Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid that may be formulated with a flammable substance. Poisonous gases, including oxides of sulfur; oxides of phosphorus; and phosphoric acid, are produced in fire. Use dry chemical, carbon dioxide; or foam extinguishers if formulated with a flammable substance. Vapors are heavier than air and will collect in low areas. Vapors from a flammable carrier may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be

trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. TEPP is 50% hydrolyzed in water in 6.8 h at 25°C, and 3.3 h at 38°C; 99% hydrolysis requires 45.2 h at 25°C, or 21.9 h at 38°C. Hydrolysis of TEPP yields nontoxic products. Incineration is, however, an option for TEPP disposal. In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Terbufos T:0190

Molecular Formula: $C_9H_{21}O_2PS_3$

Common Formula: $(C_2H_5O)_2PSSCH_2SC(CH_3)_3$

Synonyms: AC 921000; Counter; Counter 15G soil insecticide; Counter 15G soil insecticide-nematicide; *S*-([(1,1-Dimethylethyl)thio]methyl) *O*,*O*-diethyl phosphorodithioate; Phosphorodithioic acid, *S*-([(1,1-dimethylethyl)thio] methyl), *O*,*O*-diethyl ester; Phosphorodithioic acid, *S*-[(*tert*-butylthio)methyl], *O*,*O*-diethyl ester; *S*-[(*tert*-Butylthio) methyl] *O*,*O*-diethyl phosphorodithioate

CAS Registry Number: 13071-79-9

RTECS® Number: TD7200000

UN/NA & ERG Number: UN3018 (organophosphorus pesticide, liquid, toxic)/152

EC Number: 235-963-8 [*Annex I Index No.:* 015-139-00-2]

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B), severe pollutant.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S36/37; S45; S60. S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Terbufos is a colorless to pale yellow liquid. Molecular weight = 288.45; Boiling point = 70°C at 0.01 mm; Freezing/Melting point = −29°C; Vapor pressure = 3×10^{-4} mmHg at 20°C; Flash point = 88°C (oc). Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 3, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, or application of this soil insecticide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 0.01 mg/m^3 TWA, inhalable fraction and vapor [skin]; not classifiable as a human carcinogen; BEI issued (1999).

Protective Action Criteria (PAC)

TEEL-0: 0.01 mg/m^3

PAC-1: 0.03 mg/m^3

PAC-2: 1 mg/m^3

PAC-3: 1 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: The EPA (see "References" below) has developed a lifetime health advisory of 0.18 μg/L.

Determination in Water: Analysis of terbufos is by a gas chromatographic (GC) method applicable to the determination of certain nitrogen−phosphorus containing pesticides in water samples. In this method, approximately 1 L of sample is extracted with methylene chloride. The extract is concentrated and the compounds are separated using capillary column GC. Measurement is made using a nitrogen−phosphorus detector. Fish Tox = 0.04733000 ppb (EXTRA HIGH).

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This material may be fatal if swallowed, inhaled, or absorbed through the skin. Repeated inhalation or skin contact may progressively increase susceptibility to poisoning. Acute exposure to terbufos may produce the following signs and symptoms: pinpoint pupils; blurred vision; headache, dizziness, muscle spasms; and profound weakness. Vomiting, diarrhea, abdominal pain; seizures, and coma may also occur. The heart rate may decrease following oral exposure or increase following dermal exposure. Chest pain may be noted. Hypotension (low blood pressure) may be noted, although hypertension (high blood pressure) is not uncommon. Respiratory symptoms include dyspnea (shortness of breath), respiratory depression; and respiratory paralysis. Psychosis may occur.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous

system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox: 0.90000 ppb (EXTRA HIGH).

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Transport to a health-care facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organophosphorus pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." Terbufos falls in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: This is a liquid organophosphorus pesticide. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 500.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including sulfur and phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Terephthalic acid T:0200

Molecular Formula: $C_8H_6O_4$

Common Formula: $HOOCC_6H_4COOH$

Synonyms: Acide terephthalique (French); *p*-Benzenedicarboxylic acid; 1,4-Benzenedicarboxylic acid; *p*-Phthalic acid; Phthalic acid, *p*-isomer; TA 12; TA

CAS Registry Number: 100-21-0

RTECS® Number: WZ0875000

EC Number: 202-830-0

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: TPA is a white crystalline solid. Molecular weight = 166.14; Specific gravity (H_2O:1) = 1.51 at 25°C; Sublimation point ≥400°C; Flash point = 260°C; Autoignition temperature = 495°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Drug, Mutagen, Primary Irritant. TPA is used primarily in the production of polyethylene terephthalate polymer for the fabrication of polyester fibers and films. A high-volume production chemical in the US.

Incompatibilities: Dust may form an explosive mixture with air. May react with strong oxidizers, such as chlorine or permanganate, and may form explosive compounds when exposed to nitric acid.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 10 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 0.1 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

The Netherlands: MAC-TGG 10 mg/m^3, 2003. Russia[43] set a MAC in work-place air of 0.1 mg/m^3. Kansas[60] has set a guideline for ambient air of 556 μg/m^3.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.1 mg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.96.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to mouth, nose, or throat. *Skin:* May cause irritation, especially in open cuts or sores. *Eyes:* Can cause irritation. *Ingestion:* Mildly toxic.

Long Term Exposure: No information found.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: May require supportive measures for allergic reaction. Urinary excretion is rapid.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Wear a dust mask. Where there is potential for overexposure to this chemical, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in detached units of noncombustible construction. As far as possible use dust-tight equipment and vacuum cleaning.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Fine dust may form explosive mixture with air and produce a severe hazard. Use carbon dioxide, dry chemical, or water. Wear a self-contained breathing apparatus when fighting a fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*m-, o-, p*-isomers).

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: There are three isomeric terphenyls, all having the formula $C_6H_5{-}C_6H_4{-}C_6H_5$. Pure terphenyl is a white, crystalline solid. The commercial grades are light yellow. All three isomers are unusually stable toward heat. Molecular weight = 230.32 (*m-, o-, p-isomers*). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. All are insoluble in water.

The properties of the terphenyls are:

m-isomer

Specific gravity (H_2O:1) = 1.23 at 25°C; Boiling point = 365°C; Freezing/Melting point = 89°C; Vapor pressure = 0.01 mmHg at 93°C; Flash point = 191°C.

o-isomer

Specific gravity (H_2O:1) = 1.10 at 25°C; Boiling point = 332°C; Freezing/Melting point = 58°C; Vapor pressure = 0.09 mmHg at 93°C; Flash point = 163°C.

p-isomer

Specific gravity (H_2O:1) = 1.23 at 25°C; Boiling point = 405°C; Freezing/Melting point = 212.8°C; Vapor pressure = 1.23 mmHg at 93°C; Flash point = 207°C.

Potential Exposure: Compound Description (*p*-isomer): Agricultural Chemical. Terphenyl is used primarily as a heat storage and heat transfer agent. It is also used as a high-temperature lubricant; a constituent of waxes and polishes; and as a plasticizer for resin-bodied paints; as a coolant and heat storage agent.

Incompatibilities: Materials are combustible. Avoid contact with strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 9.57 mg/m^3 (*m- and p*-isomers); 1 ppm = 9.42 mg/m^3 at 25°C & 1 atm (*o*-isomer).

All isomers

OSHA PEL: 1 ppm/9 mg/m^3 Ceiling Concentration.

NIOSH REL: 0.5 ppm/5 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 0.53 ppm/5 mg/m^3 Ceiling Concentration.

NIOSH IDLH: 500 mg/m^3.

Protective Action Criteria (PAC)

European/International Regulations: Not listed in Annex I.

p- and *mixed isomers*

TEEL-0: 0.4 mg/m^3

PAC-1: 1.25 mg/m^3

PAC-2: 9 mg/m^3

PAC-3: 500 mg/m^3

Denmark: Ceiling Concentration 0.5 ppm (5 mg/m^3), 1999; Switzerland: MAK-W 0.5 ppm (5 mg/m^3), 1999; United Kingdom: STEL 0.5 ppm (4.8 mg/m^3), 2000.

Terphenyls, hydrogenated

Australia: Ceiling Concentration 0.5 ppm (5 mg/m^3), 1993; Belgium: Ceiling Concentration 0.5 ppm (4.9 mg/m^3), 1993; Denmark: Ceiling Concentration 0.4 ppm (4.4 mg/m^3), 1999; France: VME 0.5 ppm (5 mg/m^3), 1999; Russia: STEL 5 mg/m^3, 1993; Switzerland: MAK-W 0.5 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.5 ppm.

Russia: MAC 5 mg/m^3. Several states have set guidelines or standards for terphenyls in ambient air[60] ranging from 40 μg/m^3 (Virginia) to 50 μg/m^3 (North Dakota) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5021, *o*-terphenyl.

Routes of Entry: Inhalation of dusts and mists, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritation of eyes, skin, and respiratory tract. Skin or eye contact may cause thermal burns. Inhalation can cause lung irritation with coughing, wheezing, and/or shortness of breath. Symptoms of exposure include headache, sore throat.

Long Term Exposure: May affect the liver and kidneys. Repeated skin contact can cause dermatitis; drying and cracking. In animals: liver, kidney damage.

Points of Attack: Eyes, skin, respiratory system; liver, kidneys.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 25 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 50 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Terphenyls are combustible solid, but do not easily ignite. Use dry chemical, carbon dioxide; water spray; alcohol foam or polymer foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

RTECS® Number: XA3030000

UN/NA & ERG Number: UN3249 (Medicine, solid, toxic, n.o.s.)/151

EC Number: 200-370-5; 200-351-1 (testosterone propionate)

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal Sufficient Evidence; Human Limited Evidence, 1979.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer (testosterone and its esters) 1/1/88.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Testosterone is an odorless, white or slight cream-colored crystals or crystalline powder. Molecular weight = 288.47; Freezing/Melting point = 155°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Used as an androgenic, anabolic, and estrogenic hormone for both males and females.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

No TEEL available.

Russia[43] set a MAC in work-place air of 0.005 mg/m^3 (5 $\mu g/m^3$).

Harmful Effects and Symptoms

Short Term Exposure: Testosterone can affect you when breathed in and by passing through your skin. Testosterone is a teratogen. Handle with extreme caution. Exposure can cause nausea, upset stomach; acne, and fluid and salt retention in body tissues.

Long Term Exposure: Women can also develop male features, baldness, increased body hair; deep voice and menstrual changes. Men can have lower sperm production, painful enlarged breasts; enlarged prostate; and excess of red blood cells. Repeated exposure can cause women to develop male characteristics including face and body hair, baldness, deepened voice, and enlarged female genitalia (clitoris). Higher levels can cause irregular menstrual cycles, lighter periods, and smaller breasts. If carried home (clothing, etc.) children in the home may have stunted growth, premature puberty in boys, and masculine appearance and abnormal genitals in girls.

Points of Attack: Blood cells, sex organs.

Medical Surveillance: Frequent exams (at least monthly) are recommended to evaluate for any signs or symptoms of exposure. If exposure is suspected, the following are recommended: red blood cell count (in men). Urine test for androsterone and/or etiocholanolone. (The more common 17-ketosteroid test is not sufficiently sensitive for such exposures).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to testosterone, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Medicine, solid, toxic, n.o.s., requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Testosterone may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray; or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin 4/1/91.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

List of Stockholm Convention POPs: Annex C (Unintentional production and release) as *polychlorinated dibenzo-p-dioxins (PCDD)*.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetrachlorodibenzo-*p*-dioxin is a white, needle-shaped, crystalline solid. Molecular weight = 321.96; Boiling point = (decomposition); Freezing/Melting point = 305°C; Vapor pressure = 2×10^{-6} mmHg at 25°C. Decomposition begins at 500°C and is virtually complete within 21 s at 800°C. Very slightly soluble in water; solubility = 0.00000002%. Polychlorinated dibenzo-*p*-dioxins are formed in the manufacturing process of all chlorophenols. However, the amount formed is dependent on the degree to which the temperature and pressure are controlled during production. An especially toxic dioxin, 2,3,7,8-tetrachlorodibenzo-*p*-dioxin (TCDD), is formed during the production of 2,4,5,-TCP (trichlorophenol) by the alkaline hydrolysis of 1,2,4,5-tetrachlorobenzene.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. TCDD has no uses except as a research chemical. As noted above, TCDD is an inadvertent contaminant in herbicide precursors and thus in the herbicides themselves. It is also formed during various combustion processes including the incineration of chemical wastes (chlorophenols, chlorinated benzenes, and biphenyl ethers). It may be found in flue gases, fly ash, and soot particles. It is highly persistent in soil, and contamination may be retained for years. TCDD is the most toxic of all the dioxins, and has the potential for bioaccumulation in animals. Thus, it is applied in herbicide formulations, but is not used *per se*. It has been estimated that approximately 2 million acres in the United States have been treated for weed control on one or more occasions with approximately 15 million pounds of TCDD contaminated 2,4,5,-T, 2,4,-D, or combinations of the two.

Incompatibilities: Decomposes in UV light.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: Carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

Protective Action Criteria (PAC)

TEEL-0: 0.00000001 mg/m^3

PAC-1: 0.0015 mg/m^3

PAC-2: 0.0075 mg/m^3

PAC-3: 0.0075 mg/m^3

DFG MAK: 1.0×10^{-8}, inhalable fraction Peak Limitation Category II(8) [skin]; Carcinogen Category 4; Pregnancy Risk Group C.

Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Switzerland: carcinogen, 1999. Several states have set guidelines or standards for TCDD in ambient air[60] ranging from zero (North Dakota and South Carolina) to 1.1 pg/m^3 (Massachusetts) to 0.003 ng/m^3 (North Carolina) to 0.0001 μg/m^3 (Pennsylvania) to 3.0 μg/m^3 (Virginia) to 450.0 μg/m^3 (Indiana).

Determination in Air: No method available.

Permissible Concentration in Water: There is insufficient data to permit the development of criteria for the protection of freshwater or saltwater aquatic life. For the protection of human health, the concentration is preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed at a concentration of 4.55×10^{-7} μg/L as of 1979. A concentration of 0.0039 μg/L was estimated to limit cancer risk to one in a million by EPA in 1980. States which have set guidelines for TCDD in drinking water include Maine at 2×10^{-4} μg/L and Minnesota at 2×10^{-6} μg/L.[61]

Determination in Water: Methylene chloride extraction followed by transfer to benzene and capillary column gas chromatography/mass spectrometry with electron impact ionization (EPA Method #613); or gas chromatography plus mass spectrometry (EPA Method #625).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Note:* 2,3,7,8-TCDD is one of the most toxic synthetic chemicals, and the most toxic of the 75 dioxins. LD_{50} = (oral-rat) 0.05 mg/kg. Exposure can cause headache, weakness, and digestive disturbances. Most symptoms develop slowly, over many days. Inhalation can cause burning sensation in nose and throat, headache, dizziness, nausea, vomiting, pain in the joints; tiredness, emotional disorders; blurred vision; muscle pain; nervousness, irritability, and intolerance to cold. Itching, swelling, and redness, followed by acne-like eruptions of the skin known as chloracne commonly occur. Symptoms of chloracne may appear weeks or months after initial exposure and may last a few months or up to 15 years. Can cause abnormalities of liver, pancreas, circulatory system, respiratory system, and death. Skin contact with very small amounts can cause chloracne. Eye contact can cause burning and irritation. Animal studies suggest that daily exposure to amounts smaller than one grain of salt may cause severe symptoms and death within a few weeks.

Long Term Exposure: Can cause effects under inhalation, especially chloracne (an acne-like skin rash), as well as numbness and tingling in arms and legs. Can cause allergic dermatitis porphyria; gastrointestinal disturbance; possible reproductive problems. A blood abnormality may occur which may include light sensitive skin, blisters, dark skin coloration; excessive hair growth and dark red urine. Reproductive problems and an increased susceptibility to infection may occur. TCDD is considered a potential occupational carcinogen because extremely low levels cause cancer and birth defects in animals. May cause liver, kidney damage. May be a teratogen. May decrease fertility in males and females.

Points of Attack: Eyes, skin, liver, kidneys, reproductive system, liver, and kidneys. Cancer site in animals: tumors at many sites; liver, lung, mouth, tongue, skin cancer. Causes lymphomas in humans.

Medical Surveillance: In short, contact with TCDD should be avoided but obviously careful preplacement and regular physical exams should be carried out in those cases where worker exposure cannot be avoided, with emphasis on liver and kidney function studies. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Liver and nerve function screening tests should be performed. Also monitor serum triglycerides and cholesterol.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Use in isolated area with adequate ventilation, preferably a hood; segregated glassware and tools; and plastic-backed absorbent. Thoroughly wash hands and forearms after each manipulation and before leaving work area. Use the same precautions required for radioactive work.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Warn other workers of spill. Wear protective clothing, collect powdered material in the most convenient and safe manner and deposit in sealed containers. Rinse area with 1,1,1-trichloroethane, then wash with detergent and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Determination in Air: NIOSH Analytical Method (IV) #1016; OSHA Analytical Method #7.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact with either chemical can irritate the eyes and the skin, causing a rash or a burning feeling. 1,1,1,2-Tetrachloro-2,2-difluoroethane can affect you when breathed in. May cause central nervous system depression. High levels may irritate the lungs, causing coughing, shortness of breath; drowsiness, dyspnea (breathing difficulty). Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. 1,1,2,2,-Tetrachloro-1,2-difluoroethane can affect you when breathed in. Exposure can cause you to become dizzy, lightheaded, and to pass out. Very high exposures could cause death. May affect the heart, causing an irregular rhythm. Exposure can cause you to become dizzy and lightheaded. Extremely high levels could cause you to pass out and even die. It can irritate the lungs, causing coughing and/or shortness of breath. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Either compound may cause liver damage. Repeated exposure to either compound may reduce the number of white blood cells.

Points of Attack: Eyes, skin, respiratory system; central nervous system; heart.

Medical Surveillance: *For the 1,1,1,2-compound:* For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24-h EKG to look for irregular heart rhythms). Consider chest X-ray after acute overexposure. Liver function tests. Complete blood count (CBC). For the *1,1,2,2-compound:* If symptoms develop or overexposure has occurred, blood tests for liver function, a complete blood count (CBC) and lung function tests may be useful. If heart rhythm symptoms are occurring, special 24-h EKG test might be indicated.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. (This is particularly true of the 1,1,1,2-compound).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Barrier® and Viton gloves; Tychem® BR, Tychem® TK, Responder®, and Trellchem suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid or dust-proof goggles and face shield when working with powders or dusts, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2000 ppm:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or

SCBAE (any appropriate escape-type, self-contained breathing apparatus).
Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Tetrachlorodifluoroethanes must be stored to avoid contact with chemically active metals (such as sodium, potassium, beryllium, zinc, powdered aluminum, or magnesium), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.
Shipping: Not regulated.
Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Absorb liquid in vermiculite, dry sand; earth, or similar material and deposit in sealed containers. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.
Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Tetrachloro-difluoroethanes do not burn. Poisonous gases are produced in fire, including hydrogen chloride, hydrogen fluoride, and phosgene. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

NTP: Toxicity studies, RPT#TOX-45, October 2000.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U208.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.057; Nonwastewater (mg/kg), 6.0.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8010 (5); 8240 (5).

Safe Drinking Water Act: Priority List (55 FR 1470).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B)

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1,1,1,2-Tetrachloroethane is a colorless to yellowish-red liquid. Molecular weight = 167.84; Specific gravity (H_2O:1) = 1.54 at 25°C; Boiling point = 135.6°C; Freezing/Melting point = −70°C; Vapor pressure = 14 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.1%.
Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. 1,1,1,2-Tetrachloroethane is used as a solvent and in manufacture of insecticides, herbicides, soil fumigants; blanches, paints, and a number of widely used products; as are the other chloroethanes.
Incompatibilities: Oxidizers, strong bases; dinitrogen tetraoxide, metal caustics, hot iron, potassium hydroxide, nitrogen tetroxide; 2,4-dinitrophenyl disulfide, chemically active metals: potassium, sodium, magnesium, and zinc.
Permissible Exposure Limits in Air
OSHA PEL: None
NIOSH REL: No numerical value but users are cautioned to handle with caution in the workplace. See *NIOSH Pocket Guide*, Appendix C.
Protective Action Criteria (PAC)
TEEL-0: 3 ppm

PAC-1: 7.5 ppm
PAC-2: 30 ppm
PAC-3: 30 ppm

Brazil[35] 4 ppm (27 mg/m^3) for work-place air over a 48-h week. Russia[43] set a MAC for tetrachloroethanes (no isomer indicated) of 5 mg/m^3 in work-place air.

Determination in Air: No method available.

Permissible Concentration in Water: For 1,1,1,2-tetrachoroethane the criterion to protect freshwater aquatic life is 9320 μg/L based on acute toxicity data. For saltwater aquatic life, no criterion for 1,1,1,2-tetrachloroethane can be derived using the guidelines, and there is insufficient data to estimate a criterion using other procedures. For the protection of human health, there is insufficient data to derive criteria for 1,1,1,2-tetrachloroethane.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.4$.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Contact irritates the eyes and skin. Inhalation can irritate the respiratory tract causing coughing, wheezing, and/or shortness of breath. Can cause headache, nausea and vomiting. May cause central nervous system depression. Symptoms of exposure include weakness, restlessness, tremor, dizziness, drowsiness, irregular/irregularities of respiration; decreased muscle coordination; coma.

Long Term Exposure: There is limited evidence that this chemical causes liver cancer in animals. Can cause dermatitis; drying and cracking. May affect the liver and nervous system.

Points of Attack: Eyes, skin, central nervous system; liver.

Medical Surveillance: Liver function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from potassium, sodium, dinitrogen tetraoxide; potassium hydroxide; nitrogen tetroxide; sodium potassium alloy; 2,4-dinitrophenyl disulfide. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded.

Shipping: Tetrachloroethane requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible liquid. Poisonous gases, including chlorine and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Tetrachloroethane is a heavy, volatile colorless to light yellow liquid. It has a sweetish, chloroform-like odor. The odor threshold is 0.5 ppm in water and 1.5 ppm in air. Molecular weight = 146.3; Specific gravity (H_2O:1) = 1.59 at 25°C; Boiling point = 146.7°C; Freezing/Melting point = −36.1°C; Vapor pressure = 5.8 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Slightly soluble in water; solubility = 0.29% at 20°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Human Data. Tetrachloroethane is used as an intermediate in the trichloroethylene production from acetylene and as a solvent; as a dry cleaning agent; as a fumigant; in cement; and in lacquers. It is used in the manufacture of artificial silk, artificial leather, and artificial pearls. Recently, its use as a solvent has declined due to replacement by less toxic compounds. It is also used in the estimation of water content in tobacco and many drugs, and as a solvent for chromium chloride impregnation of furs.

Incompatibilities: Violent reaction with chemically active metals; strong caustics; strong acids; especially fuming sulfuric acid. Degrades slowly when exposed to air. Attacks plastic and rubber.

Permissible Exposure Limits in Air

OSHA PEL: 5 ppm/35 mg/m^3 TWA [skin].

NIOSH REL: 1 ppm/7 mg/m^3 TWA [skin]; potential occupational carcinogen; See *NIOSH Pocket Guide*, Appendix A and C (chloroethanes).

ACGIH TLV®[1]: 1 ppm/6.9 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: potential occupational carcinogen 100 ppm.
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 3 ppm
PAC-2: 20 ppm
PAC-3: 100 ppm
DFG MAK: 1 ppm/7.0 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B; Pregnancy Risk Group D.
Australia: TWA 1 ppm (7 mg/m^3) [skin], 1993; Austria: MAK 1 ppm (7 mg/m^3) [skin], Suspected: carcinogen, 1993; Belgium: TWA 1 ppm (6.9 mg/m^3) [skin], 1993; Denmark: TWA 1 ppm (7 mg/m^3) [skin], 1999; Finland: TWA 1 ppm (7 mg/m^3), STEL 3 ppm (21 mg/m^3) [skin], 1999; France: VME 1 ppm (7 mg/m^3), VLE 5 ppm (35 mg/m^3), 1999; Japan: 1 ppm (6.9 mg/m^3) [skin], 1999; the Netherlands: MAC-TGG 7 mg/m^3 [skin], 2003; Norway: TWA 1 ppm (7 mg/m^3), 1999; the Philippines: TWA 5 ppm (35 mg/m^3) [skin], 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 35 mg/m^3, 1999; Russia: TWA 1 ppm, 1993; Switzerland: MAK-W 1 ppm (7 mg/m^3) [skin], 1999; Turkey: TWA 5 ppm (35 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Russia set a MAC for ambient air in residential areas[35] of 60 μg/m^3 on a once-daily basis. Several states have set guidelines or standards for 1,1,2,2-tetrachloroethane in ambient air[60] ranging from zero (North Carolina) to 1.2 μg/m^3 (Massachusetts) to 16.667 μg/m^3 (Kansas) to 23.3 μg/m^3 (New York) to 34.4 μg/m^3 (Connecticut) to 167.0 μg/m^3 (Pennsylvania).

Determination in Air: Adsorption on charcoal, workup with CS_2, analysis by gas chromatography/flame ionization. Use NIOSH Analytical Method #1019.[18]

Permissible Concentration in Water: *To protect freshwater aquatic life:* 9320 μg/L on an acute toxicity basis and 2400 μg/L on a chronic basis. *To protect saltwater aquatic life:* 9020 μg/L on an acute toxicity basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 1.7 μg/L. Russia[43] set a MAC in water bodies used for domestic purposes of 200 μg/L for tetrachloroethanes in general. Several states have set guidelines for 1,1,2,2-tetrachloroethane in drinking water[61] ranging from 0.5 μg/L (Arizona) to 1.7 μg/L (Kansas and Vermont) to 1.75 μg/L (Minnesota). New Mexico has set a standards of 10.0 μg/L.

Determination in Water: Inert gas purge followed by gas chromatography with halide specific detection (EPA Method #601) or gas chromatography plus mass spectrometry (EPA Method #624).

Routes of Entry: Inhalation of vapor and absorption of liquid through the skin (there is some evidence that tetrachloroethane absorbed through the skin affects the central nervous system only), ingestion, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A central nervous system depressant. Symptoms may include nervousness, loss of appetite; constipation, tremors, fatigue, dizziness, nausea, vomiting, and headache. May cause liver and kidney damage. These symptoms have been reported after prolonged exposure to 75 ppm. *Inhalation:* Exposure of 116 ppm for 20 min has caused dizziness and vomiting. At 260 ppm for 10 min, irritation of nose and throat were felt also. At 335 ppm for 10 min, rapid fatigue was also experienced. These symptoms generally disappear when exposure stops. Large accidental exposures have resulted in death. *Skin:* Causes skin irritation. Absorption through skin is possible. Significant skin absorption may occur to produce toxic effects. Earliest and most common symptom is tremors of hands, followed by skin irritation, numbness, and effects listed above. Death has occurred from a combination of inhalation and skin absorption. *Eyes:* Causes irritation and tearing. *Ingestion:* Abdominal pain; nausea, and vomiting followed by similar symptoms as *inhalation.* As little as 3 mL (1/10 liquid oz) may cause unconsciousness. LD_{50} = (oral-rat) 25 mg/kg.

Long Term Exposure: Repeated exposure may cause dermatitis, drying and cracking. May damage the blood forming organs, causing monocytosis (increased blood monocytes). May affect the central nervous system causing tremors, weakness, dizziness, decreased coordination; and even unconsciousness and death. May cause kidney and liver damage; jaundice, hepatitis, liver tenderness. Tetrachloroethane is a mutagen and a potential occupational carcinogen. There is limited evidence that this chemical is a teratogen in animals.

Points of Attack: Skin, liver, kidneys, central nervous system; gastrointestinal tract. Cancer site in animals: liver tumors.

Medical Surveillance: NIOSH lists the following tests: Blood Urea Nitrogen; liver function tests; urinalysis (routine). Preplacement and periodic examination should be comprehensive because of the possible involvement of many systems. Special attention should be given to liver, kidney, and bone marrow function, as well as to the central and peripheral nervous system. Alcoholism may be a predisposing factor.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact.

Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™, Viton™, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. 1,1,2,2-Tetrachloroethane must be stored to avoid contact with chemically active metals (such as potassium, powdered aluminum; sodium, magnesium, and zinc) or strong acids (such as hydrochloric, sulfuric, and nitric), since violent reactions occur. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Tetrachloroethane requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. 1,1,2,2-Tetrachloroethane itself does not burn. Poisonous gases, including phosgene, chlorine, and hydrogen chloride, are produced in fire. Vapors are heavier than air and will collect in low areas. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.
Description: Tetrachloroethylene is a clear, colorless, nonflammable liquid with a characteristic odor. The odor is noticeable at 47 ppm, though after a short period it may become inconspicuous, thereby becoming an unreliable warning signal. The odor threshold is variously given as 5 ppm[41] to 6.17 (3M). Molecular weight = 165.82; Specific gravity (H_2O:1) = 1.62 at 25°C; Boiling point = 121.1°C; Freezing/Melting point = −18.9°C; Vapor pressure = 14 mmHg at 25°C. Slightly soluble in water; solubility = 0.02%.
Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Tetrachloroethylene is used in the textile industry and as a chemical intermediate or a heat-exchange fluid; a widely used solvent with particular use as a dry cleaning agent; a degreaser; a fumigant, and medically as an anthelmintic.
Incompatibilities: Violent reaction with strong oxidizers; powdered, chemically active metals, such as aluminum, lithium, beryllium, and barium; caustic soda; sodium hydroxide; potash. Tetrachloroethylene is quite stable. However, it reacts violently with concentrated nitric acid to give carbon dioxide as a primary product. Slowly decomposes on contact with moisture producing trichloroacetic acid and hydrochloric acid. Decomposes in UV light and in temperatures above 150°C, forming hydrochloric acid and phosgene.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 6.78 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 100 ppm TWA; 200 ppm Ceiling Concentration; 300 ppm (5-min maximum peak in any 3 h).
NIOSH REL: Potential occupational carcinogen; limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 25 ppm/170 mg/m^3 TWA; 100 ppm/685 mg/m^3 STEL, animal carcinogen with unknown relevance to humans; BEI issued.
NIOSH IDLH: potential occupational carcinogen 150 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 25 ppm
PAC-1: **35** ppm
PAC-2: **230** ppm
PAC-3: **1200** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.
DFG MAK: [skin]; Carcinogen Category 3B; BAT: 1 mg [tetrachloroethylene]/L in blood at the beginning of the next shift.

Arab Republic of Egypt: TWA 5 ppm (35 mg/m^3) [skin], 1993; Australia: TWA 50 ppm (335 mg/m^3), STEL 150 ppm, carcinogen, 1993; Austria: MAK 50 ppm (345 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (339 mg/m^3), STEL 200 ppm (1368 mg/m^3), 1993; Denmark: TWA 10 ppm (70 mg/m^3) [skin], 1999; Finland: TWA 50 ppm (335 mg/m^3), STEL 75 ppm (520 mg/m^3) [skin], 1999; France: VME 50 ppm (335 mg/m^3), carcinogen, 1999; the Netherlands: MAC-TGG 240 mg/m^3 [skin], 2003; Japan: 50 ppm (340 mg/m^3), 2B carcinogen, 1999; Norway: TWA 20 ppm (130 mg/m^3), 1999; the Philippines: TWA 100 ppm (670 mg/m^3), 1993; Poland: MAC (TWA) 60 mg/m^3; MAC (STEL) 480 mg/m^3, 1999; Russia: TWA 50 ppm, STEL 10 mg/m^3, 1993; Sweden: NGV 10 ppm (70 mg/m^3), KTV 25 ppm (170 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 50 ppm (345 mg/m^3), STEL 100 ppm [skin], 1999; Thailand: TWA 100 ppm, STEL 200 ppm, 1993; United Kingdom: TWA 50 ppm (345 mg/m^3), STEL 199 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm. Limits in ambient air in residential areas have been set by The Czech Republic[35] at 1.0 mg/m^3 on a daily average basis and 4.0 mg/m^3 on a half-hour basis as well as by Russia at 0.06 mg/m^3 on a daily average basis and 0.5 mg/m^3 on a once-daily basis. Several states have set guidelines or standards for tetrachloroethylene in ambient air[60] ranging from 0.05 μg/m^3 (Rhode Island) to 0.18 μg/m^3 (Massachusetts) to 1.7 μg/m^3 (Michigan) to 5.882 μg/m^3 (Kansas) to 21.0 μg/m^3 (North Carolina) to 1116.0 μg/m^3 (New York) to 1700.0 μg/m^3 (Connecticut) to 3350.0 μg/m^3 (Indiana, South Carolina, South Dakota) to 3350−13,400 μg/m^3 (North Dakota) to 5600 μg/m^3 (Virginia) to 7976.0 μg/m^3 (Nevada) to 8040 μg/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated[18]; #2549, Volatile organic compounds; OSHA Analytical Method #1001.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 5,280 μg/L on an acute toxicity basis and 840 μg/L on a chronic toxicity basis. *To protect saltwater aquatic life:* 10,200 μg/L on an acute toxicity basis and 450 μg/L on a chronic toxicity basis. *To protect human health:* preferably 0. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 8.0 μg/L.[6] A lifetime health advisory of 10 μg/L has been suggested by EPA.[48] A drinking water maximum of 5 μg/L has more recently been suggested by EPA.[62] WHO[35] has set 10 μg/L as a guideline for drinking water as has Japan. Several states have set guidelines for PCE in drinking water[61] ranging from 0.67 μg/L (New Hampshire) to 1.0 μg/L (Arizona) to 4.0 μg/L (California) to 5.0 μg/L (Colorado) to 7.0 μg/L (Kansas and Vermont) to 20.0 μg/L (Connecticut, Massachusetts and Wisconsin) to 35.0 μg/L (Maine). Standards have been set at 1.0 μg/L (New Jersey) to 3.0 μg/L (Florida) to 20.0 μg/L (New Mexico).

Determination in Water: Inert gas purge followed by gas chromatography with halide-specific detection (EPA Method #601); or gas chromatography plus mass spectrometry (EPA Method #624). Octanol−water coefficient: Log K_{ow} = 2.9.

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Irritates the eyes and respiratory tract causing coughing and/or shortness of breath. High exposure can cause headache, dizziness, lightheadedness, nausea, vomiting, and unconsciousness. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Exposures of 200 ppm for 1 h can cause irritation of the nose, mouth and throat; dizziness, headaches and lightheadedness; exposures of 1000 ppm for 30 min can cause difficult breathing; weakness, loss of muscle control; irritability, tremors, convulsions, paralysis, coma, heart irregularities and death. *Skin:* Contact can cause irritation and burns. Can cause dry, scaly skin; a mild-to-moderate burning sensation; redness and inflammation. *Eyes:* Can cause burning and irritation. *Ingestion:* Can cause nausea, vomiting, diarrhea, bloody stool; a reddening of face and neck; weakness and loss of muscle control.

Long Term Exposure: May affect the liver, kidneys, and nervous system. Exposures *over 200 ppm* during weeks or months can cause irritation of the respiratory tract, nausea, headache, sleeplessness, abdominal pain; constipation, dizziness, increased perspiration; fatigue, skin infection; kidney and liver damage; fluid in the lungs and coma. Long term exposure can cause dermatitis; drying and cracking of the skin. Tetrachloroethylene has caused liver cancer and birth defects in mice. Whether it causes cancer in humans is unknown. May damage the developing fetus.

Points of Attack: Liver, kidneys, lungs.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: urinalysis. Liver function tests. Lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Special 24-h EKG (Holter monitor) to look for irregular hearth beat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Exposure to tetrachloroethylene should not be controlled with the use of respirators except: during the time period necessary to install or implement engineering or work practice controls; in work situations in which engineering and work practice controls are technically not feasible; to supplement engineering and work practice controls when such controls fail to adequately control exposure to tetrachloroethylene; for operations which require entry into tanks or closed vessels; or in emergencies.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Tetrachloroethylene must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and chlorine dioxide; chemically active metals, such as barium, lithium, and beryllium; and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Tetrachloroethylene requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Tetrachloroethylene itself does not burn. Poisonous gases, including hydrogen chloride, phosgene, and chlorine are produced in fire or heat above 150°C. Vapors are heavier than air and will collect in low areas. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. Alternatively, PCE may be recovered from waste gases and reused.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (several countries) (UN).[13]

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Hydrochloride:

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Developmental/Reproductive toxin [Tetracycline (internal use)] 10/1/92; [Tetracycline hydrochloride (internal use)] 1/1/91.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetracycline trihydrate is a white crystalline substance. Molecular weight = 444.48; Freezing/Melting point = 170−175°C (decomposition). It is commonly employed as the *hydrochloride*; Molecular weight = 480.94; Freezing/Melting point = 214°C (decomposes). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1. Tetracycline is slightly soluble in water; the hydrochloride is highly soluble in water.

Potential Exposure: Tetracycline is an antibiotic medicine used as capsules, tablets, or intravenous injections against certain infections in humans and animals.

Incompatibilities: Although no dangerous incompatibilities are reported, the potency of this medicine is reduced by heat, sunlight, and solutions with pH <2; and destroyed by caustic hydroxide solutions.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.75 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 500 mg/m^3

Russia[43] set a MAC in work-place air of 0.1 mg/m^3 and also MAC values for ambient air in residential areas of 0.01 mg/m^3 on a momentary basis and 0.006 mg/m^3 on a daily average basis.

Determination in Air: No method available.

Routes of Entry: Ingestion, inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Tetracycline can affect you when breathed in. Exposure can cause sneezing, itching of the nose; stomach upset; vomiting and diarrhea.

Long Term Exposure: Tetracycline can cause an allergic skin rash to develop. If skin allergy develops, sunlight may exacerbate the reaction. May cause stomach upset with nausea, vomiting, and diarrhea. Tetracycline is used as a medical drug. Used that way, it may cause liver and kidney damage. It is not known if this can occur with occupational exposure. May cause mutations. Whether it poses a cancer risk requires more study. Handle with extreme caution. It may also damage the developing fetus.

Points of Attack: Liver, kidneys, skin.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from sunlight, heat, and caustic materials.

Shipping: Medicine, solid, toxic, n.o.s., requires a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any agent suitable for surrounding fires. Poisonous gases are produced in fire, including nitrogen oxides (and in the case of the *hydrochloride:* hydrogen chloride). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: C, N; Risk phrases: R21/22; R34; R43; R51/53; Safety phrases: S1/2; S26; S36/37/39; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Tetraethylenepentamine is a yellow, viscous liquid. Molecular weight = 189.36; Boiling point = 333−340°C; Freezing/Melting point = −40 to −30°C; Flash point = 163−185°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Tetraethylenepentamine is used as a solvent for resins and dyes, in manufacture of synthetic rubber; and intermediate for oil additives; in papermaking.

Incompatibilities: Violent reaction with strong oxidizers. This chemical is strongly alkaline; reacts with acids.

Permissible Exposure Limits in Air

AIHA WEEL: 5 mg/m^3 TWA [skin]; Potential for dermal sensitization.

Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 50 mg/m^3
PAC-2: 350 mg/m^3
PAC-3: 500 mg/m^3

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Tetraethylenepentamine can affect you when breathed in and by passing through your skin. Tetraethylenepentamine is a corrosive chemical, and skin or eye contact can cause burns. The vapor is strongly irritating to the nose, throat, and bronchial tubes. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure may damage the liver, kidneys, heart muscle, and/or brain; impairing thinking, reasoning, and concentration. Some related chemicals can cause a skin or lung allergy to develop. It is not known whether this chemical can cause the same allergies.

Points of Attack: Lungs, liver, kidneys, heart, brain.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Exam of central nervous system. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer 50/50 solution of vinegar/water, water, or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to tetraethylenepentamine, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Tetraethylenepentamine must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where tetraethylenepentamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Tetraethylenepentamine requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides; are produced in fire. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: listed in Annex 1, Part 3 without Index Number.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Tetraethyl lead is a colorless oily liquid with a sweet, slight musty odor. In commerce it is usually dyed red, orange, or blue. Tetraethyl lead will decompose in bright sunlight yielding needle-like crystals of tri-, di-, and mono-ethyl lead compounds, which have a garlic odor. Molecular weight = 323.47; Specific gravity (H_2O:1) = 1.65 at 25°C; Boiling point = (decomposes) 118.9°C; Freezing/Melting point = −130°C; Vapor pressure = 0.2 mmHg at 25°C; Flash point = 93°C; Autoignition temperature ≥110°C. Explosive limits: LEL = 1.8%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 3. Practically insoluble in water; solubility = 0.00002%.

Potential Exposure: Compound Description: Tumorigen, Organometallic, Mutagen; Reproductive Effector; Human Data. Tetraethyl lead is used as a component of antiknock mixes for gas and as an intermediate in making fungicides; Tetraethyl lead (used as an antiknock compound in gasoline) can also contain impurities, such as *ethylene dibromide* and *ethylene dichloride*.

Incompatibilities: Violent reaction with strong oxidizers, sulfuryl chloride; halogens, oils and fats; rust, potassium permanganate. Decomposes slowly in light and at room temperature, and more rapidly at temperatures above 110°C. Attacks rubber and some plastics and coatings.

Permissible Exposure Limits in Air

OSHA PEL: 0.075 mg[Pb]/m^3 TWA [skin].

NIOSH REL: 0.075 mg[Pb]/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg[Pb]/m^3 [skin]; not classifiable as a human carcinogen.

NIOSH IDLH: 40 mg[Pb]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1170 mg/m^3

PAC-1: 0.468 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 62.4 mg/m^3

DFG MAK: 0.05 mg[Pb]/m^3; Peak Limitation Category II (2) [skin]; Pregnancy Risk Group B.

Arab Republic of Egypt: TWA 0.1 mg/m^3, 1993; Australia: TWA 0.1 mg/m^3 [skin], 1993; Austria: MAK 0.1 ppm (0.075 mg/m^3) [skin], 1999; Belgium: TWA 0.1 mg/m^3 [skin], 1993; Denmark: TWA 0.007 ppm (0.05 mg/m^3) [skin], 1999; France: VME 0.10 mg/m^3 [skin], 1999; Hungary: TWA 0.005 mg/m^3, STEL 0.01 mg/m^3 [skin], 1993; the Netherlands: MAC-TGG 0.05 mg/m^3 [skin], 2003; Norway: TWA 0.001 ppm (0.075 mg/m^3), 1999; the Philippines: TWA 0.075 mg/m^3 [skin], 1993; Poland: MAC (TWA) 0.05 mg/m^3; MAC (STEL) 0.1 mg/m^3, 1999; Russia: STEL 0.005 mg/m^3 [skin], 1993; Sweden: NGV 0.05 mg/m^3, ktv 0.2 mg/m^3 [skin], 1999; Switzerland: MAK-W 0.01 ppm (0.075 mg/m^3), KZG-W 0.02 ppm [skin], 1999; Thailand: TWA 0.075 mg/m^3, 1993; United Kingdom: LTEL 0.10 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for TEL in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 1.5 μg/m^3 (Connecticut) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2533, Tetraethyl lead (as Pb).

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects. Russia[35,43] set a MAC of zero in water bodies used for domestic purposes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.15$. See also "Lead" entry.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Tetraethyl lead is extremely poisonous; may be fatal if inhaled, swallowed, or absorbed through the skin. Irritates the moist eyes, skin, and respiratory tract. Contact may cause burns to skin and eyes; causing permanent loss of vision. Most symptoms of poisoning are due to the effects of tetraethyl lead on the nervous system. Signs and symptoms of acute exposure to tetraethyl lead may be severe and include intoxication, anxiety, irritability, insomnia, violent/frightening, strange dreams; headache, disorientation, hyperexcitability, delusions, reduced memory; hallucinations, personality changes; tremors, convulsions, and death. Muscular weakness, ataxia, tremors, convulsions, cerebral edema; and coma may occur. A metallic taste may be noted. Sneezing, bronchitis, and pneumonia may be observed. Bradycardia (slow heart rate), hypotension (low blood pressure), hypothermia, and pallor may also occur. Gastrointestinal symptoms include vomiting and diarrhea.

Long Term Exposure: May be a reproductive toxin; may damage the developing fetus. There is limited evidence that this chemical causes cancer in animals. High levels can cause muscle and joint pains, weakness, muscle cramps; and easy fatigue. Repeated exposure may cause lead to accumulate in the body. May cause kidney and brain damage, and damage to the blood cells; causing anemia.

Points of Attack: Central nervous system; cardiovascular system, kidneys, eyes.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite): blood urea nitrogen, calcium, carbon dioxide; Sugar/Glucose; Biologic Monitoring of Urine every 3 months; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urinalysis (routine). If symptoms develop or overexposure is suspected, the following may be useful: Urine test for lead (levels of 0.1 mg/L of urine indicate increased exposure. Such levels increase risk from further exposure). Blood lead tests are not usually accurate with exposure to tetraethyl lead. Kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.75 ppm:* Sa (APF = 10) (any supplied-air respirator). *1.875 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *3.75 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *40 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetraethyl lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where tetraethyl lead is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of tetraethyl lead. Wherever tetraethyl lead is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Motor fuel antiknock mixtures require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including lead and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide; mist and foam. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Use water from unmanned monitors and hose-holders to keep fire-exposed containers cool. When stopping leak, use water spray to protect firefighters from a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration with scrubbing for collection of lead oxides which may be recycled or landfilled. It is also possible to recover alkyl lead compound from wastewaters as an alternative to disposal.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetraethyltin is a colorless liquid. Molecular weight = 234.97; Boiling point = 181°C; Freezing/Melting point = −112°C; Flash point = 53°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Used as biocide, bactericide, fungicide and insecticide; preservative for wood, textile, paper, and leather. Not registered as a pesticide in the US.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Sn]/m^3 TWA.

NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg[Sn]/m^3 TWA; 0.2 mg[Sn]/m^3 STEL [skin].

NIOSH IDLH: 25 mg[Sn]/m^3 [skin].

Protective Action Criteria (PAC)

TEEL-0: 0.198 mg/m^3

PAC-1: 0.396 mg/m^3

PAC-2: 7 mg/m^3

PAC-3: 49.5 mg/m^3

DFG MAK: 0.1 mg[Sn]/m^3 inhalable fraction [skin]; Pregnancy Risk Group D.

Determination in Air: Use NIOSH Analytical Method (IV) #5504, Organotin.

Permissible Concentration in Water: A MAC in water bodies used for domestic purposes of 0.2 μg/L has been set by Russia joint project.[43]

Routes of Entry: Inhalation, skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact may cause skin burns. Inhalation can cause coughing, wheezing, and/or shortness of breath. Toxic hazard rating is high for oral, intravenous, intraperitoneal administration. This material causes swelling of the brain and spinal cord. Exposure may result in muscular weakness and paralysis, leading to respiratory failure; convulsive movements; closure of eyelids and sensitivity to light; headaches, EEG changes; dizziness, psychological and neurological disturbances; vertigo (an illusion of movement), sore throat; cough, abdominal pain; nausea, vomiting, diarrhea, urine retention; paresis, focal anesthesia; pruritus. Higher levels can cause unconsciousness, collapse, and death.

Long Term Exposure: Repeated or prolonged contact can cause dermatitis; dry and cracked skin. May cause brain damage, hepatic necrosis; kidney damage.

Points of Attack: Skin, brain, kidneys.

Medical Surveillance: NIOSH lists the following tests: Glaucoma; kidney function tests; liver function tests; urine (chemical/metabolite); urinalysis (routine). Also consider, psychological testing; examination of the nervous system; EEG.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 1 mg/m^3:* CcrOvDM [any chemical cartridge respirator with organic vapor cartridge (s) in combination with a dust and mist filter]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 mg/m^3:* CcrFOv100 (APF = 50) (any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter); or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 25 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Organotin compounds, liquid, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wearing protective equipment, absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Ventilate and wash area after cleanup is complete. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This material is a flammable liquid. Extinguish small fires with dry chemical, carbon dioxide; water spray or foam. For large fires, use water spray, fog, or foam. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Tetrafluoroethylene T:0320

Molecular Formula: C_2F_4

Synonyms: Ethene, tetrafluoro-; Ethylene, tetrafluoro-; Fluroplast 4; Perfluoroethene; Perfluoroethylene; Teflon 1,1,2,2-Tetrafluoroethylene; Tetrafluoroethylene, Inhibited; Tetrafluoroethene; TFE

CAS Registry Number: 116-14-3

RTECS® Number: KX4000000

UN/NA & ERG Number: UN1081 (stabilized)/116P

EC Number: 204-126-9

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B; NTP: Reasonably anticipated to be a human carcinogen.

California Proposition 65 Chemical: Cancer 5/1/97.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: TFE is a colorless, flammable gas. Molecular weight = 100.02; Melting point = −143°C; Boiling point = −76°C; Flash point ≤0°C; Autoignition temperature = 188°C. Its flammable limits in air are LEL = 10%; UEL = 50%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 3. Insoluble in water.

Potential Exposure: Those involved in the production of TFE and the manufacture of fluorocarbon polymers.

