinogen. Prolonged exposure may cause liver damage.

Points of Attack: Eyes, liver.

Medical Surveillance: Examination of the eyes. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Under 40 CFR 261.5 small quantity generators of this waste may qualify for partial exclusion from hazardous waste regulations.

Carcinogenicity: (*m*-isomer) IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996; NTP; NCI: Carcinogenesis Studies (feed); clear evidence: mouse, rat;

NTP: Carcinogenesis studies; on test (2-year studies), October 2000; (*p*-isomer) IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996; NCI: Carcinogenesis Studies (feed); equivocal evidence: rat; test completed (peer review), October 2000.

NTP: Toxicity studies, (all isomers) Report No: TOX-23, October 2000; (*o*-isomer) Report No: TOX-44, October 2000.

All isomers:

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% all isomers.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R46; R22; R62; R51/53; Safety phrases: S51/53 S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*o*-isomer); 2—Water polluting (*m*- and *p*-isomers).

Description: Nitrotoluene is formed in 3 isomeric forms. The *o*- and *m*- forms are yellow liquids or solids. The *p*-form is a pale yellow crystalline solid. All have weak aromatic odors. The odor thresholds are 0.05 mg/L (*o*-isomer); 1.74 ppm (*m*-isomer). Molecular weight = 137.15 (all isomers); Specific gravity (H_2O:1) = 1.16 (all isomer); Boiling point = 222°C (*o*-isomer); 232°C (*m*-isomer); 238° (*p*-isomer); Freezing/Melting point = − 4°C (*o*-isomer); 16°C (*m*-isomer); 52°C (*p*-isomer); Vapor pressure = 0.1 mmHg (all isomers); Flash point = 101−106°C (all isomers). Explosive limits: LEL = 2.2; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): (*o*-, *p*-) Health 3, Flammability 1, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description (all isomers): Tumorigen, Mutagen; Reproductive Effector. The nitrotoluenes are used in the production of toluidines and other dye intermediates. All isomers are used in manufacture of agriculture and rubber chemicals and in various dyes.

Incompatibilities: Decomposes on contact with strong oxidizers, strong acids, reducing agents, strong bases, ammonia, amines producing toxic fumes, causing fire and explosion hazard. Heat above 190°C may cause explosive decomposition. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

In addition, Several states have set guidelines or standards for *p*-nitrotoluene in ambient air[60] ranging from 5.5 μg/m^3 (South Carolina) to 36.7 μg/m^3 (New York) to 110.0 μg/m^3 (Florida). Further, Several states have set guidelines or standards for *m*-nitrotoluene in ambient air[60] ranging from 37.0 μg/m^3 (New York) to 110.0 μg/m^3 (North Dakota) to 220.0 μg/m^3 (Connecticut) to 262.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2005, Nitrobenzenes.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 414 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.3-2.5$ (all isomers).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause coughing and wheezing. Exposure can cause headache, flushing of the skin, rapid heartbeat, nausea, vomiting, weakness, irritability, convulsions, coma, and death. High levels may affect the blood, causing formation of methemoglobinemia. Symptoms include anoxia, cyanosis, headache, weakness, dizziness, ataxia, dyspnea (breathing difficulty), tachycardia, vomiting.

Long Term Exposure: May damage the liver, kidneys, and blood; anemia may develop. May cause damage to the testes.

Points of Attack: Blood, skin, gastrointestinal tract, cardiovascular system, central nervous system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests (all isomers): whole blood (chemical/metabolite), Methemoglobin, complete blood count, urinalysis (chemical/metabolite). Consider the points of attack in preplacement and periodic physical examinations. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For *p*-nitrotoluene, Butyl rubber and polycarbonate are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *20 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBA (any self-contained breathing apparatus). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *100 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from combustibles, reducing agents, strong oxidants, strong bases, strong acids. Where possible, automatically transfer materials from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nitrotoluenes, *liquid* (*o*-; *m*-; *p*-) require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II. Nitrotoluenes, *solid* (*m*- or *p*-) require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. With the solid (*p*-isomer) isomer, dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Solid:* This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. *Liquid:* This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration—care must be taken to maintain complete combustion at all times. Incineration of large quantities may require scrubbers to control the emission of nitrogen oxides.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 5-Nitro-*o*-toluidine is a yellow, crystalline solid. Molecular weight = 152.17; Freezing/Melting point = 107°C.

Incompatibilities: Oxidizers, strong acids, acid chlorides, acid anhydrides, chloroformates.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 1 mg/m^3 inhalable fraction TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 250 mg/m^3

DFG MAK: Carcinogen Category 2

Determination in Air: Use NIOSH Analytical Method (IV) #2005, Nitrobenzenes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact may irritate the skin and eyes. High levels of exposure may interfere with the blood's ability to carry oxygen (methemoglobinemia) causing headache, fatigue, dizziness, and cyanosis (a blue color to the skin and lips). Higher levels can cause trouble breathing, collapse, and death.

Long Term Exposure: There is limited evidence that this chemical causes liver cancer in animals.

Points of Attack: Liver, blood.

Medical Surveillance: Blood methemoglobin levels. Complete blood count (CBC). Liver function disease.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, acid chlorides, acid anhydrides, chloroformates. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Nitrotoluidines (mono) require a label of “POISONOUS/TOXIC MATERIALS.” They fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, alcohol foam, or polymer foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Nitrous oxide N:0680

Molecular Formula: N_2O

Synonyms: Dinitrogen monoxide; Factitious air; Hyponitrous acid anhydride; Laughing gas; Nitrogen Oxide

CAS Registry Number: 10024-97-2

RTECS® Number: QX1350000

UN/NA & ERG Number: UN1070 (compressed)/122; UN2201 (refrigerated liquid)/122

EC Number: 233-032-0

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Positive: V79 cell culture—gene mutation; Negative: Sperm morphology—mouse; Inconclusive: Carcinogenicity—mouse/rat.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

California Proposition 65 Developmental/Reproductive toxin 8/1/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Nitrous oxide is a colorless gas with a slightly sweet odor. Shipped as a liquefied compressed gas. Molecular weight = 44.02; Boiling point = −88°C; Freezing/Melting point = −91.1°C; Relative density of the vapor/air mixture (air = 1) = 1.53 at 20°C; Vapor pressure = 51.3 atm. Slightly soluble in water; solubility = 0.1% at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data. Used as an anesthetic in dentistry and surgery, as a gas in food aerosols, such as whipped cream, in the manufacture of nitrites, in rocket fuels, firefighting, and diesel emissions. Large amounts of nitrous oxide will decrease the amount of available oxygen. Oxygen should be routinely tested to ensure that it is at least 19% by volume.

Incompatibilities: Violent reactions with organic peroxides, hydrazine, hydrogen, hydrogen sulfide, lithium, boron, lithium hydride, sodium, aluminum, phosphine. This chemical is a strong oxidizer above 300°C and self-explodes at high temperature. May form explosive mixtures with ammonia, carbon monoxide, hydrogen sulphide, oil, grease and fuels.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.80 mg/m^3 at 25°C & 1 atm.

OSHA PEL: none.

NIOSH REL: 25 ppm/46 mg/m^3 TWA over the time exposed; [*Note:* REL for exposure to waste anesthetic gas].

ACGIH TLV®[1]: 50 ppm TWA; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 50 ppm

PAC-1: 150 ppm

PAC-2: 10,000 ppm

PAC-3: 20,000 ppm

DFG MAK: 100 ppm/180 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Denmark: TWA 50 ppm (90 mg/m^3), 1999; Finland: TWA 100 ppm, 1999; Norway: TWA 100 ppm (180 mg/m^3), 1999; Sweden: NGV 100 ppm (180 mg/m^3), KTV 500 ppm (900 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (200 mg/m^3), KZG-W 200 ppm (400 mg/m^3), 1999; United Kingdom: TWA 100 ppm (183 mg/m^3), 2000; the Netherlands: MAC-TGG 152 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. The recommended ACGIH TLV is 50 ppm. Connecticut[60] has set a guideline for nitrous oxide in ambient air of 1.34 mg/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #6600, Nitrous oxide; OSHA Analytical Methods ID-166.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause dizziness and difficult breathing. Excessive exposure may cause headaches, nausea, fatigue, and irritability. Loss of consciousness may result from exposure to concentrations of 400,000−800,000 ppm. Anesthetic grades are composed of 80% nitrous oxide with 20% oxygen. High concentrations may cause a deficiency of oxygen in the air. *Skin, Eyes:* Liquid may cause frostbite and freezing burns. Vapors are nonirritating. *Ingestion:* Liquid may cause frostbite and freezing burns of the mouth and throat.

Long Term Exposure: Increased incidence of liver and kidney disease, neurological disease, and spontaneous abortion have been reported. Nitrous oxide has been shown to cause birth defects in rats. Repeated exposure can damage the nervous system, causing numbness and weakness in the arms and legs. May damage the bone marrow and affect blood cell production. May be a teratogen in humans.

Points of Attack: Respiratory system, central nervous system, blood, reproductive system.

Medical Surveillance: Before beginning employment and regular times after that, for those with frequent or potentially high exposures, the following is recommended: examination of the nervous system. If symptoms develop or overexposure is suspected, the following may be useful: consider nerve conduction studies, complete blood count (CBC), examination of the nervous system. Check the work-place air to make certain that the oxygen level is at least 19%.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles, unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Exposure to nitrous oxide is dangerous because it can replace oxygen and lead to suffocation. Where there is potential for exposure *over 25 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/ MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Nitrous oxide must be stored to avoid contact with organic peroxides, ammonia, carbon monoxide, hydrogen, hydrogen sulfide, and phosphine, since violent reactions occur. Cylinders of nitrous oxide should be stored in a cool, preferably fire-resistant area, away from heat sources.

Shipping: Nitrous oxide requires a shipping label of "NONFLAMMABLE GAS, OXIDIZER." Nitrous oxide, *refrigerated liquid*, requires a shipping label of "NONFLAMMABLE GAS." Both fall in DOT Hazard Class 2.2.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place and repair leak or allow cylinder to empty. If flow cannot be stopped, allow it to flow into a mixture of caustic soda and slaked lime and dispose of the resulting material in a hood. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nitrous oxide is an oxidizer and will increase the intensity of any fire. Nitrous oxide self-explodes at high temperature. Extinguish fire using an agent suitable for type of surrounding fire. Nitrous oxide itself does not burn. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disperse in atmosphere or spray on dry soda ash/lime with great care; then flush to sewer.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Nonane is a colorless liquid. Odor threshold = 47 ppm. Molecular weight = 128.29; Specific gravity (H_2O:1) = 0.72; Boiling point = 150.6°C; Freezing/Melting point = −51°C; Vapor pressure 3 mmHg at 20°C; Flash point = 31°C; Autoignition temperature = 205°C. Explosive limits: LEL = 0.8%; UEL = 2.9%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Drug, Primary Irritant. Nonane is used in the synthesis of biodegradable detergents as a distillation chaser and as an ingredient in Stoddard solvent and gasoline.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.25 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 200 ppm/1050 mg/m^3 TWA.

ACGIH TLV®[1]: 200 ppm TWA.

Protective Action Criteria (PAC)

TEEL-0: 200 ppm

PAC-1: 200 ppm

PAC-2: 350 ppm

PAC-3: 350 ppm

Denmark: TWA 200 ppm (1050 mg/m^3), 1999; Finland: TWA 200 ppm (1050 mg/m^3); STEL 250 ppm (1315 mg/m^3), 1999; France: VME 200 ppm (1050 mg/m^3), 1999; Japan: 200 ppm (1050 mg/m^3), 1999; Norway: TWA 100 ppm (525 mg/m^3), 1999; Sweden: NGV 150 ppm (800 mg/m^3), KTV 200 ppm (1100 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (1050 mg/m^3), 1999; the Netherlands: MAC-TGG 1050 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 200 ppm. Several states have set guidelines or standards for nonane in ambient air[60] ranging from 10.5−13.0 mg/m^3 (North Dakota) to 17.5 mg/m^3 (Virginia) to 21.0 mg/m^3 (Connecticut) to 25.0 mg/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nonane can affect you when breathed in. Narcotic at high concentrations; may affect the central nervous system. Exposure to high levels can cause headache, drowsiness, dizziness, confusion, nausea, tremor, lack of coordination, and unconsciousness. Irritates the eyes, skin, respiratory tract. Swallowing the liquid may cause chemical pneumonitis.

Long Term Exposure: Prolonged contact can cause drying and cracking of the skin. Repeated exposure can affect the liver.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Wear solvent-resistant gloves and clothing. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work.

Respirator Selection: Where there is potential for exposures *over 200 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with an organic vapor cartridge/canister. Greater protection is provided by a powered air-purifying respirator. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where nonane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of nonane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Wherever nonane is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Use only nonsparking tools and equipment, especially when opening and closing containers of nonane.

Shipping: Nonanes require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Nonyl trichlorosilane N:0690

Molecular Formula: $C_9H_{19}Cl_3Si$

Common Formula: $C_9H_{19}SiCl_3$

Synonyms: Silane, nonyltrichloro-; Silane, trichlorononyl-; Trichlorononylsilane

CAS Registry Number: 5283-67-0

RTECS® Number: VV4660000

UN/NA & ERG Number: UN1799/156

EC Number: 226-113-7

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Carcinogenicity: IARC: Animal Inadequate Evidence, Human Inadequate Evidence*, not classifiable as carcinogenic to humans*, Group 3 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Nonyl trichlorosilane is a clear fuming liquid with an irritating odor. Molecular weight = 261.73. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2₩. Reacts with water.

Potential Exposure: Used in silicone (polysiloxane) manufacture.

Incompatibilities: Chlorosilanes can self-ignite in air. They react with water or steam, producing heat and fumes of HCl. Forms a self-igniting compound with ammonia.

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.60** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Nonyl trichlorosilane can affect you when breathed in. Nonyl trichlorosilane is a corrosive chemical and can cause severe eye burns leading to permanent damage. Contact can cause severe skin burns. Exposure can irritate the eyes, nose, and throat. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May cause lung irritation; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to nonyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard

EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from combustible materials, such as wood, paper, or oil.

Shipping: Nonyl trichlorosilane requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 1.0/1.5

Fire Extinguishing: Nonyl trichlorosilane may burn but does not readily ignite. Use dry chemical, CO_2, or foam extinguishers. Poisonous gases, including hydrogen chloride and chlorine, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 213-589-6 [*Annex I Index No.:* 650-004-00-7]

Regulatory Authority and Advisory Bodies

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Norbormide is a white crystalline powder. Molecular weight = 511.61; Freezing/Melting point = 190−198°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used as a selective rat poison.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.75 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 3.8 mg/m^3
PAC-3: 3.8 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Moderately to highly toxic to humans. Probable human lethal dose is 50−500 mg/kg, or 1 teaspoon to 1 pint for a 150-lb person. Exposure may cause a transient decrease in temperature and blood pressure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Pesticides, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Small wet spills:* Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills*: dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Small amounts may be treated with alkali and then landfilled. Large amounts should be incinerated.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

O

Octafluorocyclobutane O:0100

Molecular Formula: C_4F_8
Synonyms: Cyclobutane, cyclooctafluorobutane; Freon C-318®; Octafluoro-; Perfluorocyclobutane
CAS Registry Number: 115-25-3
RTECS® Number: GU1779500
UN/NA & ERG Number: UN1976/126
EC Number: 204-075-2
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Octafluorocyclobutane is a colorless gas. Molecular weight = 200.03; Boiling point = −6°C; Freezing/Melting point = −41°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble (slight hydrolysis).
Potential Exposure: This material is used as a refrigerant.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 25,000 ppm
PAC-1: 65,000 ppm
PAC-2: 230,000 ppm
PAC-3: 300,000 ppm
Routes of Entry: Inhalation, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Octafluorocyclobutane can affect you when inhaled. Inhalation can irritate the lungs, causing coughing and shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. High levels can cause you to feel dizzy, lightheaded, and to pass out. Very high levels could cause death.
Long Term Exposure: Similar chemicals can cause irregular heartbeat, which could lead to death. Highly irritating chemicals may affect the lungs; may cause bronchitis and lung damage.
Points of Attack: Lungs, heart.
Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: special 24-h EKG (Holter Monitor) to look for irregular heartbeat. Consider chest X-ray after acute overexposure.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures to octafluorocyclobutane, use NIOSH/MSHA- or European Standard EN 149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with the full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potential high heat sources. Protect cylinders from physical damage. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.
Shipping: This compound requires a shipping label of "NONFLAMMABLE GAS." Octafluorocyclobutane falls in DOT Hazard Class 2.2.
Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00014-X

Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Octafluorocyclobutane itself does not burn. Poisonous gases, including fluorine, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (in agriculture) (Russia, USA) (UN).[13]

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

US EPA Hazardous Waste Number (RCRA No.): P085.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+; Risk phrases: R27/28; Safety phrases: S1/2; S36/37; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: OMPA is a dark brown viscous liquid. Molecular weight = 286.30; Boiling point = 120−125°C at 0.5 mmHg; Freezing/Melting point = 14−20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Material is used as a systemic insecticide for plants and as an acaricide. Not registered as a pesticide in the United States.

Incompatibilities: Acids.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.15 mg/m^3

PAC-1: 0.5 mg/m^3

PAC-2: 0.8 mg/m^3

PAC-3: 3.5 mg/m^3

Russia[35, 43] set a MAC of 0.02 mg/m^3 in work-place air and a MAC of 0.002 mg/m^3 for ambient air in residential areas on a momentary basis and 0.0004 mg/m^3 on an average daily basis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Acute exposure to OMPA may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) and chest pain may be noted. Hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea, respiratory depression, and respiratory paralysis. Psychosis may occur. This material is extremely toxic; probable oral lethal dose in humans is 5−50 mg/kg, between 7 drops and

1 teaspoonful for a 150-lb person. It is highly toxic when inhaled. Material is a cholinesterase inhibitor. It is similar in action to other organophosphorus pesticides in its toxicity. It is slightly less toxic than parathion. Gastrointestinal, neurologic, and respiratory symptoms may accompany poisoning with this material. High doses may cause a toxic psychosis similar to acute alcoholism.

Note: Persons taking the following drugs may be at greater risk: Phenobarbital and phenaglycodol together; glutethimide, chlorpromazine hydrochloride; or mepromabate. These drugs appear to enhance the toxicity of the material markedly.

Long Term Exposure: A cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures.

Note to physician: 1,1′-trimethylenebis(4-formylpyridinium bromide)dioxime (a.k.a TMB-4 dibromide and TMV-4) has been used as an antidote for organophosphate poisoning.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash; pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from acids. Where possible, automatically transfer from drums or other storage containers to process containers.

Shipping: This chemical is technically Organophosphorus pesticides, liquid, toxic; its effects are very similar and requires a shipping label of "POISONOUS/TOXIC MATERIALS." This falls in DOT Hazard Class 6.1 and Packing Group I.

Spill Handling: Use water spray to knock down vapors. Attempt to stop leak if it can be done without hazard. Avoid breathing vapors. Keep upwind. Avoid bodily contact with material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they

must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Poisonous gases, including nitrogen oxides and potassium oxides, are produced in fire. Do not extinguish fire unless flow can be stopped. Use water in flooding quantities as fog. Solid streams of water may be ineffective. Cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Use alcohol foam, carbon dioxide, or dry chemical. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Octane O:0120

Molecular Formula: C_8H_{18}

Synonyms: n-Octane; normal-Octane

CAS Registry Number: 111-65-9 (n-); 540-84-1 (iso-)

RTECS® Number: RG8400000

UN/NA & ERG Number: UN1262/128

EC Number: (*n*-) 203-892-1 [*Annex I Index No.:* 601-009-00-8]; (*iso*-) 208-759-1[*Annex I Index No.:* 601-009-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA (*isooctane; oral*): Inadequate Information to assess carcinogenic potential.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (n- and *iso*-): Hazard Symbol: F, Xn, N; Risk phrases: R11; R38; R65; R67; R50/53; Safety phrases: S2; S9; S16; S29; S33; S60; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*octane and isomers*).

Description: Octane is a colorless liquid with a gasoline-like odor. The odor threshold is 4 ppm[41] and 48 ppm (New Jersey Fact Sheet). Molecular weight = 114.26; Specific gravity (H_2O:1) = 0.70; Boiling point = 125.6°C; Freezing/Melting point = −56.7°C; Vapor pressure = 10 mmHg at 20°C; Flash point = 13°C (cc); Autoignition temperature = 206°C. Explosive limits: LEL = 1.0%; UEL = 6.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 0. Practically insoluble in water; solubility = 7×10^{-5}.

Potential Exposure: Octane is used as a solvent; as a fuel; as an intermediate in organic synthesis; and in azeotropic distillations.

Incompatibilities: Reacts with strong oxidizers, causing fire and explosion hazard. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.67 mg/m^3 at 25°C & 1 atm.

OSHA PEL (*n-octane only*): 500 ppm/2350 mg/m^3 TWA; *Construction Industry:* 400 ppm/1900 mg/m^3 TWA.

NIOSH REL (*n-octane only*): 75 ppm/350 mg/m^3 TWA; 385 ppm/1800 mg/m^3 [15-min] Ceiling Concentration.

ACGIH TLV®[1] (*all isomers*): 300 ppm/1401 mg/m^3 TWA.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)

n-isomer

TEEL-0: 300 ppm
PAC-1: 300 ppm
PAC-2: 385 ppm

PAC-1: 300 ppm
PAC-2: 300 ppm
PAC-3: 1000 ppm

DFG MAK (*n-isomer*): 500 ppm/2400 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group D.

Australia: TWA 300 ppm (1450 mg/m^3); STEL 375 ppm, 1993; Austria: MAK 300 ppm (1400 mg/m^3), 1999; Belgium: TWA 300 ppm (1400 mg/m^3); STEL 375 ppm (1750 mg/m^3), 1993; Denmark: TWA 200 ppm (935 mg/m^3), 1999; Finland: TWA 300 ppm (1400 mg/m^3); STEL 375 ppm (1750 mg/m^3), 1999; France: VME 300 ppm (1450 mg/m^3), 1999; Japan: 300 ppm (1400 mg/m^3), 1999; the Netherlands: MAC-TGG 1450 mg/m^3, 2003; Norway: TWA 150 ppm (725 mg/m^3), 1999; the Philippines: TWA 500 ppm

(2350 mg/m^3), 1993; Poland: MAC (TWA) 1000 mg/m^3; MAC (STEL) 1800 mg/m^3, 1999; Russia: TWA 300 ppm, 1993; Sweden: NGV 200 ppm (900 mg/m^3), KTV 300 ppm (1400 mg/m^3), 1999; Switzerland: MAK-W 300 ppm (1400 mg/m^3), KZG-W 600 ppm (2800 mg/m^3), 1999; Turkey: TWA 400 ppm (1900 mg/m^3), 1993; United Kingdom: LTEL 300 ppm (1450 mg/m^3); STEL 375 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 300 ppm. Several states have set guidelines or standards for octane in ambient air[60] ranging from 7.0 mg/m^3 (Connecticut) to 14.5−18.0 mg/m^3 (North Dakota) to 24.0 mg/m^3 (Virginia) to 34.524 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1500, for Hydrocarbons, BP 36-126°C; #2549, Volatile organic compounds; OSHA Analytical Method 7.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = 4.5$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Octane can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Skin contact can cause rash and a burning sensation. Swallowing the liquid may cause aspiration into the lungs and chemical pneumonitis. Exposure to high concentrations of vapor can cause lightheadedness, dizziness, confusion, and may cause you to pass out.

Long Term Exposure: Repeated or prolonged contact can result in dry, cracked skin.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do NOT induce vomiting. Give victim nothing to drink.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, Nitrile/PVC, and Nitrile are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 750 ppm:* Sa* (APF = 10) (any supplied-air respirator). *Up to 1000 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Octane must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where octane is used, handled, or stored. Metal containers used in the transfer of 5 gallons or more of octane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of octane.

Shipping: Octanes require a shipping label of "FLAMMABLE LIQUID." It falls in DOT Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Octyl phenol O:0130

Molecular Formula: $C_{14}H_{22}O$
Common Formula: $C_8H_{17}C_6H_4OH$
Synonyms: Diisobutyl phenol
CAS Registry Number: 1322-69-6; 27193-28-8
RTECS® Number: SM5775000
EC Number: 248-310-7

Regulatory Authority and Advisory Bodies

FDA: 21CFR§175.105

WGK (German Aquatic Hazard Class): No value assigned.

Description: Octyl phenol is a white to pink crystalline solid. Molecular weight = 206.36; Boiling point = 280−302°C; Freezing/Melting point = 72−74°C; Flash point = about 149°C. Insoluble in water.

Potential Exposure: As a fuel oil stabilizer; as an intermediate for resins; in fungicides, bactericides, dyestuffs, adhesives, antioxidants, nonionic surfactants; in plasticizers and rubber; in adhesives; and in food packaging.

Incompatibilities: Oxidizers, such as chlorine and dichromate.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to lungs and throat. *Skin:* May cause irritation. *Eyes:* May cause severe irritation. *Ingestion:* Moderately toxic; may cause digestive upset. LD_{50} = (ip-mouse) 25 mg/kg.

Long Term Exposure: May cause liver and/or kidney damage. May be a mutagenic.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a

full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Will ignite at about 149°C. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (tetroxide).

European/International Regulations (*tetroxide*): Hazard Symbol: T+, N; Risk phrases: R26/27/28; R34; Safety phrases: S1/2; S7/9; S26; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent. (metal); no value assigned to the tetroxide.

Description: Osmium is a blue-white metal. It is found in platinum ores and in the naturally occurring alloy osmiridium. Osmium when heated in air or when the finely divided form is exposed to air at room temperature, oxidizes to form the tetroxide (OsO_4), osmic acid.

Osmium tetraoxide is a colorless, crystalline solid or pale-yellow mass with an unpleasant, acrid, chlorine-like odor. A liquid above 41°C. Odor threshold = 0.0019 ppm. Molecular weight = 190.20; 254.20 (OsO_4); Specific gravity (H_2O:1) = 5.10 (OsO_4); Boiling point = 130°C (sublimes well below the BP) (OsO_4); Freezing/Melting point = 41°C (OsO_4); Vapor pressure = 7 mmHg at 20°C (OsO_4). Slightly soluble in water; solubility = 6% at 25°C (OsO_4). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 3 (Oxidizer).

Potential Exposure: Compound Description (tetroxide): Drug, Mutagen; Reproductive Effector; Human Data. Osmium may be alloyed with platinum metals, iron, cobalt, and nickel, and it forms compounds with tin and zinc. The alloy with iridium is used in the manufacture of fountain pen points, engraving tool, record player needles, electrical contacts, compass needles, fine machine bearings, and parts for watch and lock mechanisms. The metal is a catalyst in the synthesis of ammonia and in the dehydrogenation of organic compounds. It is also used as a stain for histological examination of tissues. Osmium tetroxide is used as an oxidizing agent, catalyst, and as a fixative for tissues in electron microscopy. Other osmium compounds find use in photography. Osmium no longer is used in incandescent lights or in fingerprinting.

Incompatibilities: Osmium tetroxide is a strong oxidizer. Reacts with combustibles and reducing materials. Reacts with hydrochloric acid to form toxic chlorine gas. Forms unstable compounds with alkalis.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.40 mg/m^3 (tetroxide) at 25°C & 1 atm.

OSHA PEL: 0.002 mg[Os]/m^3 TWA.

NIOSH REL: 0.0002 ppm/0.002 mg[Os]/m^3 TWA; 0.006 mg[Os]/m^3/0.0006 ppm STEL.

ACGIH TLV®[1]: 0.0002 ppm/0.0016 mg[Os]/m^3 TWA; 0.0047 mg[Os]/m^3/0.0006 ppm STEL.

NIOSH IDLH: 1 mg[Os]/m^3.

Protective Action Criteria (PAC)

PAC-1: 0.75 mg/m^3
PAC-2: 6 mg/m^3
PAC-3: 30 mg/m^3

Tetroxide

TEEL-0: 0.0002 ppm
PAC-1: 0.0006 ppm
PAC-2: 0.0084 ppm
PAC-3: 4 ppm

Arab Republic of Egypt: TWA 0.0002 ppm (0.002 mg[Os]/m^3), 1993; Australia: TWA 0.0002 ppm (0.002 mg[Os]/m^3); STEL 0.0006 ppm, 1993; Austria: MAK 0.0002 ppm (0.002 mg[Os]/m^3), 1999; Belgium: TWA 0.0002 ppm (0.0016 mg[Os]/m^3); STEL 0.0006 ppm, 1993; Denmark: TWA 0.0002 ppm (0.002 mg[Os]/m^3), 1999; Finland: TWA 0.0002 mg[Os]/m^3; STEL 0.002 mg[Os]/m^3, 1999; France: VME 0.0002 ppm (0.002 mg[Os]/m^3), 1999; the Netherlands: MAC-TGG 0.002 mg[Os]/m^3, 2003; Norway: TWA 0.0002 ppm (0.002 mg[Os]/m^3), 1999; the Philippines: TWA 0.002 mg[Os]/m^3, 1993; Switzerland: MAK-W 0.0002 ppm (0.002 mg[Os]/m^3), KZG-W 0.0004 ppm, 1999; United Kingdom: TWA 0.0002 ppm (0.002 mg[Os]/m^3); STEL 0.0006 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.0006 (Os) ppm. There is presently no PEL for elemental, metallic osmium. Several states have set guidelines or standards for osmium tetroxide in ambient air[60] ranging from zero in North Dakota to 0.04 μg/m^3 (Connecticut) to 1.0 μg/m^3 (Nevada) to 3000 μg/m^3 (Virginia).