Incompatibilities: Reacts with air. Hazardous polymerization may occur unless inhibited. Will explode at pressures above 2.7 bar if terpene inhibitor is not added. Inhibited monomer can decompose explosively in fire, under pressure, or upon contact with materials with which it can react exothermically. Violent reaction with oxygen, oxidizers, sulfur trioxide; halogen compounds.

Permissible Exposure Limits in Air

ACGIH TLV®[1]: 2 ppm/8.2 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **220** ppm

PAC-2: **550** ppm

PAC-3: **3300** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 2.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Tetrafluoroethylene can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Very high exposures can displace the oxygen in the air, causing lightheadedness, dizziness, poor coordination, and unconsciousness. High levels may also damage the liver and/or kidneys and irritate the lungs. Contact with liquefied gas may cause frostbite.

Long Term Exposure: May cause lung irritation; bronchitis may develop. May cause kidney and liver damage.

Points of Attack: Lungs, kidneys, liver.

Medical Surveillance: NIOSH lists the following tests: chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pelvic X-ray; sputum cytology; urine (chemical/metabolite); urine (chemical/metabolite) pre- and postshift; urinalysis (routine); complete blood count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, Viton™, butyl rubber; and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Combustion by-products include hydrogen fluoride and carbonyl fluoride. The respiratory recommendations for *fluorides* has been included for reference: NIOSH: *(fluorides) 12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3*: Any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100; or SA* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM*† *if not present as a fume* (any powered, air-purifying respirator with a dust and mist filter). *125 mg/m^3:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* HieF† (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Check that oxygen content is at least 19% before entering storage or spill area. Prior to working with this chemical you should be trained on its proper handling and storage. Tetrafluoroethylene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilate area. Protect storage against physical damage. Will explode at pressures above 2.7 bar if terpene inhibitor is not added. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Tetrafluoroethylene, inhibited, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined space, such as a sewer because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases, including hydrogen fluoride and carbonyl fluoride, are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Tetrafluoromethane T:0330

Molecular Formula: CF_4

Synonyms: Arcton O; Carbon fluoride; Carbon tetrafluoride; F 14; FC 14; Freon 14; Halocarbon 14; Halon 14; Methane, tetrafluoro-; Perfluoromethane; R 14

CAS Registry Number: 75-73-0

RTECS® Number: FG4920000

UN/NA & ERG Number: UN1982/126

Ec Number: 200-896-5

Regulatory Authority and Advisory Bodies

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetrafluoromethane is a colorless, odorless gas. Molecular weight = 88.01; Boiling point = −128°C; Freezing/Melting point = −183.6°C; Autoignition temperature ≥1100°C. Insoluble in water.

Potential Exposure: Tetrafluoromethane is used in fire extinguishers and as a low temperature refrigerant.

Incompatibilities: Forms hydrogen fluoride and fluorides on decomposition with hot surfaces above 125°F/52°C or open flame. Incompatible with powdered metals; including aluminum, zinc, and beryllium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 200 ppm
PAC-1: 600 ppm
PAC-2: 5000 ppm
PAC-3: 25,000 ppm

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Tetrafluoromethane can affect you when breathed in. High levels can cause you to feel dizzy, lightheadedness, and to pass out. Very high levels could cause death. Similar chemicals can affect the cardiovascular system, causing irregular heartbeat, which could lead to death. Contact with the liquefied gas could cause frostbite. Exposure at high levels can cause depletion of oxygen, causing unconsciousness and death by suffocation.

Long Term Exposure: Unknown at this time.

Points of Attack: Cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heart beat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof goggles unless full-face-piece respiratory protections is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to tetrafluoromethane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from powdered metals; including aluminum, zinc, and beryllium; and from open flames or temperatures above 125°F/51.6°C. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Tetrafluoromethane, compressed, requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand; earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tetrafluoromethane may burn, but does not readily ignite. Use dry chemical or carbon dioxide extinguishers. Poisonous gases are produced in fire, including fluorides, such as hydrogen fluoride. Containers may explode in fire. If liquid or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse; equivocal evidence: rat; NTP: Carcinogenesis Studies (inhalation): some evidence: rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

US EPA Hazardous Waste Number (RCRA No.): U213.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 1000 lb (454 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F, Xi; Risk phrases: R11; R19; R36/37; Safety phrases: S2; S16; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Tetrahydrofuran is a colorless liquid with an ether-like odor. The odor threshold is listed at 3.8 (3M), 20−50 ppm[41] and 31 ppm. Molecular weight = 72.12; Specific gravity (H_2O:1) = 0.89 at 25°C; Boiling point = 66.1°C; Freezing/Melting point: −108.5°C; Vapor pressure = 132 mmHg; Flash point = −15°C (cc); Autoignition temperature = 321°C. Explosive limits: LEL = 2%; UEL = 11.8%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 1. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. The primary use of tetrahydrofuran is as a solvent to dissolve synthetic resins, particularly polyvinyl chloride and vinylidene chloride copolymers. It is also used to cast polyvinyl chloride films, to coat substrates with vinyl and vinylidene chloride; and to solubilize adhesives based on or containing polyvinyl chloride resins. A second large market for THF is as an electrolytic solvent in the Grignard reaction-based production of tetramethyl lead. THF is used as an intermediate in the production of polytetramethylene glycol.

Incompatibilities: Forms thermally explosive peroxides in air on standing (in absence of inhibitors). Peroxides can be detonated by heating, friction, or impact. Reacts violently with strong oxidizers, strong bases, and some metal halides. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.95 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 200 ppm/590 mg/m^3 TWA.

NIOSH REL: 200 ppm/590 mg/m^3 TWA; 250 ppm/735 mg/m^3 STEL.

ACGIH TLV®[1]: 50 ppm/147 mg/m^3 TWA; 100 ppm/295 mg/m^3 STEL [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 2000 ppm [LEL].

Protective Action Criteria (PAC)*
TEEL-0: 50 ppm
PAC-1: **100** ppm
PAC-2: **500** ppm
PAC-3: **5000** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 50 ppm/150 mg/m^3 TWA; Peak Limitation Category I(2) [skin]; Carcinogen Category 4; Pregnancy Risk Group C; BAT: 8 mg/L in urine/end-of-shift.

Australia: TWA 200 ppm (590 mg/m^3), STEL 250 ppm, 1993; Austria: MAK 200 ppm (590 mg/m^3), 1999; Belgium: TWA 200 ppm (590 mg/m^3), STEL 250 ppm (738 mg/m^3), 1993; Denmark: TWA 100 ppm (295 mg/m^3), 1999; Finland: TWA 100 ppm (290 mg/m^3), STEL 150 ppm (440 mg/m^3), 1999; France: VME 200 ppm (590 mg/m^3), 1999; Hungary: TWA 200 mg/m^3, STEL 400 mg/m^3, 1999; Japan: 200 ppm (590 mg/m^3), 1999; the Netherlands: MAC-TGG 300 mg/m^3 [skin], 2003; Norway: TWA 50 ppm (150 mg/m^3), 1999; the Philippines: TWA 200 ppm (590 mg/m^3), 1993; Poland: MAC (TWA) 600 mg/m^3, MAC (STEL) 750 mg/m^3, 1999; Russia: TWA 200 ppm, STEL 100 mg/m^3, 1993; Sweden: NGV 50 ppm (150 mg/m^3), KTV 80 ppm (250 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (590 mg/m^3), STEL 1000 ppm, 1999; Turkey: TWA 200 ppm (590 mg/m^3), 1993; United Kingdom: TWA 100 ppm (300 mg/m^3), STEL 200 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 250 ppm; Russia[43] set a MAC values for ambient air in residential areas of 0.2 mg/m^3 both on a momentary and a daily average basis. Several states have set guidelines or standards for tetrahydrofuran in ambient air[61] ranging from zero (North Carolina) to 0.8 mg/m^3 (Massachusetts) to 5.9−7.35 mg/m^3 (North Dakota) to 9.8 mg/m^3 (Virginia) to 11.8 mg/m^3 (Connecticut, Florida, New York) to 14.048 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1609[18]; 3800; OSHA Analytical Method #7.

Permissible Concentration in Water: No criteria set but EPA[32] has suggested a permissible ambient goal of 8100 μg/L (based on health effects). Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L (500 μg/L). States which have set guidelines for tetrahydrofuran in drinking water include Wisconsin at 50.0 μg/L and New Hampshire at 154 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Tetrahydrofuran can affect you when breathed in and may enter the body through the skin. Eye contact causes severe irritation and possible damage. Skin contact causes severe irritation. If covered by clothing or prolonged, blistering can occur. The vapors irritate the eyes, nose, throat, and lungs. Very high exposures can affect the central nervous system causing narcosis, unconsciousness, and rapid death. High exposure can damage the liver and kidneys.

Long Term Exposure: May cause dermatitis; drying and cracking. Repeated exposure may cause liver and kidney damage. May cause lung irritation; bronchitis may develop.

Points of Attack: Eyes, respiratory system; central nervous system; liver and kidneys.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *2000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance causes eye irritation or damage; eye protection needed.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetrahydrofuran must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where tetrahydrofuran is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of tetrahydrofuran should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of tetrahydrofuran.

Shipping: Tetrahydrofuran requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to

fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Concentrated waste containing peroxides—perforation of a container of the waste from a safe distance followed by open burning.

Tetramethyl lead T:0360

Molecular Formula: $C_4H_{12}Pb$

Common Formula: $Pb(CH_3)_4$

Synonyms: Lead, tetramethyl-; Plumbane, tetramethyl-; Tetramethylplumbane; TML

CAS Registry Number: 75-74-1

RTECS® Number: TP4725000

UN/NA & ERG Number: UN1649 (motor fuel antiknock mixture)/131

EC Number: 200-897-0; Listed in Title I, Part 3 with no Index Number. HS2931.00

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: (organolead) Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1987.

Toxic Substance (World Bank).[15]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 1000 lb (450 kg).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

EPCRA Section 313 (as organic lead compound) Form R *de minimis* concentration reporting level: 1.0%.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

European/International Regulations: Listed in Annex 1, Part 3 without Index Number.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Tetramethyl lead is a colorless liquid with a slight musty odor. In commerce it is usually dyed red, orange, or blue. Molecular weight = 267.35; Boiling point ≥100°C (decomposes); Freezing/Melting point = −27°C; Flash point = 37°C. Explosive limits: LEL = 1.8%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 3₩. Insoluble in water.

Potential Exposure: Compound Description: Organometallic; Reproductive Effector. Those engaged in the manufacture, distribution, and blending into gasoline of this antiknock agent for aviation gasoline.

Incompatibilities: Violent reaction with oxidizers, such as sulfuryl chloride or potassium permanganate; strong acids; especially nitric acid; chemically active metals. Decomposes and may explode in heat above 90°C. Attacks rubber.

Permissible Exposure Limits in Air

OSHA PEL: 0.075 mg[Pb]/m^3 TWA [skin].

NIOSH REL: 0.075 mg[Pb]/m^3 TWA [skin].

ACGIH TLV®[1]: 0.15 mg[Pb]/m^3 [skin].

NIOSH IDLH: 40 mg[Pb]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0968 mg/m^3

PAC-1: 0.581 mg/m^3

PAC-2: 4 mg/m^3

PAC-3: 51.6 mg/m^3

DFG MAK: 0.05 mg[Pb]/m^3; Peak Limitation Category II (2); Peak Limitation Category II(2) [skin]; Pregnancy Risk Group B.

Arab Republic of Egypt: TWA 0.05 mg[Pb]/m^3, 1993; Australia: TWA 0.15 mg[Pb]/m^3, 1993; Australia: TWA 0.15 mg/m^3 [skin], 1993; Austria: MAK 0.01 ppm (0.075 mg/m^3) [skin], 1993; Austria: MAK 0.01 ppm (0.075 mg/m^3), 1999; Belgium: TWA 0.15 mg[Pb]/m^3, 1993; Belgium: TWA 0.15 mg/m^3 [skin], 1993; Denmark: TWA 0.007 ppm (0.05 mg/m^3) [skin], 1999; the Netherlands: MAC-TGG 0.05 mg/m^3 [skin], 2003; Finland: TWA 0.1 mg[Pb]/m^3, 1993; France: VME 0.15 mg[Pb]/m^3 [skin], 1999; VME 0.15 mg/m^3 [skin], 1993; Hungary: STEL 0.04 mg[Pb]/m^3, carcinogen, 1993; Hungary: TWA 0.005 mg/m^3, STEL 0.01 mg/m^3 [skin], 1993; Norway: TWA 0.01 ppm (0.075 mg/m^3), 1999; the Philippines: TWA 0.07 mg/m^3 [skin], 1993; TWA 0.15 mg[Pb]/m^3, 1993; Russia: STEL 0.005 ppm (0.01 mg[Pb]/m^3), 1993; Sweden: NGV 0.05 mg[Pb]/m^3, KTV 0.2 mg[Pb]/m^3 [skin], 1999; NGV 0.05 mg/m^3, STEL 0.2 mg/m^3 [skin], 1993; Switzerland: MAK-W 0.01 ppm (0.075 mg/m^3), KZG-W 0.02 ppm [skin], 1999; TWA 0.01 ppm (0.075 mg/m^3), STEL 0.02 ppm [skin], 1993; TWA 0.1 mg[Pb]/m^3, 1993; Thailand: TWA 0.07 mg/m^3, 1993; TWA 0.2 mg[Pb]/m^3, 1993; Turkey: TWA 0.2 mg[Pb]/m^3, 1993; United Kingdom: LTEL 0.15 mg[Pb]/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.15 mg[Pb]/m^3 [skin]. Several states have set guidelines or standards for TML in ambient air[60] ranging from 1.5 μg/m^3 (Connecticut and North Dakota) to 2.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #2534.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 2 μg/L based on health effects.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vapors are very toxic. Tetramethyl lead irritates the moist skin, eyes, and mucous membrane. May affect the central nervous system. Fatal lead poisoning may occur by ingestion, vapor inhalation, or skin absorption. Several cases of acute toxicity, usually in the form of degenerative brain disease, have been described following occupational exposure. Signs and symptoms of acute exposure to tetramethyl lead may be severe and include nausea, delirium, mania, anxiety, irritability, headache, insomnia, disorientation, violent/frightening dreams; hyperexcitability, delusions, and hallucinations. Muscular weakness, tremor, a lack of coordination; convulsions, cerebral edema; and coma may occur. A metallic taste may be noted. Sneezing, bronchitis, and pneumonia may be noted. Bradycardia (slow heart rate), hypotension (low blood pressure), hypothermia, and pallor may also occur. Gastrointestinal symptoms include vomiting and diarrhea.

Long Term Exposure: High levels can cause muscle and joint pains, weakness, muscle cramps; and fatigue. Lead can accumulate in the body with repeated exposure. May affect the kidneys.

Points of Attack: Central nervous system; cardiovascular system, kidneys.

Medical Surveillance: NIOSH lists the following tests: Biologic monitoring of urine every 3 months; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urinalysis (routine). If symptoms develop or overexposure is suspected, the following may be useful: urine test for lead levels of 0.1 mg/L of urine indicate increased exposure. Such levels increase risk from further exposure. Blood lead tests are not usually accurate with exposure to tetramethyl lead. Complete blood count (CBC). Kidney function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed; medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *0.75 mg/m^3:* Sa (APF = 10) (any supplied-air respirator). *1.875 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *3.75 mg/m^3:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *40 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA

(APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Tetramethyl lead must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and chemically active metals (such as potassium, sodium, magnesium, and zinc), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where Tetramethyl lead is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of tetramethyl lead should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of tetramethyl lead. Wherever tetramethyl lead is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Motor fuel antiknock mixtures requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tetramethyl lead is a flammable and reactive liquid. Use dry chemical, carbon dioxide, water spray; or foam extinguishers. Poisonous gases, including lead, lead oxides and carbon monoxide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration with scrubbing for collection of lead oxides which may be recycled or landfilled. It is also possible to recover alkyl lead compounds from wastewaters (A-58) as an alternative to disposal.

Molecular Formula: $C_8H_{12}N_2$

Common Formula: $(CH_3)_2C(CN)C(CN)(CH_3)_2$

Synonyms: Tetramethylbutane dinitrile; Tetramethylsuccinic acid dinitrile; TMSN

CAS Registry Number: 3333-52-6

RTECS® Number: WN4025000

UN/NA & ERG Number: UN2811 (toxic solid, organic, n.o.s.)/154

EC Number: None assigned.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

As cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents. as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Tetramethyl succinonitrile is a colorless, odorless solid. Molecular weight = 136.22; Specific gravity (H_2O:1) = 1.07 at 25°C; Boiling point = sublimes; Freezing/Melting point = 170°C (sublimes). Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector. Tetramethyl succinonitrile is reported to be a breakdown product of azobisisobutyronitrile, which is used as a blowing agent or propellant for the production of vinyl foams. Forms cyanide in the body.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.57 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 3 mg/m^3/0.5 ppm TWA [skin].

NIOSH REL: 3 mg/m^3/0.5 ppm TWA [skin].

ACGIH TLV®[1]: 0.5 ppm TWA [skin].

No Teel available.

DFG MAK: [skin] No numerical value established. Data may be available.

NIOSH IDLH: 5 ppm.

Australia: TWA 0.5 ppm (3 mg/m^3) [skin], 1993; Austria: MAK 0.5 ppm (3 mg/m^3) [skin], 1999; Belgium: TWA 0.5 ppm (28 mg/m^3) [skin], 1993; Denmark: TWA 0.5 ppm (3 mg/m^3) [skin], 1999; Finland: TWA 0.5 ppm (3 mg/m^3), STEL 1.5 ppm (8.4 mg/m^3) [skin], 1999; France: VME 0.5 ppm (3 mg/m^3) [skin], 1999; the Netherlands: MAC-TGG 3 mg/m^3 [skin], 2003; the Philippines: TWA 0.5 ppm (3 mg/m^3) [skin], 1993; Switzerland: MAK-W 0.3 ppm (5 mg/m^3), KZG-W 2 ppm [skin], 1999; United Kingdom: TWA 0.5 ppm (2.8 mg/m^3), STEL 2 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.5 ppm [skin]. Several states have set guidelines or standards for TMSN in ambient air[60] ranging from 30 μg/m^3 (North Dakota) to 50 μg/m^3 (Virginia) to 60 μg/m^3 (Connecticut) to 71 μg/m^3 (Nevada).

Determination in Air: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; NIOSH II (3), Method #S155.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 41 μg/L based on health effects.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: May affect the nervous system. Symptoms of exposure are headaches, nausea, convulsions, coma. May affect the liver, kidneys, gastrointestinal tract. Exposure to high concentrations may result in death. The fatal dose for humans is about 25 mg/kg of body weight.

Long Term Exposure: May affect the kidneys, liver.

Points of Attack: Central nervous system; liver, kidneys, gastrointestinal tract.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Blood cyanide level. Kidney and liver functions. G.I. series. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit, oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. See NIOSH Criteria Document 212 *Nitriles*.

Respirator Selection: Up to 28 mg/m^3: Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Toxic solids, organic, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration—incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions.

Tetranitromethane T:0380

Molecular Formula: CN_4O_8
Common Formula: $C(NO_2)_4$
Synonyms: Methane, tetranitro-; NCI-C55947; Tetan; Tetranitrometano (Spanish); TNM
CAS Registry Number: 509-14-8
RTECS® Number: PB4025000
UN/NA & ERG Number: UN1510/143
EC Number: 208-094-7
Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1996; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Studies (inhalation); clear evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

US EPA Hazardous Waste Number (RCRA No.): P112.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 10 lb (4.54 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

California Proposition 65 Chemical: Cancer 7/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetranitromethane, a nitroparaffin, is a colorless to pale yellow liquid or solid with a pungent odor. It causes tears. Molecular weight = 196.05; Specific gravity (H_2O:1) = 1.62 at 25°C; Boiling point = 126.1°C; Freezing/Melting point 14°C; Vapor pressure = 8 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 3 (Oxidizer). Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Tetranitromethane is used as a solvent for polymers and as a stabilizer; as an oxidizer in rocket propellant combinations. It is also used as an explosive in admixture with toluene.

Incompatibilities: Tetranitromethane is a powerful oxidizer. It is more easily detonated than TNT. Contact with hydrocarbons, alkalis, or metals form explosive mixtures. Contact with toluene or cotton may cause fire and explosion. Combustible material wet with tetranitromethane may be highly explosive. The potential for explosion is severe, especially when exposed to heat, powerful oxidizers, or reducing agents; or, when subject to mild shock. Impurities can also cause explosives. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 8.02 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1 ppm/8 mg/m^3 TWA.

NIOSH REL: 1 ppm/8 mg/m^3 TWA.

ACGIH TLV®[1]: 0.005 ppm/0.04 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 4 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 0.52 ppm

PAC-1: 0.52 ppm

PAC-2: **0.52** ppm

PAC-3: **1.7** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 1 ppm (8 mg/m^3), 1993; Austria: carcinogen, 1999; Belgium: TWA 1 ppm (8 mg/m^3), 1993; Denmark: TWA 1 ppm (8 mg/m^3), 1999; Finland: TWA 1 ppm (8 mg/m^3), STEL 3 ppm (24 mg/m^3), 1999; France: VME 1 ppm (8 mg/m^3), 1999; the Netherlands: MAC-TGG 0.04 mg/m^3, 2003; the Philippines: TWA 1 ppm (8 mg/m^3), 1993; Poland: MAC (TWA) 0.04 mg/m^3, 1999; Russia: STEL 0.3 mg/m^3, 1993; Sweden: NGV 0.05 ppm (0.4 mg/m^3), KTV 0.2 ppm (0.8 mg/m^3), 1999; Switzerland: MAK-W 1 ppm (8 mg/m^3), carcinogen, 1999; Turkey: TWA 1 ppm (8 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for TNM in ambient air[60] ranging from 80 μg/m^3 (North Dakota) to 130 μg/m^3 (Virginia) to 160 μg/m^3 (Connecticut) to 190 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #3513.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.5 mg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin contact causes burns. After more prolonged inhalation, headache, dizziness, chest pain; dyspnea, and respiratory distress may occur. After prolonged exposure, central nervous system; heart, liver, and kidney damage can occur as well as pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Can cause methemoglobinemia and cyanosis.

Long Term Exposure: Chronic signs and symptoms include weariness and pneumonia. May cause CNS, kidney, and liver damage.

Points of Attack: Respiratory system, eyes, skin, blood, central nervous system.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Kidney and liver function tests. Complete blood count (CBC). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 4 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); ccrFS (APF = 50) [any chemical cartridge respirator with a full face-piece and cartridge(s) providing protection against the compound of concern]; or GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or PaprS (APF = 25) [any powered, air-purifying respirator with cartridge(s) providing protection against the compound of concern]; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Note:* Substance causes eye irritation or damage; requires eye protection. Only nonoxidizable sorbents allowed (not charcoal).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in an explosion-proof freezer. Keep away from metals and other organic and easily oxidized compounds. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: Tetranitromethane requires a shipping label of "OXIDIZER, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 5.1 and Packing Group I. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid shock and friction if liquid spills on combustible material, such as wood or paper. Use water spray to reduce vapors. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Flush area with flooding amounts of water and dike spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.2/0.3
Night 0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60.
Then: Protect persons downwind (miles/kilometers)
Day 0.4/0.6
Night 0.6/1.4

Fire Extinguishing: Combustible liquid, but difficult to ignite. Poisonous gases, including nitrogen oxides, are produced in fire. Material is a strong oxidizer. The potential for explosion is severe, especially when exposed to heat or to powerful oxidizing or reducing agents; or when shocked or heated. It is more easily detonated than TNT. Impurities can also cause explosives. Extinguish small fires with water only, no dry chemicals or carbon dioxide. For large fires, flood the fire area with water. Do not move cargo or vehicle if cargo has been exposed to heat. Cool containers that are exposed to flames with water from the side until well after fire is out. For massive fire, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant

(≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Open burning at remote burning sites is not entirely satisfactory since it makes no provision for the control of the toxic effluents, nitrogen oxides and HCN. Suggested procedures are to employ modified closed pit burning, using blowers for air supply and passing the effluent combustion gases through wet scrubbers.

Tetrasodium EDTA T:0390

Molecular Formula: $C_{10}H_{12}N_2Na_4O_8$

Common Formula: $[(NaOOCCH_2)_2NCH_2]_2$

Synonyms: *N*,*N*′-1,2-Ethanediylbis[*N*-(carboxymethyl)] glycine tetrasodium salt; Ethylene dinitrilotetra-acetic acid tetrasodium salt; Sodium EDTA; Sodium ethylene-diaminetetraacetate; Sodium ethylenediaminetetraacetic acid; Sodium salt of ethylene-diaminetetraacetic acid; Tetrasodium ethylenediaminetetraacetate; Tetrasodium ethylene-diaminetetracetate; Tetrasodium (ethylenedinitrilo)-tetraacetate; Tetrasodium salt of EDTA; Tetrasodium salt of ethylenediaminetetracetic acid

CAS Registry Number: 64-02-8

RTECS® Number: AH5075000

UN/NA & ERG Number: UN3077/171

EC Number: 200-573-9 [*Annex I Index No.:* 607-428-00-2]

Regulatory Authority and Advisory Bodies

This chemical is not specifically listed by the EPA, but ETDA is regulated.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 5000 lb (2270 kg).

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R41; Safety phrases: S2; S26; S39; S46 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Tetrasodium EDTA is a white crystalline solid. Molecular weight = 380.20; Freezing/Melting point = 240°C (decomposition). Highly soluble in water.

Potential Exposure: Used therapeutically in treating arteriosclerosis. Used as a metal cleaner; in detergents, liquid soaps; shampoos; metal chelating agent; in textiles industry to improve dyeing, scouring, and detergent operations; antioxidant.

Incompatibilities: Incompatible with strong acids, nitrates, oxidizers. Can solubilize metals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Permissible Concentration in Water: Russia[43] set a MAC for the disodium salt in water bodies used for fishery purposes of 0.05 mg/L. Maryland[61] has set a guideline for drinking water of 180 μg/L (0.18 mg/L).[61]

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Dust may cause irritation of the nose and throat. *Skin:* May cause irritation. Prolonged skin contact to high concentrations may cause irritation, even a mild burn. *Eyes:* May cause irritation. Alkaline solution can burn the eyes. *Ingestion:* Doses of 200 mg/kg have caused muscle spasms. Kidney damage has been reported at doses of 600 mg/kg for 4 days.

Long Term Exposure: ETDA may cause kidney injury, which may be due to chelating action, not inherent nephrotoxicity. Symptoms of exposure include vomiting, depression, and bloody diarrhea. It is not known if this chemical has the same effects.

Points of Attack: Kidneys.

Medical Surveillance: Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: May cause a negative calcium imbalance.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a

full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a well-ventilated area away from sources of heat. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Use extinguisher appropriate to other burning material. Poisonous gases are produced in fire, including sodium and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Tetrasodium pyrophosphate T:0400

Molecular Formula: $Na_4O_7P_2$
Common Formula: $Na_4P_2O_7$
Synonyms: Natriumpyrophosphat; Phosphotex; Pyrophosphate; Sodium pyrophosphate; Tetranatriumpyrophosphat (German); Tetrasodium diphosphate; Tetrasodium pyrophosphate, anhydrous; TSPP; Victor TSPP
CAS Registry Number: 7722-88-5
RTECS® Number: UX7350000
UN/NA & ERG Number: Not regulated.
EC Number: 231-767-1

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: TSPP is a colorless or white crystalline powder or granules. Molecular weight = 265.90; Specific gravity (H_2O:1) = 2.45 at 25°C; Boiling point = (decomposes); Freezing/Melting point = 987.8°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water; solubility = 7% at 25°C.

Potential Exposure: Compound Description: Drug TSPP is used as a water softener, as a builder in synthetic detergents; as a metal cleaner; in boiler water treatment; in viscosity control of drilling muds and in textile scouring and dyeing.

Incompatibilities: Strong acids; magnesium. The aqueous solution is a weak base.

Permissible Exposure Limits in Air

OSHA PEL: None.
NIOSH REL: 5 mg/m^3 TWA.
ACGIH TLV®[1]: withdrawn.
Protective Action Criteria (PAC)
TEEL-0: 5 mg/m^3
PAC-1: 15 mg/m^3
PAC-2: 25 mg/m^3
PAC-3: 500 mg/m^3

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3, 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; United Kingdom: TWA 5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3.

Several states have set guidelines or standards for TSPP in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #0500, Particulates NOR, total dust.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: TSPP is basically of low toxicity but it is an alkaline material. The dust is irritating to the eyes, skin, and respiratory tract. Contact irritates the skin.

Long Term Exposure: May cause dermatitis. May affect the lungs.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong acids and magnesium.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type or surrounding fire. Tetrasodium pyrophosphate itself does not burn. Poisonous gases are produced in fire, including oxides of phosphorus and sodium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 207-531-9 [*Annex I Index No.:* 612-017-00-6]

Regulatory Authority and Advisory Bodies

Carcinogenicity: The carcinogenicity of tetryl in humans and animals has not been studied.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: E, T; Risk phrases: R3; R23/24/25; R33; Safety phrases: S1/2; S35; S36/37; S45; R63 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tetryl is a colorless to yellow, odorless crystalline solid. High explosive material. Molecular weight = 287.17; Specific gravity (H_2O:1) = 1.57 at 25°C; Boiling point = 180−190°C (explodes); Freezing/Melting point = 129−131°C; Flash point = 187°C (explodes); Vapor pressure = <1 mmHg at 25°C. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Tetryl is used in explosives; as an intermediary detonating agent; and as a booster charge for military devices; it is also used as a chemical indicator. No longer manufactured or used in the US.

Incompatibilities: Violent reaction with hydrazine; oxidizable materials. May explosively decompose from heat, shock, friction, or concussion. Explosive decomposition/detonation from heat takes: approximately 1000 s at 160°C; 0.1 s at 500°C.

Permissible Exposure Limits in Air

OSHA PEL: 1.5 mg/m^3 TWA [skin].
NIOSH REL: 1.5 mg/m^3 TWA [skin].
ACGIH TLV®[1]: 1.5 mg/m^3 TWA [skin].
NIOSH IDLH: 750 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 1.5 mg/m^3
PAC-1: 7.5 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 500 mg/m^3

DFG MAK: [skin] danger of skin sensitization; Carcinogen Category 3B.

Australia: TWA 1.5 mg/m^3, 1993; Austria: MAK 1.5 mg/m^3 [skin], 1999; Belgium: TWA 1.5 mg/m^3, 1993; Denmark: TWA 1.5 mg/m^3 [skin], 1999; Finland: TWA 1.5 mg/m^3, STEL 3 mg/m^3 [skin], 1993; France: VME 1.5 mg/m^3 [skin], 1999; the Netherlands: MAC-TGG 1.5 mg/m^3 [skin], 2003; the Philippines: TWA 1.5 mg/m^3 [skin], 1993; Switzerland: MAK-W 1.5 mg/m^3 [skin], 1999; Turkey: TWA 1.5 mg/m^3, 1993; United Kingdom: TWA 1.5 mg/m^3, STEL 3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1.5 mg/m^3. Several states have set guidelines or standards for tetryl in ambient air[60] ranging from 15 μg/m^3 (North Dakota) to 25 μg/m^3 (Virginia) to 30 μg/m^3 (Connecticut) to 36 μg/m^3 (Nevada).

Determination in Air: Use NIOSH II(3), Method #S225.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. May affect the nervous system. Contact may stain skin and hair yellow or orange. Tetryl is acutely irritating to the mucous membranes of the respiratory tract and the eyes, causing coughing, sneezing, epistaxis, conjunctivitis, and palpebral and periorbital edema.

Long Term Exposure: Tetryl is a potent sensitizer, and allergic dermatitis is common. Dermatitis first appears on exposed skin areas, but can spread to other parts of the body in fair-skinned individuals or those with poor personal hygiene. Repeated or prolonged inhalation exposure may cause asthma. The severest forms show massive generalized edema with partial obstruction of the trachea due to swelling of the tongue, and these cases require hospitalization. Tetryl exposure may cause irritability, easy fatigability; malaise, headaches, lassitude, insomnia, nausea, and vomiting. Anemia of the marrow depression or deficiency type has been observed among tetryl workers. Tetryl exposure has produced liver and kidney damage in animals. The substance may have effects on the liver, kidneys, and blood.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: NIOSH lists the following tests: complete blood count; anemia; liver function tests. Preplacement physical examination should give special attention to those individuals with a history of allergy, blood dyscrasias, or skin, liver, or kidney disease. Periodic examinations should be directed primarily to the control of dermatitis and allergic reactions, plus any effects on the respiratory tract, eyes, central nervous system; blood, liver, and kidneys.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 7.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 15 mg/m^3:* 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 37.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 75 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 750 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). Emergency or planned entry into unknown concentrations or IDLH conditions: SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Explosive. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers, hydrazine and sources of heat. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Tetryl requires a shipping label of "EXPLOSIVE." It falls in Hazard Class 1.1D and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive solid. If material is on fire and conditions permit, do not extinguish. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Solution in acetone and incineration in furnace equipped with afterburner and caustic soda solution scrubber.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

Thallium malonite:
Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
WGK (German Aquatic Hazard Class): 2—Water polluting (*thallium chlorate, nitrate(I), nitrate(II), and sulfate*).

Description: Thallium is a soft, bluish-white, heavy, very soft metal insoluble in water and organic solvents. It turns gray on exposure to air. Molecular weight = 204.38; Boiling point = 1457°C; Freezing/Melting point = 304°C; Vapor pressure = 1.41×10^{-23} mmHg at 25°C. The nitrate is a colorless, crystalline powder. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in hot water. Thallium(I)carbonate(2:1) has molecular weight = 468.75. Thallium(I)sulfate(2:1) (7446-18-6) is a white or colorless, odorless crystalline solid. Molecular weight = 504.80; Freezing/Melting point = 632°C. Soluble in water. Thallium is usually obtained as a by-product from the flue dust generated during the roasting of pyrite ores in the smelting and refining of lead and zinc.

Potential Exposure: Compound Description: [elemental] Mutagen, Human Data; [thallium(I) carbonate] Mutagen; Reproductive Effector; [sulfate(I)] Agricultural Chemical; Reproductive Effector; Human Data. Thallium has not been produced in the United States since 1984, but is imported for use in the manufacture of electronics, optical lenses, and imitation precious jewels. It also has use in some chemical reactions and medical procedures. Thallium and its compounds are used as a rodenticide* and fungicide; in the manufacture of plates and prisms, high-density liquids; as insecticides, catalysts; in certain organic reactions, in phosphor activators; in bromoiodide crystals for lenses, plates, and prisms in infrared optical instruments; in photoelectric cells; in mineralogical analysis; alloyed with mercury in low-temperature thermometers, switches, and closures; in high-density liquids; in dyes and pigments; in fireworks; and imitation precious jewelry. It forms a stainless alloy with silver and a corrosion-resistant alloy with lead. Its medicinal use for epilation has been almost discontinued. Highly persistent in the environment.

*Thallium was used in the past as a rodenticide, it has been banned in the US due to its toxicity from accidental exposure. In some countries, thallium(I)sulfate(2:1) is still used as a rat poison and ant bait.

Incompatibilities: Varies. Thallium metal reacts violently with strong acids (such as hydrochloric, sulfuric, and nitric) and strong oxidizers (such as chlorine, bromine, and fluorine). Cold thallium ignites on contact with fluorine. Reacts with other halogens at room temperature.

DFG MAK: *soluble compounds:* No numerical value established. Data may be available.

Australia: TWA 0.1 mg/m^3 [skin], 1993; Austria: MAK 0.1 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3 [skin], 1993; Finland: TWA 0.1 mg/m^3 [skin], 1999; France: VME 0.1 mg/m^3, 1999; Norway: TWA 0.1 mg/m^3, 1999; the Netherlands: MAC-TGG 0.1 mg/m^3 [skin], 2003; Poland: MAC (TWA) 0.1 mg[Tl]/m^3; MAC (STEL) 0.3 mg[Tl]/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3 [skin], 1999; Thailand: TWA 0.1 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3 [skin], 1993; United Kingdom: LTEL 0.1 mg/m^3 [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg[Tl]/m^3 [skin]. Several states have set guidelines or standards for thallium soluble compounds in ambient air[60] ranging from 0.238 μg/m^3 (Kansas) to 0.33 μg/m^3 (New York) to 1.0 μg/m^3 (Florida, North Dakota) to 1.6 μg/m^3 (Virginia) to 2.0 μg/m^3 (Connecticut and Nevada) to 2.47 μg/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method (IV) #7300; #7301; #7303; #9102; #8005 (Elements in blood or tissue); OSHA Analytical Method ID-121.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 1400 μg/L on an acute toxicity basis and 40 μg/L on a chronic basis. *To protect saltwater aquatic life:* 2130 μg/L on an acute toxicity basis. For the protection of human health from the toxic properties of thallium ingested through water and contaminated aquatic organisms, the ambient water criterion is 13.0 μg/L.[6] Kansas[61] has set a guideline for thallium in drinking water of 13.0 μg/L. Russia set a MAC in water bodies used for domestic purposes of 0.1 μg/L.

Determination in Water: Digestion followed by atomic absorption measurement gives total thallium. Dissolved thallium may be determined by the same procedure preceded by 0.45 μm filtration. Octanol−water coefficient: Log K_{ow} = (estimated) 0.23.

Routes of Entry: Ingestion and percutaneous absorption of dust, eye/skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Thallium salts may be eye and skin irritants and skin sensitizes. Exposure can cause fatigue, weakness, poor appetite; insomnia and mood changes. Acute poisoning rarely occurs in industry, and is usually due to ingestion of thallium. When it occurs, gastrointestinal symptoms, abdominal colic; loss of kidney function; peripheral neuritis; strabismus, disorientation, convulsions, joint pain; and alopecia develop rapidly. The symptoms of acute thallium poisoning (except for gastrointestinal symptoms) do not become manifest until 12 h to 4 days after exposure. Death is due to damage to the central nervous system. Thallium may affect the peripheral and the central nervous system; liver and kidneys; the gastrointestinal tract; skin (hair) and the cardiovascular system; resulting in polyneuritis; optic nerve atrophy; encephalopathy, cardiac disturbances; liver and kidney damage; alopecia. Exposure may result in death. The nitrate can irritate and burn the skin and eyes. The nitrate can damage the nervous system causing headache, weakness, irritability, pain, "pins and needles" in arms and leg; convulsions, coma, and death. The sulfate(I) irritates the eyes and the skin. May affect the nervous system; cardiovascular system; kidneys and gastrointestinal tract. Exposure may result in death. Exposure may result in hair loss.

Long Term Exposure: Thallium is an extremely toxic and cumulative poison. In nonfatal occupational cases of moderate or long-term exposure, early symptoms usually include fatigue, limb pain; metallic taste in the mouth and loss of hair; although loss of hair is not always present as an early symptom. Later, peripheral neuritis, proteinuria, and joint pains occur. Occasionally, neurological signs are the presenting factor, especially in more severe poisonings. Long-term exposure may produce optic atrophy, paresthesia, and changes in papillary and superficial tendon reflexes (slowed responses). Some thallium compounds are teratogens in animals.

Points of Attack: Eyes, central nervous system; lungs, liver, kidneys, gastrointestinal tract; body hair.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); biologic tissue/biopsy; nerve conduction studies; urine (chemical/metabolite); urinalysis (routine). Preplacement and periodic examinations should give special consideration to the eyes, central nervous system; gastrointestinal symptoms; and liver and kidney function. Hair loss may be a significant sign.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give a slurry of activated charcoal in water to drink and induce vomiting. Do not make an unconscious person vomit. The symptoms of acute thallium poisoning (except for gastrointestinal symptoms) do not become manifest until 12 h to 4 days after exposure.

For severe poisoning BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] has been used to treat toxic symptoms of certain heavy metals poisoning. In the case of thallium it may have SOME value. Although BAL is reported to have a large margin of safety, caution must be exercised, because toxic effects may be caused by excessive dosage. Most can be prevented by premedication with 1-ephedrine sulfate (CAS: 134-72-5).

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA [as thallium (soluble compounds)]: *0.5 mg/m*^{3}*:* Qm (APF = 25), if not present as a fume (any quarter-mask respirator). *1 mg/m*^{3}*:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *2.5 mg/m*^{3}*:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PAPRDM, if not present as a fume (any powered, air-purifying respirator with a dust and mist filter). *5 mg/m*^{3}*:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *15 mg/m*^{3}*:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Thallium must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) and strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur.

Shipping: Thallium compounds n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thallium *metal* may burn, but does not readily ignite. Extinguish fire using an agent suitable for type of surrounding fire. For the *nitrate* use water only; *do not* use chemicals, foam, or carbon dioxide. Poisonous gases produced in fire will vary, including (*sulfide:* thallium and sulfur oxides; *nitrates:* nitrogen oxides and thallium). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dilute thallium solutions may be disposed of in chemical waste landfills. When possible, thallium should be recovered and returned to the suppliers.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R36/38; R52/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Thioacetamide is combustible, crystalline compound with a slight mercaptan odor. Molecular weight = 75.14; Freezing/Melting point = 115°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector. Thioacetamide is used as a replacement for hydrogen sulfide in qualitative analyses. Thioacetamide has been used as an organic solvent in the leather, textile, and paper industries; as an accelerator in the vulcanization of buna rubber; and as a stabilizer of motor fuel.

Incompatibilities: Strong oxidizers; strong acids; strong bases.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.5 mg/m^3

PAC-1: 5 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 125 mg/m^3

United Kingdom: carcinogen, 2000. North Dakota[60] has set a guideline for thioacetamide in ambient air at zero concentration.

Determination in Water: Octanol−water coefficient: Log K_{ow} = low, about −0.40.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact. Absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Skin and eye irritation; conjunctivitis. Irritates the respiratory tract causing coughing. Symptoms of exposure include fatigue, nausea, vomiting, anorexia, liver damage; respiratory depression; central nervous system depression; acidosis, hypotension, tremors, convulsions, and unconsciousness.

Long Term Exposure: May cause liver damage severe enough to cause death. May cause lung damage. May cause dermatitis; eczema. A potential occupational carcinogen.

Points of Attack: Liver, lungs.

Medical Surveillance: Liver function tests. Lung function tests.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water or milk to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Thioacetamide is a potential occupational carcinogen. Toxic solids, organic, n.o.s., requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Use absorbent dampened with 60−70% acetone to pick up remaining material. Wash surfaces well with soap and water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thioacetamide is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including hydrogen sulfide and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Treatment in an incinerator, boiler, or cement kiln.

4,4′-Thiobis(6-*tert*-butyl-*m*-cresol) T:0440

Molecular Formula: $C_{12}H_{18}OS$

Common Formula: $[(CH_3)_3CC_6H_2(OH)(CH_3)_2]S$

Synonyms: Bis-3-*tert*-butyl-4-hydroxy-6-methylphenyl) sulfide; Bis(4-hydroxy-5-*tert*-butyl-2-methylphenyl) sulfide; *m*-Cresol, 4,4′-thiobis(6-*tert*-butyl-); Disperse MB-61; Santonox; Santowhite crystals; Santox; Thioalkofen BM4; 4,4′-Thiobis(3-methyl-6-*tert*-butylphenol); 1,1′-Thiobis(2-methyl-4-hydroxy-5-*tert*-butylbenzene)

CAS Registry Number: 96-69-5

RTECS® Number: GP3150000

EC Number: 202-525-2

Regulatory Authority and Advisory Bodies

Carcinogenicity: NCI: Carcinogenesis Studies (feed); no evidence: mouse, rat.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 4,4′-Thiobis(6-*tert*-butyl-*m*-cresol) is a light gray to tan powder with an aromatic odor. Molecular weight = 358.58; Specific gravity (H_2O:1) = 1.10 at 25°C; Freezing/Melting point = 150°C; Vapor pressure = 6×10^{-7} mmHg at 25°C; Flash point = 207°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility 0.08%.

Potential Exposure: Compound Description: Tumorigen. This material is used as an antioxidant in the plastics and rubber industries; in Neoprene™ and other synthetic rubbers; in polyethylene and polypropylene.

Incompatibilities: None reported. However, it is combustible and may react with strong oxidizers. Many sulfides evolve explosive hydrogen sulfide upon contact with moisture or acids.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3, total dust TWA; 5 mg/m^3, respirable fraction TWA.

NIOSH REL: 10 mg/m^3, total dust TWA; 5 mg/m^3, respirable fraction TWA.

ACGIH TLV®[1]: 10 mg/m^3, total dust TWA, not classifiable as a human carcinogen; *Notice of intended change*: 1 mg/m^3 inhalable fraction TWA.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 300 mg/m^3

PAC-3: 500 mg/m^3

Denmark: TWA 10 mg/m^3, 1999; France: VME 10 mg/m^3, 1999; Switzerland: MAK-W 10 mg/m^3, 1999; United Kingdom: TWA 10 mg/m^3, STEL 20 mg/m^3, 2000; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for this material in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air: Use NIOSH(IV), Particulates NOR: Method #0500, total dust; Method #0600 (respirable).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Although reported to be poisonous, this compound is insignificantly toxic on the basis of acute oral toxicity to rats. However, gastroenteritis, retarded weight gain, and enlarged livers resulted in rat feeding studies.

Long Term Exposure: Repeated or high exposures may cause liver damage.

Points of Attack: Eyes, skin, respiratory system; liver.

Medical Surveillance: Liver function tests.

First Aid: *Skin Contact:*[52] Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures over *10 mg/m*^{3}, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. The spilled material may be dampened with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire, including oxides of sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P045.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R27/28; R50/53; Safety phrases: S1/2; S27; S36/37; S45; S60, 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Thiofanox is a colorless solid with a pungent odor. Molecular weight = 218.35; Freezing/Melting point = 57°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0.

Potential Exposure: Those involved in the manufacture, formulation, and application of this systemic insecticide and acaricide.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 35 mg/m^3

PAC-2: 100 mg/m^3

PAC-3: 100 mg/m^3

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This material is moderately to highly toxic. It is a cholinesterase inhibitor. Symptoms of exposure include nausea, vomiting, abdominal cramps; diarrhea, excessive salivation; sweating, weakness, runny nose; tightness of chest (inhalation exposure); blurred vision; tearing, muscle spasm; loss of eye coordination; ocular pain, extreme dilation of the pupil; loss of muscle coordination; slurring of speech; difficulty in breathing; excessive respiratory tract mucus; skin discoloration; and hypertension. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Blood, eyes, lungs.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate or organophosphate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Eye examination. Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Carbamate pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Stay upwind; keep out of low areas. Ventilate closed spaces before entering. Use water spray, fog or foam. Move container from fire area (only without risk). Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter material. Poisonous gases are produced in fire, including oxides of sulfur and nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: In accordance with 40CFR 165 recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office. Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

PAC-2: 1.25 ppm

PAC-3: 6 ppm

Australia: TWA 1 ppm (4 mg/m^3), 1993; Belgium: TWA 1 ppm (3.8 mg/m^3), 1993; Denmark: TWA 1 ppm (5 mg/m^3), 1999; Finland: TWA 1 ppm (5 mg/m^3), STEL 3 ppm (15 mg/m^3), 1993; France: VME 1 ppm (5 mg/m^3) [skin], 1999; Hungary: TWA 0.5 mg/m^3, STEL 1 mg/m^3, 1993; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Netherlands: MAC-TGG 4 mg/m^3 [skin], 2003; Russia: STEL 0.1 mg/m^3 [skin], 1993; United Kingdom: TWA 1 ppm, 3.8 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1 ppm [skin]. Several states have set guidelines or standards for thioglycolic acid in ambient air[60] ranging from 40 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Octanol−water coefficient: Log K_{ow} = low, <0.1.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive to the eyes, skin, and respiratory tract. Contact can cause eye and skin burns and blisters. It can also cause conjuctival edema and corneal damage. Inhalation can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingesting the liquid may cause chemical pneumonitis. Exposure can cause death. Irritation, blistering, and severe burns of the skin, eyes, and mucous membranes; corrosion of tissues.[52] If ingested, severe burning pain in the mouth, pharynx, and abdomen; vomiting, bloody diarrhea; sharp drop in blood pressure: and asphyxia. If inhaled; coughing, choking, headache, dizziness, weakness, tightness in the chest; air hunger; and cyanosis. In animals: weakness, asping respirations; convulsions.

Long Term Exposure: Repeated contact may cause a skin rash.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, contact a physician, hospital or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. If conscious, do not induce vomiting. For dilute acid, give water, milk, milk of magnesia; A $(OH)_3$, or $Ca(OH)_2$. Avoid carbonates or bicarbonates. For concentrated acid, it may be dangerous to administer water or antacids. Some authorities suggest ice water or a snow slurry. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema or pneumonitis, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thioglycolic acid may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray; or foam extinguishers. Poisonous gases, including sulfur oxides and hydrogen sulfide, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in flammable solvent and burn in furnace equipped with afterburner and alkaline scrubber.

EC Number: 206-049-6 [*Annex I Index No.*: 015-112-00-5]

Regulatory Authority and Advisory Bodies

Very Toxic Substance (World Bank).[15]

US EPA Hazardous Waste Number (RCRA No.): P040.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

European/International Regulations: Hazard Symbol: T+; Risk phrases: R27/28; Safety phrases: S1/2; S36/37/39; S38; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Thionazin is an amber to colorless liquid. Molecular weight = 248.46; Boiling point = 80°C at 0.001 mmHg; Freezing/Melting point = −1.7°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly soluble in water.

Potential Exposure: Those involved in the manufacture, formulation, and application of this insecticide, fungicide, and nematocide.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 0.6 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 3.5 mg/m^3

PAC-3: 3.5 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus pesticides.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact may cause burns to skin and eyes. Poisonous; may be fatal if inhaled, swallowed, or absorbed through skin. Acute effects include loss of appetite; nausea, vomiting, diarrhea, excessive salivation; papillary constriction; bronchoconstriction, muscle twitching; convulsions, and coma. Organic phosphorus insecticides are absorbed by the skin, as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness; blurred vision; nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. May cause dermatitis.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Shampoo hair. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if possible; use water spray to reduce vapors. *Small spill*: take up with sand or other noncombustible absorbent material and place into container for later disposal. *Large spills*: dike far ahead of spill for later disposal. Avoid breathing vapors. Avoid bodily contact with materials. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Extinguish fire using agent suitable for type of surrounding fire. Use water in flooding quantities as fog. Use foam, carbon dioxide; or dry chemicals. Poisonous gases, including oxides of nitrogen, phosphorus, and sulfur, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

OSHA 29CFR1910.119, Appendix A. Process Safety List of Highly Hazardous Chemicals, TQ = 250 lb (114 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R20/22; R29; R35; Safety phrases: S1/2; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Thionyl chloride is a pale yellow to reddish liquid with a suffocating odor like sulfur dioxide. Fumes form when exposed to moist air. Molecular weight = 118.96; Specific gravity (H_2O:1) = 1.64 at 25°C; Boiling point = 79°C (decomposes to SO_2 and S_2Sl_2 at 140°C); Freezing/Melting point = −104°C; Vapor pressure = 100 mmHg at 21°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 0, Reactivity 2₩. Reacts with water.

Potential Exposure: Thionyl chloride is used as specialty chlorinating agent, particularly in preparation of organic acid chlorides; in organic synthesis; as a catalyst.

Incompatibilities: Reacts violently with water to form sulfur dioxide and hydrogen chloride. Keep away from water, acids, alkalis, ammonia, chloryl perchlorate.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.87 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/5 mg/m^3 Ceiling Concentration.

Protective Action Criteria (PAC)*

ACGIH TLV®[1]: 0.2 ppm TWA Ceiling Concentration

TEEL-0: 0.06 ppm

PAC-1: **0.2** ppm

PAC-2: **2.4** ppm

PAC-3: **14** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 1 ppm (5 mg/m^3), 1993; Belgium: STEL 1 ppm (4.9 mg/m^3), 1993; Denmark: TWA 1 ppm (5 mg/m^3, 1999; Switzerland: MAK-W 1 ppm (5 mg/m^3), 1999; United Kingdom: STEL 1 ppm (4.9 mg/m^3), 2000; the Netherlands: MAC 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 1 ppm.

North Dakota[60] has set a guideline for thionyl chloride in ambient air of 50 μg/m^3 (5 mg/m^3).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: A corrosive irritant to the eyes, skin, and mucous membrane. Contact causes eye and skin burns. Can cause dermatitis, rhinitis (inflammation of the nose), and pneumonia. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. This chemical is more toxic than sulfur dioxide.

Long Term Exposure: Highly irritating substances can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs. Consider chest X-ray following acute overexposure.

Medical Surveillance: Lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to medical personnel: Administer oxygen, using intermittent positive-pressure breathing apparatus: 5% solution of sodium bicarbonate may be used, as well as bronchodilators and decongestants.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with thionyl chloride you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from water, acids, alkalis, ammonia, chloryl perchloride. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Cover with sodium bicarbonate or an equal mixture of soda ash and slaked lime. After mixing, spray water from an atomizer with great caution. Transfer slowly into a large container of water. Neutralize and drain into the sewer with sufficient water. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

When spilled on land

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.2/0.3
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 300/100.
Then: Protect persons downwind (miles/kilometers).
Day 0.6/0.9
Night 1.2/1.9

When spilled in water

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.2/0.3
Night 0.9/1.5

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 1000/300.
Then: Protect persons downwind (miles/kilometers).
Day 2.1/3.3
Night 4.7/7.5

Fire Extinguishing: This chemical is a noncombustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Keep water out of open containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Spray on a thick layer of a (1:1) mixture of dry soda ash and slaked lime behind a shield. After mixing, spray water from an atomizer with great precaution. Transfer slowly into a large amount of water. Neutralize and drain into the sewer with sufficient water.

Thiosemicarbazide T:0490

Molecular Formula: CH_5N_3S
Common Formula: $H_2NNHCSNH_2$
Synonyms: AI3-16319; *N*-Aminothiourea; 1-Amino-2-thiourea; 1-Aminothiourea; Aminothiourea; Hydrazinecarbothioamide; Isothiosemicarbazide; Semicarbazide, 3-thio-; Semicarbazide, thio-; Thiocarbamoylhydrazine; Thiocarbamylhydrazine; 2-Thiosemicarbazide; 3-Thiosemicarbazide; Tiosemicarbazida (Spanish); TSC; TSZ
CAS Registry Number: 79-19-6
RTECS® Number: VT4200000
UN/NA & ERG Number: UN2771/151
EC Number: 201-184-7

Regulatory Authority and Advisory Bodies

US EPA Hazardous Waste Number (RCRA No.): P116.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Thiosemicarbazide is an odorless, white crystalline powder. Molecular weight = 91.15; Freezing/Melting point = 180−184°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: This compound is used as an intermediate for pharmaceuticals and herbicides; as a reagent for ketones and certain metals; in certain photography and dye operations; as a rodenticide. It is also effective for control of bacterial leaf blight of rice.

Incompatibilities: None listed, but may react with nitrates.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.5 mg/m^3
PAC-1: 5 mg/m^3
PAC-2: 9.2 mg/m^3
PAC-3: 9.2 mg/m^3

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.67$. See Feigel, *Spot Tests in Organic Analysis*, Elsevier Publishing Company, New York.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: This material is highly toxic by ingestion. May cause delayed toxic effects in blood and skin. May be mutagenic in human cells. Thiosemicarbazide may induce goiter and has also been reported to cause bone marrow depression with accompanying decreases in white blood cells and platelets. It may also cause skin irritation.

Long Term Exposure: May cause delayed toxic effects in blood and skin. May be mutagenic in human cells. May be a cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure.

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving carbamate pesticides (or organophosphates) is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Thiosemicarbazide, pesticides, solid, toxic, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Avoid skin contact, ingestion, or inhalation. Do not touch spilled material; stop leak if you can do it without risk. *Small spills:* take up with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Remove all ignition sources. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing
Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Thiotepa T:0500

Molecular Formula: $C_6H_{12}N_3PS$
Synonyms: 1,1′,1″-Phosphinothioylidynetrisaziridine; Phosphorothioic acid triethylenetriamide; SK 6882; Tespamine; Thiofozil; Thiophosphamide; Thio-TEP; Tiofosfamid; Tiofozil; Triaziridinylphosphine sulfide; *N*,*N*′, *N*″-Tri-1,2-ethanediylphosphorothioic triamide; *N*,*N*′,*N*″-Tri-1,2-ethanediylthiophosphoramide; Tri(ethyleneimino) thiophosphoramide; *N*,*N*′,*N*″-Triethylenephosphorothioic triamide; *N*,*N*′,*N*″-Triethylenethiophosphamide; *N*,*N*′,*N*″-Triethylen-ethiophosphoramide; Triethylenethiophosphorotriamide; Tris(1-aziridinyl)phosphine sulfide; Tris(ethylenimino)thiophosphate
CAS Registry Number: 52-24-4
RTECS® Number: SZ2975000
UN/NA & ERG Number: UN3249 (Medicines, toxic, solid, n.o.s.)/151
EC Number: 200-135-7
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Human Sufficient Evidence, 1978; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1, 1997; NTP: Reasonably anticipated to be a human carcinogen; NCI: Carcinogenesis Studies (ipr); clear evidence: mouse, rat.
Banned or Severely Restricted (In Household Products) (Japan).[13]
California Proposition 65 Chemical: Cancer 1/1/88.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Thiotepa is a crystalline substance. Molecular weight = 189.24; Freezing/Melting point = 51.5°C. Insoluble in water.
Potential Exposure: Thiotepa has been prescribed for a wide variety of neoplastic diseases (adenocarcinomas of the breast and the ovary; superficial carcinoma of the urinary bladder; controlling intracavitary or localized neoplastic disease; lymphomas, such as lymphosarcomas and Hodgkin's disease; as well as bronchogenic carcinoma). It is now largely superseded by other treatments.
Permissible Exposure Limits in Air
No standards or TEEL available.
Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.
Harmful Effects and Symptoms
Long Term Exposure: Tris(1-aziridinyl)phosphine sulfide (Thiotepa) is carcinogenic in mice and rats after administration by various routes, producing a variety of malignant tumors. There are several reports and epidemiological studies suggesting the development of acute nonlymphocytic leukemia in patients treated with thiotepa for ovarian and other malignant tumors.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers.

Shipping: Medicine, solid, toxic, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." This material falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including oxides of nitrogen, sulfur, and phosphorus. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

California Proposition 65 Chemical: Cancer 1/1/88.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R40; R51/53; Safety phrases: S2; S36/37; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Thiourea consists of colorless, lustrous crystals or powder with a bitter taste. Molecular weight = 76.13; Boiling point = decomposes below BP; Freezing/Melting point = 180−182°C; Flash point = 55°C. Partially soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Thiourea is used as rubber antiozonant, toning agent; corrosion inhibitor; and in pharmaceutical manufacture; in the manufacture of photosensitive papers; flame-retardant textile sizes; boiler water treatment. It is also used in photography; pesticide manufacture; in textile chemicals.

Incompatibilities: Reacts violently with acrolein, strong acids (nitric acid), and strong oxidants.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 1.25 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 125 mg/m^3

DFG MAK: [skin] Danger of skin sensitization; danger of photo-contact sensitization; Carcinogen Category 3B.

Austria Suspected: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Russia: STEL 0.3 mg/m^3, 1993; Sweden: carcinogen, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3 [skin], 2003. Several states have set guidelines or standards for thiourea in ambient air[60] ranging from zero (North Dakota) to 0.03 μg/m^3 (New York).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -2.38/-0.95$.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes. Thiourea may affect you when breathed in. A related chemical (naphthylthiourea) in higher exposures can cause fluid in the lungs, a medical emergency. It is not known if thiourea has this effect.

Long Term Exposure: Repeated exposure can cause goiter (enlarged thyroid gland). Exposure may damage the bone marrow, causing reduced red blood cells; white blood cells and platelets (reduced blood clotting ability). Thiourea has been identified as a sensitizer in people suffering from photosensitivity. A possible human carcinogen.

Points of Attack: Thyroid gland, blood, skin. Cancer site in animals: thyroid, liver.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended. Lung function tests. Complete blood count. Consider thyroid test for thyroxin. If symptoms develop or overexposure is suspected, the following may be useful. Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with has head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: At any exposure level, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Thiourea must be stored to avoid contact with acrolein, hydrogen peroxide; and nitric acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Toxic solids, organic, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire, including nitrogen and sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant

(≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

US EPA Hazardous Waste Number (RCRA No.): U244.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)] (as dustable powder formulations containing a combination of: Benomyl at or >7%; carbofuran at or >10%; thiram at or >15%).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R20/22; R36/38; R43; R48/22; R50/53; Safety phrases: S2; S26; S36/37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Thiram is a colorless to yellow, crystalline solid (which is sometimes dyed blue) with a characteristic odor. Commercial pesticide products may be dyed blue. Molecular weight = 240.44; Boiling point = 129°C; Freezing/Melting point = 156°C; Flash point = 148°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Human Data; Hormone, Primary Irritant. Some thiurams have been used as rubber components: thiram is used as a rubber accelerator and vulcanizer; a seed, nut, fruit, and mushroom disinfectant; a bacteriostat for edible oils and fats; and as an ingredient in suntan and antiseptic sprays and soaps. It is also used as a fungicide, rodent repellent; wood preservative; and may be used in the blending of lubricant oils.

Incompatibilities: Strong oxidizers; strong acids; oxidizable materials.

Permissible Exposure Limits in Air

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 5 mg/m^3 TWA.
ACGIH TLV®[1]: 0.05 mg/m^3, measured as inhalable fraction and vapor TWA; not classifiable as a human carcinogen.
NIOSH IDLH: 100 mg/m^3.
Protective Action Criteria (PAC)
TEEL-0: 0.05 mg/m^3
PAC-1: 10 mg/m^3
PAC-2: 75 mg/m^3
PAC-3: 100 mg/m^3
DFG MAK: MAK: 1 mg/m^3, inhalable fraction TWA; Peak Limitation Category II(2); danger of skin sensitization; Pregnancy Risk Group C.
Australia: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 1 mg/m^3, 1999; Finland: TWA 5 mg/m^3, STEL 10 mg/m^3 [skin], 1999; France: VME 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; the Philippines: TWA 5 mg/m^3, 1993; Poland: MAC (TWA) 0.5 mg/m^3; MAC (STEL) 2 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3 [skin], 1993; Sweden: TWA 1 mg/m^3, STEL 2 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, STEL 25 mg/m^3, 1999; Thailand: TWA 5 mg/m^3, 1993; Turkey: TWA 5 mg/m^3, 1993; United Kingdom: TWA 5 mg/m^3, STEL 10 mg/m^3 2000 Occupational Exposure Limit; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[35, 43] has set MAC values for ambient air in residential areas of 0.01 mg/m^3 on a momentary basis and 0.006 mg/m^3 on a daily average basis. Several states have set guidelines or standards for Thiram in ambient air[60] ranging from 50 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5005, Thiram.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 1.0 μg/L. Further, it set a MAC in water bodies used for fishery purposes of zero. The state of Maine[61] has set a guideline for thiram in drinking water of 10 μg/L.

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Skin irritation can lead to rash, and allergy. High exposures can cause kidney and liver damage. Brain and nerve damage can also occur. Inhalation can cause irritation of the respiratory tract with stuffy nose; nosebleeds, hoarseness, cough, and/or phlegm. *Inhalation:* Animal studies indicate that irritation of the nose and throat may occur at levels above 5 mg/m^3. *Skin:* Exposure to spray containing 45% Thiram resulted in irritation and skin sensitization. *Eyes:* May cause irritation, tearing, and sensitivity to light. *Ingestion:* No information available on human exposure. In animal studies, 38 ppm in food caused nausea, vomiting, diarrhea, hyperexcitability, weakness, and loss of muscle control. Death may occur from ingestion of approximately one teaspoonful.

Note: Can cause extreme illness when exposure is combined with alcohol ingestion.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization. Prolonged contact has caused eye irritation; tearing, increased sensitivity to light; reduced night vision and blurred vision. Occupational exposures to 0.03 mg/m^3 over a 5-year period has caused mild irritation of the nose and throat. Whether it has this effect in humans is not known. May affect the thyroid and liver. Thiram has caused birth defects in laboratory animals and has been shown to be a teratogen in animals.

Points of Attack: Eyes, skin, respiratory system; central nervous system.

Medical Surveillance: Preplacement and periodic medical examinations should give special attention to history of skin allergy, eye irritation; and significant respiratory, liver, or kidney disease. Workers should be aware of the potentiating action of alcoholic beverages when working with tetramethylthiuram disulfide.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *50 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator equipped with an organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *100 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or

GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprOvHie (APF = 25) (any powered, air-purifying respirator with an organic vapor cartridge in combination with a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool place away from strong oxidizers; strong acids; oxidizable materials.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Cover the spill with weak solution of calcium hypochlorite (up to 15%). Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including sulfur dioxide, carbon disulfide, and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Thiram can be dissolved in alcohol or other flammable solvent and burned in an incinerator with an afterburner and scrubber.

Carcinogenicity: IARC: Human Sufficient Evidence [diagnostic injection of thorium-232 as stabilized thorium-232 dioxide in colloidal form (Thorotrast)]; Humans Inadequate Evidence (inhalation thorium-232), generally in Group, 2001; RTECS: (thorium dioxide).[9]

Thorium dioxide:
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
California Proposition 65 Chemical: Cancer 2/27/87.
European/International Regulations: Not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned (all CAS numbers shown above).

Description: Thorium is a silvery-white, soft, ductile metal which is a natural radioactive element. Atomic weight = 232.00; Freezing/Melting point = 1750±30°C. Insoluble in water. It occurs in the minerals monazite, thorite, and thorinite; usually mixed with its disintegration products. Thorium chloride is a crystalline solid. Molecular weight = 373.80; Boiling point = 927.5°C; Freezing/Melting point = 770°C. Soluble in water; Thorium nitrate, $Th(NO_3)_4$ is a crystalline solid which decomposes at 500°C. Thorium oxide, ThO_2 is a white crystalline powder or solid. Molecular weight = 264.00; Boiling point = 4400°C; Freezing/Melting point = 3320°C. Insoluble in water.

Potential Exposure: *Metallic thorium* is used in nuclear reactors to produce nuclear fuel; in the manufacture of incandescent mantles; as an alloying material, especially with some of the lighter metals, e.g., magnesium as a reducing agent in metallurgy; for filament coatings in incandescent lamps and vacuum tubes; as a catalyst in organic synthesis; in ceramics; and in welding electrodes. Exposure may occur during production and use of thorium-containing materials, in the casting and machining of alloy parts; and from the fume produced during welding with thorium electrodes.

Thorium nitrate is an oxidizer. Contact with combustibles and reducing agents will cause violent combustion or ignition.

Incompatibilities: *Metal:* The powder may ignite spontaneously in air. Heating may cause violent combustion or explosion. May explosively decompose from shock, friction, or concussion. Potentially hazardous reactions with strong oxidizers, chlorine, fluorine, bromine, oxygen; phosphorus, nitryl fluoride; peroxyformic acid; silver, sulfur.

North Dakota[60] has set a guideline for ambient air of zero for thorium dioxide.

Routes of Entry
Ingestion of liquid, inhalation of dust or gas, and percutaneous absorption.

Harmful Effects and Symptoms
Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Inhalation may cause damage to the bone marrow and lungs. May affect the blood-forming system, reducing the ability to produce white blood cells, resulting in pernicious anemia.

Long Term Exposure: Gas and aerosols can penetrate the body by way of the respiratory system, the digestive system, and the skin. Only 0.001% of an ingested dose is retained in the body. Thorium, once deposited in the body, remains in the bones, lymph system; lungs and other body organs; and parenchymatous tissues for long periods of time. Low repeated exposures may scar the lungs, and damage the liver and kidneys. Characteristic effects of the activity of thorium and its disintegration products are changes in blood-forming, nervous and reticuloendothelial systems; and functional and morphological damage to lung and bone tissue. Only much later do illness and symptoms characteristic of chronic radiation disease appear. After a considerable time, neoplasms may occur and the immunological activity of the body may be reduced. Repeated or prolonged contact with skin may cause dermatitis. A potential occupational carcinogen. May cause heritable genetic damage. May cause birth defects.

Points of Attack: Bone marrow, lungs. Liver, kidneys, lungs. Cancer site in humans (thorium dioxide): liver.

Medical Surveillance: Monitoring of personnel for early symptoms and changes, such as abnormal leukocytes in the blood smear, may be of value. In cases of chronic or acute exposure, the determination of thorium in the urine or the use of whole body radiation counts and breath radon are useful methods of monitoring the exposure dose and excretion rates. White blood cell count. Lung function test. Consider periodic chest X-ray for persons with potentially high or repeated lower exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposure to thorium nitrate, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered, air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Radioactive. Color Code—Yellow Stripe: Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Thorium nitrate must be stored to avoid contact with combustible, organic, or other readily oxidizable materials, since violent reactions occur.

Shipping: Thorium metal, pyrophoric, requires a shipping label of "RADIOACTIVE, SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 7. Thorium nitrate, solid, requires a shipping label of "RADIOACTIVE, OXIDIZER." It falls in Hazard Class 7.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Thorium dioxide may burn, but does not readily ignite. Thorium nitrate can cause violent combustion or ignition when in contact with readily combustible substances. On thorium nitrate, use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides in thorium nitrate. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery and recycling is in the preferred route.

Tin & inorganic compounds T:0530

Molecular Formula: Sn

Synonyms: Alloy 510; Alloy 511; Alloy 521; Alloy 725; Estano (Spanish); Metallic tin; Prepared bath 2137; Tin, elemental; Tin flake; Tin metal; Tin powder; Zinn (German)

Other tin inorganic compounds for reference: Tin fluoroborate (B_2F_8Sn) (13814-97-6); Tin hydroxide (H_2O_2Sn) (12026-24-3); Tin nitrate (41480-79-9); Tin nitrite (100737-27-7); Tin(II) chloride dihydrate ($C_{12}H_4O_2Sn$) (10025-69-1); Tin(II) oxide (1332-29-2); Tin(IV) oxide (O_2Sn) (18282-10-5); Stannic tetrachloride ($C_{14}Sn$); (7646-78-8); Stannous chloride (Cl_2Sn) (7772-99-8)

CAS Registry Number: 7440-31-5 (metal); 18282-10-5 [Tin(IV) oxide]; 21651-19-4 (oxide)

RTECS® Number: XP7320000 (elemental)

UN/NA & ERG Number: No citation.

EC Number: 231-141-8

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, tin, elemental and tin compounds, n.o.s.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent (metal, oxide).

Description: Tin is a gray to almost silver-white, ductile, malleable, lustrous metal. Specific gravity (H_2O:1) = 7.28 at 25°C; Molecular weight = 118.69; Boiling point = 2625°C; Melting point = 232°C. Ignition temperature of dust cloud = 630°C; Minimum Explosive concentration = 0.19 oz/ft^3.[USBM] Relative explosion hazard of dust: Moderate (due to oxide coating). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 1. Insoluble in water. The primary commercial source of tin is cassiterite (SnO_2, tinstone).

Potential Exposure: Compound Description: Tumorigen; Human Data. The most important use of tin is as a protective coating for other metals, such as in the food and beverage canning industry; in roofing tiles; silverware, coated wire; household utensils; electronic components; and pistons. Common tin alloys are phosphor bronze; light brass; gun metal; high tensile brass; manganese bronze; die-casting alloys; bearing metals; type metal; and pewter. These are used as soft solders, fillers in automobile bodies; and as coatings for hydraulic brake parts; aircraft landing gear and engine parts. Metallic tin is used in the manufacture of collapsible tubes and foil for packaging. Exposures to tin may occur in mining, smelting, and refining; and in the production and use of tin alloys and solders. Inorganic tin compounds are important industrially in the production of ceramics; porcelain, enamel, glass; and inks; in the production of fungicides; anthelmintics, insecticides; as a stabilizer it is used in polyvinyl plastics and chlorinated rubber paints; and it is used in plating baths.

Incompatibilities: Tin is a reducing agent; keep away from strong oxidizers; turpentine, acids, bases, alkalis. Powder quickly corrodes in air, especially if moist.

Permissible Exposure Limits in Air

Metal

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Element; #7301; #7303; OSHA Analytical Method ID-121; ID-206.

Routes of Entry: Inhalation of dust, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Dust irritates the eyes, skin, and respiratory tract. Tin may be contaminated with toxic lead or arsenic, causing exposure to these chemicals from dust or fumes. Inorganic tin salts are irritants to the skin and mucous membranes; they may be strongly acidic or basic depending on the cation or anion present. In animals: vomiting, diarrhea, paralysis with muscle twitching.

Long Term Exposure: Exposure to dust or fumes of inorganic tin is known to cause a benign pneumoconiosis (stannosis). Tin or dust fumes can cause "spots" to appear on chest X-ray and may represent reduced lung function. This form of pneumoconiosis produces distinctive progressive X-ray changes of the lungs as long as exposure persists, but there is no distinctive fibrosis; no evidence of disability; and no special complicating factors. Because tin is so radio-opaque, early diagnosis is possible. Fumes can also cause chronic cough and may cause reduced lung function. Tin may interfere with the body's ability to absorb iron from food or vitamin pills, contributing to iron-deficiency anemia.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Chest X-ray; urine (chemical/metabolite). Also, see NIOSH Analytical Method #8310, Metals in urine.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA: *Up to 10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 100 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Powdered tin is a moderate explosion risk. Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Color Code—Green (*tin metal*): General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Tin must be stored to avoid contact with chlorine, bromine, bromine trifluoride; chlorine monofluoride; copper nitrate; turpentine, and potassium dioxide, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where tin is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tin dust may be a fire hazard. Toxic metal fumes may be produced in a fire. Use dry chemicals appropriate for extinguishing metal fires. *Do not use water*. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Banned or Severely Restricted (Japan) (UN).[13]

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*900-95-8; fentin acetate* and *76-87-9; fentin hydroxide*): European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24/25; R26; R37/38; R40; R41; R48/23; R63; R50/53; Safety phrases: S1/2; S26; S28; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*fentin acetate; fentin hydroxide; Triphenyltin chloride; Trimethyltin chloride*).

Description: $Sn(R)_{4-x}$ $(\text{radical})_x$. A typical compound is triphenyltin hydroxide, $C_{18}H_{16}OSn$, which is a white powder; Freezing/Melting point = 122°C. Slightly soluble in water.

Potential Exposure: Organotin compounds are used as additives in a variety of products and processes. Diorganotins find application as heat stabilizers in plastics, as catalysts in the production of urethane foams; in the cold curing of rubber; and as scavengers for halogen acids. Tri- and tetraorganotins are used as preservatives for wood, leather, paper, paints, and textiles; and as biocides.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Sn]/m^3 TWA (*Note*: The PEL applies to all organic tin compounds).

NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin] (*Note:* The REL applies to all organic tin compounds, except Cyhexatin).

ACGIH TLV®[1]: 0.1 mg[Sn]/m^3 TWA; 0.2 mg[Sn]/m^3 STEL [skin].

NIOSH IDLH: 25 mg[Sn]/m^3.

DFG MAK: 0.1 mg[Sn]/m^3; inhalable fraction TWA; Peak Limitation Category II(2); [skin]; Pregnancy Risk Group D.

Cyhexatin

Australia: TWA 0.1 mg[Sn]/m^3 [skin], 1993; Austria: MAK 0.1 mg[Sn]/m^3 [skin], 1999; Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 0.1 mg[Sn]/m^3 [skin], 1999; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 0.1 mg[Sn]/m^3; STEL 0.3 mg[Sn]/m^3, 1999; France: VME 5 mg/m^3, 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Hungary: STEL 0.1 mg[Sn]/m^3 [skin], 1993; Norway: TWA 0.1 mg[Sn]/m^3, 1999; the Philippines: TWA 0.1 mg[Sn]/m^3, 1993; Russia: STEL 0.02 mg/m^3 [skin], 1993; Switzerland: MAK-W 0.1 mg [Sn]/m^3, KZG-W 0.2 mg[Sn]/m^3 [skin], 1999; Thailand: TWA 0.1 mg[Sn]/m^3, 1993; United Kingdom: TWA 5 mg/m^3; STEL 10 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Phenyltin compounds

DFG MAK: 0.002 mg[Sn]/m^3; inhalable fraction TWA; Peak Limitation Category II(2); Pregnancy Risk Group C.

Determination in Air: Use NIOSH Analytical Method (IV) #5504, Organotin.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 1.4 μg/L based on health effects.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Organic tin compounds, especially tributyl and dibutyl compounds, may cause acute burns to the skin. The burns produce little pain but may itch. They heal without scarring. Clothing contaminated by vapors or liquids may cause subacute lesions and diffuse erythermatoid dermatitis on the lower abdomen, thighs, and groin of workmen who handle these compounds. The lesions heal rapidly on removal from contact. The eyes are rarely involved, but accidental splashing with tributyltin has caused lacrimation and conjunctival edema which lasted several days; there was no permanent injury. Triphenyltin hydroxide has been subjected to a carcinogenesis bioassay by NCL and found to be not carcinogenic. Certain organic tin compounds, especially alkyltin compounds, are highly toxic when ingested. The trialkyl and tetraalkyl compounds cause damage to the central nervous system with symptoms of headaches, dizziness, photophobia, vomiting, and urinary retention; some weakness and flaccid paralysis of the limbs in the most severe cases. Percutaneous absorption of these compounds has been postulated, but to date, deaths and serious injury have resulted only from ill-advised attempts at therapeutic use by mouth. The mechanism of action of the organotins is not clearly understood, although triethyltin is an extremely potent inhibitor of oxidative phosphorylation. Occasionally, mild organotin intoxication is seen in chemical laboratories with headache, nausea, and EEG changes. Symptoms also include sore throat and cough, abdominal pain; skin burns and itching.

Points of Attack: Central nervous system; eyes, liver, urinary tract, skin, blood.

Medical Surveillance: NIOSH lists the following tests: complete blood count [RBC hemolysis; electrocardiogram, especially on workers over 40 years; glaucoma, liver function tests; urine (chemical/metabolite)]. For organotins, preplacement and periodic examinations should include the skin, eyes, blood, central nervous system; liver and kidney function.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: It is important that employees be trained in the correct use of personal protective equipment. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Depending on physical properties, wear splash or dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Skin contact should be prevented by protective clothing, and, especially in the case of organic tin compounds, clean work clothes should be supplied daily and the worker required to shower following the shift and prior to change to street clothes.

Respirator Selection: *(organotin) Up to 1 mg/m^3:* CcrOvDM [any chemical cartridge respirator with organic vapor cartridge(s) in combination with a dust and mist filter]; or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter]; or GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s) in combination with a high-efficiency particulate filter]; or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 25 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage.

Shipping: Organotin compounds, liquid, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." Hazard Class 6.1 and Packing Group II.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up

spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Dry material:* This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or alcohol foam extinguishers. Poisonous gases are produced in fire, including tin. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Australia: TWA 2 mg[Sn]/m^3, 1993; Austria: MAK 2 mg/m^3, 1999; Belgium: TWA 2 mg[Sn]/m^3, 1993; Denmark: TWA 2 mg[Sn]/m^3, 1999; Finland: TWA 2 mg[Sn]/m^3, 1999; Hungary: TWA 1 mg[Sn]/m^3; STEL 2 mg[Sn]/m^3 [skin], 1993; Norway: TWA 2 mg[Sn]/m^3, 1999; the Philippines: TWA 2 mg[Sn]/m^3, 1993; Poland: TWA 2 mg [Sn]/m^3, 1999; Switzerland: MAK-W 2 mg[Sn]/m^3, KZG-W 4 mg[Sn]/m^3, 1999; Thailand: TWA 2 mg[Sn]/m^3, 1993; United Kingdom: TWA 2 mg[Sn]/m^3; STEL 4 mg[Sn]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 mg[Sn]/m^3.

Determination in Air: Filter; Acid; Inductively coupled plasma; NIOSH Analytical Method (IV) #7300, Element.

Routes of Entry: Inhalation, eyes, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Tin tetrachloride can affect you when breathed in. Tin tetrachloride is a corrosive chemical and eye or skin contact can cause severe burns. Breathing tin tetrachloride can irritate the throat and bronchial tubes, causing cough, and/or difficulty breathing. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: May affect the nervous system. May cause lung irritation; bronchitis may develop. Changes may occur on chest X-ray with repeated exposures.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys, urinary tract; blood.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite). Chest X-ray; urine (chemical/metabolite). Also, see NIOSH Analytical Method #8310, Metals in urine. Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Hemoglobin or hematocrit.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA: *Up to 10 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 20 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa* (APF = 10) (any supplied-air respirator). *Up to 50 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25)* (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 100 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter; or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SAF; PD,PP: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Tin tetrachloride must be stored to avoid contact with water, alcohols, amines, chlorine, turpentine, ethylene oxide; alkyl nitrates; potassium and sodium, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable and combustible materials. Keep tin tetrachloride dry and out of direct sunlight. If moisture enters containers, pressure may cause the containers to burst. Tin tetrachloride can attack some plastics, rubbers, and coatings.

Shipping: This compound requires a shipping label of “CORROSIVE.” It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tin tetrachloride does not burn, but it does react violently with water. *Do not use water*. Use dry chemical or carbon dioxide extinguishers to extinguish surrounding fire. Poisonous gases, including hydrogen chloride, chlorine, and tin oxides, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers, but do not get water inside containers or on spilled tin tetrachloride as poisonous gases will be formed. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: $SnCl_4$: Pour onto sodium bicarbonate; spray with ammonium hydroxide while adding crushed ice; when reaction subsides, flush down drain.

EC Number: 231-142-3

Regulatory Authority and Advisory Bodies

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Titanium is a silvery metal or dry, dark-gray amorphous, lustrous powder. Molecular weight = 47.90; Boiling point = 3260°C; Freezing/Melting point = 1675°C; Autoignition temperature = 1200°C (solid); 480°C (powder in air). Hazard Identification (based on NFPA-704 M Rating System) (powder): Health 1, Flammability 3, Reactivity 1; (solid metal) Health 1, Flammability 0, Reactivity 0. It is brittle when cold and malleable when hot. The dry powder is easily ignited, and burns with an intense flame. Ignition temperature of dust cloud = 460°C; Minimum Explosive concentration = 0.45 oz/ft^3.[USBM] Relative explosion hazard of dust: Severe. Insoluble in water. The most important minerals containing titanium are ilmenite, rutile, perovskite, and titanite or sphene. Insoluble in water.

Potential Exposure: Titanium metal, because of its low weight, high strength, and heat resistance, is used in the aerospace and aircraft industry as tubing, fittings, fire walls; cowlings, skin sections; jet compressors; and it is also used in surgical appliances. It is also used as control-wire casings in nuclear reactors, as a protective coating for mixers in the pulp-paper industry, and in other situations in which protection against chlorides or acids is required; in vacuum lamp bulbs and X-ray tubes; as an addition to carbon and tungsten in electrodes and lamp filaments; and to the powder in the pyrotechnics industry. It forms alloys with iron, aluminum, tin, and vanadium, of which ferrotitanium is especially important in the steel industry. Other titanium compounds are utilized in smoke screens, as mordants in dyeing; in the manufacture of cemented metal carbides; as thermal insulators; and in heat-resistant surface coatings in paints and plastics.

Incompatibilities: Dust may ignite spontaneously in air. Violent reactions occur on contact with water, steam, halocarbons, halogens, and aluminum. The dry powder is a strong reducing agent; violent reaction with strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

Metal

TEEL-0: 0.6 mg/m^3

PAC-1: 2 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 60 mg/m^3

Titanium compounds including titanium carbide

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 250 mg/m^3

Determination in Air: Filter; Acid; Hydride generation atomic absorption spectrometry; NIOSH Analytical Method (IV) #7900. See also #7300, Elements.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal for titanium compounds (as Ti) of 83 μg/L, based on health effects.

Routes of Entry: Inhalation of dust or fume, eyes.

Harmful Effects and Symptoms

Short Term Exposure: Titanium can affect you when breathed in. Contact may irritate the eyes. Breathing titanium may irritate the throat and air passages with cough and phlegm.

Long Term Exposure: Repeated exposure may cause chronic bronchitis and possibly emphysema. There is limited evidence that titanium may damage the developing fetus.

Points of Attack: Lungs.

Medical Surveillance: Preemployment and periodic physical examinations should give special attention to lung disease, especially if irritant compounds are involved. Chest X-ray should be included in both examinations and pulmonary function evaluated periodically. Smoking history should be taken. Careful attention should be given to the eyes and the skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the

skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to titanium, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (Dust/fume/mist) filters. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered, air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Titanium powder is a severe explosion risk. (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Titanium must be stored to avoid contact with water, steam, halocarbons, halogens, and aluminum, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where titanium is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only non-sparking tools and equipment, especially when opening and closing containers of titanium. Wherever titanium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Titanium powders require a shipping label of "SPONTANEOUSLY COMBUSTIBLE." They fall in Hazard Class 4.2 and Packing Group III. Titanium powder, wetted [with not $<25\%$ water (a visible excess of water must be present) (a) mechanically produced, particle size $<53\,\mu m$; (b) chemically produced, particle size <840 microns require a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Use HEPA vacuum or wet method to reduce dust during cleanup. Do not dry sweep. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Titanium is a flammable solid; dust and powders are an explosion hazard. *Do not use water* on burning titanium; this can cause explosion. Ordinary extinguishers are often ineffective. Use special extinguishers designed for metal fires. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B; NCI: Carcinogenesis Bioassay (feed); no evidence: mouse, rat; NIOSH: Potential occupational carcinogen.

US EPA Gene-Tox Program, Negative: Carcinogenicity—mouse/rat; Cell transform.—SA7/SHE.

FDA—over-the-counter drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Titanium dioxide is an odorless white powder. Molecular weight = 79.90; Specific gravity (H_2O:1) = 4.26 at 25°C; Boiling point = 2500−3000°C; Freezing/Melting point = 1830−1850°C (decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Titanium dioxide is a white pigment used as a pigment in paint; in the rubber, plastics, ceramics, paint, and varnish industries, in dermatological preparations; and is used as a starting material for other titanium compounds; as a gem; in curing concrete; and in coatings for welding rods. It is also used in paper and cardboard manufacture.

Incompatibilities: Strong acids.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3, total dust TWA.

NIOSH REL: Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 mg/m^3 TWA, not classifiable as a human carcinogen.

NIOSH IDLH: 5000 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 15 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 50 mg/m^3

PAC-3: 500 mg/m^3

DFG MAK: 1.5 mg/m^3, respirable fraction (previously "fine dust"); Pregnancy Risk Group C.

Arab Republic of Egypt: TWA 15 mg/m^3, 1993; Australia: TWA 10 mg/m^3, 1993; Austria: MAK 6 mg/m^3, 1999; Belgium: TWA 10 mg/m^3, 1993; Denmark: TWA 6mg[Ti]/m^3, 1999; France: VME 10 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; Poland: MAC (TWA) 10mg[Ti]/m^3; MAC (STEL) 30mg[Ti]/m^3, 1999; Sweden: NGV 5 mg/m^3, 1999; Turkey: TWA 15 mg/m^3, 1993; United Kingdom: TWA 10 mg/m^3 (total inhalable dust); TWA 4 mg/m^3 (respirable dust), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia have set limits for ambient air in residential areas at 0.5 mg/m^3 on a momentary basis. Several states have set guidelines or standards for titanium dioxide in ambient air[60] ranging from 0.13−0.79 μg/m^3 (Montana) to 17.86 μg/m^3 (Kansas) to 80.0 μg/m^3 (Virginia) to 300.0 μg/m^3 (Connecticut).

Determination in Air: Use NIOSH II(3), Method #S385; #7300, Elements by ICP.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal for titanium compounds (as Ti) of 83 μg/L, based on health effects.

Routes of Entry: Inhalation of dust.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause irritation of the eyes and respiratory tract, causing cough and phlegm. Irritates the skin.

Long Term Exposure: High exposures may cause lung irritation; bronchitis may develop. Continued exposure may result in emphysema, lung scarring; lung fibrosis; and tumors. A potential occupational carcinogen.

Points of Attack: Respiratory system. Cancer site in animals: lung tumors.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Store in tightly closed containers in a cool, well-ventilated area away from strong acids and other metals. Where possible, automatically transfer material from other storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use any extinguishing agent suitable for surrounding fires. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Landfill.

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 2500 (1.00% concentration); *Theft hazard* 45 (≥13.33% concentration); Sabotage/Contamination Hazard: A placarded amount (commercial grade).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 2500 lb (1135 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C; Risk phrases: R14; R34; Safety phrases: S1/2; S7/8; S26; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Titanium tetrachloride is a noncombustible, colorless to light yellow liquid with a penetrating acrid odor. Molecular weight = 189.70; Boiling point = 136°C; Freezing/Melting point = −24°C. Reacts with water. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1₩. Decomposes in water.

Potential Exposure: Used in the manufacture of titanium salts; mordant dye; titanium pigments; and used as a chemical intermediate for titanium metal; titanium dioxide; as an agent in smoke screens; polymerization catalyst; and iridescent agent in glass and pearl manufacturing.

Incompatibilities: Violent reaction with water or steam, releasing heat and hydrogen chloride fumes. Contact with moist air releases hydrogen chloride. Attacks many metals in presence of moisture.

Permissible Exposure Limits in Air

AIHA WEEL: 0.5 mg/m^3 TWA.

Protective Action Criteria (PAC)*

TEEL-0: 0.645 ppm

PAC-1: 0.645 ppm

PAC-2: **1.0** ppm

PAC-3: **5.7** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: This compound is a highly corrosive, acute irritant to the skin, eyes, mucous membranes and the respiratory tract. It is capable of causing death or permanent injury due to exposures encountered in normal use. Even short contact may lead to eye inflammation which may result in corneal opacities. Inhalation symptoms include congestion and irritation of upper respiratory tract, coughing, burning of the throat; headache and weakness. Prolonged exposure to low concentrations may cause cough and pneumonia. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Ingestion causes mouth, throat, and GI tract irritation, nausea, vomiting, cramps, and diarrhea.

Long Term Exposure: May cause respiratory problems; lung damage; bronchitis may develop.

Points of Attack: Respiratory system, eyes.

Medical Surveillance: Lung function tests. Eye examination. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store away from possible contact with all forms of moisture. Store in tightly closed containers in a cool, well-ventilated area. Metal containers involving the transfer of this chemical should be grounded and bonded. Where possible, automatically pump liquid from drums or other storage containers to process containers.

Shipping: This compound requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group II. A plus sign (+) symbol indicates that the designated proper shipping name and hazard class of the material must always be shown whether or not the material or its mixtures or solutions meet the definitions of the class.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of

potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

FM, when used as a weapon—not listed in DOT tables

When spilled on land

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

When spilled in water

First: Isolate in all directions (feet/meters) 200/60.
Then: Protect persons downwind (miles/kilometers).
Day 0.4/0.6
Night 1.2/1.9

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.
Then: Protect persons downwind (miles/kilometers).
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60.
Then: Protect persons downwind (miles/kilometers).
Day 0.4/0.6
Night 1.2/1.9

Fire Extinguishing: Not flammable. For small fires, use dry chemical or carbon dioxide. For large fires, flood fire area with water from a distance. Do not get solid streams of water on spilled material. Move container from fire area if this can be done without risk. Cool containers exposed to flames with water until well after fire is out. Poisonous gases are produced in fire, including hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 1/1/88; 4/1/92 (dihydrochloride).

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R45; R22; R51/53; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: *o*-Tolidine is a white to reddish crystal or powder. Darkens on exposure to air. Often used in paste or wet cake form. Used as a basis for many dyes. Molecular weight = 212.32; Boiling point = 300°C (also listed at 200°C); Freezing/Melting point = 129°C; Flash point = 244°C; Autoignition temperature = 526°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.1% at 25°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Over 75% of *o*-tolidine is used as a dye and as an intermediate in the production of dyestuffs and pigments. Approximately 20% of *o*-tolidine is used in the production of polyurethane-based high-strength elastomers, coatings, and rigid plastics. *o*-Tolidine has also been used in small quantities in chlorine test kits by water companies and swimming pool owners. Used as a laboratory agent to detect blood.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: Cancer suspect agent. Exposures of workers to this chemical is to be controlled through the required use of engineering controls, work practices; and personal protective equipment, including respirators. See 29 CFR 1910.1003-1910.1016 for specific details of these requirements.

NIOSH REL: Carcinogen: 0.02 mg/m^3 [60 min.] Ceiling Concentration; [skin]; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendices A and C.

Note: OSHA and NIOSH concluded that benzidine and benzidine-based dyes were potential occupational carcinogens and recommended that worker exposure be reduced to the lowest feasible level. OSHA and NIOSH further concluded that *o*-tolidine and *o*-dianisidine [119-90-4] (and dyes based on these chemicals) may present a cancer risk to workers and should be handled with caution and exposure minimized.

ACGIH TLV®[1]: [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.1 mg/m^3

PAC-1: 0.3 mg/m^3

PAC-2: 2 mg/m^3

PAC-3: 100 mg/m^3

No TEEL available for dihydrochloride.

DFG MAK: Carcinogen Category 2

Australia [skin], carcinogen, 1993; Austria: carcinogen, 1999; Finland: carcinogen, 1999; France: carcinogen, 1993; Switzerland: carcinogen, 1999; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Guidelines or standards which have been set for *o*-tolidine in ambient air[60] range from zero (North Dakota) to 20.0 μg/m^3 (Virginia).

Determination in Air: OSHA Analytical Method #ID-71; NIOSH Analytical Method (IV) #5013, Dyes.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.34$.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *o*-Tolidine can affect you when breathed in and can rapidly enter the body through the skin. High exposure can irritate the nose and throat.

Long Term Exposure: *o*-Tolidine may affect the kidneys and bladder. A potential occupational carcinogen.

Points of Attack: Eyes, respiratory system; liver, kidneys. Cancer site in animals: liver, bladder, and mammary gland tumors.

Medical Surveillance: Before employment and every 6 months thereafter, the following are recommended to detect bladder cancer at an early stage: Kidney function tests. Urine cytology test (a test for abnormal cells in urine).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter].

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from direct light. Sources of ignition, such as smoking and open flames, are prohibited where 3,3′-dimethylbenzidine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s., must be labeled "POISONOUS/TOXIC MATERIALS." *o*-Tolidine falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide; water spray; or extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve in flammable solvent and spray into firebox of an incinerator equipped with afterburner and scrubber.[22] Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Toluene is a clear, colorless, noncorrosive liquid with a sweet, pungent, benzene-like odor. The odor threshold in air is variously given as 0.17 ppm,[41] 2.9 ppm (NJ) and 8 ppm (EPA). The odor threshold in water is 0.04−1.0 mg/L. Molecular weight = 92.15; Specific gravity (H_2O:1) = 0.87; Boiling point = 111.1°C; Freezing/Melting point = −95°C; Vapor pressure = 21 mmHg; Flash point = 4°C (cc); Autoignition temperature = 480°C. Explosive limits: LEL = 1.1%; UEL = 7.1%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Toluene is used as an industrial chemical, chemical intermediate; solvent, and emulsifier; may be encountered in the manufacture of benzene. It is also used as a chemical feed for toluene diisocyanate, phenol, benzyl and benzoyl derivatives; benzoic acid; toluene sulfonates; nitrotoluenes, vinyltoluene, and saccharin; as a solvent for paints and coatings; or as a component of automobile and aviation fuels.

Incompatibilities: Strong oxidizers may cause fire and explosions. Violent reaction with mixtures of nitric and sulfuric acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.77 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 200 ppm/754 mg/m^3 Ceiling Concentration; 300 ppm/500 ppm [10-min maximum peak per 8-h shift].

NIOSH REL: 100 ppm/375 mg/m^3 TWA; 150 ppm/560 mg/m^3 STEL.

ACGIH TLV®[1]: 20 ppm/75 mg/m^3 TWA [skin]. BEI; 0.5 mg[*o*-cresol]/L in urine/end-of-shift; 1.6 g[hippuric acid]g/g creatinine in urine/end-of-shift; 0.05 mg[toluene]/L in blood, prior to last shift of workweek, not classifiable as a human carcinogen.

NIOSH IDLH: 500 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 20 ppm

PAC-1: **200** ppm

PAC-2: **1200** ppm

PAC-3: **4500** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 50 ppm/190 mg/m^3 TWA; Peak Limitation Category II(4) [skin], Pregnancy Risk Group: C; BAT:0.1 mg[toluene]/L in blood/end-of-shift; 0.3 mg[*o*-cresol]/L in urine/end-of-shift, for long-term exposure, after several shifts.