Determination in Air: No NIOSH Analytical Method available.

Determination in Water: Osmium tetraoxide may be hazardous to the environment; crustacea, in particular, may be at risk.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Osmium metal is innocuous, but persons engaged in the production of the metal may be exposed to acids and chlorine vapors. By contrast, osmium tetroxide vapors are poisonous and extremely irritating to the eyes; even in low concentrations they may cause weeping and persistent conjunctivitis. Longer exposure can cause redness, swelling of the eye tissue, blurred vision, and may result in damage to the cornea and permanent loss of vision. Contact with skin may cause discoloration (green or black), dermatitis and ulceration. *Inhalation*: fumes are extremely irritating to the respiratory system, causing tracheitis, bronchitis, bronchial spasm, and difficulty in breathing which may last several hours. Longer exposures can cause serious inflammatory lesions of the lungs (bronchopneumonia with suppuration and gangrene). Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure to high concentrations may result in death. Slight kidney damage was seen in rabbits inhaling lethal concentrations of vapor for 30 min. Some fatty degeneration of renal tubules was seen in one fatal human case along with bronchopneumonia following an accidental overexposure.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may have effects on the kidneys. Repeated exposure may cause lung irritation; bronchitis may develop. There is limited evidence that osmium tetroxide may cause mutations.

Points of Attack: Eyes, respiratory system, lungs, skin, kidneys.

Medical Surveillance: Consider the skin, eyes, respiratory tract, and renal function in preplacement or periodic examinations. Lung function tests. Complete eye examination. Urinalysis. Chest X-ray.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give nothing to drink. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Avoid all contact. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.1 mg/m^3:* CcrFS100 (APF = 50) [Any air-purifying full-face-piece respirator equipped with cartridge(s) providing protection against the compound of concern in combination with an N100, R100, or P100 filter] or GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 1 mg/m^3*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison (*osmium tetroxide*): Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store refrigerated in tightly closed containers away from hydrochloric acid, reducing agents and easily oxidized materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Osmium tetroxide requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Osmium tetraoxide may burn but does not easily ignite. *Small fires:* dry chemical, carbon dioxide, water spray, or foam extinguishers. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Contact with easily oxidized organic materials may cause fires and explosions. Poisonous gases, including osmium, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Ouabain O:0150

Molecular Formula: $C_{29}H_{44}O_{12}$
Synonyms: Acocantherin; Astrobain; Gratibain; Gratus strophanthin; G-Strophanthin; Ouabagenin-l-rhamnosid (German); Ouabaine; Oubain; Purostrophan; Quabagenin-l-rhamnoside; Strophanthin G; Strophoperm
CAS Registry Number: 630-60-4; 11018-89-6 (octahydrate)
RTECS® Number: RN3675000
UN/NA & ERG Number: UN1544 (Alkaloids, solid, n.o.s.)/151
EC Number: 211-139-3 [*Annex I Index No.*: 614-025-00-5]
Regulatory Authority and Advisory Bodies
SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
Canada: WHMIS, Class D1A; Not on DSL or NDSL lists.
European/International Regulations (*630-60-4*): Hazard Symbol: T; Risk phrases: R23/25; R33; Safety phrases: S1/2; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Ouabain is a white crystalline solid. Molecular weight = 584.652; Freezing/Melting point = 190−200°C. Slightly soluble in waer.
Potential Exposure: Compound Description: Drug, Mutagen, Natural Product. Ouabain, similar to digitoxin, is used to produce rapid digitalization in acute congestive heart failure. Also recommended in treatment of atrial or nodal paroxysmal tachycardia and atrial flutter; enzyme inhibitor.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1.5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 8.3 mg/m^3
PAC-3: 12.5 mg/m^3
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Upon exposure to ouabain, symptoms of heart failure occur, with marked increase in serum potassium. Signs may include confusion, vomiting, coma, convulsions, and respiratory failure. It is classified as extremely toxic. Probable oral lethal dose in humans is less than 5 mg/kg or a taste (less than 7 drops) for a 70-kg (150 lb) person. Exposure may result in respiratory and cardiac failure; and/or hyperalkemia. LD_{50} = (oral-mouse) ≥ 500 mg/kg.
Note: Patients with frequent premature ventricular heartbeat or who have received any preparation of digitalis during preceding 3 weeks are prone to toxicity.
Points of Attack: Heart.
Medical Surveillance: EKG.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: For emergency situations, wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash; pressure, pressure-demand, full face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator with escape SCBA and a fully-encapsulating, chemical-resistant suit.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.
Shipping: Alkaloids, solid, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1 and ergotamine tartrate in Packing Group I.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep combustibles (wood, paper, oil, etc.) away from spilled material. Do not touch spilled material. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills*: with clean shovel place material into clean, dry container and cover;

move container from spill area. *Large spills*: dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Cool containers that are exposed to flames with water from the side until well after fire is out. For massive fires use unmanned hose holder or monitor nozzles; if this is impossible, withdraw and let fire burn. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 205-634-3 [*Annex I Index No.*: 607-006-00-8]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R21/22; Safety phrases: S2; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Oxalic acid is a colorless, odorless powder or granular solid. The anhydrous form $(COOH)_2$ is an odorless, white solid; the solution is a colorless liquid. Molecular weight = 90.04; Specific gravity (H_2O:1) = 1.90; Sublimation point = 150−157°C; Freezing/Melting point (decomposes): 101.7°C; 190°C (anhydrous). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Moderately soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector; Human Data; Primary Irritant. Oxalic acid is used in textile finishing, paint stripping; metal and equipment cleaning; as an intermediate; as an analytic reagent and in the manufacture of dyes, inks, bleaches, paint removers; varnishes, wood, and metal cleansers; dextrin, cream of tartar, celluloid, oxalates, tartaric acid, purified methyl alcohol, glycerol, and stable hydrogen cyanide. It is also used in the photographic, ceramic, metallurgic, rubber, leather, engraving, pharmaceutical, paper, and lithographic industries.

Incompatibilities: The aqueous solution is a medium strong acid. Incompatible with strong oxidizers, silver compounds, strong alkalis, chlorites. Contact with some silver compounds forms explosive materials.

Permissible Exposure Limits in Air

OSHA PEL: 1 mg/m^3 TWA.

NIOSH REL: 1 mg/m^3 TWA; 2 mg/m^3 STEL.

ACGIH TLV®[1]: 1 mg/m^3 TWA; 2 mg/m^3 STEL.

NIOSH IDLH: 500 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

Arab Republic of Egypt: TWA 1 mg/m^3, 1993; Australia: TWA 1 mg/m^3; STEL 2 mg/m^3, 1993; Austria: MAK 1 mg/m^3, 1999; Denmark: TWA 1 mg/m^3, 1999; Finland: TWA 1 mg/m^3; STEL 3 mg/m^3, 1999; France: VME 1 mg/m^3, 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 2 mg/m^3, 1999; Sweden: NGV 1 mg/m^3, KTV 2 mg/m^3, 1999; Switzerland: MAK-W 1 mg/m^3, 1999; United Kingdom: TWA 1 mg/m^3; STEL 0.2 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 2 mg/m^3. Several states have set guidelines or standards for oxalic acid in ambient air[60] ranging from 3.3 μg/m^3 (New York) to 10.0 μg/m^3 (Florida and South Carolina) to 10−20 μg/m^3 (North Dakota) to 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μ/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Determination in Water: Octanol-water coefficient: Log $K_{ow} = <-1$ (estimated).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Corrosive on ingestion. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Also, very high exposure (far above the OEL) can cause death. *Inhalation:* Contact with dust or mist can cause irritation, burns, and sores of the nose and throat. *Skin:* Contact with solid or solution may cause severe burns. *Eyes:* Contact with solid or solution may cause severe burns and eye damage. *Ingestion:* Onset of symptoms is usually rapid and includes burning and erosion of mouth, throat, and stomach tissue; nausea; vomiting, including vomiting blood; abdominal pain; diarrhea and bloody stools; numbness of fingers and toes; shock; collapse and convulsions; and kidney damage. Ingestion of 5 g (1/6 oz) can be fatal.

Long Term Exposure: Prolonged skin contact can cause irritation and slowly healing sores, pain, and discoloration (blue color) in fingers and localized tissue damage; gangrene may develop. Contact with dust or mist may cause inflammation and irritation of the nose and throat. May affect the kidneys and urinary stone formation. Repeated exposure may cause irritability, headache, and weakness.

Points of Attack: Eyes, skin, respiratory system, kidneys.

Medical Surveillance: NIOSH lists the following tests: urine (chemical/metabolite). If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Examination of the blood vessels in exposed areas. For an acute overexposure, consider testing serum calcium level.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Natural rubber, Neoprene™, Nitrile/PVC, nitrile, and polyethylene are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *25 mg/m³:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PAPRDM* (any powered, air-purifying respirator with a dust and mist filter). *50 mg/m³:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *500 mg/m³:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Oxalic acid must be stored to avoid contact with silver or strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where oxalic acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Corrosive solids, n.o.s. require a shipping label of "CORROSIVE." Oxalic acid falls in DOT Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wearing proper protective clothing and equipment, cover with soda ash or sodium bicarbonate. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, or water spray, or alcohol foam extinguishers. Poisonous gases, including carbon monoxide and formic acid, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Pretreatment involves chemical reaction with limestone or calcium oxide forming calcium oxalate. This may then be incinerated utilizing particulate collection equipment to collect calcium oxide for recycling.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 0.28.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R21; R26/28; R51; 53; Safety phrases: S1/2; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Oxamyl is a white crystalline solid with a sulfur- or garlic-like odor. Molecular weight = 219.29; Freezing/Melting point = 101°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Used as an insecticide, nematicide, and acaricide on many field crops, vegetables, fruits, and ornamentals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.35 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 1.7 mg/m^3

PAC-3: 15 mg/m^3

Permissible Concentration in Water: A lifetime health advisory of 175 μg/L has been developed by EPA.[47] In addition, Massachusetts has set a guideline of 50 μg/L for oxamyl in drinking water.[61]

Determination in Water: Fish Tox = 707.10678000 ppb MATC (VERY LOW).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can cause skin and eye irritation. Acute exposure to oxamyl usually leads to a cholinergic crisis. Signs and symptoms may include increased salivation, lacrimation (tearing), perspiration, spontaneous defecation, and spontaneous urination. Pinpoint pupils, blurred vision, tremor, muscle twitching, mental confusion, convulsions, and coma may occur. Gastrointestinal symptoms include abdominal pain, diarrhea, nausea, and vomiting. Bradycardia (slow heart rate) is common. Dyspnea (shortness of breath) and pulmonary edema may also occur. Classified by the World Health Organization as highly hazardous. Has also been rated as extremely to super-toxic. Acute oral exposure (ingestion) to oxamyl has caused death. Oxamyl is a potent cholinesterase inhibitor.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system causing numbness and/or weakness in the hands and feet. Repeated exposure may cause personality changes with depression, anxiety, and irritability. May cause liver damage. Human Tox = 200.00000 ppb MCL (VERY LOW).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, liver, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Consider liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a the health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and light. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Carbamate pesticide, solid, toxic, n.o.s. requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using agent suitable for type of surrounding fire, as the material itself does not burn or burns with difficulty. Use water in flooding quantities as a fog. Use alcohol foam, carbon dioxide, or dry chemical. Move container from fire area. Fight fire from maximum distance. Dike fire control water for later disposal do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases, including nitrogen oxides and sulfur oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Small quantities may be treated with alkali and buried in a landfill.[22] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: mouse, rat; NTP: Reasonably anticipated to be a human carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R46; R 23/24/25; R62; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 4,4′-Oxydianiline is a white crystalline solid, or a beige powder. Molecular weight = 200.26; Boiling point ≥300°C (sublimes); Freezing/Melting point = 186−187°C; Flash point = 219°C. Very slightly soluble in water.

Potential Exposure: Intermediate in the manufacture of high-temperature-resistant, straight polyimide and poly (esterimide) resins capable of withstanding temperatures of up to 480°C for short periods or 260°C for prolonged periods of time. Some *p*-phenylenediamine compounds have been used as rubber components, and DFG warns of danger of skin sensitization.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 300 mg/m^3

DFG MAK: Dangerous skin sensitization; Carcinogen Category 2.

Russia set a MAC of 5.0 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of the skin and/or eyes. Poisonous. LD_{50} = (oral-rat) 725 mg/kg.

Long Term Exposure: It has caused liver disease and retinopathy in rats. A potential occupational carcinogen.

Points of Attack: Liver.

Medical Surveillance: Liver tests.

First Aid: *Skin Contact:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.[52] *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere. Protect from exposure to light and oxidizing agents. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with 60−70% acetone to avoid airborne dust and collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with provision for nitrogen oxides removal from flue gases.

9,10-Oxydiphenoxarsine O:0190

Molecular Formula: $C_{24}H_{16}As_2O_3$

Synonyms: Bis(10-phenoxarsinl) oxide; Bis(phenoxarsin-10-yl) ether; Bis(10-phenoxarsyl) oxide; 10,10′-Bis(phenoxyarsinyl) oxide; Bis(10-phenoxyarsinyl) oxide; DID 47; Diphenoxarsin-10-yl oxide; OBPA; 10-10′-Oxidiphenoxarsine; 10-10′-Oxybisphenoxyarsine; Phenoxaksine oxide; PXO; SA 546; Vinadine; Vinyzene; Vinyzene BP 5; Vinyzene BP 5-2; Vinyzene (Pesticide); Vinyzene SB 1

CAS Registry Number: 58-36-6

RTECS® Number: SP6800000

UN/NA & ERG Number: Not regulated

EC Number: 200-377-3

Regulatory Authority and Advisory Bodies

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1987.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

As arsenic compound:

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; IARC: Human Sufficient Evidence, 1980; Animal Limited Evidence, *carcinogenic to humans*, Group 1, 1987.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.

Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

Reportable Quantity (RQ): 1 lb (0.454 kg).

EPCRA (Section 313): Includes any unique chemical substance that contains arsenic as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: organics 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides, liquid, toxic, flammable, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as arsenic, water-soluble compounds, n.o.s.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 10-10′-Oxidiphenoxarsine is a colorless crystalline, organometallic solid or a dense yellow liquid. Molecular weight = 502.23; Boiling point = 233°C; Freezing/Melting point = 185°C. Decomposition temperature = 380°C. Flash point = <32°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Practically insoluble in water.

Incompatibilities: A reducing agent; reacts violently with strong oxidizers. Keep away from strong acids and strong bases.

Potential Exposure: This material is used primarily for fungicidal and bactericidal protection of plastics. It is an organoarsenic and a heavy metal compound.

Permissible Exposure Limits in Air

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA.

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

Protective Action Criteria (PAC)

TEEL-0: 1.68 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 14 mg/m^3

PAC-3: 14 mg/m^3

Permissible Concentration in Water: While not specifically citing the compounds, EPA[6] gives a desirable level of zero for arsenic in water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. Contact with eyes may be severe. Ingestion causes nausea, vomiting, and diarrhea. Arsenic compounds are acutely poisonous by ingestion. In severe cases, there may be bloody vomitus and stools and the victim may suffer collapse and shock with weak, rapid pulse; cold sweats; coma; and death. LD_{50} = (oral-rat) 40 mg/kg.

Long Term Exposure: Arsenic compounds are recognized carcinogens of the skin, lungs, and liver. Ingestion or inhalation may result in chronic poisoning. Symptoms may include disturbances of the digestive system, loss of appetite, cramps, nausea, constipation, diarrhea. May cause liver damage, resulting in jaundice. May cause disturbances of the blood, kidneys, and nervous system. May cause skin abnormalities including itching, pigmentation, and even cancerous changes.

Points of Attack: Blood, kidneys, skin, nervous system.

Medical Surveillance: Kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, Dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine* (*not penicillin*) has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-plate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard (*dissolved in a flammable carrier solvent*): Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue (*carcinogen*): Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Small fires: dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Stay upwind; keep out of low areas. Wear self-contained (positive pressure if available) breathing apparatus and full protective clothing. Poisonous gases, including arsenic, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Oxydisulfoton O:0200

Molecular Formula: $C_8H_{19}OsPS_3$

Synonyms: BAY 23323; *O,O*-Diethyl *S*-[2-(ethylsulfinyl) ethyl] phosphorodithioate; *O,O*-Diethyl *S*-[(ethylsulfinyl) ethyl] phosphorodithioate; Disulfoton disulfide; Disulfoton sulfoxide; Disyston sulfoxide; Ethylthiomelton sulfoxide

CAS Registry Number: 2497-07-6

RTECS® Number: TD8600000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 219-679-1 [*Annex I Index No.:* 015-096-00-X]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24; R28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; 60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Oxydisulfoton is a liquid. Molecular weight = 290.42. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0.

Potential Exposure: This material is an agricultural insecticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 3.5 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms include the following: *mild exposure:* headache, loss of appetite, nausea, dizziness; *moderate exposure:* abdominal cramps, diarrhea, salivation, excessive tearing, muscular cramps; *severe exposure:* fever, blue lips, lack of sphincter control, coma, heart shock, difficult breathing.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish with dry chemical, carbon dioxide, water spray, fog, or foam. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases may be generated from the fire or runoff water. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank

discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

European/International Regulations: Hazard Symbol: O; Risk phrases: R8; Safety phrases: S2; S17 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Oxygen is a colorless odorless gas or a bluish cryogenic liquid. Molecular weight = 32.00; Boiling point = −183°C; Freezing/Melting point = −219°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Oxidizer. Slightly soluble in water. Liquid sinks and boils in water.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data. Compressed oxygen is used in various oxidation processes, for feedstock; and enrichment purposes; as a medicinal gas; a chemical intermediate; in oxyacetylene welding; in metallurgy. Liquid oxygen is used as a rocket fuel. Oxygen is naturally present at a concentration of 21% in breathing air.

Incompatibilities: A strong oxidizer. Reacts violently with nearly every element, combustibles, organics, and reducing materials.

Permissible Exposure Limits in Air

No standards or TEEL available. Minimum acceptable breathing air contains 19% oxygen.

Determination in Air: Use NIOSH Analytical Method #6601, Oxygen.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Note:* Increased pressure speeds up the toxic effects of oxygen. Drugs and chemical can also effects toxicity either positively or negatively. *Inhalation:* The air we breathe contains 21% oxygen. Normal activity requires a minimum of 19% oxygen. Breathing up to 50% oxygen at normal pressure produced no symptoms. Breathing 100% oxygen at normal pressure produced no symptoms after 12 h, but after 24 h has caused weakness, dizziness, burning in the nose and throat; fatigue, pain in joints and muscles; numbness and tingling in the arms and legs; palpitations, headache, cough, nasal congestion; ear disturbances; nausea, vomiting, loss of appetite; sore throat, fever, and swelling of the mucous membranes. Pressure levels greater than 3 times normal may cause convulsions and coma. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Contact with liquid oxygen may cause freezing burns and tissue damage. *Eyes:* Liquid oxygen may cause freezing burns and tissue damage. *Ingestion:* Liquid oxygen may cause freezing burns in the mouth and throat.

Long Term Exposure: Breathing of 50−100% oxygen at normal pressure even intermittently, over a prolonged period can cause lung damage.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures to pure oxygen, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure to pure oxygen.

First Aid: *Eye Contact:* With liquid oxygen—immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. *Skin Contact*: with liquid oxygen—if frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water. Seek medical attention. *Breathing Pure Oxygen or Gases >40%* O_2; Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquefied oxygen. Wear gas-proof chemical goggles and face shield unless full facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Specific engineering controls are required by OSHA. See OSHA Standard 1910.104.

Respirator Selection: Entering into oxygen enriched atmospheres (greater than 21% oxygen) is highly dangerous. Consult *NFPA Code 53M.*

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Liquid oxygen must be stored to avoid contact with organic and combustible materials (such as oil, grease, and coal dust) since violent reactions occur. Open storage is preferred. Oxygen gas evaporating from liquid or from oxygen enriched environments is easily absorbed into clothing and any source of ignition (such as a static spark) can cause flash burning. Compressed oxygen cylinders must be securely stored separately from fuel cylinders. Liquid oxygen tanks should be stored outdoors. Sources of ignition, such as smoking and open flames, are prohibited where oxygen is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Oxygen, *compressed*, or oxygen, *refrigerated liquid* (*cryogenic liquid*), requires a shipping label of "NONFLAMMABLE GAS, OXIDIZER." They fall in DOT Hazard Class 2.2.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Liquid:* Do NOT absorb liquid in saw-dust or similar combustible absorbents. This is an oxidizer and a dangerous fire and explosion risk. Use only water. Do not use chemical or carbon dioxide extinguishers. NEVER direct water jet on liquid. Allow liquid oxygen spills to evaporate. *Gas:* Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. If liquid oxygen is spilled or leaked, take the following steps: Keep combustibles (wood, paper, oil, etc.) away from spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Oxygen is not flammable but supports combustion and greatly increases the intensity of any fire. Mixtures of liquid oxygen and any fuel are highly explosive. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. For a large fire, evacuate danger area and consult an expert. For small fire, extinguish using an agent suitable for type of surrounding fire. Oxygen itself does not burn. Do not use chemical or carbon dioxide on *liquid* oxygen. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 15 (≥0.09% concentration).

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Oxygen difluoride is a colorless gas with a foul, peculiar odor. Shipped as a nonliquefied compressed gas. Molecular weight = 54.00; Boiling point = −145.6°C; Freezing/Melting point = −223.9°C; Vapor pressure = >1 atm at 20°C; Relative vapor density (air = 1) = 1.88. Slightly soluble in water (slowly reactive); solubility = 0.02%.

Potential Exposure: Compound Description: Reproductive Effector; Human Data. Oxygen difluoride may be used as an oxidant in missile propellant systems.

Incompatibilities: A strong oxidizer. Explodes on contact with steam. Violent reaction with reducing agents, combustible materials, chlorine, bromine, iodine, platinum, metal oxides, moist air, hydrogen sulfide (explosive in ambient air), hydrocarbons, water. Attacks mercury.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.21 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.05 ppm/0.1 mg/m^3 TWA.

NIOSH REL: 0.05 ppm/0.1 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.05 ppm/0.11 mg/m^3 Ceiling Concentration.

NIOSH IDLH: 0.5 ppm.

Protective Action Criteria (PAC)*
TEEL-0: 0.05 ppm
PAC-1: 0.1 ppm
PAC-2: **0.83** ppm
PAC-3: **2.5** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Arab Republic of Egypt: TWA 0.05 ppm (0.1 mg/m^3), 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Denmark: TWA 0.05 ppm (0.1 mg/m^3), 1999; Finland: STEL 0.05 ppm (0.1 mg/m^3), 1999; Norway: TWA 0.05 ppm (0.1 mg/m^3), 1999; the Philippines: TWA 0.05 ppm (0.1 mg/m^3), 1993; Poland: MAC (TWA) 1 mg[HF]/m^3; MAC (STEL) 3 mg [HF]/m^3, 1999; the Netherlands: MAC 0.1 mg/m^3, 2003; United Kingdom: TWA 2.5 mg[F]/m^3, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.05 ppm. Several states have set guidelines or standards for oxygen difluoride in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Connecticut and Nevada) to 80,000 μg/m^3 (Virginia).

Determination in Air: No NIOSH Analytical Method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Gas under pressure is corrosive to eyes, skin, and respiratory tract; causes burns. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure at low levels may result in severe, intractable headaches.

Points of Attack: Lungs, eyes.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 0.5 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50)* [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Only nonoxidizable sorbents are allowed (not charcoal).

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Protect cylinder containers against physical damage. Do not use wood pallets. Preferably handle behind body shield, in outdoor, or open protective fences. Wear long rubber gloves, goggles, protective clothing, and self-contained breathing apparatus. See 29 CFR 1910.101 for specific regulations on storage of compressed gas. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Oxygen difluoride requires a shipping label of "POISON GAS, OXIDIZER, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

Oxygen difluoride, oxygen difluoride, compressed

First: Isolate in all directions (feet/meters) 2500/800
Then: Protect persons downwind (miles/kilometers)
Day 3.3/5.3
Night 7.0+/11.0+

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 7.0+/11.0+
Night 7.0+/11.0+

Fire Extinguishing: This chemical is a nonflammable gas but a strong oxidizer that can increase the intensity of a fire. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray or sift on a thick layer of a (1:1) mixture of dry soda ash and slaked lime behind a shield. After mixing, spray water from an atomizer with great precaution. Transfer slowly into a large amount of water. Neutralize and drain into the sewer with sufficient water.

Ozone O:0230

Molecular Formula: O_3
Synonyms: Oxygen mol (O_3); Ozono (Spanish); Triatomic oxygen
CAS Registry Number: 10028-15-6
RTECS® Number: RS8225000
UN/NA & ERG Number: UN1955/123
EC Number: 233-069-2
Regulatory Authority and Advisory Bodies
Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); equivocal evidence: mouse; no evidence: rat; NTP: Carcinogenesis Studies (inhalation); some evidence: mouse.
US EPA Gene-Tox Program, Negative: *In vivo* cytogenetics—nonhuman bone marrow; Negative: *In vivo* SCE—nonhuman; Inconclusive: *In vivo* cytogenetics—nonhuman lymphocyte; Inconclusive: *In vitro* cytogenetics—human lymphocyte; Inconclusive: *In vivo* cytogenetics—human lymphocyte; Inconclusive: Cytogenetics—male germ cell.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
SARA Hazard Classes: Sudden Release of pressure hazard; Fire Hazard; Acute Health Hazard; Chronic Health Hazard.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; Category DIA, C. D2B.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Ozone is a colorless to blue gas with a very pungent, characteristic, sulfur-like odor, associated with electrical sparks; condenses to a blue-black liquid or crystalline solid. The odor threshold is 0.045 ppm. Molecular weight = 48.00; Boiling point = −112°C; Freezing/Melting point = −193°C; Vapor pressure = >1 atm at 20°C; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 3. Slightly soluble in water; solubility = 0.001% at 0°C.
Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Ozone is found naturally in the atmosphere as a result of the action of solar radiation and electrical storms. It is also formed around electrical sources, such as X-ray or ultraviolet generators, electric arcs; mercury vapor lamps; linear accelerators; and electrical discharges. Ozone is used as an oxidizing agent in the organic chemical industry (e.g., production of azelaic acid); as a disinfectant for air, mold and bacteria inhibitor for food in cold storage rooms, and for water (e.g., public water supplies; swimming pools; sewage treatment); for bleaching textiles; waxes, flour, mineral oils and their derivatives; paper pulp; starch and sugar; for aging liquor and wood; for processing certain perfumes; vanillin and camphor; in treating industrial wastes; in the rapid drying of varnishes and printing inks; and in the deodorizing of feathers.
Incompatibilities: A powerful oxidizer. A severe explosion hazard when exposed to shock or heat. Spontaneously decomposes to oxygen under ordinary conditions; heating increases oxygen production. Reacts with all reducing agents, combustibles, organic, and inorganic oxidizable materials, and can form products that are highly explosive. Incompatible with alkenes, aniline, benzene, bromine, ether, ethylene, hydrogen bromide, nitric oxide, stibine. Attacks metals except gold and platinum.
Permissible Exposure Limits in Air
OSHA PEL: 0.1 ppm/0.2 mg/m^3 TWA.
NIOSH REL: 0.1 ppm/0.2 mg/m^3 Ceiling Concentration.
ACGIH TLV®[1]: (*heavy work*) 0.05 ppm/0.1 mg/m^3 TWA; (*moderate work*) 0.08 ppm/0.16 mg/m^3 TWA; (*light work*) 0.01 ppm/0.2 mg/m^3 TWA; (*light, moderate, or heavy workload* $\leq$*2 h*) 0.2 ppm/0.4 mg/m^3 TWA; not classifiable as a human carcinogen.
NIOSH IDLH: 5 ppm.
Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.15 ppm
PAC-2: 1 ppm
PAC-3: 5 ppm
DFG MAK: Carcinogen Category 3B.
Arab Republic of Egypt: TWA 0.1 ppm (0.02 mg/m^3), 1993; Australia: TWA 0.1 ppm (0.2 mg/m^3); STEL 0.3 ppm, 1993; Austria: MAK 0.1 ppm (0.2 mg/m^3), 1999; Belgium: STEL 0.1 ppm (0.2 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.2 mg/m^3), 1999; Finland: TWA 0.1 ppm (0.2 mg/m^3); STEL 0.3 ppm (0.6 mg/m^3), 1999; France: VME 0.1 ppm (0.2 mg/m^3), VLE 0.2 ppm (0.4 mg/m^3), 1999; Hungary: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, 1993; Japan: 0.1 ppm (0.2 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.2 mg/m^3), 1999; the Philippines: TWA 0.1 ppm (0.2 mg/m^3), 1993; Poland: MAC (TWA) 0.1 mg/m^3; MAC (STEL) 0.6 mg/m^3, 1999; Russia: TWA 0.1 ppm; STEL 0.1 mg/m^3, 1993; Sweden: NGV 0.1 ppm (0.2 mg/m^3), TGV 0.3 ppm (0.6 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.2 mg/m^3), KZG-W 0.2 ppm (0.4 mg/m^3), 1999; Turkey: TWA 0.1 ppm (0.2 mg/m^3), 1993; United Kingdom: STEL 0.2 ppm (0.4 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.
The US EPA has set a national ambient air quality standard of 0.12 ppm (240 μg/m^3) for ozone on a 1-h average basis and a standard of 0.08 ppm (160 μg/m^3) for total photochemical oxidants (expressed as ozone) on a 1-h average basis (to be exceeded not more than once a year). The Czech Republic[35] has set a TWA of 0.1 mg/m^3 in workplace air with a ceiling of 0.2 mg/m^3. Russia set a MAC of 0.16 mg/m^3 for ambient air in residential areas on a once-daily basis and 0.03 mg/m^3 on an average daily basis. State

limits for ozone in ambient air[60] range from 0.005 mg/m^3 in Nevada to 0.235 mg/m^3 in Connecticut.