Australia: TWA 100 ppm (375 mg/m^3), STEL 150 ppm, 1993; Austria: MAK 100 ppm (380 mg/m^3), 1999; Belgium: TWA 100 ppm (377 mg/m^3), STEL 150 ppm (565 mg/m^3), 1993; Denmark: TWA 35 ppm (130 mg/m^3) [skin], 1999; Finland: TWA 100 ppm (375 mg/m^3), STEL 150 ppm [skin], 1999; France: VME 100 ppm (375 mg/m^3), VLE 150 ppm (550 mg/m^3), 1999; Hungary: TWA 100 mg/m^3, STEL 300 mg/m^3 [skin], 1993; the Netherlands: MAC-TGG 150 mg/m^3, 2003; Norway: TWA 25 ppm (94 mg/m^3), 1999; the Philippines: TWA 100 ppm (375 mg/m^3), 1993; Poland: MAC (TWA) 100 mg/m^3; MAC (STEL) 350 mg/m^3, 1999; Russia: TWA 100 ppm, STEL 50 mg/m^3, 1993; Sweden: NGV 50 ppm (200 mg/m^3), TKV 100 ppm (400 mg/m^3) [skin], 1999; Switzerland: MAK-W 50 ppm (190 mg/m^3), KZG-W 250 ppm (950 mg/m^3), 1999; Thailand: TWA 200 ppm, STEL 300 ppm, 1993; Turkey: TWA 200 ppm (750 mg/m^3), 1993; United Kingdom: TWA 50 ppm (191 mg/m^3), STEL 150 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Russia[35, 43] has also set a MAC for ambient air in residential areas of 0.6 mg/m^3, both on a momentary and a daily average basis. Several states have set guidelines or standards for toluene in ambient air[60] ranging from 0.05 mg/m^3 (Massachusetts) to 1.0 mg/m^3 (Arizona) to 0.4−2.0 mg/m^3 (Rhode Island) to 1.875 mg/m^3 (Indiana) to 3.75−5.60 mg/m^3 (North Dakota) to 6.0 mg/m^3 (Virginia) to 7.5 mg/m^3 (Connecticut, New York, and South Dakota) to 8.929 mg/m^3 (Nevada) to 4.7−56.0 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #8002, Toluene in blood; #1500 Hydrocarbons (BP 36−126°C), #1501, Hydrocarbons, aromatic, #4000, Toluene (passive); OSHA Analytical Method #111.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 17,500 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 6300 μg/L on an acute toxicity basis and 5000 μg/L on a chronic basis. To protect human health—14.3 mg/L.[6] EPA more recently[48] set a lifetime health advisory of 2.42 mg/L and even more recently[62] proposed a drinking water standard of 2.0 mg/L (2000 μg/L). Several states have set guidelines for toluene in drinking water[61] ranging from 100 μg/L (California and Maine) to 340 μg/L (Massachusetts) to 343 μg/L (Wisconsin) to 750 μg/L (New Mexico) to 1000 μg/L (Connecticut) to 2000 μg/L (Arizona, Kansas, Minnesota, and Vermont). Russia[35,43] set a MAC in water bodies used both for household purposes and fishery purposes of 0.5 mg/L (500 μg/L). Octanol−water coefficient: Log K_{ow} = 2.69.

Determination in Water: Inert gas purge followed by gas chromatography and photoionization detection (EPA Method #602) or gas chromatography plus mass spectrometry (EPA Method #624).

Routes of Entry: Inhalation of vapor, percutaneous absorption of liquid, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. Causes central nervous system depression. High levels of exposure may cause fatigue, weakness, confusion, euphoria, dizziness, headache, dilated pupils; lacrimation (discharge of tears); nervousness, muscle fatigue, insomnia, paresthesia; cardiac dysrhythmia; unconsciousness and death may occur. *Inhalation:* 100 ppm exposure can cause dizziness, drowsiness, and hallucinations. 100−200 ppm can cause depression; 200−500 ppm can cause headache; nausea, loss of appetite; loss of energy; loss of coordination and coma. In addition to the above, death has resulted from exposure to 10,000 ppm for an unknown time. *Skin:* Can cause dryness and irritation. Absorption may cause or increase the severity of symptoms listed above. *Eyes:* Can cause irritation at 300 ppm. *Ingestion:* Can cause a burning sensation in the mouth and stomach, upper abdominal pain; cough, hoarseness, headache, nausea, loss of appetite; loss of energy; loss of coordination; and coma.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis; drying, cracking, itching, and skin rash. May cause liver, kidney, and brain damage; decreased learning ability; psychological disorders. Levels below 200 ppm may produce headache, tiredness, and nausea. From 200 to 750 ppm symptoms may include insomnia, irritability, dizziness, some loss of memory; cause heart palpitations and loss of coordination. Blood effects and anemia have been reported but are probably due to contamination by benzene.

Points of Attack: Eyes, skin, respiratory system; central nervous system; liver, kidneys.

Medical Surveillance: Whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-workweek; whole blood (chemical/metabolite), prior to last shift of workweek, Expired Air, During Exposure; urine (chemical/metabolite). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following is recommended before beginning work and at regular times after that: Urinary hippuric acid excretion (at the end-of-shift) as an index of overexposure. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Liver and kidney function tests, and evaluation for renal tubular acidosis. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Exposure to toluene at levels greater than 200 ppm may result in hippuric acid levels above 5 g/L urine. After elevated exposure, toluene may also be detected in blood.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton™/Neoprene™, Teflon™, Viton™/chlorobutyl, and Silvershield™ are recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *500 ppm:* CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister]; or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]; or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Toluene must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), since violent reactions occur. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where toluene is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of toluene should be grounded and bonded. Drums must be equipped with self-closing, valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of toluene.

Shipping: Toluene requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases may be produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

California Proposition 65 Chemical: Cancer (95-80-7) 1/1/88; [25376-45-8 (mixed isomers)]1/1/90.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% *as Toluene-2,4-diamine, Toluene-ar,ar′-diamine, Toluene-3,4-diamine, Toluene-3,5-diamine*.

Description: Toluene-2,4-diamine takes the form of colorless needles. Molecular weight = 122.19; Specific gravity (H_2O:1) = 1.05 (liquid at 100°C); Freezing/Melting point = 98.9°C; Vapor pressure = 1 mmHg at 107°C; Flash point = 148°C. Soluble in water.

Potential Exposure: Compound Description (*toluene-2,4-diamine*): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Compound Description (*toluene-2,6-diamine*): Mutagen. Toluene-2,4-diamine is a chemical intermediate for toluene diisocyanate (used in the production of flexible and rigid polyurethane foams, polyurethane coatings; cast elastomers including fabric coatings and polyurethane and other adhesives), for dyes used on textiles; leather, furs; and in hair-dye formulations.

Incompatibilities: Strong acids; chloroformates, oxidizers.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: (*all isomers*) Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

Toluene-2,5-diamine

DFG MAK (*toluene-2,4-diamine*): [skin] danger of skin sensitization.

Determination in Air: Use NIOSH Analytical Method (IV) #5516, OSHA Analytical Method #ID-65.

Routes of Entry: Inhalation, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and skin. Eye contact may cause permanent damage. Skin contact may cause burns and blistering. Methemoglobinemia, central nervous system depression, and degeneration of the liver typically result from exposure to toluene-2,4-diamine. Exposure can cause cyanosis, headache, fatigue, dizziness, nausea, vomiting.

Long Term Exposure: May cause liver damage. Jaundice and anemia are reported. Repeated exposure causes CNS depression causing headache, weakness, dizziness, fatigue, nausea, vomiting, and possible death. There is limited evidence that toluenediamines may reduce fertility in males and may affect the developing fetus. 2,4-Diaminotoluene is carcinogenic in rats and after its oral administration, producing hepatocellular carcinomas; and its subcutaneous injection, inducing local sarcomas. Diaminotoluenes are mutagens.

Points of Attack: Central nervous system; liver, blood. Cancer site in animals: liver, mammary glands.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examination. Examination of the nervous system. Methemoglobin level. Complete blood count (CBC). Liver function tests.

First Aid: *Skin Contact:* [52] Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Butyl rubber is recommended. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-facepiece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Use self-contained breathing apparatus.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place or a refrigerator. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: 2,4-Toluylenediamine requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical may burn but does not easily ignite. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide and nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1999; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112); Accidental Release Prevention/Flammable Substances (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (127.5 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T, N; Risk phrases: R26; R36/37/38; R42/43; R52/53; Safety phrases: S1/2; S23; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Toluene diisocyanate is a colorless, yellow, or dark liquid or solid with a sweet, fruity, pungent odor. Toluene diisocyanate (technical) is an 80:20 mixture of 2,4- and 2,6-isomers. A solid above 71°F/22°C. The odor threshold is 0.4−2.14 ppm. Molecular weight = 174.17; Specific gravity (H_2O:1) = 1.22; Boiling point = 251.1°C; Freezing/Melting point = 21.7°C; Vapor pressure = 0.01 mmHg at 25°C; Relative vapor density (air = 1) = 6.1; Flash point = 127°C; Autoignition temperature = 620°C. Explosive limits: LEL = 0.9%; UEL = 9.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 3. Insoluble; reacts exothermically with water.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Toluene diisocyanate is used in the production of polyurethane flexible foams, coatings, and elastomers. It is more widely used than MDI (diphenylmethane diisocyanate). Polyurethanes are formed by the reaction of isocyanates with polyhydroxy compounds. Since the reaction proceeds rapidly at room temperature, the reactants must be mixed in pots or spray guns just before use. These resins can be produced with various physical properties, e.g., hard, flexible, semirigid foams; and have found many uses, e.g., upholstery padding; thermal insulation; molds, surface coatings; shoe inner soles; and in rubbers, adhesives, paints, and textile finishes. Because of TDI's high volatility, exposure can occur in all phases of its manufacture and use. MDI has a much lower volatility, and problems generally arise only in spray applications.

Incompatibilities: Strong oxidizers, water, acids, bases, and amines (may cause foam and spatter); alcohols. Reacts slowly with water to form carbon dioxide and polyureas (NIOSH). Contact with bases, tertiary amines, and acyl-chlorides may cause explosive polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.13 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 0.02 ppm/0.14 mg/m^3 Ceiling Concentration.

NIOSH REL: Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.005 ppm/0.036 mg/m^3 TWA; 0.02 ppm/0.14 mg/m^3, STEL, danger of sensitization of respiratory tract; not classifiable as a human carcinogen.

Notice of intended change: 0.001 ppm/0.007 mg/m^3, measured as inhalable fraction and vapor TWA; 0.003 ppm/0.021 mg/m^3, measured as inhalable fraction and vapor STEL, danger of sensitization of respiratory tract; not classifiable as a human carcinogen.

NIOSH IDLH: Potential occupational carcinogen, 2.5 ppm

Protective Action Criteria (PAC)*

TEEL-0: 0.005 ppm

PAC-1: **0.020** ppm

PAC-2: **0.083** ppm

PAC-3: **0.51** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Danger of sensitization of the airways; Carcinogen Carcinogen Category 3A.

Arab Republic of Egypt: TWA 0.02 ppm (0.14 mg/m^3), 1993; Austria: MAK 0.01 ppm (0.07 mg/m^3), 1999; Belgium: TWA 0.005 ppm (0.036 mg/m^3), STEL 0.02 ppm, 1993; Denmark: TWA 0.005 ppm (0.035 mg/m^3), 1999; France: VME 0.01 ppm (0.08 mg/m^3), STEL 0.02 ppm (0.16 mg/m^3), 1993; Hungary: STEL 0.04 mg/m^3, 1993;

Japan; 0.02 ppm (0.14 mg/m^3), 1993; the Netherlands: MAC-TGG 0.04 mg/m^3, 2003; Norway: TWA 0.005 ppm (0.035 mg/m^3), 1999; the Philippines: TWA 0.02 ppm (0.14 mg/m^3), 1993; Poland: MAC (TWA) 0.035 mg/m^3; MAC (STEL) 0.070 mg/m^3, 1999; Russia: STEL 0.05 mg/m^3, 1993; Sweden: NGV 0.005 ppm (0.04 mg/m^3), KTV 0.01 ppm (0.07 mg/m^3), 1999; Switzerland: MAK-W 0.005 ppm (0.04 mg/m^3), KZG-W 0.01 ppm (0.08 mg/m^3), 1999; Thailand: TWA 0.02 ppm (0.14 mg/m^3), 1993; Turkey: TWA 0.02 ppm (0.14 mg/m^3), 1993; United Kingdom: TWA 0.02 [NCO]mg/m^3, STEL 0.07 mg[NCO]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 0.02 ppm.

Russia has also set MAC values for ambient air in residential areas of 0.05 mg/m^3 on a momentary basis and 0.02 mg/m^3 on a daily average basis. Several states have set guidelines or standards for TDI in ambient air[60] ranging from 0.03−0.20 μg/m^3 (Rhode Island) to 0.13 μg/m^3 (New York) to 0.4 μg/m^3 (South Carolina) to 0.48 μg/m^3 (Massachusetts) to 0.70 μg/m^3 (Virginia) to 0.72 μg/m^3 (Connecticut and South Dakota) to 0.4−1.5 μg/m^3 (North Dakota) to 0.9 μg/m^3 (Nevada) to 4.8−16.0 μg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method (IV) #5521, Isocyanates, monomeric, #5522 Isocyanates, #2535, Toluene-2,4-diisocyanate, and OSHA Analytical Method #18, superseded by #42 and #33.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.22$.

Routes of Entry: Inhalation of vapor, ingestion and skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritate the eyes, skin, and respiratory tract. Inhalation of the vapor may cause asthmatic reactions; chemical bronchitis, pneumonitis, and pulmonary edema. Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death.

Note: TDI is a strong sensitizer. Allergic individuals may experience symptoms at very low concentrations.

Inhalation: Causes irritation of nose, throat, and lungs; insomnia, euphoria, difficulty in walking; loss of consciousness; poor memory; personality changes; irritability, and depression. Allergic response is also possible. Sensitive individuals may react to 0.007 ppm or less. Exposure to high levels leads to chemical pneumonia. Levels of 0.01−0.03 ppm reportedly caused no symptoms. At 0.03−0.07 ppm, respiratory illness with continuous coughing, sore throat; difficulty in breathing; fatigue and nocturnal sweating were reported. In another study, 10 min at 0.5 ppm caused nose and throat irritation. Lung damage may be permanent. *Skin:* If not removed promptly, may cause redness, pain, swelling, and blistering. TDI is corrosive and may be absorbed through the skin. Repeated contact has caused skin sensitization in humans and allergic eczema. *Eyes:* May cause redness, pain; blurred vision; severe irritation, tears and damage to the cornea. Prolonged contact may cause permanent damage. *Ingestion:* May cause sore throat, abdominal pain; diarrhea, and irritation of mouth and stomach.

Long Term Exposure: May produce asthma-like allergy and chronic lungs disease; chronic obstructive bronchitis; emphysema, chemical bronchitis; asthmatic syndrome. May cause memory loss and concentration problems; psychological effects; central nervous system effects. May cause chest tightness (sometimes very severe), sneezing, cyanosis (blue coloration), blood changes; and collapse. Sensitization may occur after exposure to spills or other unusually high concentrations. Decreased lung function has been reported from estimated exposure to 0.02 ppm for 2 years. It has also been reported that excessive loss of pulmonary function occurs at 0.0035 ppm possibly to 0.002 ppm. Sensitization has been reported on the first exposure at concentration below 0.05 ppm and as late as 14 years (0.06 ppm) after first exposure. This substance is a probable carcinogen in humans. There is limited evidence that TDI may cause temporary impotence in males.

Points of Attack: Eyes, skin, respiratory system. Cancer site in animals: pancreas, liver, mammary gland; circulatory system; and skin tumors.

Medical Surveillance: NIOSH lists the following tests: Blood Gas Analysis; blood plasma; chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); pulmonary function tests; pre- and postshift; sputum cytology; urine (chemical/metabolite); white blood cell count/differential. Preplacement and periodic medical examinations should include chest roentgenography, pulmonary function tests; and an evaluation of any respiratory disease or history of allergy. Periodic pulmonary function tests may be useful in detecting the onset of pulmonary sensitization. See also "References."[4]

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pneumonitis or pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide

recommendations on the most protective glove/clothing material for your operation. Teflon™, Silvershield™, Viton™, polyethylene, nitrile, chlorinated polyethylene; and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from amines, strong bases (such as sodium hydroxide), and alcohols. Toluene 2,4-diisocyanate should not be stored in contact with water, because they react and release carbon dioxide gas. Toluene 2,4-diisocyanate will polymerize and rupture containers at temperatures over 177°C/350°F. At normal temperatures (21°C/70°F) Toluene 2,4-diisocyanate levels quickly exceed the PEL and therefore proper ventilation must be in practice or personal protective equipment must be worn. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. *Solid:* Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. *Liquid:* Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Solid:* Water gently applied to surface or foam may cause frothing which will extinguish the fire (NFPA). If material is on fire or involved in fire, do not extinguish fire unless flow can be stopped. Use water in flooding quantities as fog. Solid streams of water may be ineffective. Cool all affected containers with flooding quantities of water. Apply water from as far a distance as possible. Use "alcohol" foam, carbon dioxide, or dry chemical. Use water spray to absorb vapor. Poisonous gases are produced in fire, including cyanide and oxides of nitrogen. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Liquid: This chemical is a combustible liquid. Poisonous gases, including cyanide and oxides of nitrogen, are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices). In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% as toluenesulfonic acid (25231-46-3).

European/International Regulations: Hazard Symbol (*104-15-4*): Xi; Risk phrases: R36/37/38; Safety phrases: S2; S26; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class) (*104-15-4*): 1—Slightly water polluting.

Description: Toluene sulfonic acid is a colorless liquid or colorless crystalline solid. Odorless when pure; the technical grade has a slightly aromatic odor; Freezing/Melting point = 105°C. Molecular weight = 172.21; Boiling point = 140°C at20 mm; Flash point = 184°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Toluene sulfonic acid is used as catalyst, stabilizer for monomers and polymers; cleaning agents; a plating additive; in synthesis of dyes; drugs, and other chemicals.

Incompatibilities: The solution is a strong acid. Incompatible with sulfuric acid, caustics, ammonia, amines, amides, organic anhydrides; isocyanates, vinyl acetate; alkylene oxides; epichlorohydrin, and combustible materials. Attacks metals in the presence of moisture forming hydrogen gas.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

80-48-8 (Toluenesulfonic acid, methyl ester, p-)

TEEL-0: 0.75 mg/m^3

PAC-1: 2.5 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 150 mg/m^3

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Toluene sulfonic acid can affect you when breathed in. Corrosive to the eyes and skin; can cause severe irritation and burns. Irritates the respiratory tract causing burning sensation; dryness, and coughing. Overexposure can cause poisoning, which can lead to death. High levels can burn the lungs, causing a buildup of fluid, which can also cause death.

Long Term Exposure: Can irritate the lungs; bronchitis may develop with cough, phlegm, and/or shortness of breath.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. Exam of the eyes, nose and throat. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Neoprene™, chlorinated polyethylene, and polyvinyl chloride are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to solid toluene sulfonic acid, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered, air-purifying respirator. Where there is potential for high exposures to toluene sulfonic acid in liquid form, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from bases, combustibles, and other incompatible materials listed above. Where possible, automatically pump liquid or transfer dry material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Alkyl sulfonic acids, liquid, or aryl sulfonic acids, liquid (with >5% free sulfuric acid), require a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Alkyl sulfonic acids, liquid, or aryl sulfonic acids, liquid (with not >5% free sulfuric acid) requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Alkyl sulfonic acids, solid, or aryl sulfonic acids, solid (with not >5% free sulfuric acid) falls in DOT Hazard Class 8 and Packing Group III.

Alkyl sulfonic acids, solid, or aryl sulfonic acids, solid (with >5% free sulfuric acid) requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. For *small spills*, flush with water, rinse with dilute sodium bicarbonate or lime solution. Collect material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Toluene sulfonic acid may burn, but does not readily ignite. Use dry chemical, carbon dioxide, water spray; or foam extinguishers. However, water may cause frothing. Poisonous gases are produced in fire, including sulfur oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 1/1/88; *o*-Toluidine hydrochloride 1/1/88.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol *(95-53-4)*: T, N; Risk phrases: R45; R23/25; R36; R50; Safety phrases: S53; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*CAS: 95-53-4*).

Description: *o*-Toluidine is a colorless to pale yellow liquid with a weak, pleasant, aromatic odor. The odor threshold = 0.25 ppm. Molecular weight = 107.17; Relative density (H_2O:1): 1.01; Boiling point = 200°C; Freezing/Melting point = −16°C; Vapor pressure = 0.3 mmHg at 21°C; Flash point = 85°C (cc); Autoignition temperature = 482°C. Explosive limits: LEL = 1.5%; UEL—unknown. Slightly soluble in water; solubility = 2%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. *o*-Toluidine is used as an intermediate in the manufacture of dyes; as an intermediate in pharmaceutical manufacture; in textile printing; in rubber accelerators; in production of *o*-aminoazotoluene.

Incompatibilities: Strong oxidizers, especially nitric acid; bases.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.38 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/22 mg/m^3 TWA [skin].

NIOSH REL: [skin] Potential occupational carcinogen; Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 2 ppm/8.8 mg/m^3 TWA [skin], confirmed animal carcinogen with unknown relevance to humans; BEI_M issued as methemoglobin inducers.

NIOSH IDLH: Potential occupational carcinogen, 50 ppm.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 5 ppm

PAC-2: 5 ppm

PAC-3: 50 ppm

DFG MAK: [skin] Carcinogen Category 1; Germ Cell Mutation Category 3A.

Australia: TWA 2 ppm (9 mg/m^3) [skin], carcinogen, 1993; Austria [skin], carcinogen, 1999; Belgium: TWA 2 ppm (8.8 mg/m^3) [skin], Carcinogen 1993; Denmark: TWA 2 ppm (9 mg/m^3) [skin], 1999; Finland: TWA 5 ppm (22 mg/m^3), STEL 10 ppm (44 mg/m^3) [skin], carcinogen, 1999; France: VME 2 ppm (9 mg/m^3), carcinogen, 1999; Carcinogen (salts), 1993; Japan; 1 ppm (4.4 mg/m^3) [skin], 2B carcinogen, 1999; Norway: TWA 1 ppm (4.5 mg/m^3), 1999; the Philippines: TWA 5 ppm (22 mg/m^3) [skin], 1993; Poland: MAC (TWA) 3 mg/m^3; MAC (STEL) 9 mg/m^3, 1999; Russia: TWA 0.5 mg/m^3, STEL 1 mg/m^3 [skin], carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: MAK-W 0.1 ppm (0.5 mg/m^3) [skin], carcinogen, 1999; Turkey: TWA 5 ppm (22 mg/m^3) [skin], 1993; United Kingdom: carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Also, many states have set guidelines for ambient air.

Determination in Air: Use NIOSH Analytical Method #2002, amines, aromatic, #2017, #8317, OSHA Analytical Method ID-73.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested an ambient water goal of 304 μg/L based on health effects.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.32$.

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure may affect the blood causing cyanosis and formation of methemoglobin. Exposure to high concentrations may result in damage to kidneys and bladder.

Inhalation: Combines with blood cells to prevent binding of oxygen. Early symptoms are headache, nausea, vomiting, diarrhea, low blood pressure; increased salivation and loss of appetite. Causes cyanosis; lips, fingernails, and tongue may turn blue. Symptoms may begin to appear at 6 ppm after several hours, or at 100 ppm after 1 h. Continued exposure may lead to difficult breathing; dizziness, stupor, unconsciousness, and death. *Skin:* Causes irritation. May cause excessive drying of skin and irritation. Absorption is significant and may increase severity of symptoms listed under inhalation. *Eyes:* Causes irritation, redness, and chemical burns. *Ingestion:* Animal studies suggest that symptoms as listed under inhalation would occur, and that death may result from ingestion of about 2 oz by a 150 lb person.

Long Term Exposure: Skin and inhalation exposures may cause the formation of methemoglobin and cyanosis, mild blue coloration of the skin due to lack of oxygen in the blood. Loss of appetite and weight, headache, dizziness may occur. Irritation of the kidneys and bladder may occur, with decreased functions and damage. *o*-Toluidine is a potential occupational carcinogen.

Points of Attack: Eyes, skin, blood, kidneys, liver, cardiovascular system. *Cancer site:* bladder cancer.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite), Methemoglobin; Complete blood count; red blood cells/count; urine (chemical/metabolite); urine (chemical/metabolite) [Whole Blood (chemical/metabolite)]; urinalysis (routine)]. Before beginning employment and at regular times after that, the following is recommended: Urine exam for blood and abnormal cells (urine cytology) and blood. If symptoms develop or overexposure is suspected, the following may be useful: methemoglobin level every 3−6 h for 18−24 h. Liver function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobinemia in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. *o*-Toluidine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where *o*-toluidine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (oxides of nitrogen are removed from the effluent gas by scrubbers and/or thermal devices).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Toxaphene is an amber, waxy solid with a mild, piney, chlorine- and camphor-like odor. Usually dissolved in a flammable solvent. Flammability depends on the solvent used. Molecular weight = 413.80; Specific gravity (H_2O:1) = 1.65 at 25°C; Boiling point = (decomposes); Freezing/Melting point = 65−90°C; Vapor pressure = 4×10^{-6} mmHg at 20°C; Vapor pressure = 0.4 mmHg at 25°C. Flash point = 135°C (solid); 29°C (solution); Autoignition temperature = 530°C. Explosive limits: LEL = 1.1%; UEL = 6.4% (solvents only). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.0003%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Natural Product; Primary Irritant. Toxaphene is a broad spectrum, chlorinated hydrocarbon pesticide that is used as an insecticide for the control of grasshoppers, army-worms. and all major cotton pests.

Incompatibilities: Contact with strong oxidizers may cause fire and explosion hazard. Decomposes, producing fumes of hydrogen chloride and chlorine in heat above 155°C, on contact with strong bases; strong sunlight; and catalysts, such as iron. Slightly corrosive to metals in the presence of moisture.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg/m^3 TWA [skin].

NIOSH REL: A potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 0.5 mg/m^3 TWA [skin]; 1 mg/m^3 STEL [skin]; confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 200 mg/m^3 Potential occupational carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 0.5 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 200 mg/m^3

DFG MAK: [skin]; Carcinogen Category 2.

Arab Republic of Egypt: TWA 0.5 mg/m^3 [skin], 1993; Australia: TWA 0.5 mg/m^3, STEL 1 mg/m^3 [skin], 1993; Austria: MAK 0.5 mg/m^3 [skin], 1999; Belgium: TWA 0.5 mg/m^3, STEL 1 mg/m^3 [skin], 1993; Denmark: TWA 0.5 mg/m^3 [skin], 1999; Finland: TWA 0.5 mg/m^3, STEL 1.5 mg/m^3 [skin], 1999; France: VME 0.5 mg/m^3 [skin], carcinogen, 1999; the Netherlands: MAC-TGG 0.5 mg/m^3 [skin], 2003; Norway: TWA 0.5 mg/m^3, 1999; the Philippines: TWA 0.5 mg/m^3 [skin], 1993; Switzerland: MAK-W 0.5 mg/m^3 [skin], 1999; Thailand: TWA 0.5 mg/m^3, 1993; Turkey: TWA 0.5 mg/m^3 [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1 mg/m^3 [skin].

Russia set a MAC for ambient air in residential areas of 7.0 μg/m^3 on a once-daily basis. Several states have set guidelines or standards for toxaphene in ambient air[60] ranging from 1.19 μg/m^3 (Kansas) to 1.2 μg/m^3 (Pennsylvania) to 1.67 μg/m^3 (New York) to 2.5 μg/m^3 (Connecticut and South Carolina) to 5.0 μg/m^3 (Florida) to 5.0−10.0 μg/m^3 (North Dakota) to 8.0 μg/m^3 (Virginia) to 12.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #5039, Chlorinated camphene.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 0.013 μg/L as a 24-h average, never to exceed 1.6 μg/L. *To protect saltwater aquatic life:* never to exceed 0.07 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is presented by a concentration of 0.0071 μ/l.[6] More recently, EPA[62] has proposed a drinking water standard of 5.0 μg/L. States which have set drinking water guidelines include Maine at 5.0 μg/L and Minnesota at 0.3 μg/L.[61] Mexico[35] has set MPC values of 30 μg/L for estuaries, 3.0 μg/L for coastal waters, and 5.0 μg/L for receiving waters used for drinking water supply. Fish Tox = 0.03900000 ppb MATC (EXTRA HIGH).

Determination in Water: Gas chromatography (EPA Method #608) or gas chromatography plus mass spectrometry (EPA Method #625). Octanol−water coefficient: Log $K_{ow} = 3.32$.

Routes of Entry: Inhalation, skin absorption; ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: High concentrations can irritate the skin and eyes. A nervous system depressant causing tremors, weakness, dizziness, increased saliva; convulsions, unconsciousness, and possible death. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation of spray at unknown levels has caused bronchitis and inflammation of the lungs. If spilled on clothing and allowed to remain, can cause pain and reddening. May be absorbed through skin contributing to symptoms described under ingestion. Absorbed through the stomach and intestines. 0.6 g (about 1/50 oz) has caused convulsions. Other symptoms include nausea, vomiting, bluish coloration of the skin; and coma. Estimated lethal dose for an adult is between 2 and 7 g (1/15−1/4 oz).

Long Term Exposure: Aplastic anemia (low blood count) is an uncommon but serious reaction to toxaphene. High or repeated exposure may cause liver and kidney damage. Toxaphene is suspected of causing brain damage. Changes in genetic material have been observed in workers exposed to toxaphene. Toxaphene is potential occupational carcinogen.

Human Tox = 3.00000 ppb (HIGH).

Points of Attack: Central nervous system; skin. Cancer site in animals: liver cancer; thyroid tumors.

Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Complete blood count (CBC). Complete examination of the nervous system. Liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in sealed containers in a well-ventilated area away from oxidizers. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create A potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs; and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Organochlorine pesticides, solid toxic, require a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Stay upwind; keep out of low areas. Establish forced ventilation to keep levels below explosive limit. Wear boots, protective gloves, goggles, and positive-pressure breathing apparatus. Wash away any material which may have contacted the body with copious amounts of water or soap and water. In case of land spill, dig a pit, pond, lagoon, or holding area to contain the liquid or solid material. Cover solids with a plastic sheet to prevent dissolving in rain or firefighting water. In case of water spill, if camphechlor is dissolved, apply activated carbon at 10 times the spilled amounts in the region of 10 ppm or greater concentration. Remove trapped material with suction hoses. Use mechanical dredges or lifts to remove immobilized masses of pollutants and precipitates. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid that is not easy to ignite, but is usually dissolved in a flammable carrier. Flammability depends on the type of solvent being used. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire, including chlorine and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration of flammable solvent mixture in furnace equipped with afterburner and alkali scrubber.

Tributyl phosphate T:0660

Molecular Formula: $C_{12}H_{27}O_4P$

Common Formula: $(C_4H_9O)_3PO$

Synonyms: Butyl phosphate, tri-; Celluphos 4; Phosphoric acid, tributyl ester; TBP; Tributyle (phosphate de) (French); Tributylphosphat (German); Tri-*n*-butyl Phosphate

CAS Registry Number: 126-73-8

RTECS® Number: IC7700000

UN/NA & ERG Number: No citation.

EC Number: 204-800-2 [*Annex I Index No.:* 015-014-00-2]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R22; R38; R40; Safety phrases: S2; S36/37; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Tributyl phosphate is a colorless to pale yellow odorless liquid. Molecular weight = 266.36; Specific gravity (H_2O:1) = 0.98; Boiling point = 289°C (decomposes); Freezing/Melting point $\leq$−80°C; Vapor pressure = 0.004 mmHg at 25°C; Autoignition temperature = 410°C; Flash point = 146°C (oc); Autoignition temperature = 410°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Poor solubility in water.

Potential Exposure: Tributyl phosphate is used as plasticizer, solvent, and grinding assistant; in inks and as a dielectric material; as an antifoaming agent. It is also used as a solvent in uranium extraction and as a solvent for cellulose esters. It may be used as a heat exchange medium.

Incompatibilities: Alkalis, strong oxidizers; water, moist air. Reacts with warm water producing phosphoric acid and butanol. Attacks some forms of plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 10.89 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 mg/m^3 TWA.

NIOSH REL: 0.2 ppm/2.5 mg/m^3 TWA

ACGIH TLV®[1]: 0.2 ppm/2.2 mg/m^3 TWA.

NIOSH IDLH: 30 ppm.

Protective Action Criteria (PAC)

TEEL-0: 0.2 ppm

PAC-1: 6 ppm

PAC-2: 30 ppm

PAC-3: 30 ppm

DFG MAK: 1 ppm/11 mg/m^3 TWA; Peak Limitation Category II(4) [skin]; Carcinogen Category 4; Pregnancy Risk Group C.

Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant.

Australia: TWA 0.2 ppm (2.5 mg/m^3), 1993; Belgium: TWA 0.2 ppm (2.2 mg/m^3), 1993; Denmark: TWA 0.2 ppm (2.5 mg/m^3), 1999; Finland: TWA 5 mg/m^3, STEL 10 mg/m^3 [skin], 1999; France: VME 0.2 ppm (2.5 mg/m^3), 1999; Norway: TWA 0.2 ppm (2.5 mg/m^3), 1999; the Philippines: TWA 5 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Switzerland: MAK-W 0.2 ppm (2.5 mg/m^3), 1999; United Kingdom: TWA 5 mg/m^3, STEL 5 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.2 ppm.

Several states have set guidelines or standards for TBP in ambient air[60] ranging from 25 μg/m^3 (North Dakota) to 40 μg/m^3 (Virginia) to 50 μg/m^3 (Connecticut) to 59 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5034.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 4.02$.

Permissible Concentration in Water: Russia[43] set a MAC in water bodies used for domestic purposes of 0.01 mg/L.

Routes of Entry: Inhalation of mist, eye and/or skin contact, ingestion.

Harmful Effects and Symptoms

Short Term Exposure: Tributyl phosphate can affect you when breathed in. Skin or eye contact can cause severe irritation or even burns. Breathing overexposure can irritate the nose, throat, and bronchial tubes and cause headaches, weakness, muscle twitching; nausea, collapse, and even death. Inhalation exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Animal data have shown weak anticholinesterase activity.

Long Term Exposure: Similar to other highly irritating substances, Tributyl phosphate may be able to cause lung damage. Animal data have shown weak anticholinesterase activity.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: Consider lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *2 ppm:* Sa (APF = 10) (any supplied-air respirator). *5 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *10 ppm:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *50 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv 100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Tributyl phosphate must be stored to avoid contact with strong oxidizers, such as chlorine, bromine, and fluorine, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where tributyl phosphate is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides; phosphine, and phosphoric acid; are produced in fire. Use dry chemical, carbon dioxide; or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Tributyl phosphate may be recovered from nuclear fuel processing operations.

Inconclusive: Mammalian micronucleus; *B. subtilis* rec assay; Inconclusive: *E. coli* polA without S9.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Dropped from Extremely Hazardous Substance (EPA-SARA) in 1988.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazard Chemical as organophosphates.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R43; R50/53; Safety phrases: S2; S24; S37; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Trichlorfon is a white to pale yellow crystalline solid. Molecular weight = 257.44; Specific gravity (H_2O:1) = 1.73 at 25°C; Boiling point = 100°C at 1 mmHg; Freezing/Melting point = 83−84°C; Vapor pressure = 2×10^{-6} mmHg at 20°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Soluble in water; solubility = 15.4 g/100 mL at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Trichlorfon is used as an agricultural and forest insecticide.

Incompatibilities: Alkaline materials: lime, lime sulfur, etc. Corrosive to iron and steel.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®[1]: 1 mg/m^3 (intermittent) TWA, sensitizer, not classifiable as a human carcinogen; BEI$_A$ issued for acetylcholinesterase inhibiting pesticides.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 13 mg/m^3

PAC-3: 500 mg/m^3

Poland: MAC (TWA) 0.5 mg/m^3, MAC (STEL) 2 mg/m^3, 1999; Russia: STEL 0.5 mg/m^3 [skin] 1993. Russia[43] set a MAC in residential areas of 0.04 mg/m^3 on a momentary basis and 0.02 mg/m^3 on a daily average basis.

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Permissible Concentration in Water: Russia[35,43] set a MAC in water bodies used for domestic purposes of 0.05 mg/L and in water bodies used for fishery purposes of zero.

Determination in Water: Fish Tox = 24.99773000 (ppb) (INTERMEDIATE). Octanol−water coefficient: Log K_{ow} = 0.48.

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Very toxic: probable oral lethal dose (human) 50−500 mg/kg, between 1 teaspoon and 1 oz for 150 lb (70 kg) person. Toxicity is relatively low among organic phosphate insecticides, although it is a potent cholinesterase inhibitor. Skin sensitivity has been reported. Symptoms of exposure: muscle weakness; twitching, respiratory depression; sweating, vomiting, diarrhea, chest and abdominal distress; sometimes pulmonary edema; excessive salivation; headache, giddiness, vertigo, and weakness; runny nose and sensation of tightness in chest (inhalation), blurring of vision; tearing, ocular pain; loss of muscle coordination; and slurring of speech.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage. Human Tox; 14.00000 ppb (INTERMEDIATE).

Points of Attack: Respiratory system, lungs, central nervous system; cardiovascular system, skin, eyes, plasma, and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months.

When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an exam of the nervous system. Also consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode. A/P2 filter respirator for organic vapor and harmful dust. *Escape:* GmFOv 100 [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from alkaline materials. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Parking Group III.

Spill Handling: As for other organophosphorus pesticides, stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive-pressure breathing apparatus and special protective clothing. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean dry containers and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 10.

Fire Extinguishing: This material may burn, but does not ignite readily. For small fires, use dry chemical, carbon dioxide; water spray; or foam. For large fires, use water spray, fog, or foam. Poisonous gases are produced in fire, including chlorine and phosphorus oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Add a combustible solvent and burn in a furnace equipped with an afterburner and an alkali scrubber.[24] In accordance with 40CFR165, follow recommendations for the disposal of pesticides and pesticide containers. Must be disposed properly by following package label directions or by contacting your local or federal environmental control agency, or by contacting your regional EPA office.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: C, N; Risk phrases: R35; R50/53; Safety phrases: S1/2; S26; S36/37/39; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Trichloroacetic acid is a colorless crystalline solid which is used in liquid solutions. Molecular weight = 163.38; Specific gravity (H_2O:1) = 1.62 at 25°C; Boiling point = 197.8°C; Freezing/Melting point = 57.8°C; Vapor pressure = 1 mmHg at 51°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Trichloroacetic acid is used as medication, in organic syntheses; and as a reagent for albumin detection; as an intermediate in pesticide manufacture and in the production of sodium trichloroacetate which is itself an herbicide.

Incompatibilities: Moisture, iron, zinc, aluminum, strong oxidizers. Corrosive to metals.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.68 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 1 ppm/7 mg/m^3 TWA.

ACGIH TLV®[1]: 1 ppm/6.7 mg/m^3 TWA, confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 1 ppm

PAC-1: 1 ppm

PAC-2: 2 ppm

PAC-3: 25 ppm

Austria: MAK 1 ppm (5 mg/m^3), 1999; Belgium: TWA 1 ppm (6.7 mg/m^3), 1993; Denmark: TWA 1 mg/m^3, 1999; France: VME 1 ppm (5 mg/m^3), 1999; Norway: TWA 0.75 ppm (5 mg/m^3), 1999; Russia: STEL 5 mg/m^3 [skin], 1993; Switzerland: MAK-W 1 ppm (7 mg/m^3), 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for TCA in ambient air[60] ranging from 70 μg/m^3 (North Dakota) to 80 μg/m^3 (Virginia) to 100 μg/m^3 (Connecticut) to 119 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Fish Tox: 538434.64955000 ppb (VERY LOW).

Routes of Entry: Inhalation, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Causes irritation to respiratory tract with choking, coughing, dizziness, and weakness. Swelling of throat and lungs can occur. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. *Skin:* Corrosive to the skin. Burns and blisters may result if not removed promptly. May cause thickening of skin. *Eyes:* Corrosive to the eyes. Can cause extremely painful burns and sores on eyes, which can result in blindness. *Ingestion:* May cause intense burning of mouth, throat, and stomach; vomiting, diarrhea, and fatigue. Throat may swell to block airway. The estimated lethal dose is about 1 g (1/30 oz).

Long Term Exposure: Fumes may produce irritation of throat and lungs with persistent cough. Disturbances of the digestive tract may also be noticed. These should only be significant at levels above the recommended occupational exposure limit. Human Tox = 60.00000 ppb (LOW).

Points of Attack: Eyes, skin, respiratory system; gastrointestinal tract.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater) the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for

pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and face shield when working with powders or dust, unless full-face-piece respiratory protection is worn. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 1 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved respirator with a high-efficiency particulate filter. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered, air-purifying respirator. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. If trichloroacetic acid is a liquid, where the potential exists for exposures *over 1 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with an acid gas canister. Increased protection is obtained from full-face-piece powered, air-purifying respirators.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry, well-ventilated place away from strong oxidizers, strong bases. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Trichloroacetic acid, solid, requires a shipping label of "CORROSIVE." Trichloroacetic acid, solution. Both fall in DOT Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Wearing protective equipment and clothing, spread soda ash on spill and mop up with water. Shovel slurry into appropriate container. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 3.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Trichloroacetic acid itself does not burn. Poisonous gases are produced in fire, including chlorine, chloroform, phosgene, and hydrogen chloride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (127.5 kg).

Reportable Quantity (RQ): 500 lb (127.5 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Trichloroacetyl chloride is a clear liquid. Molecular weight = 181.82; Boiling point = 118°C; Freezing/Melting point = −146°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1₩. Decomposes in water.

Incompatibilities: Violent reaction with water, forming hydrochloric acid and trichloroacetic acid. Keep away from strong oxidizers.

Potential Exposure: Used in chemical syntheses.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 0.03 ppm
PAC-1: 0.075 ppm
PAC-2: 0.606 ppm
PAC-3: 6 ppm
Russia[43] set a MAC in work-place air[43] of 0.1 mg/m^3.

Routes of Entry: Inhalation, ingestion, eye, and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Corrosive. Severe irritation to the eyes, skin, and respiratory tract. Skin or eye contact may cause burns. Moderately toxic by ingestion and inhalation. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Highly irritating substances may affect the lungs; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: This compound requires a shipping label of "CORROSIVE, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 8 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Material may burn but does not ignite readily. Material may react violently with water. Extinguish with dry chemical, carbon dioxide; water spray, fog, or foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Wear positive-pressure breathing apparatus and special protective clothing. Poisonous gases are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure

position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as trichlorobenzenes, liquid.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: Xn, N; Risk phrases: R22; R38; R50/53; Safety phrases: S2; S37/39; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,2,4-Trichlorobenzene is a low-melting solid or liquid with a pleasant, aromatic odor. The odor threshold is 1.4 ppm. Molecular weight = 181.44; Specific gravity (H_2O:1) = 1.45 at 25°C; Boiling point = 213.3°C; Freezing/Melting point = 17.2°C; Vapor pressure = 1 mmHg; Flash point = 105°C; Autoignition temperature = 571°C. Explosive limits: LEL = 2.5%; UEL = 6.6%, both at 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Insoluble in water; solubility = 0.003%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. 1,2,4-Trichlorobenzene is used as a dye carrier, herbicide intermediate; a heat transfer medium; a dielectric fluid in transformers; a degreaser; a lubricant; as an industrial chemical; solvent, emulsifier, and as a potential insecticide against termites. The other trichlorobenzene isomers are not used in any quantity.

Incompatibilities: Reacts violently with oxidants, acids, acid fumes; steam.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.42 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 5 ppm/40 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 5 ppm/37 mg/m^3 Ceiling Concentration.

European OEL: 2 ppm/15.1 mg/m^3 TWA; 5 ppm, 37.8 mg/m^3 STEL [skin].[2003]

Protective Action Criteria (PAC)

TEEL-0: 0.25 ppm

PAC-1: 0.75 ppm

PAC-2: 5 ppm

PAC-3: 40 ppm

DFG MAK: [skin] Carcinogen Category 3B.

Australia: TWA 5 ppm (40 mg/m^3), 1993; Austria: MAK 5 ppm (40 mg/m^3), 1999; Belgium: STEL 5 ppm (37 mg/m^3), 1993; Denmark: TWA 5 ppm (40 mg/m^3), 1999; Finland: TWA 5 ppm (40 mg/m^3), STEL 10 ppm (74 mg/m^3) [skin], 1999; France: VME 5 ppm (40 mg/m^3), 1999; the Netherlands: MAC-TGG 15.1 mg/m^3 [skin], 2003; Switzerland: MAK-W 5 ppm (40 mg/m^3), 1999; United Kingdom: TWA 1 ppm (7.6 mg/m^3) [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 5 ppm.

Several states have set guidelines or standards for 1,2,4-trichlorobenzene in ambient air[60] ranging from 133 µg/m^3 (New York) to 350 µg/m^3 (Virginia) to 400 µg/m^3 (North Dakota and South Carolina) to 800 µg/m^3 (Connecticut) to 952 µg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5517, Polychlorobenzenes.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.98.

Permissible Concentration in Water: To protect human health—no criterion developed due to insufficient data.[6] Several states have set guidelines or standards for 1,2,4-trichlorobenzene in drinking water.[61] These include a guideline of 13 µg/L (Kansas) and a standard of 8 µg/L

(New Jersey). Russia[43] set a MAC for water bodies used for domestic purposes of 30 μg/L.

Determination in Water: Methylene chloride extraction followed by concentration, gas chromatography with electron capture detection (EPA Method #612) or gas chromatography plus mass spectrometry (EPA Method #625).

Routes of Entry: Inhalation, skin absorption; ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May cause irritation to the nose and throat, nervousness, restlessness, tremors, increased heart rate and blood pressure; weakness, digestive disturbances; weight loss; and headache.

Skin: May cause severe irritation. Prolonged contact may cause skin burns.

Eyes: Causes irritation. Levels greater than 5 ppm may cause severe irritation.

Ingestion: Animal studies suggest that a dose of 2 oz may cause liver damage and death.

Long Term Exposure: Removes the skin's natural oils, causing drying and cracking. Possible teratogenic effects. May cause liver and kidney damage.

Points of Attack: Eyes, skin, respiratory system; liver, reproductive system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function test. Urinary 2,5-dichlorophenol excretion test.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™, Neoprene™, and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,2,4-Trichlorobenzene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where 1,2,4-trichlorobenzene is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene, chlorine, and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide; or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees

are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Trichloro(chloromethyl)-silane T:0710

Molecular Formula: CH_2Cl_4Si

Common Formula: $Si(CH_2Cl)Cl_3$

Synonyms: (Chloromethyl)trichlorosilane; Chloromethyl (trichloro)silane; Trichloro(chloromethyl)silane

CAS Registry Number: 1558-25-4

RTECS® Number: VV2200000

UN/NA & ERG Number: UN1295(trichlorosilane)/139

EC Number: 216-316-9

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

OSHA 29CFR1910.119, Appendix A, Process Safety List of Highly Hazardous Chemicals, TQ = 100 lb (45 kg).

Reportable Quantity (RQ): 100 lb (45 kg).

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Trichloro(chloromethyl)-silane is a colorless liquid with a sharp, biting odor. Molecular weight = 183.92; Boiling point = 117°C; Freezing/Melting point = 111°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 1₩. Violent reaction with water.

Potential Exposure: Used in the synthesis of polysiloxane (silicone polymers).

Incompatibilities: Contact with water forms hydrochloric acid. Incompatible with strong oxidizers, acids. Corrodes metals in the presence of moisture. Contact with ammonia can cause a self-igniting compound. Some chlorosilanes self-ignite in air.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.2 ppm

PAC-1: **0.6** ppm

PAC-2: **7.3** ppm

PAC-3: **33** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Routes of Entry: Inhalation, ingestion; skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. Contact with the eyes causes irritation, pain, swelling; corneal erosion and blindness may result. Contact with the skin causes dermatitis (red, inflamed skin), severe burns; pain, and shock generally follow dermal exposure. Acute inhalation exposure may result in sneezing, choking, laryngitis, dyspnea (shortness of breath), respiratory tract irritation; and chest pain. Bleeding of nose and gums, ulceration of the nasal and oral mucosa; pulmonary edema; chronic bronchitis; and pneumonia may also occur. If ingested, symptoms include increased salivation; intense thirst; difficulty in swallowing; chills, pain, and shock. Oral, esophageal, and stomach burns are common. Vomitus generally has a coffee-ground appearance. The potential for circulatory collapse is high following ingestion.

Long Term Exposure: Highly irritating substances may cause lung effects.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Obtain authorization and/or further instructions from the local hospital for administration of an antidote or performance of other invasive procedures. Rush to a health care facility. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong oxidizers. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Trichlorosilanes require a shipping label of "DANGEROUS WHEN WET, FLAMMABLE LIQUID." They fall in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Stay upwind; keep out of low areas. If water pollution occurs, notify appropriate authorities. Shut off ignition sources; no flares, smoking, or flames in hazard area. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors do not get water inside container. *Small spills:* flush area with flooding amounts of water. *Large spills:* dike far ahead of spill for later disposal. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances as Chlorosilanes, corrosive, n.o.s.

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder is involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

When spilled in water *as trichlorosilane*

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30.

Then: Protect persons downwind (miles/kilometers).

Day	0.1/0.2
Night	0.2/0.3

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60.

Then: Protect persons downwind (miles/kilometers).

Day	0.5/0.8
Night	1.4/2.3

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including chlorine, are produced in fire. Use dry chemical, carbon dioxide or foam extinguishers. *Do not use water*. Vapor explosion hazard indoors, outdoors, or in sewers. Runoff to sewer may create fire or explosion hazard. Move container from fire area if you can do it without risk. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Do not get water inside container. Cool containers that are exposed to flames with water from the side until well after fire is out. Stay away from ends of tanks. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,1,1-Trichloroethane is a colorless, nonflammable liquid with an odor similar to chloroform. The odor threshold is 120 ppm (NJ) or 400 ppm (NY). Molecular weight = 133.40; Specific gravity (H_2O:1) = 1.34 at 25°C; Boiling point = 73.9°C; Freezing/Melting point = −30.6°C; Vapor pressure = 100 mmHg at 25°C; Flash point = none; Autoignition temperature = 537°C. Explosive limits: LEL = 7.5%; UEL = 12.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.4%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. 1,1,1-Trichloroethane is used as a cleaning solvent, chemical intermediate for vinylidene chloride. In liquid form it is used as a degreaser and for cold cleaning, dip-cleaning; and bucket cleaning of metals. Other industrial applications of 1,1,1-trichloroethane's solvent properties include its use as a dry-cleaning agent; a vapor degreasing agent; and a propellant. In recent years, 1,1,1-trichloroethane has found wide use as a substitute for carbon tetrachloride.

Incompatibilities: Strong caustics; strong oxidizers; chemically active metals, such as aluminum, magnesium powder; sodium, potassium. Reacts slowly with water to form hydrochloric acid. Upon contact with hot metal or exposure to ultraviolet radiation, it will decompose to form the irritant gases hydrochloric acid, phosgene, and dichloroacetylene. Forms shock-sensitive mixtures with potassium or its alloys. Attacks natural rubber.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 5.46 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 350 ppm/1900 mg/m^3 TWA.
NIOSH REL: 350 ppm/1900 mg/m^3 [15 min] Ceiling Concentration. NIOSH considers methyl chloroform to be a potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix C.
ACGIH TLV®[1]: 350 ppm/1910 mg/m^3 TWA, 450 ppm/2460 mg/m^3 STEL, not classifiable as a human carcinogen; BEI: 40 ppm methyl chloroform in end-exhaled air prior to last shift of workweek; 10 mg/L trichloroacetic acid in urine at end-of-workweek; 30 mg/L total trichloroethanol in urine, end-of-shift at end-of-workweek; 1 mg/L total trichloroethanol in blood, end-of-shift at end-of-workweek.
NIOSH IDLH: 700 ppm.
Protective Action Criteria (PAC)*
TEEL-0: 230 ppm
PAC-1: **230** ppm

PAC-2: **600** ppm
PAC-3: **4200** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 200 ppm/1100 mg/m^3 TWA; Peak Limitation Category II(1) [skin], Pregnancy Risk Group: C; BAT: 550 μg/L in blood after several shifts [for long-time exposure]; at the beginning of next shift.

Australia: TWA 125 ppm (680 mg/m^3), 1993; Austria: MAK 200 ppm (1080 mg/m^3), 1999; Belgium: TWA 350 ppm (1910 mg/m^3), STEL 450 ppm (2460 mg/m^3), 1993; Denmark: TWA 50 ppm (275 mg/m^3), 1999; Finland: TWA 100 ppm (540 mg/m^3), STEL 250 ppm (1400 mg/m^3), 1999; France: VME 300 ppm (1650 mg/m^3), VLE 450 ppm (2500 mg/m^3), 1999; Hungary: TWA 100 mg/m^3, STEL 300 mg/m^3 [skin], 1993; the Netherlands: MAC-TGG 555 mg/m^3, 2003; Norway: TWA 50 ppm (270 mg/m^3), 1999; the Philippines: TWA 350 ppm (1900 mg/m^3), 1993; Poland: MAC (TWA) 300 mg/m^3; MAC (STEL) 1400 mg/m^3, 1999; Russia: TWA 200 ppm, STEL 20 mg/m^3, 1993; Sweden: NGV 50 ppm (300 mg/m^3), KTV 90 ppm (500 mg/m^3), 1999; Switzerland: MAK-W 200 ppm (1080 mg/m^3), KZG-W 1000 ppm, 1999; Turkey: TWA 350 ppm (1900 mg/m^3), 1993; United Kingdom: TWA 200 ppm (1110 mg/m^3), STEL 400 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 450 ppm. Several states have set guidelines or standards for 1,1,1-Trichloroethane in ambient air[60] ranging from 1.3 mg/m^3 (Massachusetts) to 12.0−245.0 mg/m^3 (North Carolina) to 19.0 mg/m^3 (Indiana) to 19.0−24.5 mg/m^3 (North Dakota) to 32.0 mg/m^3 (Virginia) to 38.0 mg/m^3 (Connecticut, New York, South Dakota) to 45.238 mg/m^3 (Nevada). Russia set a MAC for ambient air[43] in residential areas of 2.0 mg/m^3 on a once-daily basis and 0.2 mg/m^3 on a daily average basis.

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated[18]; OSHA Analytical Method 14. See also NIOSH Analytical Method #2549, Volatile organic compounds.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.49$.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 18,000 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 31,200 μg/L on an acute toxicity basis. To protect human health, on the basis of fish consumption alone—1,030,000 μg/L.[6] The EPA has recently set a lifetime health advisory for 1,1,1-trichloroethane of 0.2 mg/L (200 μg/L).[48] Several states have set guidelines or standards for drinking water ranging from 26 μg/L (New Jersey) to 60 μg/L (New Mexico) to 140 μg/L (Massachusetts) to 200 μg/L (California, Maine, Minnesota) to 300 μg/L (Connecticut).

Determination in Water: Charcoal tube; CS2; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons.

Routes of Entry: Inhalation of vapor, moderate skin adsorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract. *Inhalation:* Exposure can cause headache, lassitude (weakness, exhaustion), central nervous system depressant/depression; poor equilibrium; cardiac arrhythmias; liver damage. May affect the heart and central nervous system; kidneys and liver; causing cardiac disorders and respiratory failure. Levels above 900 ppm can cause dizziness, mental confusion; drowsiness, loss of coordination, and unconsciousness. Death may result. *Skin:* Contact can cause irritation and rash. Absorption is moderate; may contribute significantly to health hazard. *Eyes:* Contact causes irritation. The vapor has caused irritation at levels of 450 ppm. *Ingestion:* May cause symptoms similar to inhalation. In addition, may cause mouth, throat, and stomach irritation.

Long Term Exposure: High exposures may damage the liver and kidneys. Prolonged contact can cause thickening and cracking of the skin. Repeated or prolonged contact at levels of 450 ppm or above may result in irritation and dry, scaley, fractured skin. Additionally, NIOSH recommends that this chemical be treated in the workplace with caution because of its structural similarity to other chloroethanes shown to be carcinogenic in animals.

Points of Attack: Eyes, skin, central nervous system; cardiovascular system, liver.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), During Exposure; whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-workweek; whole blood (chemical/metabolite), end-of-workweek, expired air, expired air, 16 h following end-of-exposure; expired air, end-of-workweek; expired air, prior to next shift; expired air prior to last shift of workweek; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-shift at end-of-workweek; urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior to next shift. Consider the skin, liver function; cardiac status, especially arrythmias; in preplacement or periodic examinations. Expired air analyses may be useful in monitoring exposure. Persons with heart disease may be at an increased risk of irregular heartbeat from very high exposures.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact: **8 h**: polyvinyl alcohol gloves; Viton™ gloves, suits; 4H™ and Silver Shield™ gloves; Barricade™ coated suits; CPF3™ suits; Responder™ suits; Trychem 1000™ suits; **4 h**: Teflon™ gloves, suits, boots. Also, protective clothing of leather or Neoprene™ may offer some protection. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 700 ppm:* Sa (APF = 10) (any supplied-air respirator);* or SCBA (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained positive-pressure breathing apparatus). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Methyl chloroform must be stored to avoid contact with strong caustics (such as sodium and potassium hydroxide); acetone, strong oxidizers (such as chlorine, chlorine dioxide, and bromine); and chemically active metals (such as potassium, aluminum, zinc, and magnesium); since violent reactions occur. Do not allow vapor near sources of ultraviolet light, such as arc welding, because poisonous gases may be produced. Store in tightly closed containers in a cool, well-ventilated area away from heat and moisture. Do not use aluminum containers.

Shipping: This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,1,1-Trichloroethane's combustible mixtures with air do not readily ignite, but ignition may occur in conditions of excess oxygen or in the presence of a high-energy ignition sources, such as a furnace; or welding. Use dry chemical, carbon dioxide, or foam extinguishers. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. As an alternative to disposal, trichloroethane may be recovered from waste gases and liquids from various processes and recycled.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: 1,1,2-Trichloroethane is a colorless, nonflammable liquid with a sweet, chloroform-like odor. Molecular weight = 133.40; Specific gravity (H_2O:1) = 1.44 at 25°C; Boiling point = 113.9°C; Freezing/Melting point = −36°C. Vapor pressure = 19 mmHg at 25°C; Explosive limits are: LEL = 6.0%; UEL = 15.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.4%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen, Primary Irritant. 1,1,2-Trichloroethane is used as an intermediate in the production of vinylidine chloride, and a component of adhesives; as a solvent; but is not as widely used as is its isomer 1,1,1-trichloroethane; it is an isomer of 1,1,1-Trichloroethane *but should not be confused with it toxicologically*. 1,1,2-Trichloroethane is comparable to carbon tetrachloride and tetrachloroethane in toxicity.

Incompatibilities: Strong oxidizers, strong caustics; chemically active metals, such as aluminum, magnesium powders, sodium, potassium. Attacks many plastics, rubber, coatings, steel, and zinc.

1993; the Netherlands: MAC-TGG 45 mg/m^3 [skin], 2003; Norway: TWA 10 ppm (54 mg/m^3), 1999; Russia: TWA 10 ppm, 1993; Switzerland: MAK-W 10 ppm (55 mg/m^3), KZG-W 50 ppm (275 mg/m^3) [skin], 1999; United Kingdom: LTEL 10 ppm (45 mg/m^3), STEL 20 ppm [skin], 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for 1,1,2-trichloroethane in ambient air[60] ranging from 0.00 μg/m^3 (Massachusetts) to 7.0 μg/m^3 (Rhode Island) to 27.0 μg/m^3 (Pennsylvania) to 107.143 μg/m^3 (Kansas) to 150.0 μg/m^3 (New York) to 225.0 μg/m^3 (Connecticut and Indiana) to 450.0 μg/m^3 (Florida and North Dakota) to 900.0 μg/m^3 (Virginia) to 1071.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1003, Halogenated hydrocarbons, OSHA Analytical Method 11.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.35$.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 18,000 μg/L on an acute toxicity basis and 9400 μg/L on a chronic basis. *To protect saltwater aquatic life:* no criteria developed due to insufficient data. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 6.0 μg/L.[6] Several states have set guidelines or standards for 1,1,2-trichloroethane in drinking water[61] ranging from 1.0 μg/L (Arizona) to 6.11 μg/L (Minnesota) to 10.0 μg/L (New Mexico) to 100.0 μg/L (California).

Determination in Water: Inert gas purge followed by gas chromatography with halide-specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624).

Routes of Entry: Inhalation of vapor, absorption through the skin, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure may cause central nervous depression. May affect the kidneys and liver. *Inhalation:* Inhalation may produce headache, lassitude, dizziness, a lack of coordination; low blood pressure; irregular heartbeat; coma and death from respiratory arrest. Exposure to vapor concentrations near 2000 ppm for 5 min causes central nervous system depression and anesthetic effects. Symptoms are nasal irritation, drowsiness an equilibrium disturbances. Death may result from 13,600 ppm for 2 h. *Skin:* Can cause irritation and chemical burns if allowed to remain on the skin for a prolonged period. May be absorbed through the skin to cause or increase the severity of symptoms listed above. *Eyes:* Can cause irritation. *Ingestion:* May cause effects similar to those listed under inhalation. Laboratory studies with animals suggest that the probable lethal dose for humans is about 12 oz. Liver and kidney damage have occurred in animals.

Long Term Exposure: Can destroy the skin's natural oils, causing drying and cracking. Inhalation may cause liver and kidney damage. NIOSH recommends this chemical be treated as a potential occupational carcinogen. Has caused cancer in laboratory animals. Whether it does so in humans is unknown.

Points of Attack: Eyes, respiratory system; central nervous system; liver, kidneys. Cancer site in animals: liver cancer.

Medical Surveillance: NIOSH lists the following tests: Expired Air. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact) the following are recommended before beginning work and at regular times after that: Liver and kidney function tests. If symptoms develop or overexposure is suspected, the following may be useful: special 24-h EKG (Holter monitor), to look for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and Teflon™ are recommended as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. 1,1,2-Trichloroethane must be stored to avoid contact with strong oxidizers (such as chlorates, nitrates, peroxides, chlorine, and bromine); strong caustics; and chemically active metals (such as potassium, magnesium, zinc and sodium); because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where 1,1,2-trichloroethane is used, handled, or stored in a manner that could create A potential fire or explosion hazard. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Environmentally hazardous substances, liquid, n.o.s., require a shipping label of "CLASS 9." 1,1,2-Trichloroethane falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not flammable under normal conditions but can be ignited by high-energy ignition sources, such as a furnace or welding. Use dry chemical, carbon dioxide, or foam extinguishers and water to keep fire-exposed containers cool. Poisonous gases, including hydrogen chloride and phosgene, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Trichloroethylene, a colorless (often dyed blue), nonflammable, noncorrosive liquid that has the "sweet" odor characteristic of some chlorinated hydrocarbons. The odor threshold is 25−50 ppm. Molecular weight = 131.38; Specific gravity (H_2O:1) = 1.46 at 25°C; Boiling point = 87.2°C; Freezing/Melting point = −72.8°C; Vapor pressure = 58 mmHg at 25°C; Autoignition temperature = 410°C. Explosive limits: LEL = 8.0%; UEL = 10.5% at 25°C; LEL = 7.8%; UEL = 52% at 100°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Practically insoluble in water; solubility = 0.1%.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Trichloroethylene is used as a vapor degreaser of metal parts, as a solvent; and as a drug. It is also used for extracting caffeine from coffee, as a dry-cleaning agent; and as a chemical intermediate in the production of pesticides; in making waxes, gums, resins, tars, paints, varnishes, and specific chemicals, such as chloroacetic acid.

Incompatibilities: Contact with strong caustics causes decomposition and the production of highly toxic and flammable dichloroacetylene. Violent reaction with chemically active metals; powders, or shavings, such as aluminum, barium, lithium, sodium, magnesium, titanium. Violent reaction with aluminum in the presence of dilute hydrochloric acid. Decomposition of trichloroethylene, due to contact with hot metal or ultraviolet radiation, forms hazardous products including chlorine gas, hydrogen chloride; and phosgene. Keep this chemical away from high temperatures, such as arc welding or cutting, unshielded resistance heating; open flames; and high-intensity ultraviolet light. Slowly decomposed by light in presence of moisture, with formulation of hydrochloric acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.37 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 100 ppm TWA; 200 ppm; 300 ppm [5-min maximum peak in any 2 h] Ceiling Concentration.

NIOSH REL: 25 ppm TWA; 2 ppm [60 min when used as a waste anesthetic gas] STEL; Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See the *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 10 ppm TWA; 25 ppm STEL, Suspected Human Carcinogen. BEI: 100 mg[trichloroacetic acid]/g creatinine in urine, end-of-workweek; 300 mg[trichloroacetic acid and trichloroethanol]/g creatinine in urine, end-of-shift, end-of-workweek; 4 mg[trichloroethylene]/g in blood, end-of-shift, end-of-workweek.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)*

TEEL-0: 10 ppm

PAC-1: **130** ppm

PAC-2: **450** ppm

PAC-3: **3800** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category: 1; Germ Cell Mutagen Group: 3B; TRK: 5 mg[trichloroethanol]/L in blood, end-of-exposure, end-of-shift; for long-term exposure, after several shifts; 100 mg[trichloroacetic acid]/L in urine, end-of-exposure, end-of-shift; for long-term exposure, after several shifts.

Australia: TWA 50 ppm (270 mg/m^3), STEL 200 ppm, 1993; Austria: MAK 50 ppm (270 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 50 ppm (269 mg/m^3), STEL 200 ppm (1070 mg/m^3), 1993; Denmark: TWA 10 ppm (55 mg/m^3), 1999; Finland: TWA 30 ppm (160 mg/m^3), STEL 45 ppm (240 mg/m^3) [skin], 1999; France: VME 75 ppm (405 mg/m^3), VLE 200 ppm (1080 mg/m^3), carcinogen, 1999; Hungary: TWA 10 mg/m^3, STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 190 mg/m^3, 2003; Norway: TWA 20 ppm (110 mg/m^3), 1999; the Philippines: TWA 100 ppm (535 mg/m^3), 1993; Poland: MAC (TWA) 50 mg/m^3; MAC (STEL) 400 mg/m^3, 1999; Russia: TWA 50 ppm, STEL 10 mg/m^3, 1993; Sweden: NGV 10 ppm (50 mg/m^3), KTV 25 ppm (140 mg/m^3), carcinogen, 1999; Switzerland: MAK-W 50 ppm (260 mg/m^3), KZG-W 250 ppm (1300 mg/m^3), 1999; Thailand: TWA 100 ppm, STEL 200 ppm, 1993; Turkey: TWA 100 ppm (535 mg/m^3), 1993; United Kingdom: TWA 100 ppm (550 mg/m^3), STEL 150 ppm [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 100 ppm. Russia has set MAC values for ambient air in residential areas of 4.0 mg/m^3 on a momentary basis and 1.0 mg/m^3 on a daily average basis. Several states have set guidelines or standards for trichloroethylene in ambient air[60] ranging from zero (North Carolina) to 0.25 μg/m^3 (Arizona) to 0.8 μg/m^3 (Michigan) to 2.43 μg/m^3 (Kansas) to 6.1 μg/m^3 (Massachusetts) to 900.0 μg/m^3 (New York) to 1350.0 μg/m^3 (Connecticut) to 2675.0 μg/m^3 (Indiana) to 2700.0 μg/m^3 (Florida and South Dakota) to 4500.0 μg/m^3 (Virginia) to 2700.0−10,800.0 μg/m^3 (North Dakota) to 6429 μg/m^3 (Nevada) to 6750 μg/m^3 (South Carolina) to 6840 μg/m^3 (Pennsylvania).

Determination in Air: Use NIOSH Analytical Method, #1022, Trichloroethylene, by portable GC. #3800; OSHA Analytical Method 1001.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.42$.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 45,000 μg/L on an acute toxicity basis. *To protect saltwater aquatic life:* 2000 μg/L on an acute toxicity basis. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 27 μg/L.[6] EPA more recently has proposed a maximum contaminant level of 5 μg/L for trichloroethylene.[48] Japan has set[35] a maximum permissible concentration in drinking water of 30 μg/L. Russia has set a limit of 60 μg/L and WHO has set 30 μg/L as a guideline.[35] Several states have set standards and guidelines for trichloroethylene in drinking water[61] ranging from 1.0 μg/L (New Jersey) to 2.8 μg/L (New Hampshire) to 3.0 μg/L (Florida) to 5.0 μg/L (California, Maine, and Colorado) to 25 μg/L (Connecticut) to 31.2 μg/L (Minnesota).

Determination in Water: Inert gas purge followed by gas chromatography with halide-specific detection (EPA Method #601) or gas chromatography plus mass spectrometry (EPA Method #624).

Routes of Entry: Inhalation percutaneous absorption, ingestion; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure to the vapor irritates the eyes, skin, and respiratory tract. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Inhalation causes headache, sleepiness, nausea, vomiting, dizziness, and coughing have been felt around 100 ppm. Unconsciousness can result at 3000 ppm. Exposure to 8000 ppm can cause death. Can be absorbed through skin. Can cause skin irritation, burning, or redness; blistering can occur. Can cause eye irritation; burning sensation; and/or watering, and can cause permanent damage. Ingestion can cause chemical pneumonitis and diminish kidney action. It can cause drunkenness, vomiting, diarrhea, or abdominal pain. Unconsciousness, liver or kidney damage, vision distortion, and death have been reported at large doses. Exposure to TCE may affect the central nervous system causing lightheadedness, dizziness, visual disturbances; feeling of excitement; nausea, and vomiting. High levels can cause irregular heartbeat; unconsciousness, and death.

Long Term Exposure: Contact with vapor levels near 100 ppm can cause giddiness, nervous exhaustion, increased sensitivity to alcohol including redness in the face (trichloroethylene blush); the ability to become addicted to the vapor; as well as effects of acute exposure listed above. Higher levels can cause irregular heartbeat. Repeated contact with hands can cause excessive dryness, cracking, burning, loss of sense of touch, or temporary paralysis of fingers. Most of these effects seem to go away after exposure has stopped. Trichloroethylene is considered a cancer suspect agent because high levels cause liver cancer in mice. Whether it causes cancer in humans is unknown. May affect the liver and kidney.

Points of Attack: Eyes, skin, respiratory system; heart, liver, kidneys, central nervous system. Cancer site in animals: liver and kidneys.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; whole blood (chemical/metabolite), end-of-shift-, end-of-workweek; whole blood (chemical/metabolite), end-of-workweek, expired air, Expired Air, end-of-workweek; Expired Air, prior to next shift; urine (chemical/metabolite); urine (chemical/metabolite), end-of-shift; urine (chemical/metabolite), end-of-shift at end-of-workweek; urine (chemical/metabolite), end-of-workweek; urine (chemical/metabolite), prior to next shift. For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: Liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: exam of the nervous system. Consider nerve conduction tests. Urinary trichloroacetic acid level (for repeated exposures) or blood trichloroethylene levels (for acute exposure). Consider chest X-ray after acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and Silvershield™ are among the recommended materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trichloroethylene must be handled and stored away from operations which generate high temperatures, such as arc welding or cutting; unshielded resistance heating; open flames; and high-intensity ultraviolet light. It must also be handled to avoid contact with hot metals. Poisonous gases, such as phosgene, and hydrogen chloride are formed. Prevent contact of trichloroethylene with strong alkalis, such as sodium hydroxide or potassium hydroxide, because a highly flammable, toxic liquid is produced. Also prevent contact with aluminum in the presence of dilute hydrochloric acid, because a violent reaction will occur. Prevent contact with chemically active metals; powders, or shavings, such as barium, lithium, sodium, or magnesium; and titanium powders or shavings, since an explosion can occur. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Trichloroethylene requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand; earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including hydrogen chloride, chlorine gas, and phosgene, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced. An alternative to disposal for TCE is recovery and recycling.

Trichloroisocyanuric acid T:0750

Molecular Formula: $C_3Cl_3N_3O_3$

Common Formula: $(ClNCO)_3$

Synonyms: ACL 85; CBD 90; Fichlor 91; FI Clor 91; Isocyanuric chloride; NSC-405124; Symclosen; Symclosene; Trichlorinated isocyanuric acid; Trichlorocyanuric acid; Trichloroisocyanic acid; 1,3,5-Trichloroisocyanuric acid; Trichloroisocyanuric acid; 1,3,5-Trichloro-1,3,5-triazinetrione; Trichloro-*s*-triazine-2,4,6 (1H,3H,5H)-trione; Trichloro-*s*-triazinetrione; 1,3,5-Trichloro-2,4,6-trioxohexahydro-*s*-triazine

CAS Registry Number: 87-90-1

RTECS®Number: XZ1925000

UN/NA & ERG Number: UN2468 (dry)/140

EC Number: 201-782-8 [*Annex I Index No.:* 613-031-00-5]

Regulatory Authority and Advisory Bodies

Cyanide compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112) as cyanide compound.

Clean Water Act: 40CFR423, Appendix A, Priority Pollutants as cyanide, total.

US EPA Hazardous Waste Number (RCRA No.): P030 as cyanides soluble salts and complexes, n.o.s.

RCRA 40CFR261, Appendix 8 Hazardous Constituents as cyanides, soluble salts and complexes, n.o.s.

EPCRA (Section 313): X + CN- where X = H + or any other group where a formal dissociation may occur. For example, KCN or $Ca(CN)_2$; Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as cyanide mixtures, cyanide solutions or cyanides, inorganic, n.o.s.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%; National Pollutant Release Inventory (NPRI); CEPA Priority Substance List, Ocean dumping prohibited.

TRICHLOROISOCYANURIC ACID 87-90-1 European/International Regulations: Hazard Symbol: O, Xn, N; Risk phrases: R8; R22; R31; R36/37; R50/53; Safety phrases: S2;8; S26; S41; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Trichloroisocyanuric acid is a white crystalline solid with a chlorine odor. Molecular weight = 232.41; Freezing/Melting point = 225−230°C (with decomposition). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 2 OX.

Potential Exposure: This material is used in household bleaches and detergents.

Incompatibilities: A powerful oxidizer. Violent reaction with reducing agents; combustible materials. Trichloroisocyanuric acid can release poisonous chlorine, nitrogen oxides, and cyanides when heated to high temperatures. Contact with water may also release toxic chemicals.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 30 mg/m^3

PAC-1: 75 mg/m^3

PAC-2: 500 mg/m^3

PAC-3: 500 mg/m^3

Determination in Air: Use NIOSH Analytical Method (IV) #7904, Cyanides, OSHA Analytical Method ID-120. See also Method #6010, Hydrogen Cyanide.[18]

Permissible Concentration in Water: In 1976 the EPA criterion was 5.0 μg/L for freshwater and marine aquatic life and wildlife. As of 1980, the criteria are: *To protect freshwater aquatic life:* 3.5 μg/L as a 24-h average, never to exceed 52.0 μg/L. *To protect saltwater aquatic life:* 30.0 μg/L on an acute toxicity basis; 2.0 μg/L on a chronic toxicity basis. *To protect human health:* 200 μg/L. The allowable daily intake for man is 8.4 mg/day.[6] On the international scene, the South African Bureau of Standards has set 10 μg/L, the World Health Organization (WHO) 10 μg/L, and Germany 50 μg/L as drinking water standards. Other international limits[35] include an EEC limit of 50 μg/L; Mexican limits of 200 μg/L in drinking water and 1.0 μg/L in coastal waters and a Swedish limit of 100 μg/L. Russia[43] set a MAC of 100 μg/L in water bodies used for domestic purposes and 50 μg/L in water for fishery purposes. The US EPA[49] has determined a no-observed-adverse-effect-level (NOAEL) of 10.8 mg/kg/day which yields a lifetime health advisory of 154 μg/L. States which have set guidelines for cyanides in drinking water[61] include Arizona at 160 μg/L and Kansas at 220 μg/L.

Determination in Water: Distillation followed by silver nitrate titration or colorimetric analysis using pyridine pyrazolone (or barbituric acid).

Routes of Entry: Inhalation, ingestion, eyes, and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Trichloroisocyanuric acid can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, skin, nose, throat, and air passages. Contact can cause skin or eye irritation.

Long Term Exposure: Repeated exposure may cause skin irritation. Highly irritating substances may affect the lungs, although it is not known for certain that this chemical causes lung damage.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure the following are recommended before beginning work and at regular times after that: lung function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Use amyl nitrate capsules if symptoms of cyanide poisoning develop. All area employees should be trained regularly in emergency measures for cyanide poisoning and in CPR. A cyanide antidote kit should be kept in the immediate work area and must be rapidly available. Kit ingredients should be replaced every 1−2 years to ensure freshness. Persons trained in the use of this kit; oxygen use, and CPR must be quickly available.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: None listed. Following is the information for *cyanide compounds*: *Up to 25 mg/m^3:* Sa (APF = 10) (any supplied-air respirator); or SCBAF (APF = 50) (any self-contained breathing apparatus with full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern and having an N100, R100, or P100 filter]; or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Yellow: Reactive Hazard; Store in a location separate from other materials, especially flammables and combustibles. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from combustibles (such as wood, paper, and oil). Sources of ignition, such as smoking and open flames, are prohibited where trichloroisocyanuric acid is used, handled, or stored in a manner that could create a potential fire or explosion hazard. See OSHA Standard 1910.104 and NFPA 43A *Code for the Storage of Liquid and Solid Oxidizers* for detailed handling and storage regulations.

Shipping: This compound requires a shipping label of "OXIDIZER." It falls in Hazard Class 5.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in

sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trichloroisocyanuric acid may burn, but does not readily ignite. Trichloroisocyanuric acid is a strong oxidizer and a dangerous fire risk on contact with combustibles (like paper, wood, and oil). Poisonous gases are produced in fire, including chorine, nitrogen oxides; and cyanides. Use dry chemical, carbon dioxide, or water spray extinguishers. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg).

Reportable Quantity (RQ): 500 lb (227 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

US DOT 49CFR172.101, Inhalation Hazard Chemical as organic phosphate.

European/International Regulations: Hazard Symbol: T+, N; Risk phrases: R24; R28; R50/53; Safety phrases: S1/2; S23; S28; S36/37; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Trichloronate is an amber-colored liquid. Molecular weight = 333.60; Boiling point = 108°C at 0.01 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1. Soluble in water; solubility = 50 mg/L at 20°C.

Potential Exposure: Those involved in the manufacture, formulation, or application of this nonsystemic, organophosphate insecticide which is used for the control of soil insects.

Incompatibilities: Strong oxidizers may cause release of toxic phosphorus oxides. Organophosphates, in the presence of strong reducing agents such as hydrides, may form highly toxic and flammable phosphine gas. Keep away from alkaline materials.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 300 mg/m^3

Determination in Air: OSHA versatile sampler-2; Toluene/Acetone; Gas chromatography/Flame photometric detection for sulfur, nitrogen, or phosphorus; NIOSH Analytical Method (IV) Method #5600, Organophosphorus Pesticides.

Determination in Water: Fish Tox = 14.47908000 (ppb) (INTERMEDIATE).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Toxic effects are due to action on the nervous system. It has high oral toxicity and death can occur in acute poisonings. Delayed neurotoxicity has been reported. Symptoms of exposure include headache, dizziness, nausea, salivation, vomiting, abdominal pain, diarrhea, chest pain, decreased heart rate, excessive discharge of mucous from the air passages, difficult breathing, contraction of the pupil, blurred vision, profuse perspiration, muscle twitching and spasms, profound weakness, psychotic behavior, uncoordination, unconsciousness, rarely, convulsions. Low level absorption syndrome is similar to influenza. High dosage may cause toxic psychosis similar to alcoholism. Exposures may be misdiagnosed as asthma and heart failure. Organic phosphorus insecticides are absorbed by the skin as well as by the respiratory and gastrointestinal tracts. They are cholinesterase inhibitors. Symptoms of exposure include headache, giddiness, blurred vision, nervousness, weakness, nausea, cramps, diarrhea, and discomfort in the chest. Signs include sweating, tearing, salivation, vomiting, cyanosis, convulsions, coma, loss of reflexes, and loss of sphincter control.

Long Term Exposure: Cholinesterase inhibitor; cumulative effect is possible. This chemical may damage the nervous system with repeated exposure, resulting in convulsions, respiratory failure. May cause liver damage.

Points of Attack: Respiratory system, lungs, central nervous system, cardiovascular system, skin, eyes, plasma and red blood cell cholinesterase.

Medical Surveillance: Before employment and at regular times after that, the following are recommended: plasma and red blood cell cholinesterase levels (tests for the enzyme poisoned by this chemical). If exposure stops, plasma levels return to normal in 1−2 weeks while red blood cell levels may be reduced for 1−3 months. When cholinesterase enzyme levels are reduced by 25% or more below preemployment levels, risk of poisoning is increased, even if results are in lower ranges of "normal." Reassignment to work not involving organophosphate or carbamate pesticides is recommended until enzyme levels recover. If symptoms develop or overexposure occurs, repeat the above tests as soon as possible and get an examination of the nervous system. Also, consider complete blood count. Consider chest X-ray following acute overexposure. Do not drink any alcoholic beverages before or during use. Alcohol promotes absorption of organic phosphates.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, and headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from strong bases. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

This compound requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. *Large spills:* dike far ahead of spill for later disposal. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Poisonous gases, including phosphorus oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do it without risk. Dike fire control water for later disposal; do not scatter the material. Wear positive pressure breathing apparatus and special protective clothing. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters.

Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Description: Trichlorophenols exists as 6 isomers (2,4,5-; 3,4,5-; 2,4,6-; 2,3,4-; 2,3,5-; and 2,3,6-). The most important (heavily regulated) are the 2,4,5- and 2,4,6-isomers. The 2,4,5-isomer is white powder or needles; 2,3,5- and 2,3,6- are colorless crystals; 2,4,5- is a gray crystalline solid or flakes; 2,4,6- is a colorless to light yellow crystalline solid. They have a phenolic odor. Molecular weight = 197.44; Boiling point = 248−253°C (*2,3,5-*); 253°C (*2,3,6-*); 253°C (2,4,5-); 246°C (2,4,6-); Freezing/Melting point = 84°C (*2,3,4-*); 62°C (2,3,5-); 58°C (*2,3,6-*); 67°C (*2,4,5-*); 70°C (*2,4,6-*); Flash point = 78°C (*2,3,6-*); 61°C (*2,4,6-*). Hazard Identification (based on NFPA-704 M Rating System): (*2,4,5-; 2,4,6-*) Health 2, Flammability 1, Reactivity 0. All isomers are slightly soluble or practically insoluble in water.

Potential Exposure: Compound Description (2,4,5-): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; (2,4,6-): Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant (2,3,6-) Mutagen; Human Data. 2,4,5-TCP is used as antifungal agent in adhesives and as preservative in polyvinyl acetate emulsions. 2,4,6-T is used in manufacturing slime-control agents and as an effective germicide and preservative; to produce defoliant 2,4,5-T and related products. Also used directly as a fungicide, anti-mildew and preservative agent; algicide, bactericide. 2,4,6-TCP is used to produce 2,3,4,6-TCP and PCP. Used directly as germicide, bactericide, glue and wood preservative; and anti-mildew treatment. 2,3,6-TCP is used as intermediate in production of fungicides and plant growth regulators.

Incompatibilities: Perhaps the most notable incompatibility is the reaction of 2,4,5-trichlorophenol in alkaline medium at high temperatures to produce dioxin. (2,3,4-isomer) reacts with oxidizers, acid anhydrides, and acid chlorides. (2,3,5-isomer) Decomposes on heating, on burning, and on contact with strong oxidants, producing toxic and corrosive fumes of hydrogen chloride. The substance is a weak acid. (2,3,6-isomer); the substance is a weak acid. pH = 4.8/4.2-; (2,4,6-isomer); reacts violently with strong oxidants and is incompatible with acid chlorides and acid anhydrides.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

2,3,6-

TEEL-0: 1.25 mg/m^3

PAC-1: 4 mg/m^3

PAC-2: 25 mg/m^3

PAC-3: 125 mg/m^3

2,4,5-

TEEL-0: 40 mg/m^3

PAC-1: 125 mg/m^3

PAC-2: 350 mg/m^3

PAC-3: 350 mg/m^3

2,4,6-

TEEL-0: 10 mg/m^3

PAC-1: 30 mg/m^3

PAC-2: 200 mg/m^3

PAC-3: 350 mg/m^3

DFG MAK: No numerical value established. Data may be available.

Denmark: TWA 0.5 mg/m^3, [skin] 1999 (2,4,5- and 2,3,6-isomers).

Sweden: MAC 0.5 mg/m^3; STEL 1.5 mg/m^3. Russia set a MAC of 3.0 μg/m^3 in ambient air in residential areas for the 2,4,6-isomer on a once-daily basis. Several states have set guidelines or standards for the trichlorophenols in ambient air.[60] Massachusetts has set zero for the 2,4,6-isomer and 1.6 μg/m^3 for the 2,4,5-isomer. Pennsylvania has set 3500 μg/m^3 for the 2,4,5-isomer on a 1-year exposure basis.

Determination in Air: Use NIOSH: (*o*-chlorophenol) P&CAM Method #337 (chlorophenols).

Permissible Concentration in Water: For 2,4,6-trichlorophenol, to protect freshwater aquatic life: 970 μg/L on a chronic toxicity basis. *To protect saltwater aquatic life:* no criteria developed due to insufficient data. To protect human health—for 2,4,5-TCP, 2600 μg/L; for 2,4,6-TCP, preferably zero. An additional lifetime cancer risk of 1 in 100,000 occurs at a level of 12 μg/L. These are based on organoleptic effects. A limit based on toxicological effects for 2,4,5-TCP would be 1600 μg/L.[6] Kansas[61] has set a guideline of 1.0 μg/L for the 2,4,5-isomer in drinking water. Values for the 2,4,6-isomer have been set by Kansas at 17.0 μg/L, by Minnesota at 17.5 μg/L, and by Maine at 700.0 μg/L. The WHO[35] has set a limit of 10.0 μg/L for the 2,4,6-isomer in drinking water.

Determination in Water: Methylene chloride extraction followed by gas chromatography with flame ionization or electron capture detection (EPA Method 604); or gas chromatography plus mass spectrometry (EPA Method 625).

Routes of Entry: Inhalation, ingestion, skin and/or eye contact may be absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Trichlorophenols irritates the eyes, skin, and the respiratory tract. A central nervous system depressant. High exposures can cause weakness, difficulty in breathing, tremors, convulsions, coma, and possible death. See also *chlorophenols.*

2,3,5-isomer: A mixture of trichlorophenols may cause irritation of the skin, eyes, and respiratory tract. These substances may cause acute metabolic effects resulting in damage in several organs, notably the CNS. Some technical products may contain highly toxic impurities including polychlorinated dibenzo-*p*-dioxins and -furans.

For the 2,4,5-isomer[52]: irritation of the skin, eyes, nose, and pharynx; redness and edema of the skin; dermatitis, corneal injury; iritis; sweating, thirst, nausea, vomiting, diarrhea, abdominal pain; cyanosis, hyperactivity, stupor, decreased activity and motor weakness; increase followed by decrease in respiratory rate and urinary output; fever; increased bowel action; lung, liver, or kidney damage; convulsions, collapse, and coma.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis, drying, and cracking. May affect the liver and kidneys. A related chemical, *phenol*, can cause liver and kidney damage. May be carcinogenic to humans. If any of the trichlorophenols is contaminated with 2,3,7,8-tetrachlorodibenzo-*p*-dioxin, the following effects may occur: acne-like skin rash; liver damage; nervous system damage with symptoms of weakness, pain in the legs, and numbness.

Points of Attack: *Inhalation:* Human (2,4,5-): lung, thorax, or respiration; structural or functional change in trachea or bronchi; lung, thorax, or respiration: other changes. Animal tests: change in liver weight, changes in spleen weight; other changes. Cancer site in animals (2,4,6-): liver and leukemia.

Medical Surveillance: Liver and kidney function tests. Complete blood count (CBC).

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that victim's airway is open and lay him on his side with his head lower than his body and transport at once to a medical facility. If conscious and not convulsing, give a slurry of activated charcoal in water. If medical advice is not readily available, do not induce vomiting, and rush the victim to the nearest medical facility.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool dry place or a refrigerator away from oxidizing agents and other incompatible materials listed above. Where possible, automatically transfer material from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of this chemical should be grounded and bonded. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Chlorophenols, solid, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Remove all sources of ignition and dampen spilled material with 60−70% ethanol to avoid airborne dust, then transfer material to a sealed container. Ventilate the spill area and use absorbent dampened with 60−70% ethanol to pick up remaining material. Wash surfaces well with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trichlorophenols are combustible, but are not easy to ignite. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including carbon monoxide, carbon dioxide, hydrogen chloride, and chlorine. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; R60; R20/21/22; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: 1,2,3-Trichloropropane is a colorless liquid with a strong acid odor. Molecular weight = 147.43; Specific gravity (H_2O:1) = 1.39 at 25°C; Boiling point = 156°C; Freezing/Melting point = −14°C; Flash point = 71°C (cc); Autoignition temperature = 304°C. Explosive limits: LEL = 3.2% at 120°C; UEL = 12.6% at 150°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Poor solubility in water; solubility = 0.1%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Trichloropropane dissolves oils, fats, waxes, chlorinated rubber, and numerous resins; it is used as a paint and varnish remover, a solvent, and a degreasing agent.

Incompatibilities: Violent decomposition with chemically active metals; strong bases. Vigorous reaction with strong oxidizers. Keep away from chlorinated rubber, resins and waxes, and sunlight.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.03 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 50 ppm/300 mg/m^3 TWA.

NIOSH REL: 10 ppm/60 mg/m^3 TWA [skin], Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/60 mg/m^3 TWA [skin] confirmed animal carcinogen with unknown relevance to humans.

NIOSH IDLH: 1000 ppm.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3
PAC-1: 30 mg/m^3
PAC-2: 50 mg/m^3
PAC-3: 100 mg/m^3

DFG MAK: [skin] Carcinogen Category 2.

Australia: TWA 10 ppm (60 mg/m^3), [skin], 1993; Austria: MAK 50 ppm (300 mg/m^3), 1999; Belgium: TWA 10 ppm (60 mg/m^3), [skin], 1993; Denmark: TWA 10 ppm (60 mg/m^3), [skin], 1999; Finland: TWA 50 ppm (300 mg/m^3), STEL 75 ppm (450 mg/m^3), 1999; Norway: TWA 10 ppm (60 mg/m^3), 1999; the Netherlands: MAC-TGG 0.108 mg/m^3, [skin], 2003; Russia: STEL 2 mg/m^3, 1993; Switzerland: carcinogen, 1999; United Kingdom: TWA 50 ppm (306 mg/m^3), STEL 75 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea; New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans.

Russia[43] set a MAC of 0.05 mg/m^3 for ambient air in residential areas on a daily average basis. Several states have set guidelines or standards for 1,2,3-trichloropropane in ambient air[60] ranging from 3.0–4.5 mg/m^3 (North Dakota) to 5.0 mg/m^3 (Virginia) to 6.0 mg/m^3 (Connecticut) to 7.143 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #1003, Hydrocarbons, halogenated; OSHA Analytical Method 7.[18]

Permissible Concentration in Water: Russia[43] has set 0.07 mg/L as a MAC in water bodies used for domestic purposes.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 2.27$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Trichloropropane is highly toxic by inhalation and moderately toxic by skin absorption. It is a local irritant and produces a number of unpleasant sensory effects; irritates the eyes, skin, and respiratory tract. Humans exposed to trichloropropane at 100 ppm found this to be an objectionable level of exposure, and all reported eye and throat irritation as well as an unpleasant odor. Also, according to NIOSH, skin irritation, central nervous system depression, and liver injury may result. Exposure to high concentrations may result in unconsciousness.

Long Term Exposure: Repeated contact can cause dermatitis; drying and cracking of the skin. May affect the heart and damage the liver. Although this chemical has not been adequately evaluated for brain and disturbed sleep, many solvents and petroleum-based products can cause these effects. Symptoms of exposure can include reduced memory, reduced ability to concentrate, personality changes, fatigue, sleep disturbances, reduced coordination, weakness, and/or feeling of "pins and needles" in extremities. A potential occupational carcinogen.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Cancer site in animals: forestomach, liver, and mammary glands.

Medical Surveillance: NIOSH lists the following tests: Expired Air. Liver function tests; EKG, evaluation for brain effects and psychological changes.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton and PVC are among the recommended materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a refrigerator or a cool, dry place and keep away from chemically active metals, oxidizers, strong caustics. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Toxic, liquids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." 1,2,3-Trichloropropane falls in DOT Hazard Class 6.1 and Parking Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal

environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosgene, carbon monoxide, chlorine, and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 0.8.

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.057; Nonwastewater (mg/kg), 30.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: TTE is a colorless liquid with an odor like carbon tetrachloride at high concentrations. A gas above 48°C. The odor threshold is 45−68 ppm. Molecular weight = 187.37; Specific gravity (H_2O:1) = 1.56 at 25°C; Boiling point = 48°C; Freezing/Melting point = −36°C; Vapor pressure = 285 mmHg at 25°C. Noncombustible liquid at ordinary temperatures, but the gas will ignite and burn weakly at 680°C (autoignition temperature). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 2. Practically insoluble in water; solubility = 0.02%.

Potential Exposure: Compound Description: Drug; Reproductive Effector; Human Data; Primary Irritant. TTE is used as a solvent and refrigerant; it is used in fire extinguishers; as a blowing agent and as an intermediate in the production of chlorotrifluoroethylene monomer by reaction with zinc.

Incompatibilities: Violent reaction with chemically active metals (such as powdered aluminum, beryllium, magnesium, and zinc); calcium. Contact with alloys containing more than 2% Mg causes decomposition releasing hydrogen chloride, hydrogen fluoride, and carbon monoxide.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.67 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/7600 mg/m^3 TWA.

NIOSH REL: 1000 ppm/7600 mg/m^3 TWA; 1250 ppm/9500 mg/m^3 STEL.

ACGIH TLV®[1]: 1000 ppm/7670 mg/m^3 TWA; 1250 ppm/9590 mg/m^3 STEL, not classifiable as a human carcinogen.

NIOSH IDLH: 2000 ppm.

Protective Action Criteria (PAC)
TEEL-0: 1000 ppm
PAC-1: 1250 ppm
PAC-2: 1500 ppm
PAC-3: 2000 ppm

Australia: TWA 1000 ppm (7600 mg/m^3), STEL 1250 ppm, 1993; Austria: MAK 500 ppm (3800 mg/m^3), 1999; Belgium: TWA 1000 ppm (7670 mg/m^3), STEL 1250 ppm, 1993; Denmark: TWA 500 ppm (3800 mg/m^3), 1999; Finland: TWA 1000 ppm (7600 mg/m^3), STEL 1250 ppm, 1999; France: VME 1000 ppm (7600 mg/m^3), VLE 1250 ppm, 1999; Hungary: STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 1170 mg/m^3, 2003; Norway: TWA 500 ppm (3800 mg/m^3), 1999; the Philippines: TWA 1000 ppm (7600 mg/m^3), 1993; Russia: TWA 500 ppm, STEL 5000 mg/m^3, 1993; Sweden: NGV 500 ppm (4000 mg/m^3), KTV 750 ppm (6000 mg/m^3), 1999; Switzerland: MAK-W 500 ppm (3800 mg/m^3), 1999; Turkey: TWA 1000 ppm (7600 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (7790 mg/m^3), STEL 1250 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 1250 ppm. Several states have set guidelines or standards for TTE in ambient air[60] ranging from 0.152 mg/m^3 (Connecticut) to 0.225 mg/m^3 (Indiana) to 76.0-95.0 mg/m^3 (North Dakota) to 180.952 mg/m^3 (Nevada) to 950.0 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1020, 1,1,2-Trichloro-1,2,2-trifluoroethane, #2549, Volatile organic compound; OSHA Analytical Method 113.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.30$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes and respiratory tract. May be a central nervous system depressant in high concentrations, causing headache, dizziness, loss of coordination, and unconsciousness; asphyxiation can result. *Inhalation:* No effects may be felt below 1000 ppm. Irregular heartbeat (arrhythmia) can occur at levels above 2000 ppm; may cause unconsciousness and possible death. Levels above 2500 ppm may cause loss of concentration, tiredness, and a feeling of heaviness of the head. Levels above 200,000 ppm may cause irritation of the nose and lungs, tremors, and coma. *Ingestion:* No information is available on human ingestion. However, animal studies show that Freon 113 causes unresponsiveness, facial swelling, diarrhea, and bleeding lungs. *Skin:* May cause irritation and frostbite if TTE is cold from refrigeration.

Long Term Exposure: Skin contact can cause dermatitis, drying, and cracking. Can accumulate in brain and kidneys from exposure below 2000 ppm. Will generally not produce noticeable effects at this level and may pass from the body within a week after exposure stops.

Points of Attack: Skin, heart, central nervous system, cardiovascular system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Special 24-h EKG (Holter monitor) to look for irregular heartbeat.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 2000 ppm:* Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. 1,1,2-Trichloro-1,2,2-trifluoroethane must be stored to avoid contact with chemically active metals, such as calcium, powdered aluminum, zinc, magnesium, and beryllium because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: The name of this material is not in the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, liquid, n.o.s. It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: 1,1,2-Trichloro-1,2,2-trifluoroethane itself does not easily burn. Extinguish fire using agent suitable for type of surrounding fire. The gas will ignite and burn weakly when exposed to high heat or flame. Poisonous gases, including carbonyl fluoride, chlorine, hydrogen chloride, hydrogen fluoride, and phosgene, are produced in fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Tricresyl phosphates T:0800

Molecular Formula: $C_{21}H_{21}O_4P$

Common Formula: $(CH_3C_6H_4O)_3PO$

Synonyms: *o*-Cresyl phosphate; Fosfito de tricresilo (Spanish); Phosflex 179-C; Phosphoric acid, tri-*o*-cresyl ester; Phosphoric acid, tris(methyl phenyl) ester; TCP; TOCP; TOFK; *o*-Tolyl phosphate; TPTP; Tri-*o*-cresyl ester of phosphoric acid; *o*-Tricresyl phosphate; Tri-*o*-cresyl phosphate; Tricresyl phosphate, *o*-; *o*-Trikresylphosphat (German); Tri-2-methylphenyl phosphate; Tris(*o*-cresyl) phosphate; Tris(*o*-methylphenyl) phosphate; Tri-*o*-tolyl phosphate; Tri-2-tolyl phosphate

CAS Registry Number: 78-30-8 (*o*-isomer); 563-04-2 (*m*-isomer); 78-32-0 (*p*-isomer); 1330-78-5 (mixed isomers)

RTECS® Number: TD0350000

UN/NA & ERG Number: UN2574/151

EC Number: 201-103-5 [*Annex I Index No.:* 015-015-00-8] (*o*-isomer); 209-241-8 (*m*-isomer); 201-105-6 [*Annex I Index No.:* 015-016-00-3] (*p*-isomer); 215-548-8 (mixed isomers or tris(methylphenyl) phosphate)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations (*o-o-o; o-o-m; o-o-p; o-m-m; o-m-p; o-p-p*): Hazard Symbol: T, N; Risk phrases: R39; R23/24/25; R51/53; Safety phrases: S1/2; S20/21; S28; S45; S6; (*m-m-m; m-m-p; m-p-p; p-p-p*) Hazard Symbol: Xn, N; Risk phrases: R21/2251/53; Safety phrases: S2; S28; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned (*all isomers*).