Determination in Air: Use OSHA Analytical Method ID-214.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Eye exposure may result in conjunctivitis (red, inflamed eyes). Inhalation of the gas can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation of the gas may cause asthma-like reactions. The liquid may cause frostbite. May affect the central nervous system, causing headache and impaired concentration and performance. Signs and symptoms of acute exposure to ozone may be severe and include irritation and burns of the skin, eyes, and mucous membranes. An increased respiratory rate, shallow breathing, cough, dyspnea (shortness of breath), bronchitis, pulmonary edema, and pulmonary hemorrhage may occur. Tachycardia (rapid heart rate) and hypotension (low blood pressure) may be observed. Neurologic effects include fatigue, dizziness, drowsiness, headache, exhilaration, and depression. Nausea, vomiting, and anorexia may occur. A level of 0.2 ppm for 3 h did not produce symptoms. Levels of 0.3 ppm may cause tightness in chest and throat, dry throat; and irritation of throat and lungs within 30 min. Levels of 0.5 ppm and above produce a sulfur-like odor and may cause headache, drowsiness, loss of coordination, and accumulation of fluid in the lungs. Levels near 10 ppm may result in immediate, severe irritation of throat and lungs, excessive sweating, continual coughing, decreased blood pressure, weak and rapid pulse, and severe chemical pneumonia. Death may occur from prolonged exposures at 2 ppm or short exposures at 10 ppm.

Note: There may be a delay in onset of breathing difficulties for up to 6 h.

Ozone is highly toxic via inhalation or by contact of liquid to skin, eyes, or mucous membranes. It is capable of causing acute to chronic lung damage, burns, and death or permanent injury. Ozone can be toxic at a concentration of 100 ppm for 1 min. Ozone is capable of causing death from pulmonary edema. It increases sensitivity of the lungs to bronchoconstrictors and allergens; increases susceptibility to and severity of lung bacterial and viral infections.

Long Term Exposure: Repeated or prolonged exposure may cause lung damage and/or chronic respiratory disease. Ozone may damage the developing fetus.

Points of Attack: Eyes, respiratory system, lungs.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; electrocardiogram; pulmonary function tests: forced vital capacity, forced expiratory volume (1 sec); sputum cytology; white blood cell count/differential. Preemployment and periodic physical examinations should be concerned especially with significant respiratory diseases. Eye irritation may also be important.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Administer 100% O_2. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: In areas of excessive concentration, gas masks with proper canister and full face-piece or goggles or the use of supplied-air respirators is recommended. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* CcrS (APF = 10) [any chemical cartridge respirator with cartridge(s) providing protection against the compound of concern] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]. *Up to 5 ppm:* CcrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern] or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-, mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated place. Detached storage preferred, away from combustible material and reducing agents. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Compressed gas, toxic, n.o.s. (Ozone) must be labeled "POISON GAS, OXIDIZER." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor, contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable; however, ozone may react with any combustible substance to cause fire or explosion. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Vent to atmosphere.

P

Pancreatin P:0050

Synonyms: Beef viokase; Diastase vera; Donnazyme; Entozyme; Ilozyme; Intrazyme; Pancreatic extract; Pancrex-V; Pankreon; Pankrotanon; Panteric; Stamyl; Viobin; Viokase; Zypanar

CAS Registry Number: 8057-43-0; 9002-16-8; 8049-47-6; 9046-39-3

RTECS® Number: RT9033000

Regulatory Authority and Advisory Bodies

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pancreatin is a yellowish to cream-colored amorphous powder with a strong odor. Slightly soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0.

Potential Exposure: It is an enzyme found in the pancreas and is used in medicines and in treating leather and textiles.

Incompatibilities: Alcohols, acids.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Pancreatin can affect you when breathed in. Exposure can cause an asthma-like lung reaction, with rapidly occurring symptoms of wheezing and shortness of breath. A second type of lung reaction, with fatigue, shortness of breath, and possibly fever, can occur hours after exposure. This can lead to scars in the lungs. Once allergy develops, even low exposures can trigger symptoms. Other proteolytic enzymes similar to Pancreatin can cause severe eye irritation and irritate the tongue, mouth, and cause nosebleeds and skin sores.

Long Term Exposure: Repeated breathing exposure may cause changes in lung function, even without symptoms. May cause skin allergy, with rash and itching. May cause asthma-like allergy. Can cause severe allergic lung reaction with chills, fever, chest tightness, cough, and/or shortness of breath. Repeated attacks may lead to permanent lung scarring. Once allergy develops, even low exposures can trigger symptoms.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation for up to 8 h after breathing exposure is recommended, as symptoms may be delayed.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to pancreatin, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alcohol and acids.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00015-1

If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Paraffin wax P:0100

Molecular Formula: C_nH_{2n+2}

Synonyms: Hard paraffin; Paraffin; Paraffin, *n*-; Paraffin fume

CAS Registry Number: 8002-74-2; 71808-29-2 (waxes, petroleum, clay-treated, reaction)

RTECS® Number: RV0350000

UN/NA & ERG Number: Not regulated.

EC Number: 232-315-6

Regulatory Authority and Advisory Bodies

FDA—over-the-counter drug.

US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0892-9311.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Paraffin wax is a white, somewhat translucent solid and consists of a mixture of solid aliphatic hydrocarbons. It may be obtained from petroleum and consists of a mixture of high-molecular-weight hydrocarbons (e.g., $C_{36}H_{74}$). Specific gravity (H_2O:1) = 0.88−0.92; Freezing/Melting point = 46−68°C; Flash point = 198.9°C; Autoignition temperature = 245°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 1. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Primary Irritant. Paraffin is used in the manufacture of paraffin paper, candles, food package material, varnishes, floor polishes, and cosmetics. It is also used in waterproofing and extracting of essential oils from flowers for perfume.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Paraffin wax fume

OSHA PEL: None.

NIOSH REL: 2 mg/m^3 TWA.

ACGIH TLV®[1]: 2 mg/m^3 TWA.

Protective Action Criteria (PAC)

8002-74-2

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 500 mg/m^3

71808-29-2

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Australia: TWA 2 mg/m^3 (fume), 1993; Belgium: TWA 2 mg/m^3 (fume), 1993; Denmark: TWA 2 mg/m^3 (fume), 1999; Finland: TWA 1 mg/m^3 (fume), 1999; France: VME 2 mg/m^3 (fume), 1999; Norway: TWA 2 mg/m^3, 1999; Switzerland: MAK-W 2 mg/m^3 (fume), 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg/m^3. Several states have set guidelines or standards for paraffin wax fume in ambient air[60] ranging from 20−60 μg/m^3 (North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 48 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2047.

Routes of Entry: Inhalation, eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates eyes and respiratory system. Inhalation can cause nausea. Occasionally sensitivity reactions have been reported. Chronic exposure can produce chronic dermatitis, wax boils, folliculitis, comedones, melanoderma, papules, and hyperkeratoses.

Long Term Exposure: Fume can cause lung damage, and paraffins contain carcinogens. Carcinoma of the scrotum in pressmen exposed to crude petroleum wax has been documented. Other malignant lesions of an exposed area in employees working with finished paraffin are less well documented. Carcinoma of the scrotum, occurring in workmen exposed 10 years or more, began as a hyperkeratotic nevus like a lesion and developed into a squamous cell carcinoma. The lesions can metastasize to regional inguinal and pelvic lymph nodes. Paraffinoma has been reported from use of paraffin for cosmetic purposes. Summarize by calling it an equivocal tumorigenic agent.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Medical examinations should be concerned especially with the skin. Surveillance should be continued indefinitely.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Paraffin wax is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Paraformaldehyde P:0120

Molecular Formula: $(CH_2O)_x$; $C_3H_6O_4$

Synonyms: Aldacide; Flo-more; Formagene; Formaldehyde polymer; Granuform; Paraform; Paraform 3; Paraformaldehido (Spanish); Polyformaldehyde; Polymerized formaldehyde; Polyoxymethylene; Polyoxymethylene glycol; Triformol; Trioxymethylene

CAS Registry Number: 30525-89-4; 110-88-3 (1,3,5-trioxane)

RTECS® Number: RV0540000 (paraformaldehyde); YM1400000 (trioxane)

UN/NA & ERG Number: UN2213/133

EC Number: 203-812-5 [*Annex I Index No.:* 605-002-00-0] (1,3,5-trioxane)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*110-88-3*): Hazard Symbol: F, Xn; Risk phrases: R11, R37; R63; Safety phrases: S2; S36/37; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Paraformaldehyde is a white crystalline solid with an irritating odor. The term "trioxane" applies specifically to this trimer $(CH_2O)_3$, but paraformaldehyde is applied both to trioxane and other low polymers or oligomers of formaldehyde. Boiling point = 115°C (trioxane); Freezing/Melting point = 64°C (trioxane); 120−180°C (decomposition/paraformaldehyde); Flash points = 45°C (trioxane); 70°C (paraformaldehyde); Autoignition temperature = 300°C. Explosive limits: LEL = 3.6%; UEL = 28.7% (trioxane); LEL = 7.0%; UEL = 73.0% (paraformaldehyde). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen, Primary Irritant. Paraformaldehyde is used in polyacetal resin manufacture, as a food additive, and as an odorless fuel.

Incompatibilities: Dust forms an explosive mixture with air. Decomposes on contact with oxidizers, strong acids, acid fumes, and bases; with elevated temperatures, forms formaldehyde. May explode when heated. May explode on impact if peroxide contamination develops. Mixtures with hydrogen peroxide or liquid oxygen are explosives sensitive to heat, shock, or contact with lead.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 4 mg/m^3
PAC-1: 12.5 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 100 mg/m^3
No TEEL available for *trioxane.*

The Netherlands: 2 ppm/3 mg/m^3 ceiling value[57]; Japan: 5 ppm TWA.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure can irritate the eyes, nose, throat, and skin. Exposure can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. See also "Formaldehyde"; this chemical forms formaldehyde when heated.

Long Term Exposure: Repeated or prolonged contact may cause skin and lung sensitization, resulting in allergies. Paraformaldehyde may cause mutations. Handle with extreme caution. May cause kidney damage. Testing has not been completed to determine the carcinogenicity of paraformaldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to Paraformaldehyde, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Paraformaldehyde must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids (such as hydrochloric, sulfuric, and nitric), and alkaline materials (such as potassium or sodium hydroxide), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where paraformaldehyde is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Protect containers from physical damage. Store in tightly closed containers in a cool, well-ventilated area away from areas of high humidity.

Shipping: Paraformaldehyde requires a shipping label of “FLAMMABLE SOLID.” It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep paraformaldehyde out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Dust can form an explosive mixture with air. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including formaldehyde. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Molecular weight = 132.18; Boiling point = 125°C; Freezing/Melting point = 12°C; Flash point = 36°C; Autoignition temperature = 237°C. Explosive Limits: LEL = 1.3%; UEL — unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Human Data; Primary Irritant. Paraldehyde is used primarily in medicine. It is used as a hypnotic agent, in delirium tremens, and in treatment of psychiatric states characterized by excitement when drugs given over a long period of time. It is also administered for intractable pain which does not respond to opiates and for basal and obstetrical anesthesia. It is effective against experimentally induced convulsions and has been used in emergency therapy of tetanus, eclampsia, status epilepticus, and poisoning by convulsant drugs. Since it is used primarily in medicine, the chance of accidental human exposure or environmental contamination is low. However, paraldehyde decomposes to acetaldehyde and acetic acid; these compounds have been found to be toxic. In this case, occupational exposure or environmental contamination is possible. Since paraldehyde is prepared from acetaldehyde by polymerization in the presence of an acid catalyst, there exists a potential for adverse effects, although none have been reported in the available literature. It is also used in the manufacture of organic compounds.

Incompatibilities: Forms explosive mixture with air. Incompatible with strong oxidants, strong acids, alkalis, ammonia, amines, iodides, hydrocyanic acid. Violent reaction with liquid oxygen. Contact with acids form acetaldehyde. Attacks rubber and plastics.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 40 mg/m^3
PAC-2: 300 mg/m^3
PAC-3: 300 mg/m^3
Russia[43] set a MAC of 5.0 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Paraldehyde can affect you when breathed in and by passing through your skin. Contact can cause severe eye irritation or burns with possible permanent damage, and irritates the skin. Overexposure can cause poor coordination and make you sleepy. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: High or repeated exposure can damage the liver and kidneys. Can irritate the lungs; bronchitis may develop. Repeated exposure may cause fatigue, tremors, changes in speech, personality changes, and/or poor memory.

Points of Attack: Liver, kidneys, lungs, brain.

Medical Surveillance: Liver and kidney function tests. Examine for brain effects. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to paraldehyde, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Paraldehyde must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), liquid oxygen, alkalis, and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where paraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of paraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of paraldehyde.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including formaldehyde, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration in added solvent. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 206-221-0

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P041.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Paraoxon is an odorless, reddish-yellow oil. Molecular weight = 275.22; Boiling point = 170°C at 1 mmHg; Freezing/Melting point = 189°C; Vapor pressure = 9×10^{-5} mmHg at 25°C. Slightly soluble in water; solubility = 3640 mg/L at 20°C.

Potential Exposure: An organophosphate insecticide. It has been used as a medication.

Incompatibilities: Decomposes in alkaline materials.

Permissible Exposure Limits in Air

No standards or TEEL available.

This chemical can be absorbed through the skin, thereby increasing exposure.

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.59$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can cause rapid organophosphate poisoning. Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. LD_{50} = (oral-rat) 1.8 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. Repeated exposure may cause personality changes, including depression, anxiety, irritability. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Refer to the NIOSH Criteria Documents #78-174 and #76-147 on manufacturing, formulating, and working safely with pesticides.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus compound, toxic n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances: Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30

Then: Protect persons downwind (miles/kilometers)

Day 0.3/0.4
Night 0.8/1.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 1.6/2.6
Night 2.8/4.5

Fire Extinguishing: This chemical is a combustible liquid, but does not readily ignite. Poisonous gases, including oxides of phosphorus and nitrogen, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA (*dichloride*): Possible Human Carcinogen.

US EPA Gene-Tox Program, Positive: *S. cerevisiae* gene conversion.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Banned or Severely Restricted (several countries) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg) (dichloride).

Reportable Quantity (RQ): 10 lb (4.54 kg) (dichloride).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations (*dichloride*): Hazard Symbol: T, N; Risk phrases: R24/25; R26; R36/37/38; R48/25; R50/53; Safety phrases: S1/2; S22; S28; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Paraquat is a yellow solid with a faint, ammonia-like odor. Molecular weight = 186.28; Specific gravity (H_2O:1) = 1.25; Boiling point = decomposes; Freezing/Melting point = 298°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): (paraquat) Health 4, Flammability 0, Reactivity 0. Soluble in water. Paraquat dichloride is a quaternary ion which is usually used as the dichloride salt. Molecular weight = 257.18. Highly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Those engaged in the manufacture, formulation, and application of this herbicide. Classified for restricted use: limited to use by a certified applicator, or those under applicator's direct supervision.

Incompatibilities: Strong oxidizers, alkylaryl-sulfonate wetting agents; strong bases (hydrolysis). Corrosive to metals. Decomposes in the presence of ultraviolet light. Decomposes in heat (see physical properties, above) and in the presence of UV light, producing nitrogen oxides, hydrogen chloride.

Permissible Exposure Limits in Air

OSHA PEL (*cation, dichloride, methosulfate*): 0.5 mg/m^3 respirable dust TWA [skin].

NIOSH REL (*dichloride*): 0.1 mg/m^3 respirable fraction TWA [skin].

ACGIH TLV®[1] (*cation*): 0.5 mg/m^3/; 0.1 mg/m^3 respirable fraction TWA.

NIOSH IDLH: 1 mg/m^3.

Protective Action Criteria (PAC) *(dichloride)*

TEEL-0: 0.1 mg/m^3

PAC-1: 0.1 mg/m^3

PAC-2: 0.15 mg/m^3

PAC-3: 1 mg/m^3

4685-14-7

TEEL-0: 0.1 mg/m^3

PAC-1: 0.25 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

DFG MAK (*dichloride*): 0.1 mg/m^3 measured as the inhalable fraction TWA; Peak Limitation Category I(1); [skin].

Austria: MAK 0.1 mg/m^3, [skin], 1999; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.2 mg/m^3, [skin], 1999; United Kingdom: TWA 0.08 mg/m^3, respirable dust, 2000; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg/m^3.

Several states have set guidelines or standards for paraquat in ambient air[60] ranging from 0.33 μg/m^3 (New York) to 0.50 μg/m^3 (South Carolina) to 1.0 μg/m^3 (Florida) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5003, Paraquat.

Permissible Concentration in Water: A lifetime health advisory of 3.0 μg/L has been derived by EPA (See "References" Below). In addition, the state of Maine[61] has set a guideline of 17.0 μg/L for paraquat in drinking water.

Determination in Water: Fish Tox = 2115.13304000 ppb (VERY LOW); Octanol−water coefficient: Log $K_{\mathrm{ow}} = -4.2$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Effects occur in two stages, immediate and delayed. Caution is advised. Exposure to paraquat may be fatal; there is no effective antidote. Signs and symptoms of acute exposure to paraquat may be severe and include nausea, vomiting, diarrhea, and abdominal pain. A burning sensation of the mouth and esophagus with possible ulceration may occur following ingestion. Eye exposure may result in corneal opacification (cloudiness). Dermatitis and nail atrophy may occur following dermal contact. Delayed effects include transient reversible liver injury, acute renal failure, and progressive pulmonary fibrosis with associated dyspnea (shortness of breath) and pulmonary edema. Absorbed through the skin and can lead to symptoms as listed in the following paragraph. In addition, can cause fingernail discoloration and damage (which returns to normal when exposure stops), irritation, redness, swelling, and burning. Exposure through ingestion may cause burning of the mouth and throat, nausea, vomiting, abdominal pain, diarrhea, and damage to the kidneys, heart, and liver. Lung damage, leading to death, may occur. One-half ounce of a 20% solution has caused death. Ingestion can also cause lung hemorrhage and fibrosis. The substance may cause effects on the lungs, kidneys, liver, cardiovascular system, and gastrointestinal tract, resulting in impaired functions, tissue lesions.

Long Term Exposure: Repeated or prolonged contact with skin may cause damage and possible loss of the fingernails, and can lead to dry and cracking skin with blistering. Repeated or prolonged exposure to the aerosol can cause lung irritation, lung damage; bronchitis may develop. Can cause scarring of the lungs leading to breathlessness. Can damage the liver, kidneys, and affect the heart. Human Tox = 3.15000 ppb Health Advisory (HIGH).

Points of Attack: Eyes, skin, respiratory system, heart, liver, kidneys, gastrointestinal tract.

Medical Surveillance: NIOSH lists the following tests: chest X-ray; liver function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1s); urine (chemical/metabolite); urinalysis (routine). Consider the points of attack in preplacement and periodic physical examinations. Kidney function tests. EKG. Chemical users should be cautioned about the use of alcohol which can increase liver damage.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water, or bentonite clay in water, or activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. Obtain authorization and/or further instructions from the local hospital for performance of other invasive procedures. Rush to a health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 mg/m*^{3}*:* CcrOv95* (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter); or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. This chemical is inactivated by inert clays and anionic surfactants. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, alkylaryl-sulfonate wetting agents, light. Where possible, automatically pump material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Bipyridilium pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Paraquat is in Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Poisonous gases, including nitrogen oxides, are produced in fire. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. If water pollution occurs, notify appropriate authorities. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Procedures for bipyridilium pesticides are as follows. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Paraquat is rapidly inactivated in soil. It is also inactivated by anionic surfactants.

Therefore, an effective and environmentally safe disposal method would be to mix the product with ordinary household detergent and bury the mixture in clay soil. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Hungary) (UN).[13]

SUPERFUND/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

European/International Regulations (*includes dichloride*): Hazard Symbol: T, N; Risk phrases: R24/25; R26; R36/37/38; R48/25; R50/53; Safety phrases: S1/2; S22; S28; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Paraquat methosulfate is a white to yellow crystalline solid. Molecular weight = 408.48; Freezing/Melting point = 175−180°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Those who might be involved in the manufacture or use of this contact herbicide and desiccant.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 40 mg/m^3

A MAC of 0.01 mg/m^3 has been set in Bulgaria according to the EPA Profile (see "References," below).

Determination in Air: Use NIOSH Analytical Method (IV) #5003, Paraquat.

Permissible Concentration in Water: Paraquat: A lifetime health advisory of 3.0 μg/L has been derived by EPA (see "References," below). In addition, the state of Maine[61] has set a guideline of 17.0 μg/L for paraquat in drinking water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact causes irritation. Inhalation causes nosebleeds, headaches, coughing, and a sore throat. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Swallowing causes burning in mouth, throat, and abdomen; vomiting, bloody vomitus; diarrhea with bloody stools; and headaches. It can cause death by shock and/or pulmonary damage. The fatal dose is estimated to be 6 g of paraquat ion. Exposure may cause renal tubular damage and liver dysfunction. Death may occur in 24 h or less.

Long Term Exposure: Liver and kidney damage.

Points of Attack: Lungs, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests (paraquat dichloride): chest X-ray; liver function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); urine (chemical/metabolite); urinalysis (routine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

The following is for reference: NIOSH (for *paraquat dichloride*): *Up to 1 mg/m^3:* CcrOv95* (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or PaprOvHie* (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter); or Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Bipyridilium pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Paraquat is in Packing Group III.

Spill Handling: Remove all ignition sources. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do so without risk. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for

firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] [parathion (all formulations—aerosols, dustable powder (DP), emulsifiable concentrate (EC), granules (GR), and wettable powders (WP)—of this substance are included, *except* capsule suspensions (CS))].

European/International Regulations: Hazard Symbol: T +, N; Risk phrases: R24; R26/28; R48/25; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Parathion is a clear liquid when fresh; pale yellow to dark-brown liquid with a garlic-like odor. Commercial formulations use carrier solvents that may change the physical properties shown. Molecular weight = 291.28; Specific gravity (H_2O:1) = 1.27; Boiling point = 375°C; 157−162°C at 6 mmHg (for CW agent); Freezing/Melting point = 6.1°C; also listed at 2.9°C for chemical warfare (CW) agent; Flash point = 195°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 24 mg/L.

Potential Exposure: A severely hazardous pesticide formulation. Those engaged in the manufacture, formulation, and application of this broad-spectrum insecticide. This material has also been used as a chemical warfare agent.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials. Attacks some plastics, rubbers, and coatings. Rapidly hydrolyzed by alkalis.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg/m^3 TWA [skin].

NIOSH REL: 0.05 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI; 0.05 mg[creatinine]/g in urine, end-of-shift.

NIOSH IDLH: 10 mg/m^3.

Protective Action Criteria (PAC)*

TEEL-0: 0.1 mg/m^3

PAC-1: 0.15 mg/m^3

PAC-2: **1.5** mg/m^3

PAC-3: **2** mg/m^3

AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 0.1 mg/m^3 measured as the inhalable fraction TWA; Peak Limitation Category II(8) [skin]; Pregnancy Risk Group D; BAT: 100 μg[*p*-nitrophenol]/L in urine after several shifts (sampling time).

Arab Republic of Egypt: TWA 0.1 mg/m^3, [skin], 1993; Australia: TWA 0.1 mg/m^3, [skin], 1993; Austria: MAK 0.1 mg/m^3, [skin], 1999; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Finland: TWA 0.1 mg/m^3, short-term exposure limit 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Japan: 0.1 mg/m^3, [skin], 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, [skin], 1993; Russia: STEL 0.05 mg/m^3, 1993; Thailand: TWA 0.11 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3, short-term exposure limit 0.3 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for parathion in ambient air[60] ranging from 0.238 μg/m^3 (Kansas) to 0.33 μg/m^3 (New York) to 0.5 μg/m^3 (South Carolina) to 1.0 μg/m^3 (North Dakota) to 1.6 μg/m^3 (Virginia) to 1.87 μg/m^3 (Pennsylvania) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides; OSHA Analytical Method ID-62.

Permissible Concentration in Water: Russia set a MAC[35] of 3.0 μg/L in surface water and Mexico has set maximum permissible concentrations of 1.0 μg/L in coastal waters and 10.0 μg/L in estuaries. Several states have set guidelines for parathion in drinking water[61] ranging from 8.6 μg/L in Maine to 30.0 μg/L in California and Kansas.

Determination in Water: Fish Tox = 0.26514000 ppb MATC (EXTRA HIGH); Octanol−water coefficient: Log K_{ow} = 3.15−3.8.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Parathion irritates the eyes, skin, and respiratory tract. A cholinesterase inhibitor. Acute exposure to parathion may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Hypotension (low blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression, and respiratory paralysis. Psychosis may occur. This material is extremely toxic; the probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. As little as 1 drop can endanger life if splashed in the eye. Toxicity is highest by inhalation. People at special risk are those with a history of glaucoma, cardiovascular disease, hepatic disease, renal disease, or central nervous system abnormalities. Some additional details on short-term exposure to parathion are as follows: *Inhalation:* Occasional human exposures at concentrations of 0.1−0.8 mg/m^3 did not give rise to any symptoms. Occasional human exposure at 1.5−2.0 mg/m^3 resulted in nausea and vomiting. Higher exposures can give rise to dizziness, blurred vision, wheezing, excessive salivation, and muscle and abdominal cramps. An estimated 10−20 mg (1/1500 oz) may cause death. *Skin:* However, many human poisonings have occurred through extensive skin contact at unspecified levels. This is the greatest hazard for some workers. Symptoms of poisoning include nausea, vomiting, weakness, blurring of vision, and muscle cramps. NIOSH lists the following symptoms of exposure: irritation of the eyes, skin, respiratory system; miosis; rhinorrhea (discharge of thin nasal mucus); headache; chest tightness; wheezing, laryngeal spasm; salivation, cyanosis, anorexia, nausea, vomiting, abdominal cramps; diarrhea; sweating; muscle fasciculation; weakness, paralysis; giddiness, confusion, ataxia; convulsions, coma; low blood pressure; cardiac irregular/irregularities.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 0.23100 ppb Health Advisory (EXTRA HIGH).

Points of Attack: Respiratory system, central nervous system, cardiovascular system, eyes, skin, blood cholinesterase.

Medical Surveillance: NIOSH lists the following tests: blood serum; cholinesterase: whole blood (chemical/metabolite); cholinesterase: blood plasma; cholinesterase: blood plasma, red blood cells/count; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-workweek. NIOSH recommends that medical surveillance, including preemployment and periodic examinations, shall be made available to workers who may be occupationally exposed to parathion. Biologic monitoring is also recommended as an additional safety measure. Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *0.5 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *1.25 mg/m^3*: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store where possible leakage from containers will not endanger the worker. Maintain regular inspection of containers for leakage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers and alkaline material. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." Parathion falls in DOT Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is not very combustible. Poisonous gases, including carbon monoxide, sulfur oxides, phosphorous oxides, nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. One manufacturer recommends the use of a detergent in a 5% trisodium phosphate solution for parathion disposal and cleanup problems. For parathion disposal in general, however, the recommended method is incineration (816°C, 0.5 s minimum for primary combustion; 1204°C, 1.0 s for secondary combustion) with adequate scrubbing and ash disposal facilities.[22]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); List of high-risk pollutants (Section 63.74) as arsenic compounds.

Clean Water Act: Section 311 Hazardous Substances/RQ 1 lb (0.454 kg); Toxic Pollutant (Section 401.15) as copper and compounds; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Safe Drinking Water Act 47FR9352 Regulated chemical: MCL, 0.05 mg/L (Section 141.11) applies only to community water systems (arsenic).

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 6010 (60); 7210 (200) *Note:* All species in the ground water that contain copper are included.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as arsenates, liquid, n.o.s.; arsenates, solid, n.o.s.; arsenical pesticides liquid, toxic, flammable, n.o.s.

California Proposition 65 Chemical: Cancer 2/27/87.

Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% arsenic, water-soluble compounds.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R23/25; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Paris green (copper acetoarsenite) is an odorless emerald green crystalline powder which decomposes upon heating. Molecular weight = 1013.78. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: This material is used primarily as an insecticide; it may be used as a wood preservative and a pigment, particularly for ships and submarines; and also finds use as an anthelmintic.

Incompatibilities: Can react vigorously with oxidizers. Emits highly toxic arsenic fumes on contact with acid or acid fumes; and in elevated temperatures.

Permissible Exposure Limits in Air

Arsenic, organic compounds

OSHA PEL: 0.5 mg[As]/m^3 TWA.

NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.

ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.