Description: Tricresyl phosphates are available as the *o*-isomer (TOCP), the *m*-isomer (TMCP), and *p*-isomer (TPCP). The ortho-isomer is the most toxic of the three; the meta- and para-isomers are relatively inactive. The commercial product may contain the *ortho*-isomer as a contaminant unless special precautions are taken during manufacture. Pure tri-*para*-cresyl phosphate is a solid, and ortho- and meta- are liquids (see below). The *tri-o-cresyl phosphate* will be discussed here as the specific example of these compounds because it is the most toxic of the tricresyl phosphates and specifically regulated by OSHA. TOCP is a colorless to pale yellow, odorless liquid or solid (below 52°F/11°C). Molecular weight = 368.39; Specific gravity (H_2O:1) = 1.20 at 25°C; Boiling point = 410°C (with decomposition); Freezing/Melting point = 11°C; Vapor pressure = 0.00002 mmHg at 25°C; Flash point = 110−225°C; Autoignition temperature = 385°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Mutagen; Reproductive Effector. Tricresyl phosphate is used as an additive in hydraulic fluids; as a plasticizer, pigment dispersant, flame retardant; as a plasticizer for chlorinated rubber, vinyl plastics, polystyrene, polyacrylic and polymethacrylic esters; as an adjuvant in milling of pigment pastes; as a solvent and as a binder in nitrocellulose and various natural resins; and as an additive to synthetic lubricants and gasoline. It is also used in the recovery of phenol in coke-oven wastewaters.

Incompatibilities: Contact with magnesium may cause explosion. Contact with strong oxidizers may cause fire and explosions.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg/m^3 TWA.

NIOSH REL: 0.1 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA [skin], not classifiable as a human carcinogen; BEI_A issued for acetylcholinesterase-inhibiting pesticides.

NIOSH IDLH: 40 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 0.3 ppm

PAC-2: 0.6 ppm

PAC-3: 40 ppm

Australia: TWA 0.1 mg/m^3, [skin], 1993; Austria: MAK 0.1 mg/m^3, 1999; Belgium: TWA 0.1 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, 1999; Finland: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, [skin], 1999; France: VME 0.1 mg/m^3, [skin], 1999; Hungary: TWA 0.1 mg/m^3, STEL 0.2 mg/m^3, [skin], 1993; the Netherlands: MAC-TGG 0.1 mg/m^3, 2003; the Philippines: TWA 0.1 mg/m^3, 1993; Poland: MAC (TWA) 0.1 mg/m^3; MAC (STEL) 0.3 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, 1999; United Kingdom: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for the compound in ambient air[60] ranging from 1.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Connecticut and Nevada) to 160.0 μg/m^3 (Virginia).

Determination in Air: Use NIOSH Analytical Method (IV) #5037, Triorthocresyl phosphate.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact. The widespread epidemics of poisoning that have occurred have been due to ingested ortho-isomer as a contaminant of foodstuffs. Experimental human studies with labeled phosphorus derivatives show that only 0.4% of the applied dose was absorbed.

Harmful Effects and Symptoms

Short Term Exposure: May affect the central and peripheral nervous systems, causing impaired functions (paralysis). Exposure above exposure limits may cause permanent paralysis. The major effects from inhaling, swallowing, or absorbing tricresyl phosphate through the skin are on the spinal cord and peripheral nervous system; the poison attacking the anterior horn cells and pyramidal tract as well as the peripheral nerves. Gastrointestinal symptoms on acute exposure (nausea, vomiting, diarrhea, and abdominal pain) are followed by a latent period of 3−30 days with the progressive development of muscle soreness and numbness of fingers, calf muscles, and toes; with foot and wrist drop. In chronic intoxication, the gastrointestinal symptoms pass unnoticed, and after a long latent period, flaccid paralysis of limb and leg muscles appears. There are minor sensory changes and no loss of sphincter control.

Long Term Exposure: May affect the nervous system, causing peripheral neuropathy, cramps in calves, paresthesia in feet or hands, weakness in the feet, wrist drop, muscular paralysis.

Points of Attack: Peripheral nervous system, central nervous system.

Medical Surveillance: Preplacement and periodic examinations should include evaluation of spinal cord and neuromuscular function, especially in the extremities; and a history of exposure to other organophosphate esters, pesticides, or neurotoxic agents. Periodic cholinesterase determination may relate to exposure, but not necessarily to neuromuscular effect.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Effects may be delayed. Medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton™, polyvinyl chloride, Nitrile + PVC, butyl rubber, and polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *0.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *1 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *40 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a refrigerator or a cool, dry place away from oxidizing materials. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Tricresyl phosphate with >3% ortho-isomer requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: *Solid* (below 52°F/11°C): Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Liquid: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

US EPA Hazardous Waste Number (RCRA No.): U404.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Reportable Quantity (RQ): 5000 lb (2270 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: F, C; Risk phrases: R11; R20/21/22; R35; Safety phrases: S1/2; S3; S16; S26; S29; S36/37/39; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Triethylamine is a colorless liquid with a strong ammonia-like odor. The odor threshold is 0.48 ppm. Molecular weight = 101.22; Specific gravity (H_2O:1) = 0.73 at 25°C; Boiling point = 89°C; Freezing/Melting point = –115°C; Vapor pressure = 54 mmHg at 25°C; Flash point = −7°C; Autoignition temperature = 249°C; also listed at 230°C. Explosive limits: LEL = 1.2%; UEL = 8.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Slightly soluble in water; solubility = 2%.

Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Triethylamine is used as a solvent; corrosion inhibitor; in chemical synthesis; and accelerator activators; paint remover; base in methylene chloride or other chlorinated solvents. TEA is used to solubilize 2,4,5-T in water and serves as a selective extractant in the purification of antibiotics. It is used to manufacture quaternary ammonia compounds and octadecyloxymethyltriethylammonium chloride; an agent used in textile treatment.

Incompatibilities: A strong base. Violent reaction with strong acids, halogenated compounds, and strong oxidizers. Attacks some forms of plastics, rubber, and coatings. Corrosive to aluminum, zinc, copper, and their alloys in the presence of moisture.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.14 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 25 ppm/100 mg/m^3 TWA.

NIOSH REL: No established REL; See *NIOSH Pocket Guide*, Appendix D.

ACGIH TLV®[1]: 1 ppm/4.1 mg/m^3 TWA; 3 ppm/12.4 mg/m^3 STEL, not classifiable as a human carcinogen [skin].

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 3 ppm
PAC-2: 3 ppm
PAC-3: 200 ppm

DFG MAK: 1 ppm/4.2 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group D.

Europe OEL: 2 ppm/8.4 mg/m^3 TWA; 3 ppm/12.6 mg/m^3 STEL [skin] 2002.

Australia: TWA 10 ppm (40 mg/m^3), STEL 15 ppm, 1993; Austria: MAK 2.5 ppm (10 mg/m^3), 1999; Belgium: TWA 10 ppm (41 mg/m^3), STEL 15 ppm, 1993; Denmark: TWA 10 ppm (40 mg/m^3), 1999; Finland: TWA 10 mg/m^3, STEL 20 mg/m^3, [skin], 1999; France: VLE 10 ppm (40 mg/m^3), 1999; Hungary: TWA 20 mg/m^3, STEL 40 mg/m^3, 1993; the Netherlands: MAC-TGG 20 mg/m^3, [skin], 2003; Norway: TWA 10 ppm (40 mg/m^3), 1999; the Philippines: TWA 25 ppm (100 mg/m^3), 1993; Russia: STEL 10 mg/m^3, [skin], 1993; Sweden: NGV 2 ppm (8 mg/m^3), KTV 10 ppm (40 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (40 mg/m^3), KZG-W 20 ppm (80 mg/m^3), 1999; Turkey: TWA 25 ppm (100 mg/m^3), 1993; United Kingdom: TWA 10 ppm (42 mg/m^3), STEL 15 ppm (63 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 3 ppm [skin]. Russia[43] set a MAC of 0.14 mg/m^3 in ambient air of residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for triethylamine in ambient air[60] ranging from 5.6 μg/m^3 (Massachusetts) to 20.0−200.0 μg/m^3 (Rhode Island) to 400.0−600.0 μg/m^3 (North Dakota) to 660.0 μg/m^3 (Virginia) to 800.0 μg/m^3 (Connecticut) to 952.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (II-3) #S-152, OSHA Analytical Method PV2060.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.45.

Permissible Concentration in Water: Russia[43] set a MAC of 2.0 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin absorption, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Triethylamine can affect you when breathed in and by passing through your skin. Corrosive to the eyes, skin, and respiratory tract. Contact can cause severe eye damage. Breathing the vapor can irritate the lungs. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. A central nervous system depressant.

Long Term Exposure: Can irritate the lungs; repeated exposures may cause bronchitis to develop. May cause skin allergy. May damage the kidneys and liver. Similar compounds can cause an asthma-like allergy to develop. Once allergy develops, even very small future exposures can cause wheezing, chest tightness, and shortness of breath. In animals: myocardial, kidney, liver damage.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system, liver, kidneys.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests; liver function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests; examination of the eyes and vision; evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Nitrile, Viton™, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Provide: eyewash (>1%), quick drench (>1%).

Respirator Selection: OSHA: *200 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFS (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted canister providing protection against the compound of concern] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Triethylamine must be stored to avoid contact with strong acids (such as hydrochloric, sulfuric, and nitric) or oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) because violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where triethylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of triethylamine should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of triethylamine.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including nitrogen oxides and carbon monoxide, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

Trifluorobromomethane T:0820

Molecular Formula: $CBrF_3$

Synonyms: Bromofluroform; Bromotrifluormetano (Spanish); Bromotrifluoromethane; Carbon monobromide trifluoride; F 13 B1; FC 13 B1; Flugex 13 B1; Fluorocarbon 1301; Freon 13 B1; Halon 1301; Methane, bromotrifluoro-; R 13 B1; Refrigerant 1301; Trifluoromethyl bromide; Trifluoromonobromomethane

CAS Registry Number: 75-63-8

RTECS® Number: PA5425000

UN/NA & ERG Number: UN1009/126

EC Number: 200-887-6

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Stratospheric ozone protection (Title VI, Subpart A, Appendix A), Class I, Ozone Depletion Potential = 10.0.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Trifluorobromomethane is a colorless gas with a slight ethereal odor. Shipped as a liquefied compressed gas. Molecular weight = 148.92; Specific gravity (H_2O:1) = 1.50 at 25°C; Boiling point = −58°C; Freezing/Melting point = −166°C. Slightly soluble in water; solubility = 0.03%.

Potential Exposure: Compound Description: Human Data. This material is used as a fire extinguishing agent, a chemical intermediate, and as a refrigerant.

Incompatibilities: Chemically active metals, such as calcium, powdered aluminum, zinc, magnesium. Attacks some plastics, rubber, and coatings.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 6.09 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 1000 ppm/6100 mg/m^3 TWA.

NIOSH REL: 1000 ppm/6100 mg/m^3 TWA.

ACGIH TLV®[1]: 1000 ppm/6090 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 1000 ppm

PAC-1: 3500 ppm

PAC-2: 25,000 ppm

PAC-3: 40,000 ppm

DFG MAK: 1000 ppm/6200 mg/m^3 TWA; Peak limitation Category II(8); Pregnancy Group C.

NIOSH IDLH: 40,000 ppm.

Australia: TWA 1000 ppm (6100 mg/m^3), 1993; Austria: MAK 1000 ppm (6100 mg/m^3), 1999; Belgium: TWA 1000 ppm (6090 mg/m^3), 1993; Denmark: TWA 1000 ppm (6100 mg/m^3), 1999; Finland: TWA 1000 ppm (6100 mg/m^3), STEL 1250 ppm (7625 mg/m^3), 1999; France: VME 1000 ppm (6100 mg/m^3), 1999; the Netherlands: MAC-TGG 6100 mg/m^3, 2003; the Philippines: TWA 1000 ppm (6100 mg/m^3), 1993; Russia: STEL 3000 mg/m^3, 1993; Switzerland: MAK-W 1000 ppm (6100 mg/m^3), 1999; Turkey: TWA 1000 ppm (6100 mg/m^3), 1993; United Kingdom: TWA 1000 ppm (6190 mg/m^3), STEL 1200 ppm, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 1000 ppm. Several states have set guidelines or standards for this compound in ambient air[60] ranging from 61.0 mg/m^3 (North Dakota) to 100 mg/m^3 (Virginia) to 122 mg/m^3 (Connecticut) to 145.238 mg/m^3 (Nevada).

Determination in Air: Absorption on charcoal, workup with methylene chloride; analysis by gas chromatography.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.86.

Routes of Entry: Inhalation, eye and/or skin contact with the liquid.

Harmful Effects and Symptoms

Short Term Exposure: Trifluorobromomethane can affect you when breathed in. Irritates the eyes. Contact with the liquid may cause frostbite. Exposure can cause CNS depression, causing lightheadedness and trouble concentrating. Breathing high concentrations of the vapor may cause the heart to beat irregularly or to stop.

Long Term Exposure: Unknown at this time. However, some related chemicals are known to cause liver damage with high or repeated exposure.

Points of Attack: Central nervous system, heart.

Medical Surveillance: If symptoms develop or overexposure has occurred, the following may be useful: A special 24-h EKG (Holter monitor) to look for irregular heartbeat; consider liver function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 10,000 ppm:* Sa (APF = 10) (any supplied-air respirator). *Up to 25,000 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 40,000 ppm:* SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Trifluorobromomethane must be stored to avoid contact with chemically active metals (such as calcium, powdered aluminum, zinc, and magnesium) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: This compound requires a shipping label of "NONFLAMMABLE GAS." It falls in Hazard Class 2.2.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a nonflammable gas. Poisonous gases, including phosgene, hydrogen bromide, and hydrogen fluoride, are produced in fire. Extinguish fire using an agent suitable for type of surrounding fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.

Trifluoroethane T:0830

Molecular Formula: $C_2H_3F_3$

Synonyms: *1,1,1-isomer:* Ethane, 1,1,1-trifluoro-; FC143A; Fluorocarbon FC143A; Methylfluoroform; R 143A; 1,1,1-Trifluoroethane; 1,1,1-Trifluoroform

1,1,2-isomer: Ethane, 1,1,2-trifluoro-; R 143

CAS Registry Number: 420-46-2 (1,1,1-isomer); 430-66-0 (1,1,2-isomer); 27987-06-0 (mixed isomers)

RTECS® Number: KJ4100000 (trifluoroethane); KJ4110000 (1,1,1-isomer)

UN/NA & ERG Number: UN2035 (1,1,1-Trifluoroethane, compressed or Refrigerant gas, R 143)/115

EC Number: 206-996-5 (1,1,1-isomer); 207-066-1 (1,1,2-isomer); 248-764-6 (mixed isomers)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*CAS: 420-46-2*).

Description: 1,1,1-Trifluoroethane is a colorless gas or a liquid under pressure. Molecular weight = 84.05; Boiling point = −111°C.

Potential Exposure: The 1,1,1-isomer is used to make other chemicals and may be used as a refrigerant.

Incompatibilities: None listed.

Permissible Exposure Limits in Air

AIHA WEEL: 1000 ppm TWA, as 1,1,1-Trifluoroethane.

Russia: The 1,1,1-isomer has a MAC of 3000 mg/m^3 in work-place air.[43]

No TEEL available.

Routes of Entry: Inhalation.

Harmful Effects and Symptoms

Short Term Exposure: Trifluoroethane can affect you when breathed in. Inhalation may cause central nervous system depression. Higher levels may cause dizziness, lightheadedness, unconsciousness, and asphyxiation. Contact with the liquid may cause frostbite. Exposure may cause cardiac arrhythmia (irregular heartbeat).

Long Term Exposure: No chronic health effects are known at this time.

Points of Attack: Heart, central nervous system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Holter monitor (a special 24-h EKG to look for irregular heartbeats). Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquids, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Where exposure to cold equipment, vapors, or liquid may occur, employees should be provided with special clothing designed to prevent the freezing of body tissues.

Respirator Selection: Where there is potential for exposure to trifluoroethane, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Outdoor or detached storage is recommended. Sources of ignition, such as smoking and open flames, are prohibited where trifluoroethane is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of leak to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trifluoroethane is a flammable gas. Use dry chemical, CO_2, water spray, or foam extinguishers. Use water spray to keep fire-exposed containers cool. Poisonous gases, including hydrogen fluoride, are produced in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Animal, Limited Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1991; NCI: Carcinogenesis Bioassay (feed); clear evidence: mouse; no evidence: rat; EPA: Possible Human Carcinogen.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

US EPA Gene-Tox Program, Positive: *N. crassa—aneuploidy*; Weakly Positive: *S. cerevisiae*—homozygosis; Positive/limited: Carcinogenicity—mouse/rat; Negative: *D. melanogaster* sex-linked lethal; Negative: *In vitro* UDS—human fibroblast; TRP reversion; Inconclusive: *B. subtilis* rec assay; *E. coli* polA without S9.

Banned or Severely Restricted (in US) (UN).[13]

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Safe Drinking Water Act: Priority List (55 FR 1470).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations (*containing <0.5 ppm NPDA*): Hazard Symbol: Xi; Risk phrases: R36; R43; Safety phrases: S2; S24; S37 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Trifluralin is an orange crystalline solid. Molecular weight = 335.32; Boiling point = 139°C; Freezing/Melting point = 49°C; Vapor pressure = 0.0001 mmHg. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 1, Reactivity 0. Practically insoluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector.

Those involved in the manufacture, formulation, and application of this selective preemergence herbicide.

Incompatibilities: Store in temperatures above 4.4°C. Fluorocarbons can react violently with barium, potassium, sodium.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 40 mg/m^3
PAC-1: 125 mg/m^3
PAC-2: 150 mg/m^3
PAC-3: 150 mg/m^3

The state of Pennsylvania has set a guideline of 1150 μg/m^3 for trifluralin in ambient air.[60]

Permissible Concentration in Water: EPA has set a lifetime health advisory of 2.0 μg/L. The state of Maine has set a guideline of 200.0 μg/L for drinking water.[61]

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 5.07$. Fish Tox = 1.57645000 ppb MATC (HIGH).

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Inhalation can cause irritation of the respiratory tract with cough, phlegm, and/or tightness in the chest. The vapor can cause eye and skin irritation. Skin contact can cause irritation and rash which can be exacerbated by sunlight. The majority of reported trifluralin exposure cases were occupational in nature. Other reported symptoms include respiratory involvement, abdominal cramps, nausea, diarrhea, headache, lethargy, and paresthesia following dermal or inhalation exposure.

Long Term Exposure: May cause skin sensitization. High or repeated exposure may affect the liver and kidneys and/or cause anemia. There is some dispute about the actual carcinogenic effect of trifluralin. NCI[9] reports clear evidence of carcinogenicity in mice but not in rats. Some authorities feel that dipropyl nitrosamine formed in trifluralin manufacture and contained in the technical material might be the actual culprit, and the purified trifluralin might not have this problem. Human Tox = 5.00000 ppb (HIGH).

Points of Attack: Skin, eyes, liver, kidneys, blood.

Medical Surveillance: Kidney and liver function tests. Complete blood count (CBC).

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place and protect from prolonged exposure to light.

Shipping: Trifluralin, an organofluorine, can be classed as Pesticides, solid, toxic, n.o.s., which require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust, then transfer material to a suitable container. Use absorbent dampened with alcohol to pick up remaining material. Wash surfaces well with soap and water. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Soil Adsorption Index (K_{oc}) = 8000.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxide and hydrogen fluoride. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed. Trifluralin does contain fluorine, and therefore incineration presents the increased hazard of HF in the off-gases. Prior to incineration, fluorine-containing compounds should be mixed with slaked lime plus vermiculite, sodium carbonate, or sand-soda ash mixture (90-10).

See entry under "Aluminum alkyls."

Trimellitic anhydride T:0850

Molecular Formula: $C_9H_4O_5$

Synonyms: Anhydrotrimellic acid; 1,2,4-Benzenetricarboxylic acid anhydride; 1,2,4-Benzenetricarboxylic acid, cyclic 1,2-anhydride; 1,2,4-Benzenetricarboxylic anhydride; 4-Carboxyphthalic anhydride; 1,3-Dihydro-1,3-dioxo-5-isobenzofurancarboxylic acid; 1,3-Dioxo-5-phthalancarboxylic acid; Diphenylmethane-4,4′-diisocyanate-trimellic anhydride-ethomid HT polymer; NCI-C56633; TMA; TMAN; Trimellic acid anhydride; Trimellitic acid cyclic-1,2-anhydride

CAS Registry Number: 552-30-7

RTECS® Number: DC2050000

EC Number: 209-008-0 [*Annex I Index No.:* 607-097-00-4]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: Xn; Risk phrases: R37; R41; R42/43; Safety phrases: S2; S22; S26; S36/37/39 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Trimellitic anhydride is a crystalline solid. It is the anhydride of trimellitic acid (1,2,4-benzenetricarboxylic acid). Molecular weight = 192.13; Boiling point = 245°C; Freezing/Melting point = 166.7°C; Vapor pressure = 0.000004 mmHg; Flash point = 227°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 1₩. Highly soluble; reacts with water.

Potential Exposure: Compound Description: Drug. TMA is used to produce trimellitate plasticizers, poly (amide-imide) polymers; in paints, enamels, and coatings; polymers, polyesters; as a curing agent for epoxy and other resins; in vinyl plasticizers; agricultural chemicals; dyes and pigments; pharmaceuticals, surface active agents; modifiers, intermediates, and specialty chemicals.

Incompatibilities: Dust can cause an explosion. Violent reaction with strong oxidizers. Reacts slowly with water, forming trimellitic acid.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 7.86 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 0.005 ppm/0.04 mg/m^3 TWA, Should be handled in the workplace as an extremely toxic substance.

ACGIH TLV®[1]: 0.0005 mg/m^3 measured as inhalable fraction and vapor TWA; 0.002 mg/m^3 measured as inhalable fraction and vapor Ceiling Concentration; [skin]; danger of sensitization.

DFG MAK: 0.04 mg/m^3 TWA; Peak Limitation Category I (1); danger of sensitization of the airways.

Australia: TWA 0.005 ppm (0.04 mg/m^3), 1993; Austria: MAK 0.005 ppm (0.04 mg/m^3), 1999; Belgium: TWA 0.005 ppm (0.059 mg/m^3), 1993; Denmark: TWA 0.1 mg/m^3, 1999; Finland: TWA 0.005 ppm, 1999; Norway: TWA 0.005 ppm (0.04 mg/m^3), 1999; Russia: STEL 0.1 mg/m^3, 1993; Sweden: NGV 0.04 mg/m^3, TGV 0.08 mg/m^3, 1999; Switzerland: MAK-W 0.005 ppm (0.04 mg/m^3), KZG-W 0.01 ppm (0.08 mg/m^3), 1999; United Kingdom: TWA 0.04 mg/m^3, STEL 0.12 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.04 mg/m^3. Several states have set guidelines or standards for trimellitic anhydride in ambient air[60] ranging from 0.4 μg/m^3 (North Dakota) to 0.7 μg/m^3 (Virginia) to 0.8 μg/m^3 (Connecticut) to 1.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5036, Trimellitic anhydride, OSHA Analytical Method 98.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Trimellitic anhydride can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. High exposure may cause runny nose, cough, wheezing and shortness of breath, malaise (vague feeling of discomfort), fever, muscle aches. "TMA-flu" with symptoms of cough, chills, shortness of breath, body aches, weakness, and coughing up blood may be delayed for 4−12 h following overexposure. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated inhalation exposure may cause asthma which may be delayed and is aggravated by physical activity. Allergic asthma occurs sometimes weeks or months after exposure. Trimellitic anhydride can also cause "Pulmonary Disease-Anemia Syndrome" with low blood count, and different lung changes.

Points of Attack: Eyes, skin, respiratory system, blood.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function test—these may be normal if the person is not having an attack at the time of the test. If symptoms develop or overexposure is suspected, the following may be useful: special tests for trimellitic anhydride allergy (IgE antibodies against TM-HAS). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose allergy. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 0.005 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid (no flash point can be found in the literature). Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: F+, Xn; Risk phrases: R12; R20; R37/38; R41; Safety phrases: S2; S16; S26; S39 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Trimethylamine is a strong, fishy, ammoniacal-smelling gas. Flammable gas. Shipped as a compressed gas. It may be present in an aqueous solution. The odor threshold is 0.00011−0.87 ppm. *Warning:* The odor threshold range is so broad that odor alone should not be used as a warning of potentially hazardous exposures. Molecular weight = 59.13; Boiling point = 3°C; Specific gravity (H_2O:1) = 0.58 at 25°C; Freezing/Melting point = −117°C; Vapor pressure = 1454 mmHg at 21°C; Flash point = flammable gas; Autoignition temperature = 190°C. Explosive limits: LEL = 2.0%; UEL = 11.6%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 4, Reactivity 0. Soluble in water; solubility = 48% at 30°C.

Potential Exposure: Compound Description: Reproductive Effector. Trimethylamine is used as a chemical intermediate in organic synthesis of quaternary ammonium compounds, as an insect attractant, as a warning agent in natural gas, as a flotation agent.

Incompatibilities: A medium strong base. Violent reaction with strong oxidizers (such as chlorine, bromine, fluorine), ethylene oxide, nitrosating agents (e.g., sodium nitrite), mercury, strong acids. Corrosive to many metals (e.g., zinc, brass, aluminum, copper, tin, and their alloys).

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.42 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 10 ppm/24 mg/m^3 TWA; 15 ppm/36 mg/m^3 STEL.
ACGIH TLV®[1]: 5 ppm/12 mg/m^3 TWA; 15 ppm/36 mg/m^3 STEL.
AIHA WEEL: 1 ppm TWA.
Protective Action Criteria (PAC)*
TEEL-0: 5 mg/m^3
PAC-1: **8.0** mg/m^3
PAC-2: **120** mg/m^3
PAC-3: **380** mg/m^3
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 2 ppm/4.9 mg/m^3 TWA; Peak Limitation Category I(2); Pregnancy Risk Group C.

Australia: TWA 10 ppm (24 mg/m^3), STEL 15 ppm, 1993; Belgium: TWA 10 ppm (24 mg/m^3), STEL 15 ppm, 1993; Denmark: TWA 10 ppm (24 mg/m^3), 1999; France: VLE 10 ppm (25 mg/m^3), 1999; Hungary: TWA 5 mg/m^3, STEL 10 mg/m^3, 1993; Norway: TWA 10 ppm (24 mg/m^3), 1999; the Netherlands: MAC-TGG 1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm. Several states have set guidelines or standards for trimethylamine in ambient air[60] ranging from 57.143 μg/m^3 (Kansas) to 240−360.0 μg/m^3 (North Dakota) to 400.0 μg/m^3 (Virginia) to 480.0 μg/m^3 (Connecticut) to 952.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV2060.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 0.2$.

Routes of Entry: Inhalation, ingestion (solution), skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Trimethylamine can affect you when breathed in. Exposure can irritate the eyes, skin, and respiratory tract. Very high levels may cause a buildup of fluid in the lungs (pulmonary edema). This can cause death. Contact can cause severe irritation and burns to the eyes and skin. May cause blurred vision, corneal necrosis. Contact may cause frostbite.

Long Term Exposure: Long-term effects are not known at this time.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray following acute overexposure. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid, unless full-face-piece respiratory protection is worn. Wear gas-proof goggles, unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 10 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trimethylamine must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) and mercury since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where trimethylamine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of trimethylamine. Wherever trimethylamine is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Trimethylamine, anhydrous, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1. Trimethylamine, aqueous solutions, requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." Trimethylamine, aqueous solutions, with not >50% trimethylamine by mass falls in DOT Hazard Class 3 and Packing Group I, II, or III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. For a spill of a liquid solution of trimethylamine, absorb liquid with sodium bisulfate, sand, vermiculite, earth, or a similar material. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Trimethylamine is a flammable gas or liquid. For a small fire involving trimethylamine gas, use dry chemical or CO_2 extinguishers. For small water solution fires, use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire, including oxides of nitrogen. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If liquid or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

2,4,6-Trimethylaniline T:0870

Molecular Formula: $C_9H_{13}N$
Common Formula: $C_6H_2(CH_3)_3NH_2$
Synonyms: Aminomesitylene; 2-Amino-1,3,5-trimethylbenzene; Aniline, 2,4,6-trimethyl-; Mesidine; Mesitylamine; Mezidine; 2,4,6-Trimethylbenzenamine
CAS Registry Number: 88-05-1
RTECS® Number: BZ0700000
UN/NA & ERG Number: UN2810/153
EC Number: 201-794-3
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal Inadequate Evidence; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1982.
CERCLA/SARA 40CFR302 Extremely Hazardous Substances: TPQ = 500 lb (227 kg).
Reportable Quantity (RQ): 500 lb (227 kg).
Canada, WHMIS, Classification D2B. On NDSL list.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.
Description: Aniline, 2,4,6-trimethyl- is a clear liquid. Molecular weight = 135.21; Boiling point = 233°C; Freezing/Melting point = −5°C. Insoluble in water.
Potential Exposure: Used on small scale in organic synthesis.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 0.125 mg/m^3
PAC-1: 0.4 mg/m^3
PAC-2: 2.9 mg/m^3
PAC-3: 40 mg/m^3
Routes of Entry: Ingestion.
Harmful Effects and Symptoms
Short Term Exposure: This material is moderately toxic orally. It is also considered highly toxic by unspecified routes. It is a skin and eye irritant. The danger of acute poisoning is represented by methemoglobinemia leading to adverse effects on the red cells. A number of the amines may act as skin sensitizers. Repeated exposure results in narrowing of peripheral vision, increase in size of blind spot, and decrease in photosensitivity. The LC_{50} inhalation (mouse) is 0.29 mg/L/2 h.
Long Term Exposure: Suspect occupational carcinogen. This material is a suspect carcinogen on the basis of being an aromatic amine but, unlike the 2,4,5-trimethyl-isomer, is not positive for animals.
Points of Attack: Blood, eyes, respiratory system.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.
Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically pump liquid from drums or other storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Wherever this chemical is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. A regulated, marked area

should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic, liquids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." 1,2,3-Trichloropropane falls in DOT Hazard Class 6.1 and Parking Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills*: absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills*: dike far ahead of spill for later disposal. Wear positive pressure breathing apparatus and special protective clothing. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Move container from fire area if you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. If water pollution occurs, notify appropriate authorities. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Trimethylbenzenes T:0880

Molecular Formula: C_9H_{12}

Common Formula: $C_6H_3(CH_3)_3$

See also separate ***Mesitylene*** *108-67-8 (1,3,5-Trimethylbenzene) record*

Synonyms: *1,2,3-isomer:* Hemellitol; Hemimellite; 1,2,3-Trimethylbenzene; 1,2,3-Trimetilbenceno (Spanish)

1,2,4-isomer: Pseudocumene; PSI-Cumene; *asym*-Trimethylbenzene; 1,2,4-Trimethylbenzene; 1,2,4-Trimetilbenceno (Spanish)

1,3,5-isomer: Mesitylene, *sym*-trimethylbenzene; *sym*-Trimethylbenzene; 1,3,5-Trimethylbenzene; 1,3,5-Trimetilbenceno (Spanish)

Mixed isomers: Trimethylbenzene, mixed isomers; Trimetilbenceno (Spanish)

Note: Hemimellitene is a mixture of the 1,2,3-isomer with up to 10% of related aromatics, such as the 1,2,4-isomer.

CAS Registry Number: 526-73-8 (1,2,3-isomer); 95-63-6 (1,2,4-isomer); 108-67-8 (1,3,5-isomer); 25551-13-7 (mixed isomers)

RTECS® Number: OX6825000 (1,3,5-isomer); DC3325000 (1,2,4-isomer); DC3300000 (1,2,3-isomer); DC3225000 (mixed isomers)

UN/NA & ERG Number: UN2325 (1,3,5-isomer)/129; UN1993 (flammable liquids, n.o.s.)/128

EC Number: 208-394-8 (1,2,3-isomer); 202-436-9 [*Annex I Index No.:* 601-043-00-3] (1,2,4-isomer); 203-604-4 [*Annex I Index No.:* 601-025-00-5] (1,3,5-isomer); 247-099-9 (mixed isomers)

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

1,2,4-isomer:

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (1,2,4- and 1,3,5-isomers); 1% 1,2,3- and mixed-isomers).

Note: Only the 1,2,4-isomer is regulated by the US EPA. All three isomers are "regulated" by NIOSH. The 1,3,5-isomer was dropped from the EPA's Extremely Hazardous Substance List (EPA-SARA) in 1988.

European/International Regulations (*95-63-6*): Hazard Symbol: Xn; Risk phrases: R10; R20; R36/37/38; Safety phrases S2; S26 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting *95-63-6 (1,2,4-isomer).*

Description: Trimethylbenzenes exists in three isomeric forms. All isomers are clear, colorless liquids with a distinctive, aromatic odor. The odor threshold for the class is 0.55 ppm. Molecular weight = 120.21; Specific gravity (H_2O:1) = 0.89 at 25°C; Boiling point = 176°C (1,2,3-isomer); 169°C (1,2,4-isomer); 164°C (1,3,5-isomer); Freezing/Melting point = −25°C (1,2,3-isomer); Vapor pressure = 1 mmHg at 17°C (1,2,3-); 1 mmHg at 13°C (1,2,4-); Flash points = 44°C (1,2,3- & 1,2,4-isomers); 50°C (1,3,5-isomer); 53°C [1,2,3-isomer (90.5%)]; Autoignition temperature = 470°C (1,2,3-isomer); 479°C [1,2,3-isomer (90.5%)]; 500°C (1,2,4-isomer); 559°C (1,3,5-isomer). Explosive limits: LEL = 0.9%; UEL = 6.4% (1,2,4-isomer); LEL = 0.8%; UEL = 6.6% (1,2,3-isomer). NFPA-704 M Hazard Identification (all isomers): Health 1, Flammability 2, Reactivity 0. Practically insoluble in water; solubility = 0.005% (1,2,3-isomer); 0.006% (1,2,4-isomer).

Potential Exposure: Compound Description (1,2,3- and 1,2,4-isomers): Mutagen, (mixed isomers) Primary Irritant. These materials are used as solvents and in dye and perfume manufacture. The 1,2,3-isomer is used as raw material in chemical synthesis and as an ultraviolet stabilizer. The 1,2,4-isomer is used as the raw material for trimellitic anhydride manufacture. These compounds are found in diesel engine exhaust fumes.

Incompatibilities: Oxidizers (perchlorates, peroxides, permanganates, chlorates, nitrates), strong oxidizers (chlorine, bromine, fluorine), and nitric acid.

Permissible Exposure Limits in Air

All isomers

Conversion factor: 1 ppm = 4.92 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 25 ppm/125 mg/m^3 TWA.

ACGIH TLV®[1] (*mixed isomers*): 25 ppm/123 mg/m^3 TWA.

DFG MAK: (*all isomers*) 20 ppm/100 mg/m^3 TWA; Peak Limitation Category II(2); Pregnancy Group C.

1,2,3-isomer

Austria: MAK 25 ppm (125 mg/m^3), 1999; Denmark: TWA 25 ppm (120 mg/m^3), 1999; Japan; 25 ppm (120 mg/m^3), 1999; Norway: TWA 20 ppm (100 mg/m^3), 1999; United Kingdom: TWA 25 ppm (125 mg/m^3), 2000; the Netherlands: MAC-TGG 100 mg/m^3, 2003.

1,2,4-isomer

Protective Action Criteria (PAC)*

TEEL-0: 25 ppm

PAC-1: **140** ppm

PAC-2: **360** ppm

PAC-3: 400 ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Denmark: TWA 25 ppm (120 mg/m^3), 1999; Japan; 25 ppm (120 mg/m^3), 1999; Norway: TWA 20 ppm (100 mg/m^3), 1999; United Kingdom: TWA 25 ppm (125 mg/m^3), 2000; the Netherlands: MAC-TGG 100 mg/m^3, 2003.

Mixed isomers

Australia: TWA 25 ppm (125 mg/m^3), 1993; Austria: MAK 25 ppm (125 mg/m^3), 1999; Belgium: TWA 25 ppm (123 mg/m^3), 1993; Denmark: TWA 25 ppm (120 mg/m^3), 1999; Finland: TWA 25 ppm (120 mg/m^3), STEL 40 ppm (200 mg/m^3), [skin], 1999; France: VME 25 ppm (125 mg/m^3), 1999; Norway: TWA 20 ppm (100 mg/m^3), 1999; the Netherlands: MAC-TGG 100 mg/m^3, 2003; Sweden: NGV 25 ppm (120 mg/m^3), KTV 35 ppm (170 mg/m^3), 1999; Switzerland: MAK-W 25 ppm (125 mg/m^3), 1999; United Kingdom: LTEL 25 ppm (125 mg/m^3), STEL 35 ppm, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 25 ppm. Several states have set guidelines or standard for Trimethyl benzenes in ambient air[60] ranging from 1.25−1.70 mg/m^3 (North Dakota) to 2.1 mg/m^3 (Virginia) to 2.5 mg/m^3 (Connecticut) to 2.976 mg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method PV-2091.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 3.7 (1,2,3-).

Routes of Entry: Inhalation, percutaneous absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Trimethyl benzene can affect you when breathed in. Irritates the eyes, skin, and respiratory tract. Exposure can cause you to feel dizzy, lightheaded, and to pass out. Symptoms of exposure can also include headache, drowsiness, fatigue, dizziness, nausea, a lack of coordination, vomiting, nervousness, tenseness, confusion. Liquid deposition in lungs causes bronchitis or chemical pneumonitis.

Long Term Exposure: Repeated exposures can cause headaches, tiredness, and a feeling of nervous tension. Can affect the blood cells and the blood's clotting ability; hypochromic anemia. Delayed or chronic health hazard is possible including asthmatic bronchitis with coughing and/or shortness of breath. The use of alcoholic beverages enhances the effect. May cause liver damage. The liquid destroys the skin's natural oils, causing drying and cracking.

Points of Attack: Eyes, skin, respiratory system, central nervous system, blood, liver.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. Complete blood count and platelet count. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Complete blood count (CBC) and platelet count.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 25 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved respirator with an organic vapor cartridge/canister. More protection is provided by a full-face-piece respirator than by a half-mask respirator, and even greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Trimethylbenzene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Flammable liquids, toxic, n.o.s., require a shipping label of "FLAMMABLE LIQUID, POISONOUS/TOXIC MATERIALS." The 1,2,3-, 1,2,4-, and mixed isomers fall in DOT Hazard Class 3 and Packing Group II. 1,3,5-Trimethylbenzene requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. *Small fires:* dry chemical, carbon dioxide, water spray, or alcohol-resistant foam. *Large fires:* water spray, fog, or alcohol foam. Move container from fire area if you can do so without risk. Spray cooling water on containers that are exposed to flames until well after fire is out. For massive fire in cargo area, use unmanned hose holder or monitor nozzles; if this is impossible, withdraw from area and let fire burn. Isolate for one-half mile in all directions if tank car or truck is involved in fire. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

UN/NA & ERG Number: UN1298/132

EC Number: 200-900-5

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 1000 lb (454 kg).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Trimethylchlorosilane is a colorless, fuming liquid with an irritating odor. Molecular weight = 108.66; Specific gravity (H_2O:1) = 0.85 at 25°C; Boiling point = 57°C; Freezing/Melting point = −58°C; Flash point = −15°C (cc); Vapor pressure = 200 mmHg at 18°C; Autoignition temperature = 395°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Reacts with water.

Potential Exposure: Compound Description: Tumorigen, Mutagen. Primary Irritant. Trimethylchlorosilane is used as an intermediate to make silicone products, including lubricants.

Incompatibilities: Moisture and air contact forms hydrochloric acid. Violent reaction with moisture forming corrosive chloride gases, including hydrogen chloride. Vigorous reaction with aluminum. Store in temperatures below 21°C.

Permissible Exposure Limits in Air

AIHA WEEL: 5 ppm, ceiling.

Protective Action Criteria (PAC)*

TEEL-0: 0.6 ppm

PAC-1: **1.8** ppm

PAC-2: **22** ppm

PAC-3: **100** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the respiratory tract causing coughing and wheezing. Contact can cause severe skin and eye irritation and burns with possible permanent damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Can irritate the lungs; bronchitis may develop with coughing, phlegm, and/or shortness of breath. There is limited evidence that trimethylchlorosilane causes cancer in animals.

Points of Attack: Cancer site in animals: lungs.

Medical Surveillance: Lung function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear-splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool (below 70°F/21°C), well-ventilated area away from moisture of any form and strong oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Trimethylchlorosilane requires a shipping label of "FLAMMABLE LIQUID, CORROSIVE." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

When spilled in water

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.3/0.5
Night 0.7/1.2

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including hydrogen chloride, are produced in fire. Use dry chemical or carbon dioxide. Fire may restart after it has been extinguished. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 220 (≥80.00% concentration).

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Trimethyl phosphite is a colorless liquid with a distinctive pungent, pyridine-like odor. The odor threshold is 0.0001 ppm. Molecular weight = 124.09; Specific gravity (H_2O:1) = 1.05 at 25°C; Boiling point = 111°C; Freezing/Melting point = −78°C; Vapor pressure = 24 mmHg at 25°C; Flash point = 28°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Reproductive Effector; Primary Irritant. Trimethyl phosphite is a flame retardant and used as an intermediate in the manufacture of a number of pesticides and organophosphorus additives.

Incompatibilities: Reacts (hydrolyzes) with water. Violent reaction with magnesium perchlorate. Incompatible with air, moisture, oxidizers, strong bases. Store and handle under a nitrogen blanket.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.08 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 2 ppm/10 mg/m^3 TWA.

ACGIH TLV®[1]: 2 ppm TWA.

Protective Action Criteria (PAC)*

TEEL-0: 2 ppm

PAC-1: **6.1** ppm

PAC-2: **61** ppm

PAC-3: **310** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

Australia: TWA 2 ppm (10 mg/m^3), 1993; Belgium: TWA 2 ppm (10 mg/m^3), 1993; Denmark: TWA 0.5 ppm (2.6 mg/m^3), 1999; Finland: TWA 0.5 ppm (2.6 mg/m^3), STEL 10 ppm (52 mg/m^3), [skin], 1999; France: VME 2 ppm (10 mg/m^3), 1999; the Netherlands: MAC-TGG 10 mg/m^3, 2003; United Kingdom: TWA 2 ppm (10 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 2 ppm. Several states have set guidelines or standards for Trimethyl phosphite in ambient air[60] ranging from 100 μg/m^3 (North Dakota) to 160 μg/m^3 (Virginia) to 200 μg/m^3 (Connecticut) to 238 μg/m^3 (Nevada).

Determination in Air

DFG MAK: No numerical value established. Data may be available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Trimethyl phosphite can affect you when breathed in and by passing through your skin. The vapor irritates the eyes, skin, and upper respiratory tract. Contact can severely irritate and may permanently damage the eyes. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Trimethyl phosphite can severely irritate the skin and can cause a rash and skin allergy. Exposure may damage the liver and kidneys.

Long Term Exposure: Can cause lung irritation; bronchitis may develop. Exposure may cause emphysema. May damage the liver and kidneys. In animals: teratogenic effects.

Points of Attack: Eyes, skin, respiratory system, reproductive system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy; and liver and kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 2 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full-face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from magnesium diperchlorate. Sources of ignition, such as smoking and open flames, are prohibited where trimethyl phosphite in handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of trimethyl phosphite should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters.

Shipping: Trimethyl phosphite requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including carbon monoxide, phosphine, and phosphorus oxides, are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Trinitrobenzene T:0910

Molecular Formula: $C_6H_3N_3O_6$

Common Formula: 1,3,5-$C_6H_3(NO_2)_3$

Synonyms: Benzene, 1,3,5-trinitro-; TNB; 1,3,5-Trinitrobenceno (Spanish); *sym*-Trinitrobenzene; *symmetrical*-Trinitrobenzene; Trinitrobenzene; Trinitrobenzene, dry; Trinitrobenzol (German)

CAS Registry Number: 99-35-4

RTECS® Number: DC3850000

UN/NA & ERG Number: UN0214 (dry or wetted with <30% water, by mass)/112; UN1354 (wetted with not <30% water, by mass)/113

EC Number: 202-752-7 [*Annex I Index No.:* 609-005-00-8]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

Explosive Substance (World Bank).[15]

Reportable Quantity (RQ): 10 lb (4.54 kg).

US EPA Hazardous Waste Number (RCRA No.): U234.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): 8270 (10).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Trinitrobenzene is a yellow crystalline solid. Molecular weight = 213.12; Freezing/Melting point = 122−123°C. Hazard Identification (based on NFPA-704 M Rating System): (*wetted or with <30% water*) Health 2, Flammability 4, Reactivity 4; (wetted with >30% water) Health 2, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: Trinitrobenzene is used as an explosive, and as a vulcanizing agent for natural rubber. Trinitrobenzene may be more powerful than TNT; and it is reported to be less sensitive to impact than TNT. However it is difficult to produce and is not used as widely as TNT.

Incompatibilities: Sensitive to shock and heat. Incompatible with initiating explosives, combustible materials, oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 3 mg/m^3

PAC-1: 7.5 mg/m^3

PAC-2: 60 mg/m^3

PAC-3: 125 mg/m^3

Permissible Concentration in Water: Russia[43] has set a MAC of 0.4 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract.

Long Term Exposure: Information on the carcinogenicity, mutagenicity, teratogenicity, or adverse reproductive effects of trinitrobenzene was not found in the available literature. Trinitrobenzene has been reported to produce liver damage, central nervous system damage, and methemoglobin formation in animals. Breathing difficulties have also been reported.

Points of Attack: Liver, central nervous system, respiratory system.

Medical Surveillance: Lung function tests. Liver function tests. Examination of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Treat as an explosive. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat, explosives, oxidizable materials. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Trinitrobenzene, dry or wetted with <30% water, by mass, requires a shipping label of "EXPLOSIVE." It falls in Hazard Class 1.1D and Packing Group II. Trinitrobenzene, wetted with not <30% water, by mass, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is an explosive solid. If material is on fire and conditions permit, do not extinguish. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Dissolve in a combustible solvent and spray into an incinerator equipped with afterburner and scrubber.

UN/NA & ERG Number: UN1356 (wetted with not <30% water, by mass)/113; UN0209 (TNT, dry or wetted with <30% water, by mass)/112

EC Number: 204-289-6 [*Annex I Index No.*: 609-008-00-4]

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 5000 (commercial grade); *Theft hazard* 400 (commercial grade).

Carcinogenicity: IARC: Animal, Inadequate Evidence; Human, Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1996.

US EPA Gene-Tox Program, Positive: Histidine reversion—Ames test.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: E, T, N; R2; R23/24/25; R33; R51/53; Safety phrases: S1/2; S35; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: TNT exists in five isomers; the most commonly used is 2,4,6-trinitrotoluene. It is a colorless to pale yellow odorless solid (pellets, cast blocks, and cast slabs) or crushed flakes. Molecular weight = 227.15; Specific gravity (H_2O:1) = 1.65 at 25°C; Boiling point = (explodes) 240°C; Freezing/Melting point = 80°C; Vapor pressure = 0.0002 mmHg at 25°C; Ionization potential = 10.59 eV. It explodes at 232°C (also reported at 240°C and 297°C) but burns at 295°C when not confined. TNT is a relatively stable high explosive. Practically insoluble in water; solubility = 0.01% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant. TNT is used as an explosive, i.e., as a bursting charge in military explosive shells, bombs, grenades, and mines; and an intermediate in dyestuffs and photographic chemicals.

Incompatibilities: Strong oxidizers, ammonia, strong alkalis, combustible materials, heat. Violent reaction with reducing agents. Rapid heating will result in detonation. Explodes when heated to 232°C. May explosively decompose from shock, friction, or concussion. Reacts with heavy metals.

Permissible Exposure Limits in Air

OSHA PEL: 1.5 mg/m^3 TWA [skin].