Protective Action Criteria (PAC)

Paris green; cupric acetoarsenite

TEEL-0: 1.13 mg/m^3

PAC-1: 3.38 mg/m^3

PAC-2: 22 mg/m^3

PAC-3: 22 mg/m^3

As arsenic, organic compounds

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 2.5 mg/m^3

PAC-3: 350 mg/m^3

Arab Republic of Egypt: TWA 0.2 mg/m^3, 1993; Australia: TWA 0.05 mg/m^3, carcinogen, 1993; Belgium: TWA 0.2 mg/m^3, 1993; Denmark: TWA 0.05 mg/m^3, 1999; Finland: carcinogen, 1993; France: VME 0.2 mg/m^3, 1993; Hungary: STEL 0.5 mg/m^3, carcinogen, 1993; India: TWA 0.2 mg/m^3, 1993; Norway: TWA 0.02 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3, 1993; Poland: MAC (TWA) 0.01 mg/m^3, 1999; Sweden: NGV 0.03 mg/m^3, carcinogen, 1999; Switzerland: TWA 0.1 mg/m^3, carcinogen, 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg (As)/m^3; TWA 0.5 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH: TLV: Confirmed Human Carcinogen. Russia[43] set a MAC of 0.003 mg/m^3 on a daily average basis for residential areas. Several states have set guidelines or standards for arsenic in ambient air[60]: 0.06 mg/m^3 (California Prop. 65), 0.0002 μg/m^3 (Rhode Island), 0.00023 μg/m^3 (North Carolina), 0.024 μg/m^3 (Pennsylvania), 0.05 μg/m^3 (Connecticut), 0.07−0.39 μg/m^3 (Montana), 0.67 μg/m^3 (New York), 1.0 μg/m^3 (South Carolina), 2.0 μg/m^3 (North Dakota), 3.3 μg/m^3 (Virginia), 5 μg/m^3 (Nevada).

Determination in Air: NIOSH Analytical Methods (inorganic arsenic): #7300, #7301, #7303, #7900, #9102; OSHA Analytical Methods ID-105. The American Conference of Government Industrial Hygienists (ACGIH) Method 803 measures total particulate arsenic in air.

Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons but has set a guideline of 50 μg/L[61] for drinking water.

Determination in Water: *For arsenic:* The atomic absorption graphite furnace technique is often used for measurement of total arsenic in water. It has also been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry. See OSHA Analytical Method #ID-105 for arsenic.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: It may cause eye and respiratory tract irritation. Industrial exposure may cause dermatitis. This material is extremely toxic; the probable oral lethal dose for humans is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 150-lb person. Some absorption may occur through the skin and by inhalation, but most poisonings result from ingestion. Symptoms usually appear ½ to 1 h after ingestion, but may be delayed. Causes gastric disturbance, tremors, muscular cramps, and nervous collapse, which may lead to death. Symptoms of exposure also include a sweetish, metallic taste and garlicky odor; difficulty in swallowing; abdominal pain; vomiting and diarrhea; dehydration; rapid heartbeat; dizziness and headache; and eventually coma; sometimes convulsions; and death.

Long Term Exposure: May cause liver damage. Arsenic compounds may cause blood, kidneys, and nervous system damage, and skin abnormalities may develop. See also entries for "Arsenic" and "Copper."

Points of Attack: Liver, kidneys, blood, skin.

Medical Surveillance: Liver and kidney function tests. Blood tests including CBC.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metal poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are required under OSHA 1910.1018*, Inorganic Arsenic*. See also NIOSH Criteria Document #75-149, *"Inorganic Arsenic."*
Respirator Selection: *Copper dusts and mists: 5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *10 mg/m^3:* Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *100 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape*: 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Note: Substance reported to cause eye irritation or damage; may require eye protection.
Arsenic: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFAg100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with copper acetoarsenite you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area, away from strong bases, strong acids, and moisture. Where possible, automatically pump liquid from drums or other storage containers to process containers.
Shipping: Copper acetoarsenite requires a shipping label of "POISONOUS/TOXIC MATERIALS." Copper acetoarsenite falls in Hazard Class 6.1 and Packing Group II.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Do not touch spilled material. Take up *small spills* with sand or other noncombustible absorbent material and place in sealed containers for later disposal. For *small dry spills*, use a clean shovel to place material in clean, dry

container. For *large spills*, dike far ahead of spill for later disposal. Use water spray to knock down dust. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous fumes are produced in fire, including arsenic oxide and copper. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 243-194-4

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Reportable Quantity (RQ): 500 lb (227 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pentaborane is a colorless, volatile liquid with an unpleasant, sweetish odor, like sour milk. The odor threshold is 0.8 ppm. Molecular weight = 63.14; Specific gravity (H_2O:1) = 0.62; Boiling point = 60°C; Freezing/Melting point = −47°C; Vapor pressure = 171 mmHg at 25°C; Flash point = 30°C; Autoignition temperature: about 35°C. Explosive limits: LEL = 0.42%; UEL = 98%. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 4, Reactivity 2. Reacts with water.

Potential Exposure: Pentaborane is used in rocket propellants and in gasoline additives.

Incompatibilities: Reacts on contact with oxidizers, halogens, water, halogenated hydrocarbons. May ignite *spontaneously* in moist air, decomposes at 150°C. Corrosive to natural rubber. Hydrolyzes slowly with heat in water to form boric acid. Contact with solvents, such as ketones, ethers, esters, forms shock-sensitive compounds. Corrosive to natural rubber and some synthetic rubber; some lubricants.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.58 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.005 ppm/0.01 mg/m^3 TWA.

NIOSH REL: 0.005 ppm/0.01 mg/m^3 TWA; 0.015 ppm/0.03 mg/m^3 STEL.

ACGIH TLV®[1]: 0.005 ppm/0.013 mg/m^3 TWA; 0.015 ppm/0.039 mg/m^3 STEL.

NIOSH IDLH: 1 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.005 mg/m^3

PAC-1: 0.015 mg/m^3

PAC-2: **0.14** mg/m^3

PAC-3: **0.70** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

[skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Japan: 0.1 mg/m^3, [skin], 1999; Norway: TWA 0.05 mg/m^3, 1999; the Philippines: TWA 0.1 mg/m^3, [skin], 1993; Russia: STEL 0.05 mg/m^3, 1993; Thailand: TWA 0.11 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, [skin], 1993; United Kingdom: TWA 0.1 mg/m^3, short-term exposure limit 0.3 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for pentaborane in ambient air[60] ranging from 0.16 μg/m^3 (Virginia) to 0.2 μg/m^3 (Connecticut) to 1.0–3.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Nevada).

Determination in Air: No Analytical Method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Causes severe irritation to the respiratory tract. Pentaborane may affect the central nervous system, resulting in visual disturbances, poor judgment, behavioral changes, loss of recent memory, nausea, vomiting, drowsiness, and difficulty in focusing. Inhalation of higher concentrations may cause headache, dizziness, nervous excitation, muscular pain, muscle incoordination, cramps, tremors, convulsions, and coma. Death can occur by central nervous system poisoning.

Points of Attack: Central nervous system, eyes, skin.

Medical Surveillance: Preemployment and periodic physical examinations to determine the status of the workers' general health should be performed. These examinations should be concerned especially with any history of central nervous system disease, personality or behavioral changes, as well as liver, kidney, or pulmonary disease of any significant nature. Chest X-ray, blood, liver, and renal function studies may be helpful.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.05 ppm:* Sa (APF = 10) (any supplied-air respirator). *0.125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *0.25 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *1 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Make certain respirator has no exposed rubber gaskets.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, halogens, water, halogenated hydrocarbons. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.2 and Packing Group I. A plus sign (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Do not touch spilled material, stop leak if you can do it without risk. For spills, dike for later disposal and do not apply water unless directed to do so. Clean up only under supervision of an expert. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Avoid breathing vapors, and keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.4/2.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1250/400
Then: Protect persons downwind (miles/kilometers)
Day 2.9/4.7
Night 5.5/8.9

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including boron, are produced in fire. Ignites spontaneously in air. Reacts violently with halogenated extinguishing agents. Fires tend to reignite. If material is on fire or involved in fire, do not extinguish unless flow can be stopped. *Do not use water*. Extinguish *small fires* with dry chemical or carbon dioxide. For *large fires* withdraw and let burn. Move container from fire area if you can do it without risk. Cool containers that are exposed to flames with water from the side until well after fire is out. *For massive fire* in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Wear positive pressure breathing apparatus and full protective clothing. If fire becomes uncontrollable or container is exposed to direct flame—evacuate for a radius of 1500 feet. If material is leaking (not on fire), downwind evacuation must be considered. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration with aqueous scrubbing of exhaust gases to remove B_2O_3 particulates.

EC Number: 210-172-0 [*Annex I Index No.:* 602-074-00-5]

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity.

TSCA: Subject to a proposed or final SNUR; Subject to a Section 4 test rule.

US EPA Hazardous Waste Number (RCRA No.): U183.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.055; Nonwastewater (mg/kg), 10.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 10 lb (4.54 kg).

List of Stockholm Convention POPs: Annex A (Elimination); Annex C (Unintentional production and release).

European/International Regulations: Hazard Symbol: Risk phrases: F, Xn, N; R11; R22; R50/53; Safety phrases: S2; S41; S46; S50; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Pentachlorobenzene is a colorless crystalline solid with a pleasant aroma. Molecular weight = 250.32; Boiling point = 277°C; Freezing/Melting point = 86°C. Insoluble in water; solubility 0.65 mg/L.

Potential Exposure: Pentachlorobenzene is used primarily as a precursor in the synthesis of the fungicide pentachloronitrobenzene, and as a flame retardant. Drug/Therapeutic Agent; Fungicide; bactericide; wood preservative; industrial insecticides; organochlorine; Reproductive Effect; Tumor data.

Incompatibilities: Polychlorinated hydrocarbons can react with oxidizers and may react violently with aluminum, liquid oxygen, potassium, sodium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.04 mg/m^3

PAC-1: 0.125 mg/m^3

PAC-2: 0.75 mg/m^3

PAC-3: 400 mg/m^3

Determination in Air: Filter/XAD-2; workup with hexane; GC/ECD; NIOSH Analytical Method (IV) #5517, Polychlorobenzenes.

Determination in Water: A persistent organic pollutant. Log $K_{ow} = 4.75-5.75$.

Permissible Concentration in Water: The US EPA has set a criterion of 0.5 μg/L based on toxicity studies.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May affect the nervous system. LD_{50}= (oral-rat) 1080 mg/kg.

Long Term Exposure: Pentachlorobenzene may affect the liver and kidneys, causing tissue lesions. Limited animal studies have produced developmental effects and decreased body weights in fetuses.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources.[52] Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8240 (5); 8270 (10).

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R40; R48/23; R51/53; Safety phrases: S1/2; S23; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pentachloroethane is a colorless, heavy, nonflammable liquid with a sweetish chloroform- or camphor-like odor. Molecular weight = 202.28; Boiling point = 162°C; Freezing/Melting point = −29°C; Flash point = 75°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen. Pentachloroethane is used in the manufacture of tetrachloroethylene and as a solvent for cellulose acetate, certain cellulose ethers, resins, and gums. It is also used as a drying agent for timber by immersion at temperatures greater than 100°C.

Incompatibilities: May self-ignite. Violent reaction with alkali metals (i.e., lithium, sodium, potassium, rubidium, cesium, francium) will produce spontaneous explosive chloroacetylenes. Shock- and friction-sensitive material formed by mixture with potassium.

Permissible Exposure Limits in Air

NIOSH REL: Handle with caution; See *NIOSH Pocket Guide*, Appendix C.

Protective Action Criteria (PAC)

TEEL-0: 46 mg/m^3

PAC-1: 126 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 5 ppm/42 mg/m^3 TWA; Peak Limitation Category II(2).

Rumania: TWA 30 mg/m^3; Yugoslavia: MAC 5 ppm/40 mg/m^3.

Determination in Air: Use NIOSH Analytical Method (IV) #2517.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 7240 μg/L on an acute toxicity basis and 1100 μg/L on a chronic basis. *To protect saltwater aquatic* *life:* 390 μg/L on an acute toxicity basis and 231 μg/L on a chronic basis. To protect human health—no criteria derived due to insufficient data.[6]

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Pentachloroethane is an irritant and a strong central nervous system depressant. Pentachloroethane has a strong narcotic effect. Symptoms include prompt nausea, vomiting, abdominal pain with diarrhea, headaches, dizziness, confusion, drowsiness, and occasionally, convulsions. Visual disturbances may arise followed by coma and possible death from respiratory arrest or circulatory collapse. Death may occur by respiratory arrest or circulatory collapse. Occasionally, sudden death may occur due to ventricular fibrillation. Other effects may include weight gain, edema, loss of appetite, jaundice, and pain (due to enlarged liver). The chemical is very toxic with a probable oral lethal dose of 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb person. In animals: irritation of eyes, skin; weakness, restlessness, irregular/irregularities of respiration, muscle incoordination; liver, kidney, lung changes (NIOSH).

Long Term Exposure: Exposure to this material may result in injury to the liver, lungs, and kidneys.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator away from alkalis, reactive metals, water. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including chlorine, are produced in fire. Fires should be extinguished using water, carbon dioxide, or dry chemical. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Remove and isolate contaminated clothing at the site.

Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Regulatory Authority and Advisory Bodies

US EPA GENETOX PROGRAM: Positive: Histidine reversion—Ames test, 1988.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R21/22; R36/38; R50/53; Safety phrases: S2 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Pentachloronaphthalene is a pale yellow or white solid powder with an aromatic odor. Molecular weight = 300.38; Specific gravity (H_2O:1) = 1.67; Boiling point = 335.6°C. Freezing/Freezing/Melting point = 120°C; Vapor pressure = $<$1 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Used in electric wire insulation, in additives to specialized lubricants, and as a fire- and water-proofing agent.

Incompatibilities: Violent reaction with strong oxidizers, aluminum, liquid oxygen, potassium, sodium. Heat may contribute to instability.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin].

No TEEL available.

DFG MAK: 0.5 mg/m^3 TWA [skin].

Australia: TWA 0.5 mg/m^3, 1993; Austria: MAK 0.5 mg/m^3, [skin], 1999; Belgium: TWA 0.5 mg/m^3, 1993; Denmark: TWA 0.5 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, 1999; Norway: TWA 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 1.5 mg/m^3, 1999; Sweden: NGV 0.2 mg/m^3, KTV 0.3 mg/m^3, [skin], 1999; Switzerland: MAK-W 0.5 mg/m^3, KZG-W 2.5 mg/m^3, [skin], 1999; Turkey: TWA 0.5 mg/m^3, [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 mg/m^3 [skin].

When skin contact also occurs, you may be overexposed, even though air levels are less than the limit listed above.

Determination in Air: Use NIOSH II(2), Method #S9.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 8.73−9.13 (ICSC).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin rash may occur if contaminated skin is exposed to sunlight. Can affect the nervous system, causing headache, fatigue, dizziness, vertigo (an illusion of movement), anorexia (loss of appetite).

Long Term Exposure: Repeated or prolonged contact with skin may cause acne-like rash (chloracne), pruritus. May affect the liver, causing jaundice; liver necrosis.

Points of Attack: Skin, liver, central nervous system.

Medical Surveillance: NIOSH lists the following tests: Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 mg/m^3:* Sa* (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 201-435-0 [*Annex I Index No.:* 609-043-00-5] (quintozene)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987; NCI: Carcinogenesis Studies (feed); no evidence: mouse; NTP: Carcinogenesis Studies (feed); no evidence: mouse.

US EPA Gene-Tox Program, Negative: Host-mediated assay; *In vitro* UDS—human fibroblast; Negative: TRP reversion; *S. cerevisiae*—homozygosis; Negative/limited: Carcinogenicity—mouse/rat; Inconclusive: *B. subtilis* rec assay; *E. coli* polA without S9; Inconclusive: Histidine reversion—Ames test; Inconclusive: *D. melanogaster* sex-linked lethal.

Banned or Severely Restricted (Germany, US) (UN).[13]

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U185.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.055; Nonwastewater (mg/kg), 4.8.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R43; R50/53; Safety phrases: S2; S13; S24; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pentachloronitrobenzene forms colorless needles. Technical-grade PCNB contains an average of 97.8% PCNB, 1.8% hexachlorobenzene (HCB), 0.4% 2,3,4,5-tetrachloronitrobenzene (TCNB), and less than 0.1% pentachlorobenzene. Molecular weight = 295.32; Boiling point = 328°C; Freezing/Melting point = 146°C; Vapor pressure = 1×10^{-4} mbar at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector. Those engaged in the manufacture, formulation, and application of this soil fungicide and seed treatment chemical.

Incompatibilities: Alkalis.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.5 mg/m^3 TWA: not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 500 mg/m^3

Denmark: TWA 0.5 mg/m^3, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3, 2003; Russia[35,43] set a MAC of 0.5 mg/m^3 in work-place air and MAC values for ambient air in residential areas of 0.01 mg/m^3 on a momentary basis and 0.006 mg/m^3 on a daily average basis. A guideline in ambient air has been set[60] in Pennsylvania at 2.47 μg/m^3.

Determination in Water: Fish Tox = 64.49856000 MATC (INTERMEDIATE).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May cause skin and eye irritation; sensitization with erythema, itching, and edema. A rebuttable presumption against registration of PCNB for pesticidal uses was issued on October 13, 1977 by EPA on the basis of oncogenicity.

Long Term Exposure: There is limited evidence that this compound is an animal carcinogen. Human Tox = 2.10000 ppb (HIGH).

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place away from strong bases. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Seal all wastes in vapor-tight plastic bags for eventual disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. It has been observed that the product decomposes readily when burned with polyethylene. The compound is highly stable in soil in general, as would be expected on the basis of the polychlorinated aromatic structure.[22]

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Pentachlorophenol is a colorless to white crystalline solid. It has a benzene-like odor; pungent when hot. The odor threshold in water is 1600 μg/L and the taste threshold in water is 30 μg/L. Molecular weight = 266.32; Specific gravity (H_2O:1) = 1.98; Boiling point = 308.9°C (decomposes); Freezing/Melting point = 190°C (anhydrous); Vapor pressure = 0.0001 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility in water = 0.001 at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Pentachlorophenol (PCP) is a commercially produced bactericide, fungicide, and slimicide used primarily for the preservation of wood, wood products, and other materials. As a chlorinated hydrocarbon, its biological properties have also resulted in its use as an herbicide and molluscicide. Two groups can be expected to encounter the largest exposures. One involves the small number of employees involved in the manufacture of PCP. All of these are presently under industrial health surveillance programs. The second and larger group are the formulators and wood theaters. Exposure, hygiene and industrial health practices can be expected to vary from the small theaters to the larger companies. The principal use as a wood preservative results in both point source water contamination at manufacturing and wood preservation sites and, conceivably, nonpoint source water contamination through runoff wherever there are PCP-treated lumber products exposing PCP to soil.

Incompatibilities: Reacts violently with strong oxidizers, acids, alkalis, and water.

Permissible Exposure Limits in Air
OSHA PEL: 0.5 mg/m^3 TWA [skin].
NIOSH REL: 0.5 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin]; BEI: 2 mg[total *PCP*]/g creatinine in urine/prior to last shift of workweek; 5 mg [free PCP]/L in plasma/end-of-shift; confirmed animal carcinogen with unknown relevance to humans.
NIOSH IDLH: 2.5 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.5 mg/m^3
PAC-1: 2 mg/m^3
PAC-2: 2.5 mg/m^3
PAC-3: 2.5 mg/m^3
DFG MAK: [skin] Carcinogen Category 2.
Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; Denmark: TWA 0.005 ppm (0.05 mg/m^3), [skin], 1999; Finland: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, [skin], continuous carcinogen, 1999; Hungary: TWA 0.2 mg/m^3; STEL 0.4 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.06 mg/m^3, [skin], 2003; Norway: TWA 0.05 ppm (0.5 mg/m^3), 1999; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Russia: STEL 0.1 mg/m^3, [skin], 1993; Sweden: NGV 0.5 mg/m^3, KTV 1.5 mg/m^3, [skin], 1999; Switzerland: MAK-W 0.05 ppm (0.5 mg/m^3); STEL 0.1 ppm, [skin], 1999; Turkey: TWA 0.5 mg/m^3, [skin], 1993; United Kingdom: TWA 0.5 mg/m^3; STEL 1.5 mg/m^3, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The notation "skin" is added to indicate the possibility of cutaneous absorption. Russia[43] set a MAC of 0.1 mg/m^3 in work-place air and a MAC in ambient basis. Several states have set guidelines or standards for Pentachlorophenol in ambient air[60] ranging from zero (North Carolina) to 0.034 μg/m^3 (Massachusetts) to 1.67 μg/m^3 (New York) to 5.0 μg/m^3 (North Dakota and South Carolina) to 8.0 μg/m^3 (Virginia) to 10.0 μg/m^3 (Connecticut and South Dakota) to 12.0 μg/m^3 (Nevada and Pennsylvania) to 25.64 μg/m^3 (Kansas).

Determination in Air: Use NIOSH (IV) Analytical Method #5512, Pentachlorophenol; in blood, #8001; in urine, #8303; OSHA Analytical Method 39.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 5.0$.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 55 μg/L on an acute toxicity basis and 3.2 μg/L on a chronic basis. *To protect saltwater aquatic life:* 53 μg/L on an acute basis and 34 μg/L on a chronic basis. To protect human health—1.010 μg/L is the criteria set by EPA based on toxicity data. A value of 30 μg/L is set on an organoleptic basis.[6] More recently, EPA[47] has developed a lifetime health advisory of 220 μg/L. WHO[35] has set a limit of 10 μg/L on pentachlorophenol in drinking water. Russia[43] set a MAC of 300 μg/L in water bodies used for domestic purposes. More recently, EPA has set a guideline of 200 μg/L for drinking water.[62] Several states have set guidelines for Pentachlorophenol in drinking water[61] ranging from 6 μg/L (Maine) to 30 μg/L (California) to 200 μg/L (Arizona) to 220 μg/L (Kansas and Minnesota).

Determination in Water: Methylene chloride extraction followed by gas chromatography with electron capture or halogen specific detection (EPA Method 608) or gas chromatography plus mass spectrometry (EPA Method 625). Fish Tox = 23.89351000 MATC (INTERMEDIATE) ppb.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Pentachlorophenol irritates the eyes, skin, and respiratory tract. May affect the cardiovascular system. *Inhalation:* Levels of 1 mg/m^3 can cause severe irritation of the nose, throat, and lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Breathing dust or particulates tainted with pentachlorophenol can give rise to sneezing. *Skin:* A 0.04% solution can cause pain and inflammation at point of contact. Chloracne, a skin disorder, has been observed in workers in pentachlorophenol manufacturing plants and wood preserving operations. Profuse sweating and elevated temperature are symptoms of poisoning due to prolonged contact. Excessive skin exposure has caused human death. *Eyes:* Levels of 1 mg/m^3 may be irritating and excessive contact can lead to loss of sight due to corneal damage. *Ingestion:* The lethal human dose is approximately equal to 1 teaspoon for a 150-lb person. Ingestion of 4–8 oz followed by prompt emergency treatment still produced symptoms of poisoning which included rapid breathing followed by a decrease in breathing rate, abdominal pain, reduced blood pressure, excessive and slurred speech, and weakness.

Long Term Exposure: Irritation of eyes, throat, nose, and upper lungs has been reported by individuals using pentachlorophenol as an insecticide for periods of a few years. Chemical acne has been associated with prolonged exposure to this compound. May affect the central nervous system, kidneys, liver, lungs. May be a carcinogen in humans. May damage the developing fetus. There is limited evidence that pentachlorophenol is a teratogen in animals. Tumors have been detected in experimental animals. Human Tox = 1.00000 ppb MCL (HIGH).

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, liver, kidneys, central nervous system. Cancer site in animals: liver.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); blood plasma; blood plasma, end-of-shift; blood serum; urine (chemical/metabolite); urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior-to-shift; urine (chemical/metabolite), prior-to-last-shift-of-workweek. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for pentachlorophenol. Liver and kidney function tests. Refer to the NIOSH Criteria Documents #78-174 and #76-147, *Manufacturing, formulating, and working safely with pesticides*.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, polyvinyl chloride, and Tychem® (from E.I. du Pont de Nemours & Company) are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2.5 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter) or Sa

(APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) (any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Pentachlorophenol must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pentachlorophenol requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire (the material itself does not burn). Poisonous gases, including hydrogen chloride, dioxines, and chlorinated phenols, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Incineration (600−900°C) coupled with adequate scrubbing and ash disposal facilities.[22] Alternatively pentachlorophenol in wastewaters, for example, may be recovered and recycled.

Pentaerythritol P:0250

Molecular Formula: $C_5H_{12}O_4$
Common Formula: $C(CH_2OH)_4$
Synonyms: 2,2-bis(Hydroxymethyl)-1,3-propanediol; Methane tetramethylol; Monopentaerythritol; PE; Pentaerythrite; Tetrahydroxymethylmethane; Tetramethylolmethane
CAS Registry Number: 115-77-5
RTECS® Number: RZ2490000
EC Number: 204-104-9
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.
Description: Pentaerythritol is a white crystalline solid. Molecular weight = 136.17; Specific gravity (H_2O:1) = 1.38; Boiling point = (sublimes) 276°C at 30 mmHg; Freezing/Melting point = (sublimes) 261°C; Vapor pressure = 8×10^{-8} mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Slightly soluble in water; 6% at 15°C.
Potential Exposure: Pentaerythritol is used in coatings and stabilizers; in the formation of alkyd resins and varnishes. It is used as an intermediate in the manufacture of plasticizers, explosives (PETN), and pharmaceuticals.
Incompatibilities: Organic acids, oxidizers. Explosive compound is formed when a mixture of PE and thiophosphoryl chloride is heated.
Permissible Exposure Limits in Air
OSHA PEL: 15 mg/m^3 (total inhalable dust) TWA; 5 mg/m^3 TWA, respirable fraction.
NIOSH REL: 10 mg/m^3 (total inhalable dust) TWA; 5 mg/m^3 TWA, respirable fraction.
ACGIH TLV®[1]: 10 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 15 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 500 mg/m^3
Australia: TWA 10 mg/m^3, 1993; Belgium: TWA 10 mg/m^3, 1993; Finland: TWA 10 mg/m^3; STEL 20 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3; STEL 20 mg/m^3, total inhalable dust; TWA 4 mg/m^3, respirable dust, 2000; the Netherlands: MAC-TGG 10 mg/m^3 (total dust), 2003; the Netherlands: MAC-TGG 5 mg/m^3 (respirable dust), 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 10 mg/m^3. States which have set guidelines or standards for pentaerythritol in ambient air[60] include Virginia at 80 μg/m^3 and Connecticut at 300 μg/m^3.
Determination in Air: Use NIOSH IV Method #0500, total dust; Method #0600 (respirable dust), Particulates NOR.
Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes and respiratory system. Feeding studies using human volunteers showed that 85% of Pentaerythritol fed was eliminated unchanged in the urine within 30 h. There are, in general, no significant effects on health by common routes of exposure even at abnormal use concentrations.
Points of Attack: Eyes, respiratory system.
Medical Surveillance: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Use dust respirator.
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from organic acids, oxidizers.
Shipping: Not regulated.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially

contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Pentaerythritol tetranitrate P:0255

Molecular Formula: $C_5H_8N_4O_{12}$

Common Formula: $C(CH_2ONO_2)_4$

Synonyms: Angicap; Angitet; Cardiacap; 1,3-Dinitrato-2,2-bis(nitratomethyl)propane; Nitropenta; Pentaerythrite tetranitrate; Pentaerithrityl tetranitrate; Pentaerithrityltetranitrat (German); Pentrita (Spanish); PETN; 1,3-Propanediol,2,2-bis[(nitrooxy) methyl]-, dinitrate (ester); Tetranitrato de pentaeritritilo (Spanish); Tétranitrate de pentaerithrityle (French); Vasitol; Vasodiatol

CAS Registry Number: 78-11-5; *(alt.)* 103842-90-6; *(alt.)* 108736-71-6

RTECS®Number: RZ2620000

UN/NA & ERG Number: UN3344 (Pentaerythrite tetranitrate mixture, desensitized, solid, n.o.s. with >10% but not >20% PETN, by mass)/113; UN0150 (Pentaerythrite tetranitrate, wetted or Pentaerythritol tetranitrate, wetted, or PETN, wetted or Pentaerythrite tetranitrate, or Pentaerythritol tetranitrate or PETN, desensitized)/112

EC Number: 201-084-3

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

Not listed under California Proposition 65.

Chemicals Subject to TSCA 12(b) Export Notification Requirements, Section 4 (1%).

European/International Regulations: Hazard Symbol: E; Risk phrases: R3; Safety phrases: S2; S35 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pentaerythrite tetranitrate (PETN) is a high explosive, especially when dry. PETN is a sand-like, white crystalline solid. Practically odorless. Molecular weight = 316.17; Boiling point = 205−215°C (explodes); Vapor pressure = negligible; 1.04×10^{-10} mmHg at 25°C; 1.035×10^{-10} mmHg at 25°C. Density 1.75−1.77 g/cm^3. Freezing/Melting point = 138−140°C. Autoignition temperature = (explodes) 210°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2; Flammability, 2; Reactivity, 4. Solubility in water = 4.3 mg/100 g at 25°C. The principal hazard from PETN is blast from sudden and abrupt explosion; not from ruptured or bursting container fragments or rocketing projectiles.

Potential Exposure: Compound Description: Tumorigen, Drug, Mutagen, Human Data. First introduced following WWII, PETN shares the same chemical family as nitroglycerine. It is 70% more powerful than TNT.[NYT] Used in the manufacture of fuses for detonation and explosive specialties, including the plastic explosive, Semtex, and in blasting caps. PETN is also used as a medical vasodilator to lower blood pressure by widening blood vessels to improve blood flow. PRTN has been used in terrorism attempts in 2001 by the so-called "shoe bomber," in 2009 by the "underwear bomber," and most recently in October 2010, hidden in printer cartridges being shipped internationally by passenger jet.

Incompatibilities: Normally stable, PETN does not easily explode when dropped or set on fire (rapid heating can cause detonation when heated to 210°C). Nevertheless, PETN is a dangerous high explosive and a strong oxidizer. PETN normally requires a blasting cap or other kind of detonator but may decompose explosively from concussion, shock, friction, static charges. Contact with reducing agents (e.g., zinc, alkaline metals) may cause explosion. Keep away from combustible materials, other oxidizers (e.g., nitrates, permanganates). Contact with sulfur trioxide may cause detonation. May explode in the presence of strong bases (i.e., sodium or potassium hydroxide). May react with heavy metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.015 mg/m^3

PAC-1: 0.05 mg/m^3

PAC-2: 0.35 mg/m^3

PAC-3: 500 mg/m^3

If material is mixed with TNT, see entry T:0920.

Determination in Air: NIOSH method not established. If material is mixed with TNT, see entry T:0920.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.60.

Routes of Entry: Inhalation of dust, fume, or vapor; ingestion of dust; percutaneous absorption from dust, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive and highly irritating. Target organs are the skin and heart. Contact irritates the eyes, nose, and throat. Can penetrate the skin. Exposure can cause red eyes, dizziness, irritability, headache, convulsions, nausea, vomiting.

PETN is a vasodilator and can affect the cardiovascular system, resulting in widening of blood vessels and the lowering of blood pressure. Medical care is advised.

Long Term Exposure: Lowest published toxic dose (oral, man): 1669 mg/kg/8 year—continuous. [British Journal of Dermatology (87, 498, 1972)].

Medical Surveillance: If material is mixed with TNT, see entry T:0920.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl chloride is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The Webster skin test (colorimetric tests with alcoholic sodium hydroxide) or indicator soap should be used to make sure workers have washed all PETN off their skins.

Respirator Selection: 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or any air-purifying full-face-piece respirator equipped with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100; or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or any supplied-air respirator with a full face-piece that is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: An explosive and a strong oxidizer. Color Code—Red Stripe: Flammability Hazard: Store in a explosion-proof refrigerator and keep away from reducing agents.[52] Store in a cool, dark place in a airtight container, separately from all other flammable materials. Unless specified by manufacturer, store between 15°C and 30°C. Protect from light. Prior to working with this chemical you should be trained on its proper handling and storage. Keep material wet with water and treat as an explosive. Keep away from heat, sources of ignition, metal, nitric acid, and reducing materials. Protect containers from shock. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Pentaerythrite tetranitrate mixture, desensitized, solid, n.o.s. with $>10\%$ but not $>20\%$ PETN, by mass. Must be labeled "FLAMMABLE SOLID." This falls into Hazard Class 4.1 and Packing Group II. Pentaerythrite tetranitrate, wetted or Pentaerythritol tetranitrate, wetted, or PETN, wetted or Pentaerythrite tetranitrate, or Pentaerythritol tetranitrate or PETN, desensitized must be labeled "EXPLOSIVE 1.1D." It falls in Hazard Class 1.1D and Packing Group II. Air transport in passenger and cargo planes is FORBIDDEN.

Spill Handling: Seek expert help or contact manufacturer. Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with water to avoid dust. Do not wash material to sewer. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Seek expert help or contact manufacturer. This chemical is a dangerously explosive solid and a strong oxidizer. It will increase the activity of an existing fire. The major hazard from PETN is the blast from sudden and abrupt explosion; not necessarily from ruptured or bursting container fragments or rocketing projectiles. When heated to decomposition, this material emits highly toxic nitrogen oxide fumes. If material is on fire and conditions permit, do not extinguish. Evacuate area and let burn. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 203-692-4 [*Annex I Index No.:* 601-006-00-1]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xn, N; Risk phrases: R12; R51/53; R65; R66; R67; Safety phrases: S2; S9; S16; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Pentane is a colorless liquid. Gas above 36°C. Gasoline-like odor. Molecular weight = 72.17; Specific gravity (H_2O:1) = 0.63; Boiling point = 36°C; Freezing/Melting point = −129°C; Vapor pressure = 420 mmHg at 25°C; Flash point = −49.4°C (cc); Autoignition temperature = 260°C; also listed at 284 and 309°C. Explosive limits: LEL = 1.4%; UEL = 7.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Human Data. Pentane is used in the manufacture of ice, low-temperature thermometers, in solvent extraction processes, as a blowing agent in plastics, as a fuel, as a chemical intermediate (e.g., amylchlorides).

Incompatibilities: Reacts with strong oxidizers. Attacks some plastics, rubbers, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.95 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/2950 mg/m^3 TWA.

NIOSH REL: 120 ppm/350 mg/m^3 TWA; 610 ppm/1800 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 600 ppm/1770 TWA.

NIOSH IDLH: 1500 ppm [LEL].

Protective Action Criteria (PAC)

TEEL-0: 120 ppm

PAC-1: 120 ppm

PAC-2: 610 ppm

PAC-3: 1500 ppm

DFG MAK: 1000 ppm/3000 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Australia: TWA 600 ppm (1800 mg/m^3); STEL 750 ppm, 1993; Austria: MAK 600 ppm (1899 mg/m^3), 1999; Belgium: TWA 600 ppm (1770 mg/m^3); STEL 750 ppm (2210 mg/m^3), 1993; Denmark: TWA 500 ppm (1500 mg/m^3), 1999; Finland: TWA 500 ppm (1500 mg/m^3); STEL 625 ppm (1800 mg/m^3), 1999; France: VME 600 ppm (1800 mg/m^3), 1999; Hungary: TWA 500 mg/m^3; STEL 1500 mg/m^3, 1993; the Netherlands: MAC-TGG 1800 mg/m^3, 2003; the Philippines: TWA 1000 ppm (2950 mg/m^3), 1993; Poland: MAC (TWA) 1800 mg/m^3; MAC (STEL) 2300 mg/m^3, 1999; Russia: TWA 300 ppm; STEL 300 mg/m^3, 1993; Sweden: NGV 600 ppm (1800 mg/m^3), KTV 750 ppm (2000 mg/m^3), 1999; Switzerland: MAK-W 600 ppm (1800 mg/m^3), 1999; Turkey: TWA 1000 ppm (2950 mg/m^3), 1993; United Kingdom: LTEL 600 ppm (1800 mg/m^3); STEL 750 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 600 ppm. Russia[43] set a MAC of 100 mg/m^3 in ambient air in residential areas on a momentary basis and 25 mg/m^3 on a daily average basis. Several states have set guidelines or standards for pentane in ambient air[60] ranging from 7.0 mg/m^3 (Connecticut) to 18.0−22.5 mg/m^3 (North Dakota) to 30.0 mg/m^3 (Virginia) to 42.857 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1500, Hydrocarbons, BP 36-126°C; #2549, Volatile organic compounds.[18]

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.4.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Pentane can affect you when breathed in. Exposure can cause lightheadedness and dizziness and may cause you to pass out. It may damage the nervous system, causing numbness, "pins and needles," and weakness in the arms and legs. Skin contact may cause rash and a burning sensation.

Long Term Exposure: Repeated or prolonged contact can cause dry, cracked skin.

Points of Attack: Eyes, skin, respiratory system, and central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: examination of the nervous system. Nerve conduction studies should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *1200 ppm:* Sa (APF = 10) (any supplied-air respirator). *1500 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Pentane must be stored to avoid contact with strong oxidizers (such as chlorine and bromine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where pentane is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of pentane should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of pentane.

Shipping: Pentanes require a label of "FLAMMABLE LIQUID." They fall in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location,

use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

2,4-Pentanedione P:0270

Molecular Formula: $C_5H_8O_2$

Common Formula: $CH_3COCH_2COCH_3$

Synonyms: Acetoacetone; Acetyl acetone; Diacetylmethane; Pentane-2,4-dione; 2-Propanone, acetyl

CAS Registry Number: 123-54-6; 81235-32-7

RTECS® Number: SA1925000

UN/NA & ERG Number: UN2310/131

EC Number: 204-634-0 [*Annex I Index No.:* 606-029-00-0]

Regulatory Authority and Advisory Bodies

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*23-54-6*): Hazard Symbol: Xn; Risk phrases: R10; R22; Safety phrases: S2; S21; S23; S24/25 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: 2,4-Pentanedione is a colorless to yellowish liquid with a sour, rancid odor. The odor threshold is 0.01 ppm. Molecular weight = 100.13; Boiling point = 139°C; Freezing/Melting point = −23°C; Flash point = 34°C; Autoignition temperature = 340°C. Explosive limits: LEL = 2.4%; UEL = 11.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 0. Soluble in water.

Potential Exposure: Acetoacetic acid derivative. Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Primary Irritant. 2,4-Pentanedione is used in gasoline and lubricant additives, fungicides, insecticides, and colors manufacture; as a chemical intermediate and in the manufacture of metal chelates.

Incompatibilities: Oxidizing material, bases, reducing agents, halogens, aliphatic amines, alkanolamines, organic acids, isocyanates. Light may cause polymerization.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: (2010 Notice of intended change) 25 ppm TWA [skin].

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 50 ppm

PAC-2: 100 ppm

PAC-3: 100 ppm

DFG MAK: 20 ppm/83 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group C.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Eye irritation may be severe. May affect the nervous system. If inhaled, will cause dizziness, coughing, headaches, convulsions, loss of consciousness, and possible death. In addition, to neuropathy, 2,4-pentanedione causes thymic atrophy; it complexes with and inhibits the activities of oxidizing enzymes; it causes minor to severe eye injury and minor to moderate skin irritation in animals; and it has caused contact urticaria and allergic contact dermatitis in humans.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. High exposure may affect the brain. May affect the lungs, thymus, central nervous system. There is limited evidence of reproductive damage and mutations.

Points of Attack: Skin, brain, lungs, central nervous system, thymus.

Medical Surveillance: Evaluation by a qualified allergist. Evaluation of brain effects. Thymus function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be

worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in stainless steel containers away from oxidizers, reducing agents, bases. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Pentane-2,4-dione requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Pentene is a colorless liquid. Molecular weight = 70.15; Boiling point = 30°C; Vapor pressure = 60.8 mmHg at 20°C; Flash point = −18°C; Autoignition temperature = 276°C. Explosive limits: LEL = 1.5%; UEL = 8.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1.

Potential Exposure: Workers in petroleum refineries and petrochemical plants.

Incompatibilities: Strong oxidants.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

109-67-1

TEEL-0: 300 ppm
PAC-1: 750 ppm
PAC-2: 6000 ppm
PAC-3: 75,000 ppm

Russia[43] set a MAC for amylene in ambient air of residential areas at 1.5 mg/m^3 both on a momentary and a daily average basis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Simple asphyxiant. Narcotic in high concentrations. May affect central nervous system. Moderately toxic by oral and inhalation routes.

Long Term Exposure: There is no special test for this chemical. However, if illness occurs or overexposure is suspected, medical attention is recommended.

Points of Attack: Skin, eyes, respiratory tract, and nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Use protective gloves and safety goggles. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: 1-Pentene requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Highly Reactive Substance and Explosive (World Bank).[15]

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: O, C, N; Risk phrases: R7; R10; R20/21/22; R35; R50; Safety phrases: S1/2; S3/7; S14; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Peracetic acid is a colorless liquid. Transported and stored in diluted solution with acetic acid and hydrogen peroxide to prevent explosion. Molecular weight = 76.06; Specific gravity (H_2O:1) = 1.2; Boiling point = 105°C (violent decomposition at 110°C); Freezing/Melting point = 0.1°C; Flash point = 41.3°C (oc); 56°C (32% in dilute acetic acid and <6% hydrogen peroxide); Autoignition temperature = 198°C; Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2 (Oxidizer). Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Primary Irritant. This compound is used as polymerization initiator, curing agent, and cross-linking agent; as bactericide and fungicide, especially in food processing; a reagent in making caprolactam and glycerol; an oxidant for preparing epoxy compounds; a bleaching agent; a sterilizing agent; and a polymerization catalyst for polyester resins.

Incompatibilities: This material is a powerful oxidizer. Thermally unstable, it decomposes violently at 110°C. Concentrated material is shock- and friction-sensitive. May explode if concentration exceeds 56% of carrier, due to evaporation. Isolate from other stored material, particularly accelerators, oxidizers, organic or combustible materials, olefins, hydrogen peroxide, acetic anhydride, reducing substances. Keep away from acids, alkalis, heavy metals, organic materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.15 mg/m^3

PAC-1: **0.52** mg/m^3

PAC-2: **1.6** mg/m^3

PAC-3: **15** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 3B; See section X(a).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Eye contact can cause severe irritation and burns; may cause permanent damage. Irritates the respiratory tract. Contact may burn the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Signs and symptoms of acute ingestion of peracetic acid may include corrosion of mucous membranes of mouth, throat, and esophagus with immediate pain and dysphagia (difficulty in swallowing); ingestion may cause gastrointestinal tract irritation. This is a very toxic compound. The probable oral lethal dose for humans is 50−500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb person.

Long Term Exposure: There is limited evidence that peracetic acid causes cancer in animals. It may cause cancer of the lungs. High or repeated exposure may affect the liver and kidneys.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber and Viton are recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is no REL, at any detectable concentration:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Keep in a cool, well-ventilated area, separated from organic and combustible materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Organic peroxide type D, liquid, requires a shipping label of "ORGANIC PEROXIDE." They fall in DOT Hazard Class 5.2 and Packing Group I. Organic peroxide type F, liquid, requires a shipping label of "Organic Peroxide Type F, Liquid (with $<=$ 17% Peracetic Acid with $<=$ 26% Hydrogen Peroxide)." They fall in DOT Hazard Class 5.2 and Packing Group II. Shipment of solutions with $>$43% peracetic acid is FORBIDDEN under any conditions.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid breathing vapors. Do not touch the spilled material; shut off all ignition sources and stop the leak if this can be done without risk. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Do not use spark-generating metals or organic materials for sweeping up or handling spilled material. Dispose of the absorbed peroxyacetic acid solution, in small quantities at a time, by placing it on the ground in a remote outdoor area and igniting with a long torch. Empty containers should be washed with a 10% sodium hydroxide solution. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid and a powerful oxidizer that can increase the activity of an existing fire. It explodes at 230°F/110°C and is shock sensitive, particularly if organic solvents are used in place of acetic acid as a carrier. Poisonous gases are produced in fire. Fight fires from an explosion-resistant location. In advanced or massive fires, area should be evacuated. For small fires: use dry chemical, carbon dioxide, water spray, or foam. For large fires: flood area with water. If fire occurs in the vicinity of this compound, water should be used to keep containers cool. Cleanup and salvage operations should not be attempted until all of the peroxyacetic acid solution has cooled completely. Keep unnecessary people away; wear self-contained breathing apparatus and full protective clothing. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Description: Perchloromethyl mercaptan is a pale yellow oily liquid with a foul-smelling, unbearable, acrid odor. Molecular weight = 185.87; Specific gravity (H_2O:1) = 1.69; Boiling point = (decomposes) 147.2°C; Vapor pressure = 3 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Primary Irritant. Perchloromethyl mercaptan is used as an intermediate for the synthesis of dyes and fungicides, such as Captan and Folpet. It has been considered as a warfare tear gas because of its highly irritant properties.

Incompatibilities: Water contact forms HCl, sulfur, and carbon dioxide. Reacts with alkalies, amines, hot water, alcohols, oxidizers, reducing agents, iron, and steel. Attacks most metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.60 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 0.1 ppm/0.8 mg/m^3 TWA.
NIOSH REL: 0.1 ppm/0.8 mg/m^3 TWA.
ACGIH TLV®[1]: 0.1 ppm/0.76 mg/m^3 TWA.
NIOSH IDLH: 10 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 0.013 ppm
PAC-1: **0.013** ppm
PAC-2: **0.3** ppm
PAC-3: **0.9** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.1 ppm (0.8 mg/m^3), 1993; Austria: MAK 0.1 ppm (0.8 mg/m^3), 1999; Belgium: TWA 0.1 ppm (0.76 mg/m^3), 1993; Denmark: TWA 0.1 ppm (0.8 mg/m^3), 1999; Finland: STEL 0.1 ppm (0.8 mg/m^3), 1999; France: VME 0.1 ppm (0.8 mg/m^3), 1999; Norway: TWA 0.1 ppm (0.8 mg/m^3), 1999; the Netherlands: MAC-TGG 0.8 mg/m^3, 2003; Switzerland: MAK-W 0.1 ppm (0.8 mg/m^3), KZG-W 0.2 ppm, 1999; Turkey: TWA 0.1 ppm (0.8 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm. Several states have set guidelines or standards for PMM in ambient air[60] ranging from 8.0 μg/m^3 (North Dakota) to 13.0 μg/m^3 (Virginia) to 16.0 μg/m^3 (Connecticut) to 19.0 μg/m^3 (Nevada).

Determination in Air: Sample collection by charcoal tube, analysis by gas liquid chromatography.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Signs and symptoms of acute exposure to perchloromethyl mercaptan may lead to liver, heart, and kidney damage. Respiratory effects include coughing, dyspnea (shortness of breath), painful breathing, and lung congestion. Tachycardia (rapid heart rate) is often observed. Nausea, vomiting, abdominal cramping, and diarrhea may also occur. Contact with Perchloromethyl mercaptan may result in severe dermatitis (red, inflamed skin), conjunctivitis (red, inflamed eyes), and burns with ulceration and severe pain. May cause death or permanent injury after short exposure to small quantities. Brief exposure to lower concentrations may produce central nervous system depression and lung, liver, and heart congestion. Severe exposures may be fatal. May be absorbed through the skin in quantities sufficient to cause general toxic effects. Ingestion may cause damage to mucous membranes and result in pain and burning of the mouth and throat, nausea, vomiting, cramps, and diarrhea. In severe cases, tissue ulceration and CNS depression may occur.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urinalysis (routine); white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 ppm:* CcrOv* (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa* (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv* (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv* (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)]; or SaT: Cf* (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 10 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. Store in a cool, dry place. Protect from moisture, metals, oxidizing and reducing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Perchloromethyl mercaptan requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. It may be necessary to seek emergency assistance.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.5/0.8
Night 0.9/1.5

Fire Extinguishing: This compound is neither flammable nor a serious fire hazard, although it will support combustion. Fight small fires with dry chemical, carbon dioxide, water spray, or foam, and large fires with water spray, fog, or foam. Move containers containing this compound away from fire area if possible. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Positive pressure breathing apparatus and special protective clothing should be worn. Poisonous gases, including chlorine and sulfur oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration together with a flammable solvent in a furnace equipped with afterburner and scrubber.

RTECS® Number: SD1925000
UN/NA & ERG Number: UN3083/124
EC Number: 231-526-0

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 ($\geq$25.67% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 5000 lb (2270 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Perchloryl fluoride is a colorless gas with a characteristic sweet odor. Shipped as a liquefied compressed gas. Molecular weight = 102.45; Boiling point = − 46.7°C; Freezing/Melting point = − 147.8°C; Relative vapor density (air = 1) = 3.64; Vapor pressure = 10.5 atm at 25°C; Relative vapor density (air = 1) = 3.64. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 3 (Oxidizer). Slightly soluble in water; solubility = 0.06% at 20°C.

Potential Exposure: Perchloryl fluoride has been used as a liquid oxidant in rocket propellant combinations, as an insulating gas in high-voltage electrical systems, as a fluorinating agent in organic synthesis.

Incompatibilities: A strong oxidizer. Violent reaction with benzene, calcium hydride, combustibles, olefins, strong bases, sulfur, sulfuric acid, amines, reducing agents, alcohols. Contact with carbonaceous materials (such as charcoal) or finely divided metals (such as powdered magnesium, aluminum, zinc) are a fire and explosion hazard. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.19 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 3 ppm/13.5 mg/m^3 TWA.
NIOSH REL: 3 ppm/14 mg/m^3 TWA; 6 ppm/28 mg/m^3 STEL.
ACGIH TLV®[1]: 3 ppm/13 mg/m^3 TWA; 6 ppm/25 mg/m^3 STEL.
NIOSH IDLH: 100 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 1.5 ppm
PAC-1: **1.5** ppm
PAC-2: **4.0** ppm
PAC-3: **12** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 3 ppm (14 mg/m^3); STEL 6 ppm, 1993; Austria: MAK 2.5 mg[F]/m^3, 1999; Belgium: TWA 3 ppm (13 mg/m^3); STEL 6 ppm (25 mg/m^3), 1993; Denmark: TWA 3 ppm (14 mg/m^3), 1999; Finland: TWA 3 ppm (14 mg/m^3); STEL 6 ppm (25 mg/m^3), 1999; France: VME 3 ppm (14 mg/m^3), 1999; Norway: TWA 3 ppm (14 mg/m^3), 1999; the Netherlands: MAC-TGG 14 mg/m^3, 2003; Sweden: NGV 2 mg[F]/m^3, 1999; Switzerland: MAK-W 3 ppm (13 mg/m^3), 1999; United Kingdom: TWA 3 ppm (13 mg/m^3); STEL 6 ppm (26 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 6 ppm.

Several states have set guidelines or standards for perchloryl fluoride in ambient air[60] ranging from 140−280 μg/m^3 (North Dakota) to 230 μg/m^3 (Virginia) to 270 μg/m^3 (Connecticut) to 333 μg/m^3 (Nevada).

Determination in Air: Sample collection by impinger or fritted bubbler; analysis by ion-specific electrode.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the respiratory tract. May affect the blood, causing the destruction of red blood cells; formation of methemoglobin. Cyanosis and anemia may result. The liquid may cause frostbite.

Long Term Exposure: May cause anemia. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth. Repeated exposure may cause nausea, vomiting, loss of appetite, diarrhea, or constipation.

Points of Attack: Respiratory system, skin, blood.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; whole blood (chemical/metabolite), Methemoglobin; Complete blood count; chest X-ray; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Consider the points of attack in preplacement and periodic physical examinations. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear eye protection to prevent any reasonable probability of eye contact. Employees should wash

immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 30 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 75 ppm:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 100 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, well-ventilated area away from incompatible materials listed above. Procedures for the handling, use and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Perchloryl fluoride requires a shipping label of "POISON GAS, OXIDIZER." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1500/500
Then: Protect persons downwind (miles/kilometers)
Day 2.0/3.2
Night 5.2/8.4

Fire Extinguishing: Nonflammable gas, but will support combustion and add to the intensity of an existing fire. Poisonous gases, including fluorine, fluorine oxides, chlorine, and chlorine oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration together with flammable solvent in furnace equipped with afterburner and scrubber.

WGK (German Aquatic Hazard Class): No value assigned.
Description: Phenanthrene is a white[2] crystalline substance with a weak aromatic odor. Polynuclear aromatic hydrocarbons (PAHs) are compounds containing multiple benzene rings and are also called polycyclic aromatic hydrocarbons. Molecular weight = 178.22.[2] Molecular weight = 178.24; Boiling point = 340°C at 760 mmHg[2]; Freezing/Melting point = 100°C[2]; Flash point = 171°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.
Potential Exposure: Mutagen. Used for making dyes, other chemicals; explosives, pharmaceuticals; in biological research.
Incompatibilities: Oxidizers.
Permissible Exposure Limits in Air: No specific standards have been established for phenanthrene.
OSHA PEL: 0.2 mg/m^3 TWA [1910.1002] (benzene-soluble fraction). OSHA defines "coal tar pitch volatiles" in 29 CFR 1910.1002 as the fused polycyclic hydrocarbons that volatilize from the distillation residues of coal, petroleum (excluding asphalt), wood, and other organic matter.
NIOSH REL: 0.1 mg/m^3 (cyclohexane-extractable fraction). NIOSH considers coal tar products (i.e., coal tar, coal tar pitch, or creosote) to be potential occupational carcinogens.
ACGIH TLV®[1]: 0.2 mg/m^3 TWA (as benzene-soluble aerosol); Confirmed Human Carcinogen.
NIOSH IDLH: 80 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 6 mg/m^3
PAC-2: 40 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: [skin].
Several states have set guidelines or standards for coal tar pitch volatiles in ambient air[60] ranging from zero (North Carolina) to 0.0161 $\mu g/m^3$ (Kansas) to 0.48 $\mu g/m^3$ (Pennsylvania) to 2.0 $\mu g/m^3$ (Connecticut and Virginia) to 5.0 $\mu g/m^3$ (Nevada).
Determination in Air: Use NIOSH Analytical Method #5506 polynuclear aromatic hydrocarbons by HPLC; NIOSH Analytical Method #5515, Polynuclear aromatic hydrocarbons by GC; OSHA Analytical Method ID-58.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Skin contact can cause irritation. A skin photosensitizer, contaminated skin exposed to sunlight can develop rash, skin burns, and blisters. Irritates the eyes and respiratory tract.
Long Term Exposure: May cause skin allergy. If allergy develops, very low future exposure can cause itching and skin rash.
Points of Attack: Skin, respiratory system, bladder, liver, kidneys.
Medical Surveillance: NIOSH lists: complete blood count; chest X-ray; pulmonary function tests: Forced Vital Capacity; Forced Expiratory Volume (1 s); photopatch testing; sputum cytology; urinalysis (routine); cytology, hematuria.[2]
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical

facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any detectable concentration over 0.1 mg/m^3:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Not regulated. However, the "Acridine" standard may be used for this chemical. The required label is "POISONOUS/TOXIC MATERIALS." It would fall in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Phenazopyridine & phenazo-pyridine hydrochloride P:0330

Molecular Formula: $C_{11}H_{12}ClN_5$

Synonyms: AP; 2,6-Diamino-3-phenylazopyridine; Diridone; DPP; Gastracid; Gastrotest; Mallophene; NC150; Phenazodine; Phenylazo; 3-(Phenylazo)-2,6-pyridinediamine; Pirid; Pyrazofen; Pyridacil; Pyridium; Pyripyridium; Sedural; Uridinal; Urodine; W 1655

Hydrochloride: Azodine; Azodium; Azodyne; Azo gantrisin; Azo gastanol; Azo-mandelamine; Azomine; Azo-standard; Azo-stat; Azotrex; Baridium; Bisteril; Cystopyrin; Cystural; 2,6-Diamino-3-phenylazopyridine hydrochloride; 2,6-Diamino-3-(phenylazo)pyridine monohydrochloride; Di-azo; Diridone; Dolonil; Eucistin; Giracid; Mallofeen; Mallophene; NC150; NCI-C01672; Nefrecil; PAP; PDP; Phenazo; Phenazodine; Phenazopyridine hydrochloride; Phenazopyridinium chloride; β-Phenylazo-α,α′-diaminopyridine hydrochloride; 3-Phenylazo-2,6-diaminopyridine hydrochloride; Phenylazodiaminopyridine hydrochloride;

Phenylazo-α,α′-diaminopyridine monohydrochloride; 3-(Phenylazo)-2,6-pyridinediamine, hydrochloride; Phenylazopyridine hydrochloride; Phenyl-idium; Phenylidium 200; Pirid; Piridacil; Pyrazodine; Pyrazofen; Pyredal; Pyridacil; Pyridenal; Pyridene; Pyridiate; Pyridium; Pyridivite; Pyripyridium; Pyrizin; Sedural; Suladyne; Sulodyne; Thiosulfil-A forte; Urazium; Uridinal; Uriplex; Urobiotic-250; Urodine; Urofeen; Uromide; Urophenyl; Uropyridin; Uropyrine; Utostan; Vestin; W 1655

CAS Registry Number: 94-78-0; 136-40-3 (hydrochloride)

RTECS®* *Number: US7875000 (hydrochloride); US7700000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 202-363-2; 205-243-8 (hydrochloride)

Regulatory Authority and Advisory Bodies

Carcinogenicity: (hydrochloride) IARC: Animal Sufficient Evidence; Human Limited Evidence, *possibly carcinogenic to humans*, Group 2B, 1987; NCI: Carcinogenesis Studies (feed); clear evidence: mouse; (feed); clear evidence: rat; NTP: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical: Cancer 1/1/88; 1/1/88 (hydrochloride).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phenazopyridine is a red crystalline compound. Molecular weight = 213.27; 249.73 (hydrochloride); Freezing/Melting point = (fine base) 139°C; 233−238°C (hydrochloride). Slightly soluble in water.

Potential Exposure: Phenazopyridine hydrochloride has been used for 50 years as an analgesic drug either alone or in combination with other drugs to reduce pain associated with urinary tract infection. Also used as a local anesthetic. Exposure to phenazopyridine hydrochloride occurs during manufacture and formulation.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Can affect you if swallowed. Symptoms of exposure include diarrhea, nausea, or vomiting; dehydration, decreased urine volume. May affect the development of red blood cells, causing cyanosis and methemoglobinemia and changes in blood sodium levels.

Long Term Exposure: May affect the kidneys. Phenazopyridine hydrochloride was tested in mice and rats by oral administration. In female mice, it significantly increased the incidence of hepatocellular adenomas and carcinomas. In male and female rats, it induced tumors of the colon and rectum. Symptoms of exposure include deeply stained vomitus and urine, methemoglobinemia, Heinz body anemia, hepatic enlargement, abnormal renal function. May cause mutations.

Points of Attack: Blood, kidneys.