NIOSH REL: 0.5 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.1 mg/m^3 TWA [skin].

DFG MAK: 0.011 ppm/0.1 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Carcinogen Category 3B; Pregnancy Risk Group D.

NIOSH IDLH: 500 mg/m^3.

Arab Republic of Egypt: TWA 0.5 mg/m^3, 1993; Australia: TWA 0.5 mg/m^3, [skin], 1993; Austria: MAK 0.01 ppm (0.1 mg/m^3), [skin], Suspected: carcinogen, 1999; Belgium: TWA 0.5 mg/m^3, [skin], 1993; Denmark: TWA 0.1 mg/m^3, [skin], 1999; Finland: TWA 0.5 mg/m^3, STEL 3 mg/m^3, [skin], 1999; France: VME 0.5 mg/m^3, [skin], 1999; the Netherlands: MAC-TGG 0.1 mg/m^3, [skin], 2003; Norway: TWA 0.1 mg/m^3, 1999; the Philippines: TWA 1.5 mg/m^3, [skin], 1993; Poland: MAC (TWA) 1 mg/m^3; MAC (STEL) 3 mg/m^3, 1999; Russia: TWA 0.1 mg/m^3, STEL 0.5 mg/m^3, [skin], 1993; Sweden: NGV 0.1 mg/m^3, KTV 0.2 mg/m^3, [skin], 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; Turkey: TWA 1.5 mg/m^3, [skin], 1993; United Kingdom: TWA 0.3 mg/m^3, [skin]; TWA 0.2 ppm (0.89 mg/m^3), [skin], carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3 [skin]. Several states have set guidelines or standards for TNT in ambient air[60] ranging from 5.0 $\mu g/m^3$ (North Dakota) to 8.0 $\mu g/m^3$ (Virginia) to 10.0 $\mu g/m^3$ (Connecticut) to 12.0 $\mu g/m^3$ (Nevada).

Determination in Air: Use OSHA Analytical Method 44.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 1.60$

Permissible Concentration in Water: Russia[43] set a MAC of 0.5 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation of dust, fume, or vapor; ingestion of dust; percutaneous absorption from dust; skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Exposure to trinitrotoluene may cause irritation of the eyes, nose, and throat with sneezing, cough, and sore throat. It may cause skin irritation, dermatitis, and may give the skin, hair, and nails a yellowish color. Numerous fatalities have occurred in workers exposed to TNT from toxic hepatitis or aplastic anemia. TNT exposure may also cause methemoglobinemia with cyanosis, weakness, drowsiness, dyspnea, and unconsciousness. Ingestion may cause hallucinations or distorted perceptions, cyanosis (blue color to the skin, lips, and fingertips), and gastrointestinal changes.

Long Term Exposure: May affect the liver, causing hepatitis and jaundice. May affect the blood, causing hemolysis, formation of methemoglobin. Cyanosis may also occur. May affect vision, causing cataracts. In addition, it may cause muscular pains, heart irregularities, renal irritation, menstrual irregularities, and peripheral neuritis.

Points of Attack: Blood, liver, eyes, cardiovascular system, central nervous system, kidneys, skin.

Medical Surveillance: NIOSH lists the following tests: complete blood count; aplastic anemia; liver function tests; urine (chemical/metabolite); urinalysis (routine). Placement or periodic examinations should give special considerations to history of allergic reactions, blood dyscrasias, reactions to medications, and alcohol intake. The skin, eyes, blood, and liver and kidney function should be followed. Urine may be examined for TNT using the Webster test or for the urinary metabolite 2,6-dinitro-4-aminotuluene; however, both may be negative if there is liver injury.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Polyvinyl chloride is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. The Webster skin test (colorimetric tests with alcoholic sodium hydroxide) or indicator soap should be used to make sure workers have washed all TNT off their skins.

Respirator Selection: NIOSH: *Up to 5 mg/m^3:* Sa* (APF = 10) (any supplied-air respirator). *Up to 12.5 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode). *Up to 25 mg/m^3:* SCBAF (APF = 50) (any self-contained breathing apparatus with a full-face-piece; or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: TNT is an explosive. Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in an explosion-proof refrigerator and keep away from reducing agents.[52] Keep material wet with water or treat as an explosive. Keep away from heat, sources of ignition, metal, nitric acid, and reducing materials. Protect containers from shock. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Trinitrotoluene, wetted with not <30% water, by mass, requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group I.

Trinitrotoluene or TNT, dry or wetted with <30% water, by mass, requires a shipping label of "EXPLOSIVE." It falls in Hazard Class 1.1D and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect waste material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a dangerously explosive solid. If material is on fire and conditions permit, do not extinguish. Evacuate area and let burn. Cool exposures using unattended monitors. If fire must be extinguished, use any agent appropriate for the burning material. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. Cool exposed containers from unattended equipment or remove intact containers if it can be done safely. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: TNT is dissolved in acetone and incinerated. The incinerator should be equipped with an afterburner and a caustic soda solution scrubber.

RTECS® Number: YK2680000

EC Number: 210-035-5

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Triphenylamine is a colorless crystalline solid. Molecular weight = 245.34; Specific gravity (H_2O:1) = 0.77 at 25°C; Boiling point = 365°C; also reported at 195°C at 10 mmHg; Freezing/Melting point = 127°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Insoluble in water.

Potential Exposure: Triphenylamine is used as a primary photoconductor and in making photographic film coated on photographic film bases.

Incompatibilities: Aldehydes, ketones, nitrates, oxidizers, oxygen, and peroxides.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 5 mg/m^3 TWA.

ACGIH TLV®[1]: Withdrawn due to insufficient data.

Australia: TWA 5 mg/m^3, 1993; Belgium: TWA 5 mg/m^3, 1993; Denmark: TWA 5 mg/m^3, 1999; Finland: TWA 5 mg/m^3, STEL 10 mg/m^3, [skin], 1999; France: VME 5 mg/m^3, 1999; Norway: TWA 5 mg/m^3, 1999; IN Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg/m^3. Several states have set guidelines or standards for triphenylamine in ambient air[60] ranging from 8.0 μg/m^3 (Virginia) to 50.0 μg/m^3 (North Dakota) to 100.0 μg/m^3 (Connecticut).

Determination in Air: No method available.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Triphenylamine can affect you when breathed in and by passing through your skin. Contact can irritate the skin.

Long Term Exposure: No known long-term effects are known although some related aromatic amines can cause skin and lung allergies and have been shown to be carcinogenic to the human bladder, ureter, prostate, intestines, lung, and liver.

Points of Attack: Skin.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others. *Eye Contact:* Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention. *Inhalation:* Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure. *Ingestion:* Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures *over 5 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool well-ventilated area away from aldehydes, ketones, nitrates, oxidizers, oxygen, and peroxides. Where possible, automatically transfer material from storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. The powdered material may be dampened with 60−70% acetone to avoid airborne dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 204-112-2

Regulatory Authority and Advisory Bodies

US EPA TSCA Section 8(e) Risk Notification, 8EHQ-0892-9169; 8EHQ-0892-8839; 8EHQ-0892-9290.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Triphenyl phosphate is a colorless crystalline powder with a faint, phenol-like odor. Molecular weight = 326.30; Specific gravity (H_2O:1) = 1.29 at 25°C; Boiling point = 413.3°C; Freezing/Melting point = 49°C; Vapor pressure = 1 mmHg at 193°C; Flash point = 220°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 1, Reactivity 0. Practically insoluble in water; solubility 0.002% at 54°C.

Potential Exposure: Triphenyl phosphate is used to impregnate roofing paper and as a fire-resistant plasticizer in plastics; for cellulose esters in lacquers and varnishes. Used in making adhesives, gasoline additives, flotation agents, insecticides, surfactants, antioxidants, and stabilizers. A substitute for camphor.

Incompatibilities: Contact with strong oxidizers, strong acids, and nitrates may cause fire or explosions. Phosphates are incompatible with antimony pentachloride, magnesium, silver nitrate, zinc acetate.

Permissible Exposure Limits in Air

OSHA PEL: 3 mg/m^3 TWA.

NIOSH REL: 3 mg/m^3 TWA.

ACGIH TLV®[1]: 3 mg/m^3 TWA, not classifiable as a human carcinogen.

NIOSH IDLH: 1000 mg/m^3.

Australia: TWA 3 mg/m^3, 1993; Belgium: TWA 3 mg/m^3, 1993; Denmark: TWA 3 mg/m^3, 1999; Finland: TWA 3 mg/m^3, STEL 6 mg/m^3, [skin], 1999; France: VME 3 mg/m^3, 1999; Norway: TWA 3 mg/m^3, 1999; the Netherlands: MAC-TGG 3 mg/m^3, 2003; Switzerland: MAK-W 3 mg/m^3, 1999; United Kingdom: LTEL 3 mg/m^3, STEL 6 mg/m^3, 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for triphenyl phosphate in ambient air[60] ranging from 1.6 μg/m^3 (Virginia) to 30.0 μg/m^3 (North Dakota) to 60.0 μg/m^3 (Connecticut) to 71.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5038, Triphenyl phosphate.

Determination in Water: Octanol–water coefficient: Log $K_{ow} = 4.59$.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact. Slowly absorbed by the skin.

Harmful Effects and Symptoms

Short Term Exposure: Slowly absorbed by the skin. May cause eye and skin irritation.

Long Term Exposure: Minor changes in blood enzymes. In animals: muscular weakness, paralysis. May be a cholinesterase inhibitor, but not a potent one.

Points of Attack: Blood, peripheral nervous system.

Medical Surveillance: Consider the blood in preplacement and periodic physical examinations. Examination of the peripheral nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, rinse mouth and get medical attention.

Personal Protective Methods: Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 15 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 30 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 75 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 150 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full-face-piece) or SaF (APF = 50) (any supplied-air respirator with a full-face-piece). *Up to 1000 mg/m^3:* SA: PD,PP (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place away from antimony pentachloride, magnesium, silver nitrate, zinc acetate.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Dampen spilled material with alcohol to avoid dust. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including oxides of phosphorus. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure,

explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incinerate in furnace equipped with alkaline scrubber.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% (acetate and hydroxide); 1% (chloride).

European/International Regulations (*76-87-9*): Hazard Symbol: T+, N; Risk phrases: R24/25; R26; R37/38; R40; R41; R48/23; R63; R50/53; Safety phrases: S1/2; S26; S28; S36/37/39; S45; S60; 61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*acetate, chloride, hydroxide*).

Description: Triphenyltin acetate is a white solid. Molecular weight = 409.07; Freezing/Melting point = 122°C. Practically insoluble in water. Triphenyltin chloride is a colorless to yellow crystalline solid with a characteristic odor. Molecular weight = 385.47; Boiling point = 240°C at 13.5 mmHg; Freezing/Melting point = 106°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Insoluble in water. *Triphenyltin hydroxide* is a white crystalline solid. Molecular weight = 367.03; Freezing/Melting point = 118−120°C (decomposes). Practically insoluble in water.

Potential Exposure: Compound Description (hydroxide): Agricultural Chemical; Tumorigen, Mutagen, Organometallic; Reproductive Effector; Human Data; Primary Irritant. The hydroxide is used in vinyl products to protect against mildew growth and stiffening by bacteria and fungi. At risk are those engaged in the manufacture, formulation, and application of insecticides used for fungus, algae, and mollusk control; as a chemosterilant.

Incompatibilities: Triphenyltin chloride: violent reaction with strong oxidizers. Keep away from moisture.

Permissible Exposure Limits in Air

OSHA PEL: 0.1 mg[Sn]/m^3 TWA.

NIOSH REL: 0.1 mg[Sn]/m^3 TWA [skin].

Determination in Air: Use NIOSH Analytical Method (IV) #5504, Organotin compounds.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: These chemicals are strong poisons. Toxic and irritating to the eyes, skin, and respiratory system. Dermal exposure may lead to severe skin burns as well as renal failure, and possible death in the case of the chloride. Symptom of exposure include headache, vertigo (an illusion of movement), psycho-neurologic disturbance, sore throat, cough, abdominal pain, vomiting, urine retention, paresis, focal anesthesia.

Long Term Exposure: Exposure may affect the nervous system causing headache, nausea, vomiting, dizziness, decreased coordination, muscle weakness, and visual changes. Triphenyltin chloride can irritate the lungs; bronchitis may develop. In animals: hemolysis; hepatic necrosis; kidney damage.

Points of Attack: Kidneys, liver.

Medical Surveillance: Kidney and liver function tests. Evaluation of the nervous system. Lung function tests.

First Aid: *For triphenyltin hydroxide: Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Speed in removing material from skin is of extreme importance. Shampoo hair promptly if contaminated. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA *[Tin, organic compounds as (Sn)]*: *Up to 1 mg/m^3:* CcrOv95 (APF = 10) [any air-purifying half-mask respirator with organic vapor cartridge(s) in combination with an N95, R95, or P95 filter. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOvHie (APF = 25) (any air-purifying full-face-piece respirator equipped with an organic vapor cartridge in combination with a high-efficiency particulate filter). *Up to 5 mg/m^3:* CcrFOv100 (APF = 50) [any air-purifying full-face-piece respirator equipped with organic vapor cartridge(s) in combination with an N100, R100, or P100 filter] or GmFOv100 (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or PaprTOvHie (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge (s) in combination with a high-efficiency particulate filter] or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 25 mg/m^3*: SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions*: SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [Any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from incompatible materials. Where possible, automatically transfer material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored.

Shipping: Organotin compounds, solid, n.o.s., and Organotin pesticides, liquid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in DOT Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Remove and isolate contaminated clothing at the site. Do not touch spilled material; stop leak if you can do it without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *Small fires:* dry chemical, carbon dioxide, water spray, or foam. *Large fires:* water spray, fog, or foam. Stay upwind; keep out of low areas. Ventilate closed spaces before entering them. Wear positive pressure breathing apparatus and special protective clothing. Move container from fire area is you can do so without risk. Fight fire from maximum distance. Dike fire control water for later disposal; do not scatter the material. Poisonous gases are produced in fire, including tin oxides and hydrogen chloride (triphenyltin chloride). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

HN-3 is a suspected carcinogen, developmental toxin, and reproductive toxin.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: HN-3, a nitrogen mustard blister agent (vesicants), is a colorless to pale yellow liquid. Pure material is odorless; otherwise it has a faint fish- or soap-like odor. Density: 1.2347 at 25°C; Molecular weight = 204.53; Boiling point = 256°C (HN-3 decomposes before its boiling point is reached or condenses under all conditions; the reactions involved could generate enough heat to cause an explosion[NIOSH]); Freezing/Melting point = −3.9°C; Vapor pressure = 0.0106 mmHg at 20°C; 0.0109 mmHg at 25°C. Volatility: 0.120 mg/L at 25°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Sparingly soluble in water; solubility = 160 mg/L at 25°C.

Incompatibilities: HN-3 is not stable; it undergoes slow but steady polymerization. Avoid contamination with oxidizing agents, e.g., nitrates, oxidizing acids, chlorine bleaches, pool chlorine, which may result in ignition. Unstable in the presence of light and heat and forms dimers at temperatures above 50°C. HN-3 decomposes before its boiling point is reached or condenses under all conditions; the reactions involved could generate enough heat to cause an explosion. Polymerizes slowly, so munitions would be effective for several years. Heated to decomposition emits hydrogen chloride and nitrogen oxide.

Note: Chlorinating agents destroy nitrogen mustards. Dry chlorinated lime and chloramines with a high content of active chlorine vigorously chlorinate nitrogen mustards to the carbon chain giving low-toxicity products. In the presence of water, this interaction proceeds less actively. They are rapidly oxidized by peracids in aqueous solution at weakly alkaline pH. In acid solution the oxidation is much slower.

Potential Exposure: Sulfur mustards were formerly used as a gas warfare agent. Nitrogen mustards have not previously been used in warfare.[NIOSH] Exposure to nitrogen mustard damages the eyes, skin, and respiratory tract and suppresses the immune system. Although the nitrogen mustards cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Exposure to large amounts can be fatal.[NIOSH]

Permissible Exposure Limits in Air

Protective Action Criteria (PAC) HN-3*

TEEL-0: 0.001 mg/m^3

PAC-1: 0.003 mg/m^3

PAC-2: **0.022** mg/m^3

PAC-3: **0.37** mg/m^3

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

AEL (US Military): 0.003 mg/m^3.

Determination in Water: A water contaminant. Octanol–water coefficient: Log K_{ow} = (estimated) 2.27.[NIOSH]

Routes of Entry: Inhalation, ingestion, skin contact.

Harmful Effects and Symptoms

Nitrogen mustards are extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although these agents cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Thus, patients/victims arriving immediately from the scene of nitrogen mustard exposure are not likely to have signs and symptoms. The sooner after exposure that symptoms occur, the more likely they are to progress and become severe.[NIOSH]

Short Term Exposure: Extremely toxic and may damage the eyes, skin, and respiratory tract and suppress the immune system. Although these agents cause cellular changes within minutes of contact, the onset of pain and other symptoms is delayed. Most toxic of the nitrogen mustards. The median lethal dose for inhalation is 1500 mg-min/m^3; for skin absorption (masked personnel) is 10,000 mg-min/m^3. The medium incapacitating dose for eye injury is 200 mg-min/m^3; for skin absorption is 2500 mg-min/m^3. Irritates the eyes in quantities which do not significantly damage the skin or respiratory tract, insofar as single exposures are concerned. After mild vapor exposure, there may be no skin lesions. After severe vapor exposures, or after exposure to the liquid, erythema may appear. Irritation and itching may occur. Later, blisters may appear in the erythematous areas. Effects on the respiratory tract include irritation of the nose and throat, hoarseness progressing to loss of voice, and a persistent cough. Fever, labored respiration, and moist rales develop. Bronchial pneumonia may appear after the first 24 h. Following ingestion or systemic absorption, material causes inhibition of cell mitosis, resulting in depression of the blood-forming mechanism and injury to other tissues. Severe diarrhea, which may be hemorrhagic, occurs. Lesions are most marked in the small intestine and consist of degenerative changes and nercosis in the mucous membranes. Ingestion of 2–6 mg causes nausea and vomiting.

Long Term Exposure: Chronic or repeated exposure to HN-3 may cause bone marrow suppression resulting in damage to the blood-forming (hematopoietic) system, lymph node damage, weakening of the immune system, kidney damage, and reproductive system damage.[NIOSH] Early signs of bone marrow suppression include: a low white blood cell count; an increased risk for developing infections; a tendency for easy bruising and bleeding. May cause lymph node damage and a weakened immune system. It also causes liver and kidney damage, damage to the reproductive systems of both men and women leading to decreased fertility. It is mutagenic, toxic to the developing embryo, and carcinogenic.

First Aid: There is no antidote for nitrogen mustard toxicity.

Because health effects due to nitrogen mustard may not occur until several hours after exposure, patients/victims should be observed in a hospital setting for at least 24 h. Gastric lavage is contraindicated following ingestion of this agent due to the risk of perforation of the esophagus or upper airway. If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Speed in removing material from skin is of extreme importance. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Keep victim quiet and maintain normal body temperature. Effects may be delayed; keep victim under observation.

Personal Protective Methods: Wear Totally Encapsulating Chemical Protective (TECP) suit that provides protection against CBRN agents; Chemical-resistant inner and outer gloves; Chemical-resistant boots with a steel toe and shank; Coveralls, long underwear, and a hard hat worn under the TECP suit are optional items. Take all necessary precautions to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Decontamination: Decontamination of all potentially exposed areas within minutes after exposure is the only effective means of decreasing tissue damage.[NIOSH] Remove clothes and place contaminated clothes and personal belongings in a sealed double bag. Decontamination of mustard-exposed victims by either vapor or liquid should be performed within the first 2 min following the exposure to prevent tissue damage. If not accomplished within the first several minutes, decontamination should still be performed to ensure any residual liquid mustard is removed from the skin or clothes, or to ensure any trapped mustard vapor is removed with the clothing. Removing trapped mustard vapor will prevent vapor off-gassing or subsequent cross-contamination of other emergency responders/health-care providers or the health-care facility. Physical removal of the mustard agent, rather than detoxification or neutralization, is the most important principle in patient decontamination. Mustard is not detoxified by water alone and will remain in decontamination effluent (in dilute concentrations) if hydrolysis has not taken place.

(1) Patients exposed to vapor should be decontaminated by removing all clothing in a clean air environment and shampooing or rinsing the hair to prevent vapor off-gassing.

(2) Patients exposed to liquid should be decontaminated by (a) Washing in warm or hot water at least three times. Use liquid soap (dispose of container after use and replace), large volumes of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged because skin damage may occur which may enhance absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. The rapid physical removal of a chemical agent is essential. If warm or hot water is not available, but cold water is, use cold water. Do not delay decontamination to obtain warm water. (b) Rinse the eyes, mucous membranes, or open wounds with sterile saline or water.

(3) The health-care provider should (a) Check the victim after the three washes to verify adequate decontamination before allowing entry to the medical treatment facility. If the washes were inadequate, repeat the entire process. (b) Be prepared to stabilize conventional injuries during the decontamination process. Careful decontamination can be a time-consuming process. The health-care provider may have to enter the contaminated area to treat the casualty during this process. Medical personnel should wear the proper PPE and evaluate the exposed workers.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments.* Where a potential exposure to the chemical exists, use a NIOSH-certified CBRN full-face-piece SCBA operated in a pressure-demand mode or a pressure-demand supplied air-hose respirator with an auxiliary escape bottle; or use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus (SCBA) with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Toxic liquids, organic, n.o.s. [Inhalation hazard, Packing Group I, Zone B] require a shipping label of "POISONOUS/TOXIC MATERIALS." Inhalation Hazard. It falls in Hazard Class 6.1 and Packing Group 1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Avoid inhalation and skin contact. Do not touch spilled material; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Large spills:* dike far ahead of spill for later disposal. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

HN-3, when used as a weapon

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Fire Extinguishing: Poisonous gases, including nitrogen oxides and hydrogen chloride, are produced in fire. Use dry chemical, carbon dioxide, or foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Reportable Quantity (RQ): 10 lb (4.54 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.

Rotterdam Convention Annex III [Chemicals Subject to the Prior Informed Consent Procedure (PIC)].

California Proposition 65 Chemical: Cancer 1/1/88.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: TDBP is a crystalline solid. Molecular weight = 697.67; Flash point ≥112°C.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Tris-BP is used as a flame retardant additive for synthetic textiles and plastics. It was applied to fabrics used for children's clothes (sleepwear in particular) with some used as a flame retardant in other materials, such as urethane foams. Commercial preparations of tris-BP can be obtained in two grades, viz, HV (high in volatiles) and LV (low in volatiles). A typical LV sample has been reported to contain the following impurities[1]: 0.05% 1,2-dibromo-3-chloropropane ($BrCH_2CHBrCH_2Cl$); 0.05% 1,2,3-tribromopropane ($BrCH_2CHBrCH_2Br$); and 0.20% 2,3-dibromopropanol ($BrCH_2CHBrCH_2OH$). Use and exposure have greatly decreased after a ruling by the Consumer Product Safety Commission in April 1977.

Incompatibilities: Acids, bases.

Permissible Exposure Limits in Air

No numerical OELs have been set.

Finland: carcinogen, 1999; France: carcinogen, 1993; Sweden: carcinogen, 1999.

Routes of Entry: TDBP was added to fabrics used for children's garments to the extent of 5−10% by weight. A child wearing such garment and chewing on a sleeve or collar could easily ingest some TDBP, particularly if the garment had not been laundered before use.

Harmful Effects and Symptoms

Short Term Exposure: May cause nausea, vomiting, gastrointestinal irritation. May cause central nervous system depression, headaches, dizziness.

Long Term Exposure: May cause skin sanitization and allergy; chronic lung disease; kidney damage, such as renal tubular necrosis; liver damage; testicular atrophy; and sterility. Suspected mutagenesis and carcinogenesis.

Points of Attack: Lungs, kidneys, liver, central nervous system, reproductive system.

Medical Surveillance: Lung function tests. Liver and kidney function tests. Examination of the nervous system.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eye well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that the patient's airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear dust-proof goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in a cool, dry place and keep away from acids and bases. Where possible, automatically transfer material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s., require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Follow by washing surfaces well, first with 60−70% acetone, then with soap and water. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including phosphorus oxides and bromine, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Description: Trypan blue is a dark blue crystalline solid or powder. Molecular weight = 964.88. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 1, Reactivity 0. Soluble in water.

Potential Exposure: Used in dyeing textiles; leather and paper; as a biological stain.

Incompatibilities: Strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 2 mg/m^3

PAC-1: 6 mg/m^3

PAC-2: 40 mg/m^3

PAC-3: 500 mg/m^3

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* No symptoms reported. *Skin:* may stain skin. *Eyes:* application of 0.2 mL (0.007 oz) of a 1% solution caused no eye irritation. *Ingestion:* moderately toxic. Probable lethal dose between 1 oz and 1 lb for a 150-lb person.

Long Term Exposure: A potential occupational carcinogen, mutagen, and teratogen. Has been shown to cause birth defects, cancer, and liver injury in laboratory animals.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Avoid creating dust. Where possible, automatically pump material from storage containers to process containers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is handled, used, or stored. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Dyes, solid, toxic, n.o.s. [or] Dye intermediates, solid, toxic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." Tris(2,3-dibromopropyl) phosphate falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid. Use extinguisher appropriate for burning material. Poisonous gases are produced in fire, including oxides of sodium, nitrogen, and sulfur. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

Common Formula: W; WC; WCCo; WCNi; WCTi

Synonyms: *metal:* Tungsten, elemental; Tungsten metal; Wolfram

Tungsten carbide (cemented): Cemented tungsten carbide; Cemented WC; Hard metal

Tungsten other insoluble compounds: Tungsten(IV) oxide 12036-22-5; Tungsten trioxide 1314-35-8; Tungstic acid (7783-03-1); 12070-12-1 (tungsten carbide)

CAS Registry Number: 7440-33-7 (elemental); 12718-69-3 (92% W, 8% Co); 11107-01-0 (85% W, 15% Co); 37329-49-0 (78% W: 14% Co: 8% Ti)

RTECS® Number: YO7175000 (elemental); YO7525000 (92% W: 8% Co); Y07350000 (85% W, 15% Co); YO7700000 (78% W: 14% Co: 8% Ti)

UN/NA & ERG Number: UN3189 (metal powder, self-heating, n.o.s.)/135

EC Number: 231-143-9 (tungsten)

Regulatory Authority and Advisory Bodies

Carcinogenicity: NIOSH (tungsten carbide containing >0.3% Ni) NIOSH: Potential occupational carcinogen.

Air in Pollutant Standard Set. See below, "Permissible Exposure Limits Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, for tungsten and its compounds.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Tungsten is a hard, brittle, steel-gray to tin-white metal or fine powder. Molecular weight = 183.85; Boiling point = 5927°C; Freezing/Melting point = 3410°C. Insoluble in water. Tungsten carbide is a gray powder; Freezing/Melting point = 2780°C. Cemented tungsten carbide is a mixture, generally consisting of 85−95% tungsten carbide (WC) and 5−15% cobalt (Co). Physical properties vary depending upon the specific mixture. Insoluble in water. Tungsten carbide is a gray powder. Molecular weight = 195.86; Boiling point: 6000°C at 760 mmHg; Melting point = 2730−2830°C; solubility in water = <1 mg/mL at 18°C.[NTP] Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 2, Reactivity 0.

Potential Exposure: Compound Description (tungsten): Reproductive Effector; Primary Irritant. Tungsten is used in ferrous and nonferrous alloys, and for filaments in incandescent lamps. It has been stated that the principal health hazards from tungsten and its compounds arise from inhalation of aerosols during mining and milling operations. The principal compounds of tungsten to which workers are exposed are ammonium paratungstate, oxides of tungsten (WO_3, W_2O_5, WO_2), metallic tungsten, and tungsten carbide. In the production and use of tungsten carbide tools for machining, exposure to the cobalt used as a binder or cementing substance may be the most important hazard to the health of the employees. Since the cemented tungsten carbide industry uses such other metals as tantalum, titanium, niobium, nickel, chromium, and vanadium in the manufacturing process, the occupational exposures are generally to mixed dust.

Incompatibilities: *Tungsten:* The finely divided powder is combustible and may ignite spontaneously in air. Incompatible with bromine trifluoride, chlorine trifluoride, fluorine, iodine pentafluoride. *Tungsten carbide:* Incompatible with strong oxidizers: fluorine (may cause ignition), chlorine trifluoride, iodine pentafluoride, mercuric iodine, oxides of nitrogen, lead dioxide, strong acid mixtures (i.e., HNO_3/HCl mixture).

Permissible Exposure Limits in Air

Tungsten and insoluble compounds

OSHA PEL: None.

NIOSH REL: 5 mg[W]/m^3 TWA; 10 mg[W]/m^3 STEL [also applies to other insoluble compounds (as W)].

ACGIH TLV®[1]: 5 mg[W]/m^3 TWA; 10 mg[W]/m^3 STEL [also applies to other insoluble compounds (as W)].

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 150 mg/m^3

PAC-3: 500 mg/m^3

Denmark: TWA 5 mg[W]/m^3, 1999; Norway: TWA 5 mg [W]/m^3, 1999; Poland: MAC (TWA) fume and dust 5 mg [W]/m^3, 1999; Russia: STEL 2 mg[W]/m^3, 1993; Sweden: NGV 5 mg[W]/m^3, 1999; United Kingdom: TWA 5 mg [W]/m^3, STEL 10 mg[W]/m^3, 2000.

Tungsten soluble compounds

OSHA PEL: None.

NIOSH REL: 1 mg[W]/m^3 TWA; 3 mg[W]/m^3 STEL.

ACGIH TLV®[1]: 1 mg[W]/m^3 TWA; 3 mg[W]/m^3 STEL.

Tungsten carbide containing >2% Co

NIOSH REL: 0.05 mg[W]/m^3 TWA; See *NIOSH Pocket Guide*, Appendix C.

Tungsten carbide containing >0.3% Ni

NIOSH REL: 0.015 mg[W]/m^3 TWA; Potential occupational carcinogen; Reduce exposure to lowest feasible level; See *NIOSH Pocket Guide*, Appendix A & C.

Tungsten carbide

Protective Action Criteria (PAC)

For 12070-12-1 (92% W, 8% Co)

TEEL-0: 5.33 mg/m^3
PAC-1: 10.7 mg/m^3
PAC-2: 26.6 mg/m^3
PAC-3: 125 mg/m^3

Cemented tungsten carbide (example: 85%: 15%) or *tungsten carbide, mixed with cobalt and titanium* (example: 78% W: 14% Co: 8% Ti) also known as "hard metal" refers to a mixture of tungsten carbide, cobalt, and sometimes metal oxides or carbides and other metals (including nickel). When the *cobalt* (Co) content exceeds 2%, its contribution to the potential hazard is judged to exceed that of tungsten carbide. Therefore, the NIOSH REL (10-h TWA) for cemented tungsten carbide containing >2% Co is 0.05 mg [Co]/m^3; the applicable OSHA PEL is 0.1 mg[Co]/m^3 (8-h TWA). *Nickel* (Ni) may sometimes be used as a binder rather than cobalt. NIOSH considers cemented tungsten carbide containing nickel to be a potential occupational carcinogen and recommends a REL of 0.015 mg [Ni]/m^3 (10-h TWA). The OSHA PEL for *insoluble nickel*, 1 mg (Ni)/m^3 8-h TWA applies to mixtures of tungsten carbide and nickel.

Tungsten carbide

Australia: TWA 5 mg[W]/m^3, STEL 10 mg[W]/m^3, 1993; Austria: MAK 5 mg[W]/m^3, 1999; Belgium: TWA 5 mg [W]/m^3, STEL 10 mg[W]/m^3, 1993; Denmark: TWA 5 mg [W]/m^3, 1999; Finland: TWA 5 mg[W]/m^3, 1999; Norway: TWA 5 mg[W]/m^3, 1999; the Philippines: TWA 1 mg[W]/m^3, 1993; Poland: MAC (TWA) 5 mg[W]/m^3, 1999; Sweden: NGV 5 mg[W]/m^3, 1999; Switzerland: MAK 5 mg [W]/m^3, 1999; United Kingdom: TWA 5 mg[W]/m^3, STEL 10 mg[W]/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 5 mg[W]/m^3; STEL 10 mg[W]/m^3.

For both tungsten and tungsten carbide, Russia[43] set a MAC of 6.0 mg[W]/m^3 in work-place air. Several states have set guidelines and standards for tungsten in ambient air[60] ranging from 16.0 μg/m^3 (Virginia) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada).

Determination in Air: *For tungsten metal and tungsten soluble compounds:* Use NIOSH Analytical Method (IV) #7074, #7301, OSHA Analytical Method ID-213. See also Method #7300, Elements. There is no specific method for *cemented tungsten carbide.*

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 14 μg/L based on health effects. Russia[43] set a MAC of 0.1 mg [W]/L in water bodies used for domestic purposes.

Determination in Water: By neutron activation analysis.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Tungsten* can affect you when breathed in. Irritates the eyes, skin, and respiratory system. Some tungsten compounds can cause lung and skin problems. *Tungsten carbide* can affect you when breathed in. There is no health effects from exposure to pure tungsten carbide alone. However, tungsten carbide is often combined with nickel or cobalt to make cemented tungsten carbide (hard metal). Exposure to *tungsten carbide combined with cobalt or nickel* can cause skin irritation.

Long Term Exposure: Long-term exposure to *tungsten metal* and *cemented tungsten carbide* may cause diffuse pulmonary fibrosis (lung scarring), loss of appetite, nausea, cough. May cause blood changes. Exposure to *tungsten carbide combined with cobalt or nickel* can cause skin sensitization, lung allergy, with wheezing, coughing, and shortness of breath. Repeated exposure can cause pulmonary fibrosis. Long-term exposure to *tungsten-soluble compounds:* in animals: central nervous system disturbances; diarrhea; respiratory failure; behavioral, body weight, and blood changes.

Points of Attack: *Metal* and *cemented tungsten carbides:* Eyes, skin, respiratory system, blood. *Soluble compounds:* Eyes, skin, respiratory system, central nervous system, gastrointestinal tract.

Medical Surveillance: If you are exposed to tungsten alone, no medical tests are necessary. If you are exposed to cemented tungsten carbide (hard metal), the following are recommended before beginning employment and at regular times after that: lung function tests; chest X-ray every 2−3 years after five or more years of exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield when working with powders or dust unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH *(tungsten metal and insoluble compounds)*: *Up to 50 mg[W]/m^3*: 100XQ (APF = 10) [Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Respirator for Tungsten carbide (cemented) containing Cobalt.

NIOSH/OSHA, for cobalt metal dust and fume: *0.25 mg/m^3: if not present as a fume* Qm* (APF = 25) (any quarter-mask respirator). *0.5 mg/m^3*: 95XQ* (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (APF = 10) (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf (APF = 25)* (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *20 mg/m^3:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode. *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Respirator for Tungsten carbide (cemented) containing Nickel.

At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Tungsten must be stored to avoid contact with fluorine and chlorine compounds since violent reactions occur. Store in a tightly closed container in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where tungsten is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Tungsten carbide must be stored to avoid contact with fluorine, chlorine trifluoride, iodine pentafluoride, lead dioxide, nitrous oxide, nitrogen dioxide, and mercurium iodine since violent reactions occur. Store in tightly closed containers in a cool well-ventilated area.

Shipping: Metal powder, self-heating, n.o.s. requires a label of “SPONTANEOUSLY COMBUSTIBLE.” Tungsten powdered metal falls in Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers; do not sweep in the case of tungsten carbide. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Tungsten is a flammable powder. Use dry chemicals appropriate for extinguishing metal fires. In the case of tungsten carbide, extinguish fire using an agent suitable for type of surrounding fire. Tungsten carbide itself does not burn. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify

downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery of tungsten from sintered metal carbides, scrap, and spent catalysts has been described as an alternative to disposal.

Tungsten hexafluoride T:0990

Molecular Formula: F_6W
Common Formula: WF_6
Synonyms: Tungsten fluoride
CAS Registry Number: 7783-82-6
RTECS® Number: YO7720000
UN/NA & ERG Number: UN2196/125
EC Number: 232-029-1

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Theft hazard* 45 (≥7.10% concentration).

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Tungsten hexafluoride is a toxic, colorless gas or a light yellow liquid. Molecular weight = 297.85; Freezing/Melting point = 2.5°C. Boiling point = 17.5−19.5°C. Reacts with water (decomposes).

Potential Exposure: A strong halogenating agent. Used to apply tungsten coatings to other surfaces by vapor deposition process; making electronics and components; in the manufacture of other chemicals.

Incompatibilities: Decomposes on contact with water and moist air, forming corrosive hydrofluoric acid. Violent reaction on contact with methyl silicate.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)
TEEL-0: 1.62 mg/m^3
PAC-1: 4.86 mg/m^3
PAC-2: 15 mg/m^3
PAC-3: 150 mg/m^3

Determination in Air: NIOSH Analytical Method (IV) #7074. See also Method #7300; NIOSH Analytical Method (IV) #7902, Fluorides.

Permissible Concentration in Water: The EPA has set a standard of 4 mg/L for fluoride[61] and the state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Tungsten hexafluoride is a corrosive chemical. Irritates the eyes, skin, and respiratory tract. Contact with liquid may cause frostbite. Tungsten hexafluoride can affect you when breathed in. Exposure to tungsten hexafluoride may expose you to both tungsten and fluorides. Exposure to very high levels of fluorides may cause symptoms of nausea, vomiting, abnormal pain, convulsions, and kidney damage. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis) that may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite, diarrhea, or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Eyes, respiratory system, central nervous system, skeleton, kidneys, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. Fluoride level in urine (for fluoride in urine, use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure,

begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield when working with liquid unless full face-piece respiratory protection is worn. Wear gas-proof goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-103: *Inorganic fluorides*.

Respirator Selection:

Fluorides

NIOSH/OSHA *12.5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *25 mg/m^3:* 95XQ (APF = 10)* [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa* (any supplied-air respirator). *62.5 mg/m^3:* Sa:Cf (APF = 25)*† (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25)* *if not present as a fume* (any powered, air-purifying respirator with a high-efficiency particulate filter). *125 mg/m^3:* 100F (APF = 50) + [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *250 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full faceplate and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) + [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

†May need acid gas sorbent.

Tungsten (insoluble compounds)

NIOSH *(tungsten metal)*: *Up to 50 mg/m^3*: 100XQ (APF = 10) [Any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Poison gas. Color Code—White Stripe: Contact Hazard; Store separately, not compatible with materials in solid white category. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed container in a cool well-ventilated area away from water. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169 with the recommendations of the Compressed Gas Association.

Shipping: Tungsten hexafluoride requires a shipping label of "POISON GAS, CORROSIVE." It falls in Hazard Class 2.3.

Special precautions: Cylinders must be transported in a secure upright position, in a well-ventilated truck. It is a violation of transportation regulations to refill compressed gas cylinders without the express written permission of the owner.

Spill Handling: If in a building, evacuate building and confine vapors by closing doors and shutting down HVAC systems. Restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak to disperse the gas. Wear chemical protective suit with self-contained breathing apparatus to combat spills. Stay upwind and use water spray to "knock down" vapor; contain runoff. Stop the flow of gas, if it can be done safely from a distance. If source is a cylinder and the leak cannot be stopped in place, remove the leaking cylinder to a safe place; and repair leak or allow cylinder to empty. Absorb liquids in vermiculite, dry sand, earth, or a similar material and deposit in sealed containers. Keep this chemical out of confined spaces, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.5/0.8

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 500/150
Then: Protect persons downwind (miles/kilometers)
Day 0.6/0.9
Night 1.8/2.8

Fire Extinguishing: Tungsten hexafluoride may burn but does not readily ignite. For small fires, use dry chemical or CO_2 extinguishers. Poisonous gases, including fluorine, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Nonrefillable cylinders should be disposed of in accordance with local, state, and federal regulations. Allow remaining gas to vent slowly into atmosphere in an unconfined area or exhaust hood. Refillable-type cylinders should be returned to original supplier with any valve caps and outlet plugs secured and valve protection caps in place.

Turpentine T:1000

Molecular Formula: $C_{10}H_{16}$ (approx.)

Synonyms: Gum spirits; Gum turpentine; Oil of turpentine; Spirits of turpentine; Steam distilled turpentine; Sulfate wood turpentine; Terebenthine (French); Terpentin oel (German); Turpentine steam distilled; Turps; Wood turpentine

CAS Registry Number: 8006-64-2; selected monoterpenes: 80-56-8 (α-Pinene); 127-91-3; 13466-78-9 (Carene); 498-15-7 (Carene)[CHRIS Manual]

RTECS® Number: YO8400000

UN/NA & ERG Number: UN1299/128

EC Number: 232-350-7 [*Annex I Index No.:* 650-002-00-6]

Regulatory Authority and Advisory Bodies

FDA—over-the-counter drug.

US EPA, FIFRA 1998 Status of Pesticides: Canceled/New AI.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*8006-64-2*): Hazard Symbol: Xn, N; Risk phrases: R10; R20/21/22; R36/38; R43; R51/53; R65; Safety phrases: S2; S36/37; S46; S61; S62 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*CAS: 8006-64-2*).

Description: Turpentine is the oleoresin from species of *Pinus* (Pinaceae) trees. The crude oleoresin (gum turpentine) is a yellowish, sticky, opaque mass, and the distillate (oil of turpentine) is a colorless, volatile liquid with a characteristic odor. Chemically, it contains: *alpha*-pinene; *beta*-pinene; camphene, monocyclic terpene; and terpene alcohols. Molecular weight = 136 (approx.); Specific gravity (H_2O:1) = 0.86 at 25°C; Boiling point = 153.8−170°C; Freezing/Melting point = −50 to −60°C; Vapor pressure = 4 mmHg; Flash point = 35°C (cc), also listed at 30−46°C (cc); Autoignition temperature = 253°C, also listed at 220−255°C. Explosive limit: LEL = 0.8%; UEL = 6%. Hazard Identification (based on NFPA-704 M

Rating System): Health 1, Flammability 3, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen, Human Data; Natural Product; Primary Irritant. Turpentines have found wide use as chemical feedstock for the manufacture of floor, furniture, shoe, and automobile polishes, camphor, cleaning materials, inks, putty, mastics, cutting and grinding fluids, paint thinners, resins, and degreasing solutions. Recently, *alpha*- and *beta*-pinenes, which can be extracted, have found use as volatile bases for various compounds. The components *d*-α-pinene and 3-carene, or their hydroperoxides, may be the cause of eczema and toxic effects of turpentine.

Incompatibilities: Forms an explosive mixture with air. Violent reaction with strong oxidizers, especially chlorine; chromic anhydride; stannic chloride; chromyl chloride.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 5.56 mg/m^3 (approx.) at 25°C & 1 atm.

OSHA PEL (8006-64-2): 100 ppm/560 mg/m^3 TWA.

NIOSH REL (8006-64-2): 100 ppm/560 mg/m^3 TWA (Intended change).

ACGIH TLV®[1] (*terpentine and selected monoterpenes*): 20 ppm/112 mg/m^3 TWA, sensitizer; not classifiable as a human carcinogen.

NIOSH IDLH: 200 ppm.

Protective Action Criteria (PAC)

8006-64-2

TEEL-0: 20 ppm

PAC-1: 20 ppm

PAC-2: 20 ppm

PAC-3: 800 ppm

DFG MAK (8006-64-2): 100 ppm/560 mg/m3; danger of skin sensitization.

Australia: TWA 100 ppm (560 mg/m^3), 1993; Austria: MAK 100 ppm (560 mg/m^3), 1999; Belgium: TWA 100 ppm (556 mg/m^3), 1993; Denmark: TWA 25 ppm (140 mg/m^3), 1999; Finland: TWA 100 ppm (560 mg/m^3), STEL 150 ppm, [skin], 1999; France: VME 100 ppm (560 mg/m^3), 1999; Hungary: TWA 300 mg/m^3, STEL 600 mg/m^3, 1993; the Netherlands: MAC-TGG 560 mg/m^3, 2003; the Philippines: TWA 100 ppm (560 mg/m^3), 1993; Poland: MAC (TWA) 300 mg/m^3; MAC (STEL) 840 mg/m^3, 1999; Russia: STEL 300 mg/m^3, 1993; Sweden: NGV 25 ppm (150 mg/m^3), KTV 50 ppm (300 mg/m^3), [skin], 1999; Turkey: TWA 100 ppm (560 mg/m^3), 1993; United Kingdom: TWA 100 ppm (566 mg/m^3), STEL 150 ppm, 2000; New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen.

Russia[35, 43] set a MAC of 2.0 mg/m^3 for ambient air in residential areas on a momentary basis and 1.0 mg/m^3 on a daily average basis. Several states have set guidelines or standards for turpentine in ambient air[60] ranging from 5.6−8.4 mg/m^3 (North Dakota) to 9.3 mg/m^3 (Virginia) to 11.2 mg/m^3 (Connecticut and New York) to 13.333 mg/m^3 (Nevada).

α-Pinene (80-56-8)

Protective Action Criteria (PAC)

TEEL-0: 20 ppm

PAC-1: 20 ppm

PAC-2: 60 ppm

PAC-3: 300 ppm

Determination in Air: Use NIOSH Analytical Method #1551, Terpentine, #2549, Volatile organic compound.[18]

Permissible Concentration in Water: Russia[43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation of vapor and percutaneous absorption of liquid are the usual paths of occupational exposure. However, symptoms have been reported to develop from percutaneous absorption alone. Ingestion and/or skin and/or eye contact are also routes of entry.

Harmful Effects and Symptoms

Short Term Exposure: Turpentine can affect you when breathed in and by passing through your skin. Exposure can irritate the eyes, nose, and throat. Higher levels can affect the CNS, causing headache, vertigo, dizziness, abdominal pain, nausea, vomiting, diarrhea, confusion, and rapid pulse. Swallowing the liquid may cause chemical pneumonia to develop. High exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Still higher levels can cause hematuria (blood in the urine), albuminuria, kidney damage, convulsions, and death.

Long Term Exposure: Repeated or prolonged contact may cause skin sensitization and allergy. The liquid destroys the skin's natural oils, causing dryness and cracking. May damage the kidneys, bladder, and the nervous system. Can irritate the lungs; bronchitis may develop. Various kinds of products are in use as turpentine oil. Their respective toxicities and tendency to cause eczema, which probably arise from their content of δ-α-pinene and 3-carene, vary considerably. However, systematic comparative investigations for these products are lacking.

Points of Attack: Eyes, skin, respiratory system, central nervous system, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Examination of the nervous system. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, give plenty of water to drink and get medical attention. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™ and polyvinyl alcohol are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *800 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or CcrFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates). Sources of ignition, such as smoking and open flames, are prohibited where turpentine is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of turpentine should be grounded and bonded. Drums must be equipped with self-closing values, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of turpentine.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Toxic fumes and gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity: NIOSH (*uranium, insoluble and soluble compounds*): Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 100 lb (45.4 kg).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations (*uranium and compounds*): Hazard Symbol: T+; Risk phrases: R26/28; R33; R53; Safety phrases: S1/2; S20/21; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*uranyl acetate dihydrate*).

Description: Uranium is a silver-white, malleable, ductile, lustrous solid. Weakly radioactive but must be handled with caution. A combustible solid in the form of powder or turnings. Insoluble in water. Molecular weight = 238.00; Specific gravity (H_2O:1) = 19.05 at 25°C (metal); Boiling point = 3813°C; Freezing/Melting point = 1147°C; Autoignition temperature = 20°C (dust cloud); Ignition temperature of dust cloud = 20°C; Minimum Explosive concentration = 0.060 oz/ft^3.[USBM] Relative explosion hazard of dust: Severe. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0; Minimum explosive concentration (MEC) = 60 g/m^3.

In the natural state, uranium consists of three isotopes: ^{238}U (99.28%), ^{234}U (0.006%), and ^{235}U (0.714%). There are over 100 uranium minerals; those of commercial importance are the oxides and oxygenous salts. The processing of uranium ore generally involves extraction then leaching either by an acid or by a carbonate method. The metal may be obtained from its halides by fused salt electrolysis.

Uranium(IV)oxide is a black to brown crystalline solid or powder. Molecular weight = 270.03; Freezing/Melting point = 2865°C. Insoluble in water.

Uranyl chloride (7791-26-6) is a bright yellow crystalline solid. Molecular weight = 349.90; Freezing/Melting point = 578°C. Highly soluble in water (unstable).

Uranyl nitrate, solid (10102-06-4) is a yellow crystalline solid. Molecular weight = 394.02; Boiling point = 118°C; Freezing/Melting point = 60°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 2 (Oxidizer).

Uranyl nitrate, hexahydrate

Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 1.

Uranyl sulfate: Molecular weight = 420.2. Soluble in water.