Medical Surveillance: Complete blood count (CBC). Kidney function tests.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Protect from air and light. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen chloride and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Phenol P:0340

Molecular Formula: C_6H_6O

Common Formula: C_6H_5OH

Synonyms: Acide carbolique (French); Benzene, hydroxy-; Benzenol; Carbolic acid; Carbolsaure (German); ENT 1814; Fenol (Spanish); Hydroxybenzene; Monohydroxybenzene; Monophenol; NCI-C50124; Oxybenzene; Phenic acid; Phenole (German); Phenyl alcohol; Phenyl hydrate; Phenyl hydroxide; Phenylic acid; Phenylic alcohol

CAS Registry Number: 108-95-2

RTECS® Number: SJ3325000

UN/NA & ERG Number: UN1671 (solid)/153; UN2312/153 (molten); UN2821 (solution)/153

EC Number: 203-632-7 [*Annex I Index No.:* 604-001-00-2]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Bioassay (oral); no evidence: mouse, rat; IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999; EPA: Available data are inadequate for an assessment of human carcinogenic potential; Not Classifiable as to human carcinogenicity.

US EPA Gene-Tox Program, Negative: *N. crassa*—reversion.

US EPA, FIFRA, 1998 Status of Pesticides: Supported.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR401.15 Section 307 Toxic Pollutants; 40CFR423, Appendix A, Priority Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; R34; R48/21/22/23; R68; Safety phrases: S1/2; S24/25; S26; S28; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Phenol is a colorless to light pink crystalline solid with a sweet, acrid odor. Phenol liquefies by mixing with about 8% water. The odor threshold in air is 0.04 ppm and in water is 7.9 ppm. Molecular weight = 94.12; Boiling point = 182°C; Freezing/Melting point = 42.8°C; Relative vapor density (air = 1) = 1.00 at 20°C; Vapor pressure = 0.4 mmHg at 25°C; Relative vapor density (air = 1): 3.2; Flash point = 79.4°C (cc); Autoignition temperature = 715°C. Explosive limits: LEL = 1.3%; UEL = 8.6%. Hazard Identification (based on NFPA-704 M Rating System) (*liquid, crystals*): Health 4, Flammability 2, Reactivity 1 (Corrosive). Soluble in water; solubility = 9% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Phenol is used as a pharmaceutical, in the production of fertilizer; coke, illuminating gas; lampblack, paints, paint removers; rubber, asbestos goods; wood preservatives; synthetic resins; textiles, drugs, pharmaceutical preparations; perfumes, bakelite, and other plastics (phenol formaldehyde resins); polymer intermediates (caprolactam, bisphenol-A, and adipic acid). Phenol also finds wide use as a disinfectant and veterinary drug.

Incompatibilities: The aqueous solution is a weak acid. Violent reaction with strong oxidizers, calcium hypochlorite, aluminum chloride, acids. Reacts with metals.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.85 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 5 ppm/19 mg/m^3 TWA [skin].
NIOSH REL: 5 ppm/19 mg/m^3 TWA [skin]; 15.6 ppm/60 mg/m^3/15 min Ceiling Concentration.
ACGIH TLV®[1]: 5 ppm/19 mg/m^3 TWA [skin], not classifiable as a human carcinogen; BEI: 250 mg[total phenol]/g creatinine in urine/end-of-shift.
NIOSH IDLH: 250 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 5 ppm
PAC-1: **15** ppm
PAC-2: **23** ppm
PAC-3: **200** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK; [skin], Carcinogen Category: 3B.
Arab Republic of Egypt: TWA 5 ppm (19 mg/m^3), [skin], 1993; Australia: TWA 5 ppm (19 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (19 mg/m^3), [skin], 1999; Belgium: TWA 5 ppm (19 mg/m^3), [skin], 1993; Denmark: TWA 1 ppm (4 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (19 mg/m^3); STEL 10 ppm (38 mg/m^3), [skin], 1999; France: VME 5 ppm (19 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 8 mg/m^3, [skin], 2003; Japan: 5 ppm (19 mg/m^3), [skin], 1999; Norway: TWA 1 ppm (4 mg/m^3), 1999; the Philippines: TWA 5 ppm (10 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3; MAC (STEL) 20 mg/m^3, 1999; Russia: TWA 5 ppm; STEL 0.3 mg/m^3, [skin], 1993; Sweden: NGV 1 ppm (4 mg/m^3), KTV 2 ppm (8 mg/m^3), [skin], 1999; Switzerland: MAK-W 5 ppm (19 mg/m^3), KZG-W 10 ppm (38 mg/m^3), [skin], 1999; Thailand: TWA 5 ppm (19 mg/m^3), 1993; Turkey: TWA 5 ppm (19 mg/m^3), [skin], 1993; United Kingdom: TWA 5 ppm (20 mg/m^3); STEL 10 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[35, 43] has also set a MAC of 0.01 mg/m^3 (10 μg/m^3) for ambient air in residential areas both on a momentary and a daily average basis. Many states have set guidelines or standards for phenol in ambient air[60] ranging, for example, from 10.0 μg/m^3 (New York) to 45.23 μg/m^3 (Kansas) to 52.0 μg/m^3 (Massachusetts) to 95.0 μg/m^3 (Indiana) to 190 μg/m^3 (Florida, North Dakota, South Carolina) to 315.0 μg/m^3 (Virginia) to 380.0 μg/m^3 (Connecticut, North Dakota, South Dakota) to 452.0 μg/m^3 (Nevada) to 456.0 μg/m^3 (Pennsylvania) to 95.0 μg/m^3 (North Carolina).
Determination in Air: Use NIOSH Analytical Method (IV) #2546, Cresols and Phenol, OSHA Analytical Method 32.
Permissible Concentration in Water: *To protect freshwater aquatic life:* 10,200 μg/L, based on acute toxicity data and 2560 μg/L, based on chronic toxicity data. *To protect saltwater aquatic life:* 5800 μg/L, based on acute toxicity data. For the protection of human health from phenol ingested through water and through contaminated aquatic organisms, the concentration in water should not exceed 3500 μg/L. For the prevention of adverse effects due to the organoleptic properties of chlorinated phenols inadvertently formed during water purification processes, the phenol concentration in water should not exceed 300 μg/L.[6] The Czech Republic[35] set a MAC of 0.2 mg/L for surface water and a MAC of 0.05 mg/L for drinking water. The EEC set a MAC of 0.5 μg/L in drinking water. Mexico has set maximum permissible concentrations of 1.0 μg/L in receiving waters used for drinking water supply; 1.0 mg/L in receiving water for recreational use; 0.1 mg/L in estuaries; and 0.01 mg/L in coastal waters. Russia[35, 43] set a MAC of 0.001 mg/L in drinking water. States which have set guidelines for phenol in drinking water[61] include California at 1.0 μg/L and Kansas at 300 μg/L.
Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604) or gas chromatography plus mass spectrometry (EPA Method 625). Octanol−water coefficient: Log K_{ow} = 1.46.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.
Harmful Effects and Symptoms
Short Term Exposure: Phenol and its vapor are corrosive to the eyes, skin, and respiratory tract. Eye contact can cause severe and painful burns and permanent damage. Skin contact may cause severe and painful burns, which promptly become anesthetized (numb) to touch, but deep damage and local gangrene can result. Significant skin contact or inhalation can cause death within minutes. Ulceration may follow. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. May affect the central nervous system, heart, liver, and kidneys, causing convulsions, coma, cardiac disorders, respiratory failure, collapse. Signs and symptoms of acute exposure to phenol may be severe, and range from tachycardia (rapid heart rate) and tachypnea (rapid respiratory rate) to hypotension (low blood pressure), weak pulse, cardiac failure, pulmonary edema, and respiratory arrest. Cardiac arrhythmias may be noted. Weakness, headache, dizziness, tinnitus (ringing in the ears), delirium, and shock are common. Seizures may often be followed by coma. Pallor, profuse sweating, dilated pupils, and a profound drop in body temperature may occur. Gastrointestinal effects may include nausea, abdominal pain, bloody vomitus, and bloody diarrhea. Renal insufficiency may lead to hematuria (bloody urine). Toxic hazard rating is very toxic: probable oral lethal dose (human) is 50−500 mg/kg. Ingestion of 1 g has been lethal to humans. Lethal amounts may be absorbed through skin or inhaled. Industrial contact can cause chronic poisoning with kidney and liver damage.
Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. The substance may damage the liver and kidneys and have an effect on the pancreas and heart muscle. May affect the central nervous system and

cause nerve and/or brain damage. Phenol causes mutations and may cause reproductive damage in humans; and may be a cancer risk.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: liver function tests; urine (chemical/metabolite); urine (chemical/metabolite), last 2 h of 8-h exposure; urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), pre- and postshift; urinalysis. Urinary phenol (See also NIOSH #8305 *Phenol and p-cresol in urine*). These tests should be repeated if overexposure is suspected. Interview for brain effects.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. If concentrated phenol gets on a large area of the skin, immediately rush victim to shower and use at full blast; remove all contaminated clothing; scrub the contaminated area with *soap* for at least 10 min—*water alone may be harmful.* If polyethyleneglycol-300 is available, swab exposed area with cotton soaked in it. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Rinse mouth. Give plenty of water and/or vegetable oil to drink. Do not allow the consumption of alcohol. Induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. For phenol <30%, sealed chemical materials with good to excellent resistance: polyethylene. For phenol >70%, sealed chemical materials with good to excellent resistance: butyl rubber; Neoprene™, Teflon™, Viton™, Silvershield™. Also, polyethylene offers limited protection. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 ppm:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; Sa (APF = 10) (any supplied-air respirator). *125 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *250 ppm:* CcrFOv100 (APF = 50) [air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White stripe: Contact Hazard; Store separately; not compatible with materials in solid white category. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Phenol must be stored to avoid contact with calcium hypochlorite and other strong oxidizers (such as chlorine and bromine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: *Molten phenol* requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II. *Solid phenol* requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and Packing Group II. *Phenol solutions* require a shipping label of “POISONOUS/TOXIC MATERIALS.” They fall in DOT Hazard Class 6.1 and Packing Group II or III.

Spill Handling: Remove all ignition sources. Spills must be disposed of immediately by properly protected personnel; no others should remain in area. Flush with flooding quantities of water, then use caustic soda solution for neutralization. Remove and isolate contaminated clothing at the site. Establish forced ventilation to keep levels below explosive limit. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Absorb liquids in vermiculite, dry sand, earth, or similar material and deposit in sealed containers for later disposal. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid or liquid. Flammable vapors are produced when phenol is heated. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol foam. *Large fires:* water spray, fog, or foam; use water spray to cool containers in fire area. Move container from fire area if it can be done without risk; fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Regulatory Authority and Advisory Bodies

Reportable Quantity (RQ): 10 lb (4.54 kg).

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.056; Nonwastewater (mg/kg), 1.4 as *m*-cumenyl methylcarbamate. Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500/10,000 lb (227/4540 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Phenol, 3-(1-methylethyl)-, methylcarbamate is a white, crystalline, odorless solid. Molecular weight = 193.27; Freezing/Melting point = 73°C. Soluble in water; 270 mg/L at 25°C.

Potential Exposure: Used as a carbamate insecticide.

Incompatibilities: Strong alkalies.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*
TEEL-0: 3 mg/m^3
PAC-1: 10 mg/m^3
PAC-2: 16 mg/m^3
PAC-3: 16 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract causing coughing, wheezing, shortness of breath. Inhalation or skin contact can cause rapid, severe carbamate poisoning with headache, dizziness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs also include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes and loss of sphincter control, death. LD_{50} = (oral-guinea pig) 10 mg/kg.

Long Term Exposure: May affect the nervous system. Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates. Refer to the NIOSH Criteria Documents #78-174 and #76-147 on manufacturing, formulating, and working safely with pesticides.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong alkaline materials. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Carbamate pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." Phenol, 3-(methylethyl)-, Methylcarbamate falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical

as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguishing agents suitable for surrounding fire. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 202-196-5

Regulatory Authority and Advisory Bodies

US EPA Gene-Tox Program, Positive: Cell transform.—SA7/SHE.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Phenothiazine is a greenish-yellow to greenish-gray crystalline substance with a slight odor and taste. Molecular weight = 199.28; Boiling point = (decomposes) 371°C; Freezing/Melting point = 185°C (sublimes). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Phenothiazine is used as an insecticide; as a base for the manufacture of tranquilizers; as anthelmintic in medicine and veterinary medicine; it is used widely as an intermediate in pharmaceutical manufacture; polymerization inhibitor, antioxidant.

Incompatibilities: Organosulfides are incompatible with strong acids and acid fumes; elevated temperatures; sulfur oxides and nitrogen oxides can be produced. Contact with strong reducing agents, azo and diazo compounds, halocarbons, isocyanates can generate heat and may form explosive hydrogen gas.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA [skin].

ACGIH: 5 mg/m^3 TWA [skin].

No TEEL available.

Australia: TWA 5 mg/m^3, [skin], 1993; Belgium: TWA 5 mg/m^3, [skin], 1993; Denmark: TWA 5 mg/m^3, [skin], 1999; Finland: TWA 5 mg/m^3; STEL 10 mg/m^3, [skin], 1999; France: VME 5 mg/m^3, [skin], 1999; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 5 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 5 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: 5 mg/m^3 [skin]. Several states have set guidelines or standards for Phenothiazine is ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No NIOSH Analytical Method available.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.2$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Skin absorption.

Harmful Effects and Symptoms

Short Term Exposure: Phenothiazine can affect you when breathed in and by passing through your skin. Exposure can irritate the skin and eyes. Exposure can cause an inflammation in the eye (keratitis). This can also be made worse by sunlight (photosensitization) and cause a severe skin reaction with rash and color changes. Can cause a severe allergic liver reaction. High levels of exposure may affect the blood cells, causing hemolytic anemia and toxic liver degeneration. Exposure may affect the nervous system, causing muscle twitching and shaking. May affect heart rhythm, causing irregular heartbeat.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis and allergy. Can cause kidney and liver damage. Repeated or prolonged contact may cause skin sensitization as well as skin photophobia (abnormal visual intolerance to light). There is limited evidence that this chemical may damage the developing fetus. Several related phenothiazine compounds have been associated with human teratogenic effects.

Points of Attack: Skin, cardiovascular system, liver, kidneys, heart.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: examination of the nervous system and eyes. Liver function tests, especially bile salts. Complete blood count. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. EKG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids (such as hydrochloric, sulfuric, and nitric) since toxic fumes can result.

Shipping: Not regulated.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Phenothiazine may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur oxides and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in combustible solvent and spray into incinerator equipped with afterburner and scrubber. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Phenyl dichloroarsine (Agent PD, WMD) P:0370

Molecular Formula: $C_6H_5AsCl_2$
Synonyms: Arsine, dichlorophenyl-; Arsonous dichloride, phenyl-; Diclorofenilarsina (Spanish); Dichlorophenylarsine; PD (military designation); Phenylarsinedichloride; Phenylarsonous dichloride; Phenyl arsonous dichloride; Phenyldichloroarsine
CAS Registry Number: 696-28-6
RTECS®Number: CH5425000
UN/NA & ERG Number: UN1556/152
EC Number: 211-791-9
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA Hazardous Waste Number (RCRA No.): P036.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
As arsenic compounds
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as arsenic compounds.
Clean Water Act: Toxic Pollutant (Section 401.15) as arsenic and compounds.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA (Section 313): Includes any unique chemical substance that contain arsenic as part of that chemical's infrastructure; Form R *de minimis* concentration reporting level: organics 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).
Canada: Priority Substance List & Restricted Substances/ Ocean Dumping FORBIDDEN (CEPA), National Pollutant Release Inventory (NPRI) (arsenic compounds).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Phenyldichloroarsine is a colorless or light yellow liquid or gas. Odorless. Molecular weight = 222.93; Boiling point = 257°C; Freezing/Melting point = −19°C; Flash point = 16°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 2, Reactivity 2₩. Reaction with water; insoluble.
Potential Exposure: It is used in organic synthesis and as a solvent. PD has been used as a military tear gas, vesicant, and blister agent.
Incompatibilities: Contact with water forms HCl. Heat produces fumes of arsenic and chlorine. Attacks some metals in the presence of moisture.
Permissible Exposure Limits in Air
Arsenic, organic compounds
OSHA PEL: 0.5 mg[As]/m^3 TWA.
NIOSH REL: Not established. See NIOSH Pocket Guide, Appendix A.
ACGIH TLV®[1]: 0.01 mg[As]/m^3 TWA; Confirmed Human Carcinogen; BEI established.
Phenyl dichloroarsine; dichlorophenylarsine
Protective Action Criteria (PAC)*
TEEL-0: 0.061 mg/m^3
PAC-1: 0.061 mg/m^3
PAC-2: **0.061** mg/m^3
PAC-3: **0.18** mg/m^3
AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
As arsenic, organic compounds
TEEL-0: 0.5 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 2.5 mg/m^3
PAC-3: 350 mg/m^3
NIOSH IDLH: 5 mg[As]/m^3.
Determination in Air: Filter; Acid; Hydride generation atomic absorption spectrometry; NIOSH Analytical Method (IV) #7900. See also #7300, Elements (arsenic).
Permissible Concentration in Water: EPA[6] recommends a zero concentration of arsenic for human health reasons but has set a guideline of 50 μg/L[61] for drinking water.
Determination in Water: When phenyldichloroarsine mixes with water it breaks down into hydrochloric acid and arsenicals. *For arsenic:* The atomic absorption graphite furnace technique is often used for the measurement of total arsenic in water. It has also been standardized by EPA. Total arsenic may be determined by digestion followed by silver diethyldithiocarbamate; an alternative is atomic absorption; another is inductively coupled plasma (ICP) optical emission spectrometry. See OSHA Analytical Method #ID-105 for arsenic.
Routes of Entry: Inhalation, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Phenyldichloroarsine reacts with many enzymes which damages the body. Phenyldichloroarsine will blind you and blister your skin severely, and with enough it will kill. You will know that you have been exposed when you feel immediate pain and you begin to vomit violently. Contact may cause burns to skin and eyes. Strong irritant to eyes, skin, and tissue. Corrosive if swallowed. Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Vomiting and blistering are among symptoms of exposure. The median lethal dosage is 2600 mg-min/m^3. The mean incapacitating dosage is 16 mg-min/m^3 as a vomiting agent and 1800 mg-min/m^3 as a blistering agent. 633 mg-min/m^3 produces eye injury.
Long Term Exposure: In animals: kidney damage; muscle tremor, seizure; possible gastrointestinal tract; reproductive effects; possible liver damage.

Points of Attack: Skin, respiratory system, kidneys, central nervous system, liver, gastrointestinal tract, reproductive system.

Medical Surveillance: Kidney function tests. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Note to physician: For severe poisoning BAL [British antilewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metal poisoning—including arsenic. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5). For milder poisoning *penicillamine (not penicillin)* has been used, both with mixed success. Side effects occur with such treatment and it is never a substitute for controlling exposure. It can only be done under strict medical care.

Decontamination: This is very important, and you have to decontaminate as soon as you can. Extra minutes before decontamination might make a big difference. If you do not have the equipment and training do not enter the hot or the warm zone to rescue and decontaminate victims. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available) and then move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Be sure you have decontaminated the victims as much as you can before they leave the area so that they do not spread the phenyldichloroarsine. Use the antidote "Anti-Lewisite." See "First Aid" above. Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Arsenic compounds, liquid, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." Phenyl dichloroarsine falls in DOT Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

PD, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Fire Extinguishing: Phenyl dichloroarsine may burn but does not ignite readily. Burned phenyl dichloroarsine is safer and better than the unburned product. In case of fire, evacuate the area. If there is some reason that you have to put out the fire—for example, there are things you cannot let burn nearby—use unattended equipment. You can fight phenyl dichloroarsine fires with water streams, water fog; ordinary foam; universal foam; and, for confined fires, carbon dioxide. Remember that phenyl dichloroarsine breaks down in water, forming toxic hydrochloric acid and arsenic chemicals. Wear positive pressure breathing apparatus. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases, including arsenic and chlorine, are produced in fire. Water produces corrosive chlorine fumes. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Inadequate Evidence; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1987.

US EPA Gene-Tox Program, Positive: SHE—clonal assay; Histidine reversion—Ames test; Inconclusive: Rodent dominant lethal.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R20/21; R25; R36; R40; R43; R50/53; R68; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *m*-Phenylenediamine is a colorless to white crystalline substance that turns red upon exposure to air. Molecular weight = 108.16; Boiling point = 287°C; Freezing/Melting point = 64.4°C; Flash point = 187°C; Autoignition temperature = 555°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Used in making various dyes; as a curing agent for epoxy resin; rubber, textile fibers; urethanes, corrosion inhibitors; adhesives; in photographic and analytical procedures and processes.

Incompatibilities: Reacts violently with strong oxidizers, strong acids, acid chlorides, acid anhydrides, chloroformates. Heat and light contribute to instability. Keep away from metals.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.1 mg/m^3 TWA [skin]; not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 125 mg/m^3

DFG MAK: [skin]; Carcinogen Category 3B.

Austria [skin], Suspected: carcinogen, 1999; Denmark: TWA 0.1 mg/m^3, 1999; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Determination in Air: Use OSHA Analytical Method 87.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact can irritate the eyes and skin. Irritates the respiratory tract, causing coughing, wheezing, and/or shortness of breath. May affect the blood, causing the formation of methemoglobin and cyanosis with blue coloration of the skin and lips, headache, fatigue, dizziness. High levels can cause troubled breathing, collapse, and death. The *p*-isomer is more toxic and a more severe irritant than the *m*-isomers. LD_{50} = (oral-rat) 720−1600 mg/kg.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. If allergy develops, very low future exposure can cause itching and a skin rash. Repeated or prolonged inhalation exposure may cause asthma-like allergy. May cause kidney and liver impairment. Exposure may cause anemia.

Points of Attack: Respiratory system, skin, lungs, liver, kidneys, blood.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood count (CBC). Examination of the eyes and vision. Evaluation by a qualified allergist. Lung function tests. Blood methemoglobin levels. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to this chemical of more than 0.1 mg/m^3, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and

storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Phenylenediamines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.[22]

Determination in Air: Use OSHA Analytical Method 87.

Permissible Concentration in Water: Russia[35, 43] set a MAC of 0.1 mg/L in surface water.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Contact can severely irritate and burn the eyes and skin. May cause permanent eye damage. Irritates the respiratory tract, causing coughing, wheezing, and/or shortness of breath. Inhalation of dust may irritate the pharynx and larynx; bronchial asthmatic reactions. Swelling of mouth and throat may be observed following ingestion. Exposure can cause abdominal pain, nausea, high blood pressure, dizziness, seizures, and even coma. May affect the blood, causing the formation of methemoglobin and cyanosis with blue coloration of the skin and lips, headache, fatigue, dizziness. High levels can cause troubled breathing, collapse, and death. The *p*-isomer is more toxic and a more severe irritant than the *o*- and *m*-isomers.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. If allergy develops, very low future exposure can cause itching and a skin rash. Repeated or prolonged inhalation exposure may cause asthma-like allergy. May cause kidney and liver impairment. Repeated high exposure can cause cataracts. Exposure may cause anemia.

Points of Attack: Respiratory system, skin, lungs, liver, kidneys, blood.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood count (CBC). Examination of the eyes and vision. Evaluation by a qualified allergist. Lung function tests. Blood methemoglobin levels. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water or a slurry of activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 5 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 25 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Causes eye irritation and damage; eye protection needed.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, strong acids, acid chlorides, acid anhydrides, chloroformates, and metals. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Phenylenediamines require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Establish forced ventilation to keep levels below explosive limit. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.[22]

EC Number: 204-557-2 [*Annex I Index No.:* 603-067-00-X]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human No Adequate Data, *possibly carcinogenic to humans*, Group 2B, 1999; NIOSH: Potential occupational carcinogen.

US EPA Gene-Tox Program, Positive: SHE—focus assay.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 10/1/90; male 8/7/09.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R20; R37/38; R43; R68; R52/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Phenyl glycidyl ether is a colorless liquid with an unpleasant sweet odor. Molecular weight = 150.19; Specific gravity (H_2O:1) = 1.11; Boiling point = 245°C; Freezing/Melting point = 3.3°C; Vapor pressure = 0.01 mmHg at 20°C; Flash point = 120°C. Explosive limits: LEL = 1.1%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water; solubility = 0.24% at 20°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. PGE is used to increase storage time and stability of halogenated compounds; as a reactive diluent in uncured epoxy resins to reduce the viscosity of the uncured system for ease in casting, adhesive, and laminating applications. NIOSH once estimated that 8000 workers are potentially exposed to PGE.

Incompatibilities: Strong oxidizers, amines, strong acids, strong bases, and curing agents. PGE can presumably form explosive peroxides.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.14 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 10 ppm/60 mg/m^3 TWA.

NIOSH REL: 1 ppm/6 mg/m^3 [15 min] Ceiling Concentration; A potential occupational carcinogen [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.1 ppm TWA [skin] danger of skin sensitization; confirmed animal carcinogen with unknown relevance to humans.

No TEEL available.

DFG MAK: [skin], danger of skin sensitization; Carcinogen Category 2.

NIOSH IDLH: potential occupational carcinogen 100 ppm.

Australia: TWA 1 ppm (6 mg/m^3), 1993; Austria: [skin], carcinogen, 1999; Belgium: TWA 1 ppm (6.1 mg/m^3), 1993; Denmark: TWA 1 ppm (5 mg/m^3), 1999; Finland; STEL 10 ppm (60 mg/m^3), [skin], 1999; France: VME 1 ppm (6 mg/m^3), 1999; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Philippines: TWA 10 ppm (62 mg/m^3), 1993; Poland: MAC (TWA) 0.6 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Sweden: NGV 10 ppm (60 mg/m^3), KTV 15 ppm (90 mg/m^3), 1999; Switzerland: MAK-W 1 ppm (6 mg/m^3), [skin], carcinogen, 1999; Turkey: TWA 10 ppm (60 mg/m^3), 1993; United

Kingdom: TWA 1 ppm (6.2 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for PGE in ambient air[60] ranging from 60 μg/m^3 (Connecticut and North Dakota) to 100 μg/m^3 (Virginia) to 143 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV), Phenyl glycidyl ether.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.1$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The substance irritates the eyes, skin, and upper respiratory tract. Eye and skin irritation may be severe. Exposure could cause lowering of consciousness, with headache, loss of concentration, dizziness, and unconsciousness.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. Possible hematopoietic, reproductive effects. A potential occupational carcinogen.

Points of Attack: Eyes, skin, central nervous system, hematopoietic system, reproductive system. The liquid destroys the skin's natural oils, causing dermatitis. Cancer site in animals: nasal cavity.

Medical Surveillance: NIOSH lists the following tests: pulmonary function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber, natural rubber, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not a danger. Store in a refrigerator or in a cool, dry place. Protect from exposure to acids, bases, oxidizers, and curing agents. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic, liquids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." *N*-Nitrosodimethylamine falls in DOT Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60−70% ethanol; then with soap and with 60−70% ethanol; then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific

recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Concentrated waste containing no peroxides—discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.

EC Number: 202-873-5 [*Annex I Index No.:* 612-023-00-9]; 200-444-7 (phenylhydrazinium chloride) [*Annex I Index No.:* 612-023-00-9]

Regulatory Authority and Advisory Bodies

Carcinogenicity: NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: (*Phenylhydrazine and its salts*) Cancer 7/1/92.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

Hydrochloride:

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000/10,000 lb (454/4540 kg) (hydrochloride).

Reportable Quantity (RQ): 1000 lb (454 kg) (hydrochloride).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol (*includes hydrochloride*): T, N; Risk phrases: R45; R23/24/25; R36/38; R43; R48/23/24/25; R68; R50; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Phenylhydrazine is a colorless to pale yellow liquid or solid with a weak aromatic odor. The hydrochloride is a white to tan solid with a weak odor. Molecular weight = 108.16; Specific gravity (H_2O:1) = 1.10 (base); Boiling point = (decomposes) 243.3°C (base); Freezing/Melting point = 19.4°C (base); 24°C (hemihydrate); 243−246°C (hydrochloride); Vapor pressure = 0.04 mmHg at 25°C; Flash point = 88°C (cc) (base); Autoignition temperature = 174°C (base). Explosive limits: LEL = 1.1%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2; (*hydrochloride*) Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Phenylhydrazine is a widely used reagent in conjunction with sugars, aldehydes, and ketones. In addition, it is used in the synthesis of dyes; pharmaceuticals, such as antipyrin, cryogenin, and pyramidone; and other organic chemicals. The hydrochloride salt is used in the treatment of polycythemia vera.

Incompatibilities: Phenylhydrazine is very reactive with carbonyl compounds, strong oxidizers, strong bases, alkali metals, ammonia, lead dioxide (violent). Attacks copper salts, nickel, and chromates.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.42 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/22 mg/m^3 TWA [skin].

NIOSH REL: 0.14 ppm/0.6 mg/m^3 [120 min] Ceiling Concentration [skin]; A potential occupational carcinogen

[skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.1 ppm/0.44 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 15 ppm (potential occupational carcinogen).

Protective Action Criteria (PAC)

Phenylhydrazine

TEEL-0: 0.1 ppm

PAC-1: 0.3 ppm

PAC-2: 2 ppm

PAC-3: 15 ppm

Phenylhydrazine hydrochloride

TEEL-0: 50 mg/m^3

PAC-1: 150 mg/m^3

PAC-2: 250 mg/m^3

PAC-3: 250 mg/m^3

DFG MAK: [skin], danger of skin sensitization; Carcinogen Category 3B.

Arab Republic of Egypt: TWA 5 ppm (20 mg/m^3), [skin], 1993; Australia: TWA 5 ppm (20 mg/m^3); STEL 10 ppm, [skin], carcinogen, 1993; Austria: MAK 5 ppm (22 mg/m^3), [skin], Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (22 mg/m^3); STEL 10 ppm, [skin], carcinogen, 1993; Denmark: TWA 0.1 ppm (0.6 mg/m^3), [skin], 1999; Finland: STEL 5 ppm (22 mg/m^3), [skin], 1999; Norway: TWA 0.6 mg/m^3, 1999; the Philippines: TWA 5 ppm (22 mg/m^3), 1993; Poland: MAC (TWA) 20 mg/m^3, 1999; Switzerland: MAK-W 5 ppm (22 mg/m^3), [skin], 1999; Turkey: TWA 5 ppm (22 mg/m^3), [skin], 1993; United Kingdom: CHAN, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic[35]: MAC 1.0 mg/m^3. Several states have set guidelines or standards for phenylhydrazine in ambient air[60] ranging from zero (North Dakota) to 66.7 μg/m^3 (New York) to 200.0 μg/m^3 (Connecticut, Florida, South Carolina, and Virginia) to 476.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3518.

Permissible Concentration in Water: Russia[35, 43] set a MAC of 0.01 mg/L of phenylhydrazine in water bodies used for domestic purposes.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 1.25$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: The dust and fumes can irritate and burn the eyes and skin. Inhalation can cause irritation, coughing, and difficult breathing. This material is poisonous if swallowed or if fumes are inhaled. Phenylhydrazine is a chronic poison. High levels can cause cyanosis and methemoglobinemia. Higher levels can cause troubled breathing, collapse, and even death. Exposure can cause headache, nausea, vomiting, lightheadedness, nervousness, shaking, seizures, and coma.

Long Term Exposure: Repeated or prolonged contact may cause skin irritation, dermatitis, sensitization, and allergy. May affect the blood, causing red cell damage, cyanosis, hemolytic anemia, kidney and liver damage, vascular thrombosis. A potential occupational carcinogen; it may cause leukemia.

Points of Attack: Blood, respiratory system, liver, kidneys, skin. Cancer site in animals: lungs, liver, blood vessels, and intestine. May affect the bone marrow and cause leukemia.

Medical Surveillance: NIOSH lists the following tests: blood plasma, hemoglobin; complete blood count; liver function tests; pulmonary function tests; urine (chemical/metabolite), hemoglobin; urinalysis (routine); white blood cell count/differential. Evaluation by a qualified allergist.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash- or dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red Stripe (*100-63-0*): Flammability Hazard: Do not store in the same area as other flammable materials. (2) Color Code—Blue (*hydrochloride, 59-88-1*): Health Hazard: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator under an inert atmosphere and protect from exposure to light, strong bases, ammonia, oxidizers, metal salts. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Phenylhydrazine requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid contact with solid and dust. Restrict access. Disperse and flush. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Do not touch spilled material; stop leak if you can do it without risk. *Small liquid spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* collect powdered material in the most convenient and safest manner and deposit in sealed containers; move container from spill area. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid or solid, but does not easily ignite. Poisonous gases, including nitrogen oxides and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration whereby oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

European/International Regulations: Hazard Symbol: T; Risk phrases: R10; R22; R26; R34; R37; R42/43; Safety phrases: S/23; S/26; S28; S36/37/39; S38; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Phenyl isocyanate is a colorless liquid with an irritating odor. Molecular weight = 119.30; Boiling point = 160°C; Freezing/Melting point = −30°C; Flash point = 56°C. Hazard Identification (based on NFPA-704 M

Rating System): Health 1, Flammability 2, Reactivity 0. Decomposes in water.

Potential Exposure: Compound Description: Mutagen. Phenyl isocyanate is used as a laboratory reagent and in organic synthesis.

Incompatibilities: Forms explosive mixture with air. Violent reaction with strong oxidizers. Isocyanates are incompatible with acids, caustics, ammonia, amines, amides, alcohols, glycols, caprolactum solution, water.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.006 mg/m^3

PAC-1: **0.020** mg/m^3

PAC-2: **0.15** mg/m^3

PAC-3: **0.24** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Danger of skin and airway sensitization.

Russia[43] set a MAC of 0.5 mg/m^3 in work-place air.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Phenyl isocyanate can affect you when breathed in and by passing through your skin. Exposure can strongly irritate the skin, nose, throat, and lungs. Higher levels may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. LD_{50} = (oral-rat) 800 mg/kg.

Long Term Exposure: Phenyl isocyanate can cause an asthma-like lung allergy to develop, with cough, shortness of breath, and wheezing. It can also cause an allergic skin rash.

Points of Attack: Lungs, skin.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. These may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to phenyl isocyanate, as a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Phenyl isocyanate requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I. A plus sign (+) indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive

concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.5
Night	0.4/0.6

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)

Day	1.0/1.5
Night	1.6/2.5

Fire Extinguishing: Phenyl isocyanate may burn, but does not readily ignite. Poisonous gases are produced in fire, including oxides of nitrogen. Containers may explode in fire. Use dry chemical, CO_2, water spray; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Phenyl mercaptan P:0440

Molecular Formula: C_6H_6S
Common Formula: C_6H_5SH
Synonyms: Benzenethiol; Mercaptobenzene; Phenol, thio-; Phenylmercaptan; Phenylthiol; Thiophenol
CAS Registry Number: 108-98-5
RTECS® Number: DC0525000
UN/NA & ERG Number: UN2337/131
EC Number: 203-635-3

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
US EPA Hazardous Waste Number (RCRA No.): P014.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
US DOT 49CFR172.101, Inhalation Hazardous Chemical.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Phenyl mercaptan is a water-white liquid with a repulsive, penetrating, garlic-like odor. The odor threshold is 0.0003 ppm. Molecular weight = 110.18; Specific gravity (H_2O:1) = 1.08; Boiling point = 126°C; Freezing/Melting point = −9.4°C; Vapor pressure = 1 mmHg at 18°C; Flash point = 55.6°C. Explosive limits: LEL = 1.2%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Primary Irritant. Phenyl mercaptan is used as a chemical intermediate in pesticide manufacture; as a mosquito larvicide. It is used in solvent formulations for the removal of polysulfide sealants.

Incompatibilities: Strong acids, strong bases, calcium hypochlorite, alkali metals. Oxidizes on exposure to air; supplied under nitrogen. At normal room temperature may vaporize forming explosive mixtures with air.

Permissible Exposure Limits in Air

OSHA PEL: None.
NIOSH REL: 0.1 ppm/0.5 mg/m^3 [15 min] Ceiling Concentration.
ACGIH TLV®[1]: 0.1 ppm/0.45 mg/m^3 TWA [skin].
Protective Action Criteria (PAC)*
TEEL-0: 0.1 ppm
PAC-1: 0.1 ppm
PAC-2: **0.53** ppm
PAC-3: **1.6** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.5 ppm (2 mg/m^3), 1993; Belgium: TWA 0.5 ppm (2.3 mg/m^3), 1993; Denmark: TWA 0.5 ppm (2.3 mg/m^3), 1999; Finland: STEL 0.5 ppm (2.6 mg/m^3), 1993; France: VME 0.5 ppm (2 mg/m^3), 1999; Norway: TWA 0.5 ppm (2 mg/m^3), 1999; Switzerland: MAK-W 0.5 ppm (2.3 mg/m^3), 1999; the Netherlands: MAC-TGG 2 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm.

Several states have set guidelines or standards for benzenethiol in ambient air[60] ranging from 20 μg/m^3 (North Dakota) to 35 μg/m^3 (Virginia) to 40 μg/m^3 (Connecticut) to 48 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2075.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.52$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Benzenethiol can affect you when breathed in and by passing through your skin. Irritates the eyes, skin, and respiratory tract. Benzenethiol can severely burn the eyes, causing permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure can cause weakness, dizziness, cough, wheezing, dyspnea (breathing difficulty). Higher levels can cause restlessness and irritability followed by paralysis and death. High or repeated exposure can cause liver, kidney, or lung damage. Acute exposure to thiophenol may result in cough, troubled breathing, irritation of the lungs, and pneumonitis. Nausea, vomiting, and diarrhea are often seen. May affect the nervous system.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. May cause lung, kidney, liver, spleen damage.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys, liver, spleen.

Medical Surveillance: If symptoms develop or overexposure is suspected, tests of the following may be helpful: Kidney and liver function. Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. If available, flush eyes with large amounts of 0.5% silver nitrate, followed immediately by very large amounts of water. Continue water for 15 min. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 1 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 5 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: (1) Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in airtight containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, should be prohibited where benzenethiol is handled, used, or stored. Use only nonsparking tools and equipment, especially when opening and closing containers of benzenethiol.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS, FLAMMABLE LIQUID." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including sulfur dioxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in flammable solvent and burn in furnace equipped with afterburner and alkaline scrubber.[22]

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.00057 μg/L as a 24-h average, never to exceed 0.0017 μg/L. *To protect saltwater aquatic life:* 0.025 μg/L as a 24-h average, never to exceed 3.7 μg/L. *To protect human health:* 0.144 μg/L (US EPA) set in 1979–1980.[6] These are the limits for inorganic mercury compounds in general.

Determination in Water: Total mercury is determined by flameless atomic absorption. Soluble mercury may be determined by 0.45 μm filtration followed by flameless atomic absorption.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Overexposure affects the kidneys, causing renal function failure. Extremely toxic. The probable oral lethal dose for humans is 5–50 mg/kg, between 7 drops and 1 teaspoonful for a 70-kg (150 lb) person. Symptoms arising from acute exposure may occur at varying intervals up to several weeks following exposure. Ingestion of mercurial fungicide-treated grain resulted in gastrointestinal irritation with nausea, vomiting, abdominal pain, and diarrhea. Alkylmercurials produce severe neurologic toxicity, such as loss of feeling in lips, tongue, and extremities; confusion, hallucinations, irritability, sleep disturbances; staggering walk; memory loss; slurred speech; auditory defects; emotional instability; and inability to concentrate. It is also a strong skin irritant; erythema and blistering may result 6–12 h after exposure. Phenylmercury acetate, at sufficient concentration, is expected to be injurious to the eye externally. Mercury poisoning can cause "shakes," irritability, sore gums; increased saliva; personality change and brain damage. Skin contact can cause burns, skin allergy, and a gray skin color. Heating or contact with acid or acid "fumes" releases toxic mercury vapors.

Long Term Exposure: Mercury accumulates in the body. Repeated or prolonged contact with skin may cause dermatitis. May affect the nervous system, causing nervous disorders. Based on animal tests, phenylmercuric acetate should be handled as a teratogen—with extreme caution. It also may cause mutations.

Points of Attack: Eyes, skin, central nervous system, peripheral nervous system, kidneys.

Medical Surveillance: Before first exposure and every 6−12 months after, a complete medical history and examination is strongly recommended with: examination of the nervous system, including handwriting. Routine urine test (UA). Urine test for mercury (should be less than 0.02 mg/L). Consider lung function tests for persons with frequent exposures. After suspected illness or overexposure, repeat the above tests and get a blood test for mercury. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Antidotes and Special Procedures for medical personnel: The drug NAP (*n*-acetyl penicillamine) has been used to treat mercury poisoning, with mixed success.

Note to physician: For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metal poisoning—including mercury. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #73-11024.

Respirator Selection: *Up to 0.1 mg/m³:* Sa (APF = 10) (any supplied-air respirator). *Up to 0.25 mg/m³:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 0.5 mg/m³:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 2 mg/m³:* SA: PD, PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers (such as chlorine, bromine, and fluorine). Sources of ignition, such as smoking and open flames, are prohibited where phenylmercuric acetate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Phenylmercuric acetate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Spills should be collected with special mercury vapor suppressants or special vacuums. Kits specific for cleanup of mercury spills should be available. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, foam, or carbon dioxide on solution. Use water as necessary, but run-off should be limited and controlled to prevent it from entering streams of water supplies. Materials are extremely hazardous to health, but areas may be entered with extreme care. Full protective clothing, including self-contained breathing apparatus; rubber gloves; boots and bands around legs, arms, and waist, should be provided. No skin should be exposed. Poisonous gases are produced in fire, including mercury. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. React to produce soluble nitrate form, precipitate as mercuric sulfide. Return to supplier.

N-Phenyl-β-naphthylamine P:0460

Molecular Formula: $C_{16}H_{13}N$

Common Formula: $C_{10}H_7NHC_6H_5$

Synonyms: 2-Anilinonaphthalene; β-Naphthylphenylamine; PBNA; 2-Phenylaminonaphthalene; Phenyl-β-naphthylamine

CAS Registry Number: 135-88-6

RTECS®Number: QV4550000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: 205-223-9 [*Annex I Index No.:* 612-135-00-8]

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1978; NCI: Carcinogenesis Studies (feed); equivocal evidence: mouse; no evidence: rat; NIOSH) (*since metabolized to* β*-naphthylamine*): Potential occupational carcinogen.

Banned or Severely Restricted (Sweden) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R36/38; R40; R43; R51/53; Safety phrases: S2; S26; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phenyl-β-naphthylamine is a light gray powder. A combustible solid. Molecular weight = 219.30; Specific gravity (H_2O:1) = 1.24; Boiling point = 396°C; Freezing/Melting point = 107.8°C. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Phenyl-β-naphthylamine is used as a rubber antioxidant, as an inhibitor for butadiene, a stabilizer in lubricants, and an intermediate in chemical synthesis.

Incompatibilities: Incompatible with oxidizers, strong acids, organic anhydrides, isocyanates, aldehydes.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: A potential occupational carcinogen* [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A. [**Note:* Since metabolized to β-naphthylamine].

ACGIH TLV®[1]: not classifiable as a human carcinogen.

No TEEL available.

DFG MAK: Carcinogen Category 3B.

Australia: carcinogen, 1993; Austria: Suspected: carcinogen, 1999; Belgium: carcinogen, 1993; Finland: carcinogen, 1999; Poland: MAC (TWA) 0.03 mg/m^3, 1999; Sweden: carcinogen, 1999; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Several states have set guidelines or standards for this compound in ambient air[60] ranging from zero (North Dakota) to 3.0 μg/m^3 (Virginia) to 45.0 μg/m^3 (Pennsylvania).

Determination in Air: Use OSHA Analytical Method 96.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 4.4.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: The main problem with this compound is that phenyl-β-naphthylamine, a known carcinogen, is both a contaminant in, and a metabolic product of PBNA. Phenyl-β-naphthylamine can affect you when breathed in and by passing through your skin. Contact can cause skin irritation and rash. Phenyl-β-naphthylamine should be handled as a carcinogen—with extreme caution. Exposure can affect the ability of the blood to carry oxygen (methemoglobinemia), causing cyanosis, a bluish skin color. Higher levels can cause headache and dizziness. Very high levels can cause death. LD_{50} = (oral-mouse) 1450 kg/mg.

Long Term Exposure: Repeated or prolonged contact may cause skin irritation, sensitization, allergy; hypersensitivity to sunlight. A potential occupational carcinogen. Can cause methemoglobinemia (see above); anemia may result.

Points of Attack: Eyes, skin, bladder. *Cancer site:* bladder; in animals: lung, pancreas.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat and oil. A regulated, marked area should be established where *N*-phenyl-β-naphthylamine is handled, used, or stored.

Shipping: Toxic solids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III. As a hazardous substance, solid, n.o.s., this imposes no label requirements or maximum on shipping weights.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer 8/4/00.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xi, N; Risk phrases: R36/37/38; R50; Safety phrases: S2; S22; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: *o*-Phenylphenol is a white to buff-colored crystalline solid. Molecular weight = 170.22; Boiling point = 286°C; Freezing/Melting point = 57°C; Flash point = 124°C; Autoignition temperature = 530°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. *o*-Phenylphenol is used in the manufacture of plastics, resins, rubber, as agricultural chemical; in making fungicides; as an intermediate in making dye stuffs and rubber chemicals; a germicide; used in food packaging.

Incompatibilities: Strong bases, strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 60 mg/m^3

PAC-1: 150 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: No numerical value established. Data may be available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures may affect the kidney, liver, and lungs; gastrointestinal tract; cardiovascular system, causing respiratory failure. *Inhalation:* Dusts can cause irritation of the nose, throat, and lungs. *Skin:* Can cause severe irritation and burns. Concentrations of 0.5% or higher of the sodium form can cause irritation. *Eyes:* Can cause severe irritation, burns, and damage to cornea, especially the sodium form. *Ingestion:* Based on studies of phenol, can cause burning sensation and pain in mouth and throat, sores, abdominal pain, nausea, vomiting, diarrhea, and skin rash. Larger doses may also cause muscle weakness, irregular rapid breathing, blue coloration of the skin, shock, unconsciousness, collapse, and death. Based on animal studies, 5 oz would be lethal to a 150-lb healthy adult.

Long Term Exposure: May cause kidney damage. Prolonged skin contact may cause severe irritation, sores, and skin allergy. Very irritating substances may affect the lungs; bronchitis may develop.

Points of Attack: Lungs, kidneys, skin.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to *o*-phenylphenol, use a NIOSH/MSHA- or European Standard EN149-approved full face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water. Sources of ignition, such as smoking and open flames, are prohibited where *o*-phenylphenol is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dye intermediates, solid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

EC Number: 211-325-4

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Developmental/Reproductive toxin 8/7/09.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Polyphosphinate is a clear, colorless liquid with a foul odor. Molecular weight = 110.10; Specific gravity (H_2O:1) = 1.001 at 15°C; Boiling point = 160°C. Insoluble in water; reacts.

Potential Exposure: Polyphosphinate is used as an intermediate or a chemical reagent. Polyphosphinate compounds are used as catalysts and antioxidants disproportionate, when heated to give phosphonic acid derivatives plus PF.

Incompatibilities: A strong reducing agent. Reacts violently with strong oxidizers. Water reactive; spontaneously combustible in high concentrations in moist air. Potential exposure to gaseous phenylphosphine and phosphorus oxides when heated above 200°C.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.50 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.05 ppm/0.25 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.05 ppm/0.23 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)

TEEL-0: 0.0025 ppm

PAC-1: 0.0075 ppm

PAC-2: 0.05 ppm

PAC-3: 4 ppm

Australia: TWA 0.05 ppm (0.25 mg/m^3), 1993; Belgium: STEL 0.05 ppm (0.23 mg/m^3), 1993; Denmark: TWA 0.05 ppm (0.25 mg/m^3), 1999; Finland: STEL 0.05 ppm (0.25 mg/m^3), 1999; France: VLE 0.05 ppm (0.25 mg/m^3), 1999; Switzerland: MAK-W 0.05 ppm (0.25 mg/m^3), 1999; the Netherlands: MAC 0.25 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.05 ppm. Several states have set guidelines or standards for PF in ambient air[60] ranging from 2.0 μg/m^3 (Virginia) to 2.5 μg/m^3 (North Dakota) to 6.0 μg/m^3 (Nevada).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A level of 0.6 ppm is a threshold effect level for laboratory animals; hypersensitivity to sound and touch and mild hyperemia developed above this level. Above 2.2 ppm, chronic effects developed including decreases in red blood cells, dermatitis, and severe testicular degeneration (which was, however, reversible).[53] This material is highly toxic by inhalation and ingestion; mild respiratory irritant; emits toxic fumes of phosphorus oxides when heated to decomposition.

Symptoms of exposure include mild respiratory irritation, dyspnea, nausea, vomiting, diarrhea, thirst, sensation of pressure in the chest, back pains, chills, stupor, and fainting with marked pulmonary edema. Phenylphosphine can affect you when breathed in. Exposure can cause nausea, loss of appetite, shaking (tremor), irritation of the eyes, and flushed skin.

Long Term Exposure: Repeated exposure can cause skin rash. Phenylphosphine can damage the blood cells. In animals: blood changes; anemia, testicular degeneration; loss of appetite; diarrhea, lacrimation (discharge of tears), hind leg tremor; dermatitis.

Points of Attack: Blood, central nervous system, skin, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: complete blood count. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.05* ppm, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Pyrophoric. Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Phenylthiourea P:0490

Molecular Formula: $C_7H_8N_2S$

Common Formula: $C_6H_5NCHCSNH_2$

Synonyms: NCI-C02017; Phenylthiocarbamide; *N*-phenylthiourea; α-Phenylthiourea; Phenyl-2-thiourea; 1-Phenylthiourea; PTC; PTU

CAS Registry Number: 103-85-5
RTECS® Number: YU1400000
UN/NA & ERG Number: UN2767/151
EC Number: 203-151-2
Regulatory Authority and Advisory Bodies
US EPA Hazardous Waste Number (RCRA No.): P093.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R36/38; R43; R51/53; Safety phrases: S28; S36/37-45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: *N*-phenylthiourea is a colorless crystalline solid. Molecular weight = 152.23; Freezing/Melting point = 148−154°C. Soluble in water.

Potential Exposure: Used as a repellent for rats, rabbits, and weasels; in the manufacture of rodenticides and in medical genetics.

Incompatibilities: Incompatible with oxidizers, strong bases, and acids. Contact with acids or acid fumes produces toxic fumes of sulfur oxide.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.6 mg/m^3
PAC-1: 1.5 mg/m^3
PAC-2: 3 mg/m^3
PAC-3: 3 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. High exposures can cause lung irritation, coughing, and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposure may result in vomiting, difficult breathing, noisy breathing, cyanosis, and low body temperature. It is classified as extremely toxic. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoon for a 70-kg (150 lb) person.

Long Term Exposure: Not tested for long-term health effects. May cause methemoglobinemia, cyanosis, and anemia. Phenylthiourea is reported to be similar to ANTU.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Blood methemogloblin level. Completed blood count (CBC). Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place.

Shipping: Phenylurea pesticides, solid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust or use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up

spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, alcohol foam or polymer foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Phenyl trichlorosilane P:0500

Molecular Formula: $C_6H_5Cl_3Si$

Synonyms: Phenylsilicon trichloride; Phenyl trichlorosilane; Silicon phenyl trichloride; Silane, trichlorophenyl-; Trichlorophenylsilane; Tricloro(fenil)silano (Spanish)

CAS Registry Number: 98-13-5

RTECS® Number: VV6650000

UN/NA & ERG Number: UN1804/156

EC Number: 202-640-8

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Phenyl trichlorosilane is a colorless to light yellow liquid. Molecular weight = 211.55; Specific gravity = 1.32 at 25°C; Boiling point = 202°C; Flash point = 80.6°C; 91°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 2₩. Water reactive.

Potential Exposure: Phenyl trichlorosilane is used to make silicones for water repellants, insulating resins, heat-resistant paints, and as a laboratory reagent.

Incompatibilities: May spontaneously ignite in air above flash point. Contact with water, steam, or moisture forms hydrogen chloride. Trichlorosilanes may react violently with strong oxidants, strong acids, bases, amines, alcohols, acetone, ammonia. Attacks many metals in the presence of water, releasing explosive hydrogen gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.2 ppm

PAC-1: 0.6 ppm

PAC-2: 7.3 ppm

PAC-3: 33 ppm

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Eye contact may damage the corneas and cause blindness. Inhalation may cause throat to swell, causing suffocation; and may cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Highly toxic; may cause death or permanent injury after short inhalation exposure to small quantity. Chemical burns to all exposed membranes and tissues with severe tissue destruction. *Delayed:* after oral exposure, stomach and intestines may perforate to be obstructed by scar tissue. Ingestion may cause mild to moderately severe oral and esophageal burns, with severe burns occurring in stomach. Perforations and peritonitis may occur. Severe irritation may produce spontaneous vomiting. Viscid white or blood-stained foamy mucus and threads of tissue may appear in mouth.

Long Term Exposure: Many highly irritating substances can cause lung damage; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: lung function tests. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk; then give demulcents, such as milk, cornstarch, and water. Do not induce vomiting.

Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to phenyl trichlorosilane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water at temperatures below 50°C. Phenyl trichlorosilane can give off corrosive hydrogen chloride gas on contact with water, steam, or moisture. Sources of ignition, such as smoking and open flames, are prohibited where Phenyl trichlorosilane is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Phenyl trichlorosilane requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

when spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)

Day	0.1/0.2
Night	0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)

Day	0.3/0.5
Night	1.0/1.5

Fire Extinguishing: This chemical is a combustible and corrosive liquid. Poisonous gases, including chlorine and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide. *Do not use water* or hydrous agents. Full protective clothing, including self-contained breathing apparatus; coat, pants, gloves, boots; and bands around legs, arms, and waist, should be provided. No skin surface should be exposed. Move container from fire area if you can do so without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

California Proposition 65 Chemical: Cancer 1/1/88; Reproductive toxin 7/1/87; Cancer 1/1/88 (sodium salt).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phenytoin is a crystalline compound. Molecular weight = 252.29; Freezing/Melting point = 295−298°C; Ignition temperature = 585°C. May react with water.

Potential Exposure: Phenytoin is a pharmaceutical used in the treatment of grand mal epilepsy, Parkinson's syndrome; and in veterinary medicine. Human exposure to phenytoin occurs principally during its use as a drug. Figures on the number of patients using phenytoin are not available, but phenytoin is given to a major segment of those individuals with epilepsy. The oral dose rate is initially 100 mg given 3 times per day and can gradually increase by 100 mg every 2−4 weeks until the desired therapeutic response is obtained. The intravenous dose is 200−350 mg/day.

Incompatibilities: Strong acids, strong oxidizers, water.

Permissible Exposure Limits in Air

No standards or TEEL available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Symptoms of exposure include blurred vision, hyperactivity, confusion, drowsiness, nausea, vomiting, epigastric pain, swelling of gums, fever, liver and kidney damage.

Long Term Exposure: Phenytoin is carcinogenic in mice after oral administration or by intraperitoneal injection, producing lymphomas and leukemias.

Points of Attack: Liver, kidneys.

Medical Surveillance: Liver and kidney function tests.

First Aid: *Skin Contact*[52]: Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Specific respirator(s) have not been recommended by NIOSH. However, based on potential carcinogenicity, and where the potential exists for exposure, the following might be considered:

At any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100 F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place or in a refrigerator. Protection from air, light, and moisture is recommended for long term storage.[52] A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." This compound falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources[52]: Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases, including nitrogen oxides, are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phorate is a clear mobile liquid with a skunk-like odor. Molecular weight = 260.39; Specific gravity (H_2O:1) = 1.16 at 25°C; Boiling point = 118−120°C at 0.8 mm; Freezing/Melting point = −42.8°C; Vapor pressure = 0.0008 at 20°C; Flash point = 160°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.005%.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data; Primary Irritant. Those engaged in the manufacture, formulation, and application of this systemic and contact insecticide and acaricide. It is also used as a soil insecticide.

Incompatibilities: Water, alkalis. Hydrolyzed in the presence of moisture and by alkalis; may produce toxic oxides of phosphorus and sulfur. Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 0.05 mg/m^3 TWA; 0.2 mg/m^3 STEL [skin].

ACGIH TLV®[1]: 0.05 mg/m^3 TWA, inhalable fraction and vapor; [skin] not classifiable as a human carcinogen; BEI$_A$ issued for Acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC)*

TEEL-0: 0.04 mg/m^3

PAC-1: 0.04 mg/m^3

PAC-2: **0.040** mg/m^3

PAC-3: **0.12** mg/m^3

AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 0.05 mg/m^3; STEL 0.2 mg/m^3, [skin], 1993; Belgium: TWA 0.05 mg/m^3, [skin], 1993; Denmark: TWA 0.05 mg/m^3, [skin], 1999; France: VME 0.05 mg/m^3, [skin], 1999; Norway: TWA 0.05 mg/m^3, 1999; Switzerland: MAK-W 0.05 mg/m^3, [skin], 1999; United Kingdom: TWA 0.05 mg/m^3; STEL 0.2 mg/m^3, [skin], 2000; the Netherlands: MAC-TGG 0.05 mg/m^3, [skin], 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.2 mg/m^3 [skin]. Several states have set guidelines or standards for Phorate in ambient air[60] ranging from 0.5−2.0 μg/m^3 (North Dakota) to 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus pesticides.

Permissible Concentration in Water: Maine[61] has set a guideline for phorate in drinking water of 0.2 μg/L.

Determination in Water: Fish Tox = 0.13505000 ppb (EXTRA HIGH). Octanol−water coefficient: Log K_{ow} = 3.88.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Acute exposure to phorate may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Dyspnea (shortness of breath) may be followed by respiratory collapse. Giddiness is common. This material is one of the most toxic organophosphorus insecticides. It is a cholinesterase inhibitor that acts on the nervous system; and produces toxicity similar to parathion. The probable oral lethal dose for humans is less than 5 mg/kg, i.e., a taste (less than 7 drops) for a 70-kg (150 lb) person. LD_{50} = (oral-rat) 37 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure; resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 3.50000 ppm (HIGH).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of “normal.” Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Not available according to NIOSH. *The following is included for reference:* NIOSH: *(parathion) 0.5 mg/m*^{3}*:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *1.25 mg/m*^{3}: Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any powered air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter). *2.5 mg/m*^{3}*:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter] or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *10 mg/m*^{3}*:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water and alkalis. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, liquid, toxic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, phosphorous oxides, sulfur oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Wear positive pressure self-contained breathing apparatus. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (East Germany, Philippines) (UN).[13]

Very Toxic Substance (World Bank).[15]

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phosacetim is a crystalline solid. Molecular weight = 375.22. Hazard Identification (based on NFPA-704 M Rating System): Health 4 Flammability 1, Reactivity 0.

Potential Exposure: Used as a rodenticide.

Incompatibilities: Strong oxidizers, nitrates. May hydrolyze on contact with moisture.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.7 mg/m^3

PAC-3: 3.7 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) #5600, Organophosphorus Pesticides.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control. Highly toxic. LD_{50} oral rat is 3.7 mg/kg.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous

system with repeated exposure, resulting in convulsions and respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Organophosphorus pesticides, solid, toxic, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including oxides of phosphorus, sulfur, nitrogen, and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; Safety phrases: S1/2; S28; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Phosfolan is a colorless to yellow solid. Molecular weight = 255.31; Boiling point = 115−118°C at 0.001 mm; Freezing/Melting point = 37−45°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide.

Incompatibilities: Incompatible with nitrates and water. May hydrolyze upon contact with water, steam, and moisture, and produce toxic oxides of phosphorus, nitrogen, sulfur, and chlorine.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 9 mg/m^3

PAC-3: 9 mg/m^3

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Similar to parathion in health hazards. Death may result due to respiratory arrest as a result of paralysis of respiratory muscles and intense bronchoconstriction. Also considered a cholinesterase inhibitor. Symptoms similar to parathion include nausea, vomiting, abdominal cramps, diarrhea, excessive salivation, headache, giddiness, dizziness, tightness in the chest, blurring or dimness of vision, tearing, loss of muscle coordination, slurring of speech, twitching of muscles, drowsiness, difficulty in breathing, respiratory rales, and random jerky movements.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing

material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers, nitrates, and other incompatible materials listed above. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Organophosphorus pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Extinguish with dry chemical, carbon dioxide, water spray, foam, or fog. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Phosgene (CG) is a colorless, noncombustible gas. It is shipped as a liquefied compressed gas in steel cylinders. At low concentrations CG has a sweet (not pleasant) odor like newly mown hay, green corn, or moldy hay. In higher concentrations, it is poisonous with an odor that is suffocating, irritating, and pungent. The odor is only detectable for a short amount of time when CG is initially released and odor should not be regarded as a reliable indicator of overexposure. A fuming liquid below 8.3°C/47°F. Shipped as a liquefied compressed gas. The odor threshold is between 1.5 and 6 mg/m^3. A choking agent, phosgene (CG), rapidly decomposes in relative humidity over 70%. Molecular weight = 98.92; Boiling point = 8.2°C; Freezing/Melting point = −118°C; Relative vapor density (air = 1) = 3.48; Vapor pressure = 1.61 atm at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 1. Reacts with water (slightly soluble).

Potential Exposure: Compound Description: Human Data. Phosgene can be deadly at a concentration as low as 2 ppm. Phosgene is used as an intermediate in the manufacture of many industrial chemicals, including dyes and plastics; in the making of dyestuffs based on triphenylmethane, coal tar, and urea. It is also used in the organic synthesis of isocyanates and their derivatives, carbonic acid esters (polycarbonates), and acid chlorides. Other applications include its utilization in metallurgy; and in the manufacture of some insecticides and pharmaceuticals. Exposure to phosgene may occur during arc welding and in fires involving vinyl chloride; released from household paint removers and degreasers when they are used in the presence of heat. Phosgene (CG) has been used as a military choking, pulmonary agent since WW I, and has become a staple of chemical arsenals in many countries. ***Persistence of Chemical Agent:*** Phosgene (CG & DO): Summer: 1−10 min; Winter: 10 min to 1 h.

Incompatibilities: Moisture, alkalis, ammonia, alcohols, copper. Reacts slowly in water to form hydrochloric acid and carbon dioxide. Violent reaction with strong oxidizers, amines, aluminum. Attacks many metals in the presence of water. Attacks plastic, rubber, and coatings.

DFG MAK: 0.02 ppm; 0.082 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.
Austria: MAK 0.1 ppm (0.4 mg/m^3), 1999; Denmark: TWA 0.05 ppm (0.2 mg/m^3), 1999; Finland: STEL 0.05 ppm (0.2 mg/m^3), [skin], 1999; France: VLE 0.1 ppm (0.4 mg/m^3), 1999; Japan: 0.1 ppm (0.4 mg/m^3), 1999; the Netherlands: MAC-TGG 0.08 mg/m^3, 2003; the Philippines: TWA 0.1 ppm (0.1 mg/m^3), 1993; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 1.5 mg/m^3, 1999; Sweden: TGV 0.05 ppm (0.2 mg/m^3), 1999; Switzerland: MAK-W 0.1 ppm (0.4 mg/m^3), KZG-W 0.2 ppm (0.8 mg/m^3), 1999; Thailand: TWA 0.1 ppm (0.4 mg/m^3), 1993; Turkey: TWA 0.1 ppm (0.4 mg/m^3), 1993; United Kingdom: TWA 0.02 ppm (0.08 mg/m^3); STEL 0.06 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 ppm. The Czech Republic has set a TWA of 0.5 mg/m^3 and a ceiling value of 1.0 mg/m^3 in work-place air, and MAC in ambient air of 0.01 mg/m^3 and 0.003 mg/m^3 on a daily average basis. Several states have set guidelines or standards for phosgene in ambient air[60] ranging from zero (North Carolina) to 1.33 μg/m^3 (New York) to 4.0 μg/m^3 (Florida, North Dakota, South Carolina) to 7.0 μg/m^3 (Virginia) to 8.0 μg/m^3 (Connecticut) to 10.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method 61.

Determination in Water: Octanol−water coefficient: Log $K_{\mathrm{ow}} = -0.71$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Acute exposure to phosgene may result in severe irritation and burns of the skin, eyes, mucous membranes, and respiratory passages. Cough, dyspnea (shortness of breath), pain in the chest, and severe pulmonary edema may also occur. Cyanosis and anxiety may be observed.

Note: The detection of the odor of phosgene at any time indicates the need for immediate, corrective action or withdrawal. *Inhalation:* Both immediate and delayed symptoms may be felt. Immediate symptoms of irritation to mouth, throat, and eyes, tearing, coughing, and difficult breathing are felt at levels of 5 ppm and above. Delayed effects are the accumulation of fluid in the lungs and death; if proper, rapid treatment is not obtained. The length of delay depends on the dose but may be between 2 and 15 h. Death may result from short exposures to high levels (30 ppm, 17 min) or long exposures to low levels (3 ppm, 3 h). Phosgene is particularly dangerous at low levels because lethal doses may be inhaled without warning symptoms. *Skin:* Contact with skin may lead to severe chemical burns. Liquid may cause frostbite. *Eyes:* Eye irritation begins at 3–5 ppm. Severe and permanent damage may result. Liquid phosgene is more hazardous than vapor. Liquid may cause frostbite. *Ingestion:* Expected symptoms may include severe irritation and chemical burns of the mouth, throat, lungs, and digestive tract.

Long Term Exposure: Even low levels can cause permanent lung damage, emphysema, bronchitis, pulmonary fibrosis.

Points of Attack: Respiratory system, lungs, skin, eyes.

Medical Surveillance: Preemployment medical examinations should include chest X-rays and baseline pulmonary function tests. Consider chest X-ray following acute overexposure. The eyes and skin should be examined. Smoking history should be known. Periodic pulmonary function studies should be done. Workers who are known to have inhaled phosgene should remain under medical observation for at least 24 h to insure that delayed symptoms do not occur.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately. If this chemical contacts the skin, flush with water immediately. If a person breathes in large amounts of this chemical, move the exposed person to fresh air at once and perform artificial respiration. When this chemical has been swallowed, get medical attention. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do NOT rub the affected areas or flush them with water. In order to prevent further tissue damage, do NOT attempt to remove frozen clothing from frostbitten areas. If frostbite has NOT occurred, immediately and thoroughly wash contaminated skin with soap and water.

Decontamination: Decontaminate as soon as possible. This is extremely important. If you do not have the equipment and training, do not enter the hot zone to rescue and/or decontaminate victims. If the victim cannot move, begin the decontamination process without touching and without entering the hot zone. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system so that you would not have to touch the victim; do not even wait for soap or for the victim to remove clothing, begin washing immediately. Immediately flush the eyes with water for at least 15 min. Wash–strip–wash–evacuate upwind and uphill: The approach is to immediately wash with water, then have the victim (not the first responder) remove all the victim's clothing, then wash again (with soap if available); and subsequently move away from the hot zone in an upwind and uphill direction. Wash the victim with warm water and soap. Decontaminate with diluted household bleach (10%, or one part bleach to nine parts water), but do not let any of the bleach solution get in the victim's eyes, open wounds, or mouth. Rinse off the diluted bleach solution after 15 min. In order to prevent spreading the agent, be certain the victims have been decontaminated as much as possible before they leave the decontamination area. If you get any amount of the agent on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident.

Personal Protective Methods: Where liquid phosgene is encountered, protective clothing should be supplied which is impervious to phosgene. Where gas is encountered above safe limits, full-face gas masks with phosgene canisters or supplied-air respirators should be used. Because of the potentially serious consequences of acute overexposure and the poor warning properties of the gas to the human senses, automatic continuous monitors with alarm systems are strongly recommended. Wear appropriate clothing to prevent any reasonable probability of skin contact. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated. Remove nonimpervious clothing immediately if wet or contaminated. Provide emergency showers.

Respirator Selection: *1 ppm:* Sa (APF = 10) (any supplied-air respirator). *2 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Phosgene must be stored to avoid contact with water, moisture, or steam, since violent reactions occur. Store in tightly closed, steel containers in an isolated area away from the work area and separated from all other materials, as well as sunlight. Although phosgene in anhydrous equipment is not corrosive to ordinary metals; in the presence of moisture, use monel, tantalum, or glass-lined storage containers. Phosgene should be stored away from heating and cooling ducts. Containers should be frequently inspected for leaks. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Phosgene requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Ventilate area of leak to disperse the gas. Stop flow of gas. If source of leak is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Phosgene may be neutralized by covering it with sodium bicarbonate or an equal mixture of soda ash and slaked lime. After mixing, spray very carefully with water. Transfer slowly to a larger container of water. *Do not use water* directly on spill. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

CG, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 2.5/4.1

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 3000/1000
Then: Protect persons downwind (miles/kilometers)
Day 4.7/7.5
Night 7.0+ /11.0+

DP, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 600/200
Then: Protect persons downwind (miles/kilometers)
Day 0.7/1.1
Night 1.6/2.5

Phosgene

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 300/100
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 1.6/2.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 2.0/3.2
Night 6.1/9.7

Diphosgene

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: Phosgene may burn, but does not easily ignite. For small fires, use dry chemical or carbon dioxide. Use water spray, fog, or foam for larger fires. Move container from fire area if you can do so without risk. Stay away from the ends of tanks and cool exposed containers with water until well after the fire is out. Isolate the area until gas has dispersed. Poisonous gases are produced in fire, including hydrogen chloride, carbon monoxide, and chlorine fumes. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Diphosgene (DP) will not burn. However, it is possible that a DP tank may be adjacent to a fire. In a fire, a storage tank will heat and the tank may overpressurize and explode, so evacuate the area. When heated, DP breaks down to toxic phosgene, which breaks down into chlorine and hydrogen chloride gases. The danger from a heated DP tank is too great to risk a manned firefighting effort; if possible, an unattended fire monitor aimed at the upper part of the diphosgene tank will cool the tank and may prevent tank failure. In general, it is best to use a spray or fog pattern rather than a solid stream, to avoid spreading the burning fuel around.

Disposal Method Suggested: Phosgene may be neutralized by covering it with sodium bicarbonate or an equal mixture of soda ash and slaked lime. After mixing, spray carefully with water. Transfer slowly to a larger container of water. *Do not use water* directly on spill. Pass controlled discharges of phosgene through 10% NaOH solution in a scrubbing tower.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Phosgene oxime (Agent CX, WMD) P:0555

Molecular Formula: $CHCl_2NO$

Synonyms: Carbonyl chloride oxime; CX; Dichlorformaldehyde-oxime; Dichloroformaldoxime; 1,2-Dichloroformoxime; Dichloroformoxime; Dichlormethylenhydroxylamine; Dichloroximinomethane; Kohlensauredichloridoxime (German)

CAS Registry Number: 1794-86-1

RTECS® Number: Not established

UN/NA & ERG Number: 2811/154

Regulatory Authority and Advisory Bodies

Report any release of WMD to National Response Center 1-800-424-8802.

While not a mandated "Federally listed" waste, CX is more toxic than most RCRA listed chemicals. However, GF is a "listed" hazardous waste in some states where it may have been stockpiled by the military.

WGK (German Aquatic Class): No value assigned.

Description: Phosgene oxime (military designation CX) is a noncombustible urticant (nettle agent, blister agent) with a short (seconds to minutes) latency period. CX is a colorless, low-melting point (crystalline, white powder) solid or as a liquid (liquid above 39°C; solid below 35°C). On hot days (or at body temperature) it can appear as a yellowish-brown liquid. It has a high vapor pressure (the vapor pressure of the solid is high enough to produce symptoms), slowly decomposes at normal temperatures. It has an intense, disagreeable, penetrating, and violently irritating, peppery odor. Odor detectable at less than 0.3 ppm. Molecular weight = 113.93 Da; Freezing/Melting point = 35−40°C; boiling point = 129°C (with decomposition); Vapor density = 3.9; Vapor pressure = 11.2 mmHg at 20°C (solid); 13 mmHg at 40°C (liquid); Volatility = 1800 mg/m^3 at

20°C; 76,000 mg/m^3 at 40°C; Latent heat of vaporization = 101 cal/g at 40°C; Decomposition temperature = <128°C. Solubility in water = dissolves slowly and completely. High solubility in organic solvents.

History of the chemical: CX was invented in Germany in 1929; it is among the least well-studied chemical warfare agents; therefore, detailed information is limited. Although it is believed that CX was never used on the battlefield, it was after WW II that the military tested concentrated phosgene oxime. These tests revealed that CX was a highly effective and painful chemical warfare agent. Phosgene oxime is of military interest because it easily penetrates garments and rubber much more quickly than do other chemical agents. It is possible that Iraq used CX in the Iran−Iraq war, and North Korea may have produced and stocked quantities of this chemical agent. Phosgene oxime (CX) gives off dangerous gas. It does take very little of this gas to damage a victim's lungs. Terrorists might put CX in an exploding bomb in order to break up the solid into an aerosol that can penetrate the skin and lungs. Once exposed, the victim feels immediate pain and the need to escape. Phosgene oxime (CX) easily penetrates fabrics and rubbers and cause great pain and skin damage (without blisters) in less than a minute. Soon after contact the skin dies. Recovery may take up to 6 months. Eye contact can cause blindness. Inhalation attacks the lungs, resulting in damage that can be permanent.

Potential Exposure: There is no industrial use for Phosgene oxime (CX) and because of its extreme instability, the pure material is not likely to be used in military operations.[FM 3-9] CX is especially dangerous when mixed with other chemicals such as nerve agents. It burns away the skin making it more permeable to any other "added" agents. No other chemical agent is capable of producing immediate extreme pain followed by rapid local tissue death (necrosis). Post World War II studies indicate that concentrations below 8% cause no or inconsistent effects.[ATSDR]

Persistence of Chemical Agent: *Soil:* about 2 h. *Material surfaces and water:* relatively nonpersistent.

Incompatibilities: Phosgene oxime (CX) is among the most important halogenated oximes. CX reacts with water, sweat, and heat, forming hydrochloric acid. CX may be an oxidizer, and it may ignite combustibles (e.g., wood, paper, oil, or clothing). CX is incompatible with strong acids and bases; hydrides and other strong reducing agents; strong oxidizing acids, peroxides, and hydroperoxides. Not hydrolyzed by dilute acids; reacts violently in basic solutions forming carbon dioxide, hydrogen chloride, and hydroxylamine. Hydrolysis products include HCl and methylarsenic oxide. CX quickly penetrates rubber and clothing. CX decomposes when in contact with many metals; it is corrosive to most metals, and contact with metals may cause the release flammable hydrogen gas. Traces of many metals cause it to decompose; however, it corrodes most metals.

Permissible Exposure Limits in Air: Conversion factor = 1 ppm = 4.66 mg/m^3 at 77°C.

The immediately dangerous to life and health (IDLH) concentration of CX has not been defined.

Protective Action Criteria (PAC) **CG***
TEEL-0: 0.0075 mg/m^3
PAC-1: **0.028** mg/m^3
PAC-2: **0.083** mg/m^3
PAC-3: **13** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air:

According to the USAMRICD, do NOT depend on the following for the detection of Agent CX: M272 water testing kit, MINICAMS, ICAD, M21 remote sensing alarm, CAM, ACAMS, DAAMS, and M8A1 automatic chemical-agent detector alarm are incapable of detecting CX. Likewise, M8 and M9 paper should not be depended upon to detect Agent CX.

The M256A1 detector ticket reacts to the presence of CX, but the detection threshold is not known with certainty. Liquid detection: The portable M256A1 has a response time of up to 15 min. The following detectors are listed for Agent CX detection in the *Guide for the Selection of Chemical Detection Equipment for Emergency First Responders, 3rd Edition*, published by the US Department of Homeland Security: Chemical Agent Detector C2 Kit (021330) for vapor, liquids, aerosols: Start-up time (based on experience) 1−5 min; response time (regardless of experience) 20−25 min (Anachemia Canada, Inc.); and M256A1 (T503) (063230COM) Chemical Agent Detector Simulator Training Kits for vapor only: Start-up time (based on experience) 1−5 min; response time (regardless of experience) 20−25 min (Anachemia Canada, Inc.)

The following detectors have the capacity to detect CX at the threshold limits given[USAMRICD]:
Liquid: M18A2 0.5 mg/min^3
Air: M90 (M90-D1-C) 0.15 mg/min^3
M93A1 Fox 10−100 μg/L

Permissible Concentration in Water: Do NOT use the M272 water testing kit.[USAMRICD]

Determination in Water: Contact pollution control authorities and advise shutting water intakes. CX dissolves in water and breaks down into toxic products that are much less dangerous than phosgene oxime, but still poisonous. Do not allow people to drink water containing even the breakdown products.

Routes of Entry: Skin, eye contact, inhalation.

Harmful Effects and Symptoms

Phosgene oxime (CX) is a rapid-acting casualty agent. The effects of phosgene oxime vapor and liquid on the skin, eyes, and lungs are almost instantaneous, causing immediate pain upon contact with the liquid and when the vapors are inhaled. Little is known about how CX works but it eats its way through protective clothing, the skin, and eventually reaches the blood. Phosgene oxime (CX) will cause blindness, kill skin horribly, and with enough of it on the skin a victim could die. *Eyes:* The eyes will immediately burn, the eyelids will swell, and the victim's cornea will scar, causing permanent damage to the eyes with possible blindness. *Lungs*: The effects are immediate: The victim will sneeze and cough, with runny nose. The lungs will fill with fluid causing pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Immediate stinging pain will be felt. The skin reddens and will eventually blister (up to 12 h after exposure). *Ingestion:* It is difficult to understand how one might swallow Phosgene oxime (CX), but it possibly may happen. Animal studies show that the victim's stomach and intestines would swell and bleed.

Short Term Exposure: Pain and local tissue destruction occur immediately on contact with skin, eyes, and mucous membranes. Phosgene oxime is rapidly absorbed from the skin and eyes and may result in systemic toxicity. Phosgene oxime causes redness, wheals (hives), and urticaria on the skin, but does not produce a fluid-filled blister (vesication). Despite the lack of initial blister formation, phosgene oxime produces more tissue damage than the blister agents. Known as a "nettle gas," CX produces immediate pain varying from a mild prickling to almost intolerable pain similar to a severe bee sting. Phosgene oxime has no antidote. Treatment is similar to that of the mustard agents. It causes violent irritation to the mucous membranes of the nose and eyes. Even at low temperature it has sufficient vapor pressure to produce tearing. When CX comes in contact to the skin, the area turns pale in 30 s and develops a red ring around the area. A wheal forms in about 30 min; the blanched area turns brown in 24 h and a scab forms in about a week. The scab usually falls off in about 3 weeks. Itching may be present throughout healing, which in some cases may be delayed beyond 2 months.[Army FM 3-9 and CDC] The LD_{50} for skin exposure is estimated as 25 mg/kg. LCt_{50} = no accurate data available; the estimated LCt_{50} by inhalation is 1500−2000 mg-min/m^3; ICt_{50} (respiratory) 25 mg-min/m^3. Inhaled phosgene oxime is extremely irritating to the upper airways and causes pulmonary edema. Irritation occurs with exposures to 0.2 mg-min/m^3 and becomes unbearable at 3 mg-min/m^3. The estimated LCt_{50} (the product of concentration times time that is lethal to 50% of the exposed population by inhalation) is 1500 to 2000 mg-min/m^3.[ATSDR]

Long Term Exposure: May cause permanent injury, including lung damage and blindness. Information is unavailable about the carcinogenicity, developmental toxicity, or reproductive toxicity from chronic or repeated exposure to phosgene oxime.

Points of Attack: Skin, mucous membranes of the nose and eyes.

Medical Surveillance: There are no specific tests to confirm exposure. Extreme pain may persist for days. Patients/victims should be observed for signs of whole-body (systemic) toxicity, including accumulation of fluid in the lungs (pulmonary edema). Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway.[NIOSH]

First Aid: A note to first responders: You cannot help the victim if you kill yourself. *Do not enter an area contaminated with either CX vapor or liquid unprotected.* The only option to your own survival is by wearing "Level A" protection. You must act quickly.

Remove the victim to fresh air without exposing yourself—do not touch the victim! Only when the victim is outside the hot and warm zones and decontaminated you can help. If breathing is difficult, give oxygen. Do not make the victim vomit if the victim has swallowed Phosgene oxime. If the victim is conscious, give the victim milk. Get the victim to a doctor or medical facility as soon as possible, even if symptoms do not appear serious; symptoms are often delayed.

Decontamination: *Note to first responders:* Depending on the dose and the equipment available to you: Evacuate the area and shut down heating, ventilation, and air conditioning systems to prevent further spread of Phosgene oxime (CX). Call for medical and hazmat assistance immediately. If you get CX on yourself, decontaminate immediately. Even if you think you are not contaminated, be sure to thoroughly shower and change clothes as soon as you can after the incident. Because of the rapid reaction of CX with the skin, decontamination may not be entirely effective once pain occurs. Nevertheless, decontaminate as rapidly as possible by flushing the area with large amounts of water to remove any agent that has not reacted with the skin. Wash the victim with warm water and soap. *Bleach does not work with CX.* Be certain you have decontaminated the victims as much as you can before they leave the area so that they do not spread the Phosgene oxime (CX).

Personal Protective Methods: Use Level A protection. CX quickly penetrates rubber and clothing. Corrosive to most metals.

Respirator Selection: CX quickly penetrates rubber and clothing. Corrosive to most metals.

Storage: Stable in steel containers.

Shipping: Shipping Name: Toxic solids, organic, n.o.s. Hazardous Class or Division: 6.1. Subsidiary Hazardous Class or Division: Label Poison (Toxic). Packing Group III.

Spill Handling: Immediately evacuate everyone, including yourself. Immediately call for medical and hazmat assistance. Notify police, federal authorities, medical, hazmat, and emergency authorities. Immediately decontaminate victim. Do not touch the victim or allow Phosgene oxime (CX) to touch your skin or eyes. If possible, ventilate the area. If response personnel must walk through the spilled agent, wear the appropriate Level A protection. Keep combustibles (e.g., wood, paper, and oil) away from the spilled agent. Use water spray to reduce aerosols or divert aerosol cloud drift. Avoid allowing water runoff to contact the spilled agent. Do not direct water at the spill or the source of the leak. Stop the leak if it is possible to do so without risk to personnel. Prevent entry into waterways, sewers, basements, or confined areas. Isolate the area until aerosol has dispersed.[NIOSH]

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

If a tank, rail car, or tank truck is involved in a fire, isolate it for 0.5 mile (800 m) in all directions; also, consider initial evacuation for 0.5 mile (800 m) in all directions.

CX, when used as a weapon

Small spills [involving the release of approximately 52.83 gallons (200 L) or less]

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.3/0.5

Large spills [involving quantities greater than 52.83 gallons (200 L)]

First: Isolate in all directions (feet/meters) 300/90
Then: Protect persons downwind (miles/kilometers)
Day 0.6/1.0
Night 1.9/3.1

Fire Extinguishing: Phosgene oxime (CX) is noncombustible; it burns weakly, if at all. CX may decompose upon heating producing corrosive and/or toxic gases. Containers may explode when heated. In case of fire, evacuate the area, including yourself. CX may be an oxidizer, and it may ignite combustible materials (e.g., wood, paper, oil, or clothing). If there is some reason that you have to put out the fire—for example, there are things nearby that cannot be allowed to burn—use unattended equipment, then evacuate everyone immediately, including yourself. If you *must* extinguish a Phosgene oxime (CX) fire, use water streams, water fog, alcohol foam, universal foam, and, for confined fires, carbon dioxide. (For small fires, use dry chemical, carbon dioxide, or water spray. For large fires, use dry chemical, carbon dioxide, alcohol-resistant foam, or water spray.) Vapors are heavier than air and will collect in low areas. Keep out of these areas; stay upwind. Hazardous concentrations may spread along the ground and collect and stay in poorly ventilated, low-lying, or confined areas (e.g., sewers, basements, and tanks). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Move containers from the fire area if it is possible to do so without risk to personnel. Dike fire control water for later disposal; do not scatter the material. For fire involving tanks or car/trailer loads, fight the fire from maximum distance or use unmanned hose holders or monitor nozzles. Do not get water inside containers. Cool containers with flooding quantities of water until well after fire is out. Withdraw immediately in case of rising sound from venting safety devices or discoloration of tanks. Always stay away from tanks engulfed in fire. Run-off from fire control or dilution water may be corrosive and/or toxic, and it may cause pollution. If the situation allows, control and properly dispose of run-off (effluent).

Disposal Method Suggested: Seek expert advice from armed services (see Reference section), Center for Disease Control headquarters in Atlanta, GA.

CAS Registry Number: 732-11-6
RTECS® Number: TE2275000
UN/NA & ERG Number: UN2783 (organophosphorus pesticides, solid, toxic)/152
EC Number: 211-987-4 [*Annex I Index No.:* 015-101-00-5]
Regulatory Authority and Advisory Bodies
US EPA, FIFRA, 1998 Status of Pesticides: Supported.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 10/10,000 lb (4.54/4540 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
US DOT MARINE POLLUTANT (49CFR, Subchapter 172.101, Appendix B).
US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.
European/International Regulations (not listed in Annex I, but the following may apply): Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S28; S36/37; S45; S60; S61 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.

Description: Phosmet is a white crystalline solid. Molecular weight = 317.33; Boiling point = (decomposes below BP) >100°C; Freezing/Melting point = 72°C. Hazard; Vapor pressure = 4.9×10^{-7} mbar at 20°C. Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 2. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. Used as an organophosphorus insecticide and acaricide.

Incompatibilities: Not compatible with other pesticides under alkaline conditions. Contact with water, steam, or moisture forms phthalic acids. Slightly corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.025 mg/m^3
PAC-1: 0.075 mg/m^3
PAC-2: 0.54 mg/m^3
PAC-3: 40 mg/m^3
Russia has set a ceiling value of 0.3 mg/m^3 in work-place air. Russia has also set a MAC of 0.009 mg/m^3 in ambient air in residential area on a once-daily basis and 0.004 mg/m^3 on a daily average basis.

Determination in Air: NIOSH Analytical Method (IV) Method #5600, Organophosphorus pesticides.

Permissible Concentration in Water: Russia[36] set a MAC of 0.2 mg/L in surface water.

Determination in Water: Fish Tox: 4.41815000 ppb MATC (HIGH). Octanol–water coefficient: Log K_{ow} = 2.8.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin on contact. This material is a highly toxic organophosphate; the probable oral lethal dose for humans is 50–500 mg/kg or between 1 teaspoon and 1 oz for a 150-lb person. It is a cholinesterase inhibitor and has central nervous system effects. Oral lethal doses in humans have been reported at 50 mg/kg. Acute exposure to phosmet may produce the following signs and symptoms: pinpoint pupils, blurred vision, headache, dizziness, muscle spasms, and profound weakness. Vomiting, diarrhea, abdominal pain, seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may occur, although hypertension (high blood pressure) is not uncommon. Dyspnea (shortness of breath) may be followed by respiratory collapse. Giddiness is common.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox = 7.00000 ppm Health Advisory (HIGH).

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1–2 weeks while red blood cell levels may be reduced for 1–3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Liver function tests. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and/or slurry of activated charcoal in water; and induce vomiting. Do not make an unconscious person vomit. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from other pesticide, alkaline conditions, water, and other forms of moisture. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. As for other organophosphorus pesticides stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material. Use water spray to reduce vapors. Take up *small spills* with sand or other noncombustible absorbent material and place in containers for later disposal. Take up small, dry spills with clean shovel and place in clean, dry container. Dike far ahead of *large spills* for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material may burn but does not ignite readily. For small fires, use dry chemical, carbon dioxide, water spray, or foam. For large fires, use water spray, fog, or foam. Stay upwind; keep out of low areas. Move container from fire area if you can do it without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. Wear positive pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire, including nitrogen oxides, phosphorous oxides, and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Containers may explode in fire. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency or by contacting your regional EPA office. Small amounts may be decomposed with hypochlorite. For large amounts, incineration with effective gas scrubbing is recommended.[22]