Potential Exposure: The primary use of natural uranium is in nuclear energy as a fuel for nuclear reactors, in plutonium production, and as feeds for gaseous diffusion plants. It is also a source of radium salts. Uranium compounds are used in staining glass, glazing ceramics, and enameling; in photographic processes; for alloying steels; and as a catalyst for chemical reactions; radiation shielding; and aircraft counterweights. Uranium presents both chemical and radiation hazards, and exposures may occur during mining, processing of the ore, and production of uranium metal.

Incompatibilities: *Uranium:* Metal powder is radioactive, pyrophoric (ignites spontaneously in air), and a strong reducing agent. Keep away fromchlorine, fluorine, nitric acid, nitric oxide, selenium, sulfur, carbon dioxide, carbon tetrachloride. Complete coverage of uranium metal scrap or turnings with oil is essential for prevention of fire.

Uranium(IV)oxide: May spontaneously ignite on contact with air when heated above 700°C.

Uranium hydride: Keep away from strong oxidizers, water, halogenated hydrocarbons.

DOI: 10.1016/B978-1-4377-7869-4.00020-5

Uranyl chloride: Aqueous solutions are chemically unstable.
Uranyl nitrate(s): Keep away from combustible materials; reducing agents; Uranium hexafluoride: water.
Uranium hexafluoride: Water.

Permissible Exposure Limits in Air

Uranium, soluble compounds
OSHA PEL: 0.05 mg[U]/m^3 TWA.
NIOSH REL: TWA 0.05 mg[U]/m^3, Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.2 mg[U]/m^3 TWA; 0.6 mg[U]/m^3 STEL, Confirmed Human Carcinogen.
DFG MAK (uranium compounds): 0.25 mg[U]/m^3, measured as the inhalable fraction.
NIOSH IDLH: 10 mg[U]/m^3.
Russia[43] sets a MAC of 0.015 mg[U]/m^3 in work-place air for soluble uranium compounds and 0.075 mg[U]/m^3 for insoluble compounds. Several states have set guidelines or standards for uranium in ambient air[60] ranging from 2.0 to 6.0 μg/m^3 (North Dakota) to 3.5 μg/m^3 (Virginia) to 4.0 μg/m^3 (Connecticut) to 5.0 μg/m^3 (Nevada).

EPA Limits and advisory levels:
United States, annual radiation exposure limits are found in Title 10, part 20 of the Code of Federal Regulations, and in equivalent state regulations.
Public dose limits due to licensed activities (NRC) 100 mRem (0.01 Sv)/year.
Air: Radium NESHAP = 10 mRem (0.1 Sv)*
Water: ^{226}Ra & ^{228}Ra (combined radium) MCL = 5 pCi/L; ^{224}Ra = 15 picocuries/liter (5 pCi/L)*
Indoor Air (advisory "action level"): 4 pCi/L radon (Rn)
*Both the air and water standards limit the increased lifetime cancer risk to about 2 in 10,000.

Guidance Matrix for Radiological Dispersal Device (RDD) Incidents

OSHA Occupational Exposure Limits for Ionizing Radiation 29 CFR 1910.1096	Rem (Sv)/calendar quarter
Whole body, head and trunk, active blood-forming organs, lens of eye, or gonads	1.25 (0.0125 Sv)
Hands and forearms, feet, and ankles	18.75 (0.1875 Sv)
Skin of whole body	7.5 (0.075 Sv)
Minors (workers under 18 yrs)	10% of above limits
Majors (workers over 18 yrs)	ADVANCE \d43 Rem (0.3 Sv) may be permitted under conditions specified in 29 CFR 1910.1096(b)(2)

Note: The Department of Homeland Security is currently chairing an interagency workgroup which is in the process of assessing the protective action guidance for response to an RDD event.

Determination in Air: No method is available.
Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient goal of 3 μg/L based on health effects. Several states have set guidelines and standards for uranium in drinking water ranging from 10 μCi/L (Massachusetts) to 30 μCi/L (California) to 35 μCi/L (Arizona) to 15 μg/L (Colorado).

Routes of Entry: Inhalation of fume, dust, or gas; ingestion; skin and/or eye contact. The following uranium salts are reported to be capable of penetrating intact skin: uranyl nitrate, $UO_2(NO_3)_2 \cdot 6H_2H$; uranyl fluoride, UO_2F_2; uranium pentachloride, UCl_5; uranium trioxide (uranyl oxide), UO_3; sodium diuranate [sodium uranate (VI), $Na_2U_2O_7$]; uranium hexafluoride, UF_6.

Harmful Effects and Symptoms

Short Term Exposure: Prolonged contact with skin should be avoided to prevent radiation injury.

Uranium and its compounds are highly toxic substances. The compounds which are soluble in body fluids possess the highest toxicity. Poisoning has generally occurred as a result of accidents. Acute chemical toxicity produces damage primarily to the kidneys. Kidney changes precede in time and degree the effects on the liver. Chronic poisoning with prolonged exposure gives chest findings of pneumoconiosis, pronounced blood changes, and generalized injury.

It is difficult to separate the toxic chemical effects of uranium and its compounds from their radiation effects. The chronic radiation effects are similar to those produced by ionizing radiation. Reports now confirm that carcinogenicity is related to dose and exposure time. Cancer of the lung, osteosarcoma, and lymphoma have all been reported.

For soluble compounds: lacrimation, conjunctivitis, shortness of breath, coughing, chest rales, nausea, vomiting, skin burns, casts in urine, albuminuria, high blood urea nitrogen, lymphatic cancer. *For insoluble compounds:* dermatitis; cancer of lymphatic and blood-forming tissues.

Long Term Exposure: Can cause dermatitis, kidney damage, blood changes. A potential occupational carcinogen. Potential for cancer is a result of *alpha*-emitting properties and radioactive decay products (e.g., radon).

Points of Attack: *For soluble compounds:* respiratory system, blood, liver, kidneys, lymphatic system, skin, bone marrow. *Cancer site:* lungs. *For metal and insoluble compounds:* skin, kidneys, bone marrow, lymphatic system. *Cancer site:* lungs.

Medical Surveillance: NIOSH lists the following tests: whole blood (chemical/metabolite); complete blood count; chest X-ray; urine (chemical/metabolite); urinalysis (routine). Special attention should be given to the blood, lung, kidney, and liver in preemployment physical examinations. In periodic examinations, tests for blood changes, changes in chest X-rays, or for renal injury and liver damage are advisable. Uranium excretion in the urine has been used as an index of exposure. Whole body counting may also be useful. Blood Urea Nitrogen (BUN) for soluble compounds.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: *Soluble compounds*, especially UF_6: Wear appropriate clothing to prevent any possibility of skin contact with UF_6. Wear eye protection to prevent any possibility of eye contact. Employees should wash immediately when skin is wet or contaminated with UF_6 and daily at the end of each work shift. Work clothing should be changed daily if it is possible that clothing is contaminated with UF_6. Remove nonimpervious clothing immediately if wet or contaminated UF_6. Provide emergency showers and eyewash if UF_6 is involved.

Insoluble compounds: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection:

Soluble Uranium Compounds: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape (halides):* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus). *Escape (nonhalides):* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Insoluble Uranium Compounds: At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration: SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Radioactive. (1) Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. (2) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Uranium metal, pyrophoric, requires a shipping label of “RADIOACTIVE, SPONTANEOUSLY COMBUSTIBLE.” It falls in Hazard Class 7.

Uranyl nitrate, solid, requires a shipping label of “RADIOACTIVE, OXIDIZER.” It falls in Hazard Class 7.

Uranyl nitrate, hexahydrate solution, requires a shipping label of “CORROSIVE.” It falls in Hazard Class 7.

Spill Handling: *Dry material:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Uranium chips or turnings should be covered with oil to prevent fires, and collected in sealed containers for later disposal. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Seek professional environmental engineering assistance from the US EPA’s Environmental Response Team (ERT), Edison, NJ. Telephone 24-h hotline: 908-548-8730.

Fire Extinguishing: Uranium is an explosion hazard as dust or solid when exposed to flame. In case of fire, contact the local, state, or department of energy radiological response team. *Do not use water*. Use graphite, soda ash, powdered sodium chloride, or suitable dry powder. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Disposal of wastes containing uranium (uranium and compounds) should follow guidelines set forth by the nuclear regulatory commission. Contact the nuclear regulatory commission regarding disposal notification. Recovery for reprocessing is the preferred method. Processes are available for uranium recovery from process wastewaters and process scrap. Burial at an authorized radioactive burial site.

US EPA Gene-Tox Program, Positive: *In vitro* cytogenetics—human lymphocyte; Negative: Sperm morphology—mouse; Inconclusive: *E. coli* polA without S9.

US EPA, FIFRA 1998 Status of Pesticides: Canceled.

FDA—over-the-counter and proprietary drug.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Urea is a white crystalline solid. Molecular weight = 60.07; Boiling point = (decomposes); Freezing/Melting point = 133°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Drug, Mutagen; Reproductive Effector; Human Data; Primary Irritant. Urea is used in ceramics, cosmetics, paper processing, resins, adhesives, animal feeds; in the manufacture of isocyanurates, resins, and plastics; as a stabilizer in explosives; in medicines; and others.

Incompatibilities: Violent reaction with strong oxidizers, chlorine, permanganates, dichromates, nitrites, inorganic chlorides, chlorites, and perchlorates. Contact with hypochlorites can result in the formation of explosive compounds.

Permissible Exposure Limits in Air

AIHA WEEL: 10 mg/m^3 TWA.

Protective Action Criteria (PAC)

TEEL-0: 10 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 500 mg/m^3

The state of New York[61] has set a guidelines of 0.03 μg/m^3 for urea in ambient air.

Russia set a MAC of 0.2 mg/m^3 in ambient air in residential areas on a daily average basis.

Permissible Concentration in Water: Russia[43] set a MAC of 80.0 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Causes irritation of the respiratory tract. Dust may cause difficult breathing especially if the person has asthma. *Skin:* May cause irritation, burning, or stinging. *Eyes:* Causes irritation. *Ingestion:* There have been no reported cases of human toxicity. However, some toxic effects have been seen in sheep with impaired liver function.

Long Term Exposure: Prolonged skin contact may cause dermatitis.

Points of Attack: Skin.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Controlled incineration in equipment containing a scrubber or thermal unit to reduce nitrogen oxide emissions.

California Proposition 65 Chemical: Cancer 1/1/88; Developmental/Reproductive toxin 10/1/94.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R45; Safety phrases: S53; S45 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Urethane is a colorless, almost odorless crystalline solid or powder. Molecular weight = 89.11; Specific gravity (H_2O:1) = 1.11 at 25°C; Boiling point = 183°C; Freezing/Melting point = 49°C; Flash point = 92°C (cc). Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Agricultural Chemical; Drug, Tumorigen, Mutagen; Reproductive Effector. Urethane is used as a chemical intermediate in the manufacture of pharmaceuticals, pesticides, and fungicides; in the preparation of amino resins. It may be reacted with formaldehyde to give cross-linking agents that impart wash-and-wear properties to fabrics. It has also been used as a solubilizer and cosolvent in the manufacture of pesticides, fumigants, and cosmetics. It was formerly used in the treatment of leukemia. It occurs when diethylpyrocarbonate, a preservative used in wines, fruit juices, and soft drinks, is added to aqueous solutions.

Incompatibilities: Gallium, perchlorate, and strong oxidizers.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)

TEEL-0: 500 mg/m^3

PAC-1: 500 mg/m^3
PAC-2: 500 mg/m^3
PAC-3: 500 mg/m^3
DFG MAK: [skin] Carcinogen Category 2; Germ Cell Mutation Category 3A, *as carbamic acid ethyl ester*.
Austria: carcinogen, 1999; Finland: carcinogen, 1993; Sweden: carcinogen, 1999; Switzerland: carcinogen, 1999. Several states have set guidelines or standards for urethane in ambient air[60] ranging from zero (North Dakota) to 0.03 μg/m^3 (New York) to 5000.0 μg/m^3 (South Carolina).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = -0.15$

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Urethane can affect you when breathed in and by passing through your skin. High exposures may affect the CNS, causing dizziness, lightheadedness, and unconsciousness. Very high exposures can cause damage to the liver, brain, and blood-forming organs.

Long Term Exposure: Urethane is a carcinogen and may be a teratogen. Handle with extreme caution. Repeated exposures can damage the liver, brain, and blood-forming organs.

Points of Attack: Liver, brain, blood.

Medical Surveillance: Before beginning employment, and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: liver function tests. Complete blood count. If symptoms develop or overexposure suspected, the following may be useful: examination of the nervous system.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Immediately flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: Contact a physician, hospital, or poison center at once. If the victim is unconscious or convulsing, do not induce vomiting or give anything by mouth. Assure that this airway is open and lay him on his side with his head lower than his body and transport immediately to a medical facility. If conscious and not convulsing, give a glass of water or milk to dilute the substance. Vomiting should not be induced without a physician's advice.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Urethane must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine), strong acids (such as hydrochloric, sulfuric, and nitric), strong bases, camphor, menthol, salol, or thymol since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solids, organic, n.o.s. require a label of "POISONOUS/TOXIC MATERIALS." Urethane falls in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire, including nitrogen oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any

signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Controlled incineration (incinerator equipped with a scrubber or thermal unit to reduce nitrogen oxides emissions).

V

Valeraldehyde V:0100

Molecular Formula: $C_5H_{10}O$
Common Formula: $CH_3(CH_2)_3CHO$
Synonyms: Amyl aldehyde; Butyl formal; *n*-Pentanal; Pentanal; Valeral; *n*-Valeraldehyde; Valerianic aldehyde; Valeric acid aldehyde; *n*-Valeric aldehyde; Valeric aldehyde
CAS Registry Number: 110-62-3
RTECS® Number: YV3600000
UN/NA & ERG Number: UN2058/129
EC Number: 203-784-4
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Low hazard to waters.

Description: Valeraldehyde is a colorless liquid with a strong acrid, pungent odor. The odor threshold is 0.028 ppm. Molecular weight = 86.15; Specific gravity (H_2O:1) = 0.81 at 25°C; Boiling point = 103°C; Freezing/Melting point = −92°C; Vapor pressure = 26 mmHg; Flash point = 12°C (oc); Autoignition temperature = 222°C. Explosive limits in air = LEL = 1.4%; UEL = 7.2%. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 0. Moderately soluble in water; solubility = 1.4% at 20°C.

Potential Exposure: Compound Description: Mutagen, Primary Irritant. Valeraldehyde is used in food flavorings and in resin chemistry. It is also used in the acceleration of rubber vulcanization.

Incompatibilities: Strong oxidizers, caustics, amines.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 3.53 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 50 ppm/175 mg/m^3 TWA, See Appendix C (Aldehydes) of the *NIOSH Pocket Guide*. Limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde.
ACGIH TLV®[1]: 50 ppm/176 mg/m^3 TWA.
No TEEL available.
Australia: TWA 50 ppm (175 mg/m^3), 1993; Belgium: TWA 50 ppm (176 mg/m^3), 1993; Denmark: TWA 50 ppm (175 mg/m^3), 1999; Finland: TWA 50 ppm (175 mg/m^3), STEL 75 ppm (265 mg/m^3), 1999; France: VME 50 ppm (175 mg/m^3), 1999; Norway: TWA 0.3 mg/m^3, 1999; Switzerland: MAK-W 50 ppm (175 mg/m^3), 1999; the Netherlands: MAC-TGG 175 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam; ACGIH TLV®: TWA 50 ppm. Several states have set guidelines or standards for valeraldehyde in ambient air[60] ranging from 1.75 mg/m^3 (North Dakota) to 2.9 mg/m^3 (Virginia) to 3.5 mg/m^3 (Connecticut) to 4.167 mg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV), #2018, #2536, valeraldehyde, OSHA Analytical Method 85.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.31. See also NIOSH (IV) #2539, aldehydes, screening.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Valeraldehyde can affect you when breathed in. Contact can severely irritate the eyes, skin, nose, and throat. Exposure to very high levels can cause you to feel dizzy and lightheaded. Poisonous if swallowed.

Long Term Exposure: Testing has not been completed to determine the carcinogenicity of *n*-valeraldehyde. However, the limited studies to date indicate that these substances have chemical reactivity and mutagenicity similar to acetaldehyde and malonaldehyde. Therefore, NIOSH recommends that careful consideration should be given to reducing exposures to this aldehyde. Further information can be found in the *NIOSH Current Intelligence Bulletin 55: Carcinogenicity of Acetaldehyde and Malonaldehyde, and Mutagenicity of Related Low-Molecular-Weight Aldehydes* [DHHS (NIOSH), Publication No. 91-112].

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: See Long Term Exposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00021-7

Respirator Selection: Where there is potential for exposures *over 50 ppm*, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with an organic vapor cartridge/canister. Increased protection is obtained from full-face-piece powered air-purifying respirators. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full-face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area. Sources of ignition, such as smoking and open flames, are prohibited where valeraldehyde is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of valeraldehyde should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of valeraldehyde.

Shipping: This compound requires a shipping label of “FLAMMABLE LIQUID.” It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity: DFG MAK: Carcinogen Category 2.

Air Pollutant Standard Set. See below, “Permissible Exposure Limits in Air” section.

Except when contained in an alloy:

Clean Water Act: Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 4.3; Nonwastewater (mg/L), 0.23.

RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested test method(s) (PQL μg/L): total dust 6010 (80); 7910 (2000); 7911 (40).

Safe Drinking Water Act: Priority List (55 FR 1470) as vanadium.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, elemental.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): Nonwater polluting agent.

Description: Vanadium is a light-gray or silver-white ductile solid, lustrous powder, or fused hard lump. Molecular weight = 50.94; Boiling point = 3380°C; Freezing/Melting point = 1917°C. Hazard Identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water. It is produced by roasting the ores, thermal decomposition of the iodide; or from petroleum residues; slags from ferrovanadium production; or soot from oil burning.

Vanadium carbide (CV) is a dark-gray powder. Insoluble in water.

Potential Exposure: Most of the vanadium produced is used in ferrovanadium and of this the majority is used in high speed and other alloy steels with only small amounts in tool or structural steels. It is usually combined with chromium, nickel, manganese, boron, and tungsten in steel alloys. Vanadium carbide is used in cutting tool bits. Melting point 2750−2810°C.

Incompatibilities: Violent reaction with strong oxidizers: chlorine, bromine trifluoride, lithium, nitryl fluoride, chlorine trifluoride.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.06 mg/m^3

PAC-1: 1.5 mg/m^3

PAC-2: 12.5 mg/m^3

PAC-3: 35 mg/m^3

DFG MAK: inhalable fraction, Carcinogen Category: 2; Germ cell mutagen group: 2.

Dust and fume: see vanadium pentoxide V:0120.

Determination in Air: Use NIOSH Analytical Method #7300, Elements, #7504, Vanadium oxides.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes. There is no US standard for vanadium in drinking water, but EPA[32] has suggested a permissible ambient goal of 7 μg/L based on health effects. The lack of data on acute or chronic oral toxicity is not surprising because of the extremely low absorption of vanadium from the gastrointestinal tract. Inhaled vanadium can produce adverse health effects.

Determination in Water: Russia set a limit of 0.1 mg/L for vanadium as a maximum permissible limit for water basins.

Routes of Entry: *For dust and fume:* Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vanadium can affect you when breathed in. Exposure may irritate the eyes, nose, throat, and air passages, with cough and phlegm. Eye contact may cause irritation. See also "Vanadium Pentoxide." *Ingestion:* acute poisoning in animals by ingestion of vanadium compounds has been shown to cause nervous disturbances, leg paralysis, respiratory failure, convulsions, bloody diarrhea, coma, and death.

Long Term Exposure: Can cause greenish-black coloration of the tongue and metallic taste. May cause eczema. Dust and/or fume may cause respiratory irritation; bronchitis may develop, with cough, fine rales, wheezing, dyspnea (breathing difficulty). See also "Vanadium Pentoxide."

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the workplace if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporarily removed from risk. See also "Vanadium Pentoxide."

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 mg/m^3:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators) or SA* (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Vanadium must be stored to avoid contact with oxidizers (such as chlorates, nitrates, chlorine, and bromine trifluoride), since violent reactions occur. Store the powder in tightly closed containers in a cool, well-ventilated area away from heat and sparks. Use only nonsparking tools and equipment, especially when opening and closing containers of the powder.

Shipping: Vanadium compound, n.o.s. requires a shipping label of “POISONOUS/TOXIC MATERIALS.” It falls in Hazard Class 6.1 and can fall into Packing Groups I, II, or III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Large pieces of vanadium are not combustible. The fine powder can burn. Use dry chemicals appropriate for extinguishing metal fires. *Do not use water.* Poisonous gases are produced in fire, including vanadium oxide. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1% pentoxide.

European/International Regulations: Hazard Symbol: T, Xn; Risk phrases: R20/22; R37; R48/23; R51/53; R63; R68; Safety phrases: S1/2; S36/37; S38; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Vanadium pentoxide dust is an odorless, yellow to red crystal, or powder; or a fume when vanadium is heated. Vanadium pentoxide fume is a finely divided particulate dispersed in air. Molecular weight = 181.88; Specific gravity (H_2O:1) = 3.36 at 25°C; Boiling point = 1750°C (decomposes); Freezing/Melting point = 690°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.8%.

Potential Exposure: Compound Description (*dust*): Mutagen; Reproductive Effector; Human Data; Primary Irritant; (fume) Tumorigen. Vanadium pentoxide [V_2O_5] is an industrial catalyst in oxidation reactions, used in glass and ceramic glazes, a steel additive, and used in welding electrode coatings.

Incompatibilities: Strong acids, lithium, chlorine trifluoride, peroxyformic acid, combustible substances.

Permissible Exposure Limits in Air

OSHA PEL: 0.5 mg[V_sO_5]/m^3 (*dust*), respirable fraction; 0.1 mg[V_sO_5]/m^3 (fume) Ceiling Concentration.

NIOSH REL: 0.05 mg[V]/m^3 Ceiling Concentration [15 min, except vanadium metal and vanadium carbide].

ACGIH TLV®[1]: withdrawn.

NIOSH IDLH = 35 mg[V]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.179 mg/m^3

PAC-1: 1 mg/m^3

PAC-2: 7 mg/m^3

PAC-3: 125 mg/m^3

DFG MAK: Carcinogen Category: 2; Germ cell mutagen group: 2; (DFG 2005).

Listed under "dust"

Austria: MAK 0.05 mg/m^3, 1999; Denmark: TWA 0.03 mg [V]/m^3, 1999; Japan; 0.5 mg[V_2O_5]/m^3, 1999; Poland: MAC (TWA) 0.05 mg/m^3; MAC (STEL) 0.5 mg/m^3, 1999; Switzerland: MAK-W 50 ppm (175 mg/m^3), 1999; United Kingdom: TWA 0.5 mg[V]/m^3, total inhalable (*dust*); TWA 0.04 mg[V]/m^3, (fume and respirable dust), 2000.

Listed under "fume"

Austria: MAK 0.05 mg/m^3, 1999; Japan; 0.1 mg [V_2O_5]/m^3, 1999; Poland: MAC (TWA) 0.05 mg/m^3; MAC (STEL) 0.1 mg/m^3, 1999; Sweden: NGV 0.2 mg[V]/m^3, 1999; Switzerland: MAK-W 50 ppm (175 mg/m^3), 1999; United Kingdom: TWA 0.04 mg[V]/m^3, (fume and respirable dust); TWA 5 mg/m^3, 2000. Russia[43] set a MAC of 0.002 mg/m^3 in ambient air in residential areas on a daily average basis. Several states have set guidelines or standards for vanadium pentoxide in ambient air[60] ranging from 0.14 μg/m^3 (Massachusetts) to 0.8 μg/m^3 (Virginia) to 1.0 μg/m^3 (Connecticut and Nevada) to 5.0 μg/m^3 (North Dakota).

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements by ICP, #7301; #7303; #7504, Vanadium oxides; #9102, OSHA Analytical Method ID-185.

Determination in Water: Russia set a limit of 0.1 mg/L for vanadium as a maximum permissible limit for water basins.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vanadium pentoxide is irritating to the skin, eyes, and mucous membranes. Blindness and epistaxis (bloody nose) are further complications. Headache, dry mouth, dizziness, nervousness, insomnia, and tremor may be found. Probable oral lethal dose for humans is between 5 and 50 mg/kg or between 7 drops and 1 teaspoon for a 70-kg (150-lb) person. Toxicity is about the same magnitude as pentavalent arsenic. Acute exposure to vanadium pentoxide may result in pulmonary irritation, bronchospasm, hemoptysis (coughing up of blood), emphysema, anorexia, black stools, and pulmonary edema. Pulmonary edema is a medical emergency that can be delayed for several hours, and can cause death.

Long Term Exposure: May cause dermatitis, eczema, skin allergy. Lungs may be affected by repeated inhalation of dust or fumes; bronchitis may develop, with cough, fine rales, wheezing, dyspnea (breathing difficulty). May cause a green staining of the tongue and skin.

Points of Attack: Eyes, skin, respiratory system.

Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. Consider chest X-ray after acute overexposure. Test for urine level of vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the workplace if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporarily removed from risk.

An OSHA specifically regulated substance. See NIOSH Publication No. 2005-110, December 2004.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 mg/m*^{3}*:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators) or SA* (any supplied-air respirator). *1.25 mg/m*^{3}*:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m*^{3}*:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd, Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Vanadium pentoxide must be stored to avoid contact with chlorine trifluoride, lithium, and peroxyformic acid, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat.

Shipping: Vanadium pentoxide, nonfused form, requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Do not touch spilled materials; stop leak if you can do so without risk. Use water spray to reduce vapors. *Small spills:* absorb with sand or other noncombustible absorbent material and place into containers for later disposal. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike far ahead of spill for later disposal. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Not combustible but will increase the intensity of an existing fire. Extinguish fire using an agent suitable for type of surrounding fire. Vanadium pentoxide itself does not burn, but dust may increase the intensity of fire when in contact with combustible materials. Poisonous gases are produced in fire, including oxides of vanadium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Vanadium pentoxide may be salvaged or disposed of in a sanitary landfill.

Determination in Water: Russia set a limit of 0.1 mg/L for vanadium as a maximum permissible limit for water basins.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vanadium tetrachloride can affect you when breathed in and by passing through your skin. Vanadium tetrachloride is a corrosive chemical and eye contact can cause irritation and possible damage. Exposure can irritate the eyes, nose, throat, and lungs, with cough and shortness of breath. Higher exposures can cause pneumonia or pulmonary edema (fluid in the lungs). Pulmonary edema is a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Repeated exposure can cause lung irritation; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: Before beginning employment and at regular times after that, for those with frequent or potentially high exposures, the following are recommended: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. Test for urine level of vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the workplace if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporarily removed from risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 mg/m^3:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators) or SA* (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Vanadium tetrachloride must be stored to avoid contact with water, heat, and poisonous gases since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from radiant heat and flammable and combustible materials, lithium, chlorine, and trifluoride. Vanadium tetrachloride decomposes slowly to vanadium trichloride and chloride. Open containers in dry oxygen-free atmosphere or in inert gas, wearing appropriate personal protective equipment. Chill to below 20°C before opening.

Shipping: Vanadium tetrachloride requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. *Do not use water* or wet method. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep out of sewers because of the possibility of fire and explosion. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vanadium tetrachloride itself does not burn, but it may increase the intensity of fire since it is an oxidizer. Use dry chemical or CO_2 extinguishers on surrounding fire. *Do not use water* on material. Poisonous gases, including hydrogen chloride, vanadium oxides, and vanadium, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. Use water spray to keep fire-exposed containers cool and to reduce vapors but do not get water inside containers of vanadium tetrachloride or on spilled material. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

EC Number: 248-652-7

Regulatory Authority and Advisory Bodies

Carcinogenicity: DFG MAK: Carcinogen Category 2.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Vanadyl sulfate is an odorless pale blue powder. Molecular weight = 163.1; Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Highly soluble in water.

Potential Exposure: Vanadyl sulfate is used as a fixative for textile dyes, a colorant for glass and ceramics, a reducing agent, and a catalyst.

Incompatibilities: Sulfates react with aluminum, magnesium. Incompatible with strong oxidizers.

Permissible Exposure Limits in Air

NIOSH IDLH = 35 mg[V]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 1 mg/m^3

PAC-1: 3 mg/m^3

PAC-2: 20 mg/m^3

PAC-3: 112 mg/m^3

DFG MAK: inhalable fraction, Carcinogen Category: 2; Germ cell mutagen group: 2; (DFG 2005).

Determination in Air: Use Method #7300, Elements, #7504, Vanadium oxides.

Permissible Concentration in Water: Russia[43] set a MAC of 0.1 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Toxic when ingested. Vanadyl sulfate can affect you when breathed in. Contact can irritate the skin. Exposure can irritate the eyes, nose, throat, and lungs with cough and phlegm. Higher exposures can cause pneumonia and/or pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Long Term Exposure: Lungs may be affected by repeated inhalation; bronchitis may develop. May cause a greenish-black discoloration of the tongue and skin.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: Urine test for vanadium. An EEC guideline recommends the following based on vanadium urine levels: an every-4-month control at the workplace if a 50 μg/L is reached and an annual control if the 5 μg/L urine level is reached. In case levels exceed 50 μg/L urine, workers should be temporarily removed from risk. Consider chest X-ray after acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH/OSHA (as V): *0.5 mg/m^3:* 100XQ* (APF = 10) (any air-purifying respirator with an N100, R100, or P100 filter (including N100, R100, and P100 filtering face-pieces) except quarter-mask respirators) or SA* (any supplied-air respirator). *1.25 mg/m^3:* Sa:Cf* (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *2.5 mg/m^3:* 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter) or PaprHie* (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full-face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: (1) Color Code—Yellow Stripe (*strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. (2) Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area.

Shipping: Vanadyl sulfate requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Use water spray to reduce vapors. Poisonous gases are produced in fire, including oxides of sulfur and vanadium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

European/International Regulations: Hazard Symbol: F+; Risk phrases: R11; Safety phrases: S2; S16; S23; S29; S33 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Vinyl acetate is a colorless, flammable liquid. The odor threshold is 0.12 ppm,[41] 0.3 ppm (NY, NJ). Molecular weight = 86.10; Specific gravity (H_2O:1) = 0.93 at 25°C; Boiling point = 72.2°C; Freezing/Melting point = −93.3°C; Vapor pressure = 83 mmHg at 25°C; Flash point = −8°C (cc); Autoignition temperature = 402°C. Explosive limits: LEL = 2.6%; UEL = 13.4%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 3, Reactivity 2. Slightly soluble (2%) in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. Vinyl acetate is used primarily in polymerization processes to produce polyvinyl acetate, polyvinyl alcohol, and vinyl acetate copolymer. The polymers usually made as emulsions, suspensions, solutions, or resins are used to prepare adhesives, paints, paper coatings, and textile finishes. Low-molecular-weight vinyl acetate is used as a chewing gum base.

Incompatibilities: Violent reaction with strong oxidizers. The vapor may react vigorously with silica gel or aluminum. Acids, bases, silica gel, alumina, oxidizers, azo compounds. Ozone readily polymerizes in elevated temperatures, under the influence of light or peroxides. Usually contains a stabilizer [e.g., hydroquinone (limit to 2 months) or diphenylamine (for longer term)] to prevent polymerization.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 3.52 mg/m^3 at 25°C & 1 atm.

OSHA PEL: None.

NIOSH REL: 4 ppm/15 mg/m^3 [15 min] Ceiling Concentration.

ACGIH TLV®[1]: 10 ppm/35 mg/m^3 TWA; 15 ppm/53 mg/m^3 STEL, confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)*

TEEL-0: 6.7 ppm

PAC-1: **6.7** ppm

PAC-2: **180** ppm

PAC-3: **610** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 3A.

Australia: TWA 10 ppm (30 mg/m^3), STEL 20 ppm, 1993; Austria: MAK 1 ppm (35 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 10 ppm (35 mg/m^3), STEL 20 ppm, 1993; Denmark: TWA 10 ppm (30 mg/m^3), 1999; Finland: TWA 10 ppm (35 mg/m^3), STEL 20 ppm (70 mg/m^3), 1993; France: VME 10 ppm (30 mg/m^3), 1999; the Netherlands: MAC-TGG 18 mg/m^3, 2003; Poland: MAC (TWA) 10 mg/m^3; MAC (STEL) 30 mg/m^3, 1999; Sweden: NGV 5 ppm (18 mg/m^3), KTV 10 ppm (35 mg/m^3), 1999; Switzerland: MAK-W 10 ppm (35 mg/m^3), KZG-W 20 ppm (70 mg/m^3), 1999; Turkey: TWA 10 ppm (30 mg/m^3), 1993; United Kingdom: TWA 10 ppm (36 mg/m^3), STEL 20 ppm (72 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 15 ppm.

Russia[43] set a MAC of 0.15 mg/m^3 in ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for vinyl acetate in ambient air[60] ranging from 5.0 μg/m^3 (Virginia) to 9.6 μg/m^3 (Massachusetts) to 300.0−600.0 μg/m^3 (North Dakota) to 600.0 μg/m^3 (Connecticut) to 714.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1453, vinyl acetate; OSHA Analytical Method 51.

Determination in Water: Octanol−water coefficient: Log K_{ow} = <0.8.

Permissible Concentration in Water: Russia[43] set a MAC of 0.2 mg/L in water bodies used for domestic purposes.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the eyes, skin, and respiratory tract, causing hoarseness, cough, loss of smell. A CNS depressant; high levels of exposure can cause fatigue, dizziness, lightheadedness, and disturbed sleep. *Inhalation:* Irritates the nose and throat, causing coughing and/or shortness of breath. Levels of 19 ppm for 4 h have caused slight throat irritation. The characteristic odor may not be recognized after about 2 h. Levels of 71 ppm for 1/2 h may cause definite throat irritations. May cause lesions of the lung tissue. *Skin:* Contact can cause irritation, dryness. Prolonged contact can cause rash, burns, and blisters. *Eyes:* Levels of 22 ppm and above may produce eye reddening and irritation. Contact can cause burns.

Long Term Exposure: May affect the heart, central nervous system, and liver. Levels above 22 ppm for 1 year may cause reversible irritation to eyes, throat, and lungs, sometimes accompanied by skin irritation or rash. Vinyl acetate has been related to reproductive abnormalities. Exposure caused gradual deterioration of heart muscles.

Points of Attack: Liver, eyes, heart, skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater), the following is recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: liver function tests. Examination of the nervous system. EKG. Specific engineering controls are recommended for this chemical. Refer to NIOSH Criteria Document #78-205, Occupational Exposure to Vinyl Acetate.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Teflon™, polyethylene and ethylene vinyl alcohol are recommended as protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *40 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *100 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *200 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge (s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *400 ppm:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl acetate must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat and direct sunlight. Sources of ignition, such as smoking and open flames, are prohibited where vinyl acetate is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of vinyl acetate should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinyl acetate. Wherever vinyl acetate is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Water may be ineffective. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Vinyl bromide V:0160

Molecular Formula: C_2H_3Br
Common Formula: $CH_2{=}CHBr$
Synonyms: Bromoethene; Bromoethylene; Bromure de vinyle (French); Bromuro de vinilo (Spanish); Ethene, bromo-; Ethylene, bromo-; Monobromoethylene; Vinylbromid (German); Vinyle (bromure de) (French)
CAS Registry Number: 593-60-2
RTECS® Number: KU8400000
UN/NA & ERG Number: UN1085 (stabilized)/116
EC Number: 209-800-6 [*Annex I Index No.:* 602-024-00-2]
Regulatory Authority and Advisory Bodies
Carcinogenicity: IARC: Animal, Sufficient Evidence; Human, No Adequate Data, Group 2A, 1999 NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential Occupational carcinogen.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Reportable Quantity (RQ): 1 lb (0.454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 0.1%.
California Proposition 65 Chemical 10/1/88.
Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.
European/International Regulations: Hazard Symbol: F+, T; Risk phrases: R45; R12 (Carc/Cat. 2); Safety phrases: S53; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Vinyl bromide is a colorless gas or liquid with a pleasant odor. Shipped as a liquefied compressed gas with 0.1% phenol added to prevent polymerization. Molecular weight = 106.96; Specific gravity (H_2O:1) = 1.49 (liquid at 15.6°C); Boiling point = 15.6°C; Freezing/Melting point = −139.4°C; Vapor pressure = 1.4 atm; Relative vapor density (air = 1) = 3.97; Flash point = flammable gas; Autoignition temperature = 530°C. Explosive limits: LEL = 9.0%; UEL = 15.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 1. Insoluble in water.
Potential Exposure: Compound Description: Tumorigen, Mutagen. Vinyl bromide is used as an intermediate in organic synthesis and for the preparation of plastics by polymerization and copolymerization; as a comonomer with acrylonitrile and other vinyl monomers in modacrylic fibers; in the production of flame-retardant synthetic fibers.
Incompatibilities: Strong oxidizers (e.g., perchlorates, peroxides, chlorates, permanganates, and nitrates). May polymerize in heat, light, especially sunlight. Add 0.1% phenol to gas to prevent polymerization.
Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.38 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 0.5 ppm/2.2 mg/m^3 TWA, Suspected Human Carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 3500 ppm
PAC-2: 6000 ppm
PAC-3: 6000 ppm
Australia: TWA 5 ppm (20 mg/m^3), carcinogen, 1993; Belgium: TWA 5 ppm (22 mg/m^3), carcinogen 1993; Denmark: TWA 5 ppm (20 mg/m^3), 1999; Finland: TWA 5 ppm (20 mg/m^3), STEL 10 ppm (40 mg/m^3), carcinogen, 1999; Norway: TWA 1 ppm (4 mg/m^3), 1999; Switzerland: MAK-W 5 ppm (22 mg/m^3), 1999; United Kingdom: LTEL 5 ppm (20 mg/m^3), 1993; the Netherlands: MAC-TGG 0.012 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Suspected Human Carcinogen. Several states have set guidelines or standards for vinyl bromide in ambient air[60] ranging from zero (North Dakota) to 2.0 μg/m^3 (Virginia) to 44.0 μg/m^3 (Connecticut) to 48.07 μg/m^3 (Pennsylvania) to 66.7 μg/m^3 (New York) to 100.0 μg/m^3 (South Carolina) to 200.0 μg/m^3 (Florida) to 476.0 μg/m^3 (Nevada).
Determination in Air: Charcoal tube; Ethanol; Gas chromatography/Flame ionization detection; NIOSH Analytical Method (IV) #1009, Vinyl bromide, OSHA Analytical Method 08.
Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.6.
Routes of Entry: Inhalation, ingestion (liquid), skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Vinyl bromide can affect you when breathed in. Contact can irritate the eyes. A nervous system depressant; exposures may cause dizziness, lightheadedness, confusion, a lack of coordination, narcosis, nausea, vomiting. Contact with the liquid can cause frostbite.
Long Term Exposure: Potential occupational carcinogen.
Points of Attack: Eyes, skin, central nervous system, liver. Cancer site in animals: liver and lymph node.
Medical Surveillance: There are no special tests. However, medical attention is recommended if overexposure is suspected.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately.

If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is NO REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl bromide must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and heat or flame, since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where vinyl bromide is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: This compound requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vinyl bromide is a flammable gas. For small fires, use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Vinyl chloride is a flammable gas at room temperature, and is usually encountered as a cooled liquid. The colorless liquid forms vapors which have a pleasant, ethereal odor. The odor threshold is variously given as 260 ppm,[41] 3000 ppm (NJ fact sheet), 4000 ppm (NY fact sheet) in air and 3.4 ppm in water (EPA Toxicological profile). Shipped as a liquefied compressed gas. Molecular weight = 62.50; Specific gravity (H_2O:1) = 0.88 (Liquid) at 25°C; Boiling point = −14°C; Freezing/Melting point = −160°C; Relative vapor density (air = 1) = 2.21; Flash point = flammable gas at −75°C (cc); Autoignition temperature = 472°C. Explosive limits: LEL = 3.6%; UEL = 33.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. Insoluble in water; 0.1% at 25°C.

Potential Exposure: Compound Description: Agricultural Chemical; Tumorigen, Mutagen; Reproductive Effector; Human Data. Vinyl chloride is used as a vinyl monomer in the manufacture of polyvinyl chloride (vinyl chloride homopolymer) and other copolymer resins. It is also used as a chemical intermediate and as a solvent.

Incompatibilities: Copper, oxidizers, aluminum, peroxides, iron, steel. Polymerizes in air, sunlight, heat, and on contact with a catalyst, strong oxidizers, and metals, such as aluminum and copper, unless stabilized by inhibitors, such as phenol. Attacks iron and steel in the presence of moisture.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 2.56 mg/m^3 at 25°C & 1 atm.
OSHA PEL: 1 ppm/2.56 mg/m^3 TWA; 5 ppm [Avg not exceeding any 15 min period STEL].
NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.
ACGIH TLV®[1]: 1 ppm/2.6 mg/m^3 TWA, Confirmed Human Carcinogen.
Protective Action Criteria (PAC)*
TEEL-0: 1 ppm
PAC-1: **250** ppm
PAC-2: **1200** ppm
PAC-3: **4800** ppm
*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: Carcinogen Category 1; TRK: 2 mL/m^3/5.2 mg/m^3; 2.4 mg[thioglycolic acid]/24 h, in urine; after several shifts.

Arab Republic of Egypt: TWA 2.5 mg/m^3, 1993; Australia: TWA 5 ppm (10 mg/m^3), carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 5 ppm (13 mg/m^3), carcinogen 1993; Denmark: TWA 1 ppm (3 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (15 mg/m^3), STEL 10 ppm (30 mg/m^3), carcinogen, 1993; Hungary: STEL 10 mg/m^3, carcinogen, 1993; Japan 2.5 ppm (6.5 mg/m^3), carcinogen, 1999; the Netherlands: MAC-TGG 7.77 mg/m^3, 2003; Norway: TWA 1 ppm (3 mg/m^3), 1999; the Philippines: TWA 50 ppm (100 mg/m^3), 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 30 mg/m^3, 1999; Russia: TWA 1 mg/m^3, STEL 2.5 ppm (5 mg/m^3), 1993; Sweden: NGV 1 ppm (2.5 mg/m^3), KTV 5 ppm (13 mg/m^3), [skin], carcinogen, 1999; Switzerland: MAK-W 2 ppm (5.2 mg/m^3), carcinogen, 1999; Thailand: TWA 1 ppm (2.8 mg/m^3), 1993; Turkey: TWA 500 ppm (1300 mg/m^3), 1993; United Kingdom: TWA 7 ppm, carcubigen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. MAC values have been set for ambient air in residential areas[35] by Russia at 0.005 mg/m^3 on a momentary basis and by the Czech Republic at 0.3 mg/m^3 on a momentary basis and 0.1 mg/m^3 on a daily average basis. Several states have set guidelines or standards for vinyl chloride in ambient air[60] ranging from zero (North Dakota) to 0.038 μg/m^3 (North Carolina) to 0.4 μg/m^3 (Michigan and New York) to 1.0 μg/m^3 (Virginia) to 3.846 μg/m^3 (Kansas) to 3.9 μg/m^3 (Massachusetts) to 5.0 μg/m^3 (Pennsylvania) to 50.0 μg/m^3 (Connecticut, South Carolina, South Dakota) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #1007, vinyl chloride, OSHA Analytical Method 04.

Permissible Concentration in Water: No criteria have been determined for the protection of freshwater or saltwater aquatic life due to insufficient data. For the protection of human health: preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 20 μg/L.[6] A long-term health advisory for vinyl chloride of 46 μg/L has been set by EPA.[48] Several states have set guidelines or standards for vinyl chloride in drinking water[61] ranging from zero (Rhode Island) to 0.15 μg/L (Minnesota) to 1.0 μg/L (Arizona, Florida, Kansas, Massachusetts, New Mexico, Vermont) to 2.0 μg/L (California, Maine, New Jersey, Colorado) to 5.0 μg/L (New York).

Determination in Water: Inert gas purge followed by gas chromatography with halide-specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 0.62$.

Routes of Entry: Inhalation, skin, and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* May affect the central nervous system. High exposures can cause dizziness, lightheadedness, sleepiness. Even higher levels can cause headache, nausea, weakness, unconsciousness, and possible death. Exposure at 8000 ppm for 5 min can cause a feeling of intoxication, tiredness, drowsiness, abdominal pain, numbness and tingling in fingers and toes, pains in joints, coughing, sneezing, irritability, loss of appetite and weight. *Skin:* Contact with liquid may cause frostbite; contact with vapor may cause irritation and rash. Absorption is possible through the skin. *Eyes:* Can cause severe and immediate irritation. Contact with the liquid may cause frostbite. *Ingestion:* Moderately toxic.

Long Term Exposure: May cause "scleroderma" a disease that causes the skin to become smooth, tight and shiny and causes the bones in the fingers to erode (resulting in club-like swelling and shortening of finger tips) and damage the blood vessels in the hands (Raynaud's syndrome). This causes the hands or feet to turn numb, pale or blue with even mild cold exposure. Connective tissue, bones, and joints of arms and legs may suffer damage. Repeated exposure can permanently damage the liver, spleen, kidneys, nervous system, and blood cells. Vinyl chloride can cause symptoms such as stomach ulcers and skin allergy. Not all symptoms disappear after exposure stops. Vinyl chloride has caused liver cancer in occupationally exposed individuals. It may damage the developing fetus and there is limited evidence that it is a teratogen in animals. An excess of spontaneous abortions has been reported among spouses of workers who have been exposed to vinyl chloride. Increased rates of birth defects have been reported in areas where vinyl chloride processing plants are located. Vinyl chloride's role in this increased risk is unknown at this time.

Points of Attack: Liver, central nervous system, blood, respiratory system, lymphatic system. Cancer site in humans: liver. Cancer site in animals: liver, brain, lung.

Medical Surveillance: OSHA mandates the following tests: blood serum; alkaline phosphatase; bilirubin, gamma glutamyl transpeptidase; serum glutamic oxaloacetic transaminase; serum glutamic pyruvic transaminase. NIOSH lists the following tests: alkaline phosphatase; blood serum: lactic dehydrogenase; chest X-ray; expired air; liver function tests: alkaline phosphatase, bilirubin, gamma glutamyl transpeptidase, serum glutamic oxaloacetic transaminase, serum glutamic pyruvic transaminase; pulmonary function tests; pulmonary function tests: forced vital capacity, forced expiratory volume (1 s); red blood cell count; urine (chemical/metabolite); urinalysis (routine): albumin, whole blood (chemical/metabolite), ultrasonography of the liver. Complete examination of the skin and nervous system. If symptoms develop or overexposure is suspected, the following may be useful: X-rays of the fingers. Test for "urinary thiodiglycolic acid" (normal level is usually less than 2 mg/L). Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least

15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton™, Silvershield™, and chlorinated polyethylene are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is NO REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Vinyl Chloride (1910.1017) $\leq$10 ppm: (1) Combination Type C supplied-air respirator, demand type, with half face-piece, and auxiliary self-contained air supply; (2) Type C supplied-air respirator, demand type, with half face-piece; or (3) Any chemical cartridge respirator with an organic vapor cartridge which provides a service life of at least 1 h for concentrations of vinyl chloride *Up to 10 ppm*. *$\leq$25 ppm*: (1) Powered air-purifying respirator with hood, helmet, full or half face-piece, and a canister which provides a service life of at least 4 h for concentrations of vinyl chloride up to 25 ppm; or (2) Gas mask with front- or back-mounted canister which provides a service life of at least 4 h for concentrations of vinyl chloride *Up to 25 ppm*. *$\leq$100 ppm*: (1) Combination Type C supplied-air respirator, demand type, with full face-piece, and auxiliary self-contained air supply; or (2) Open-circuit self-contained breathing apparatus with full face-piece, in demand mode; or (3) Type C supplied-air respirator, demand type, with full face-piece. *$\leq$1000 ppm*: Type C supplied-air respirator, continuous-flow type, with full or half face-piece, helmet, or hood. *$\leq$3600 ppm*: (1) Combination Type C supplied-air respirator, pressure demand type, with full or half face-piece, and auxiliary self-contained air supply; or (2) Combination type continuous-flow supplied-air respirator with full or half face-piece and auxiliary self-contained air supply. *>3600 ppm*: or unknown concentration Open-circuit self-contained breathing apparatus, pressure-demand type, with full face-piece.

Storage: Flammable gas. Color Code—Red Stripe: Flammability Hazard: Do not store in the same area as other flammable materials. Color Code—Blue: Health Hazard/ Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl chloride must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where vinyl chloride is handled, used, or stored. Metal containers involving the transfer of 5 gallons of vinyl chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinyl chloride. Wherever vinyl chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Vinyl chloride requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Ventilate area of leak to disperse the gas. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to

clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Vinyl chloride is a flammable gas. Use dry chemical or CO_2 extinguishers. Poisonous gases are produced in fire, including phosgene, hydrogen chloride, and carbon monoxide. Fire may restart after it has been extinguished. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22] A variety of techniques have been described for vinyl chloride recovery from PVC latexes.

EC Number: 202-848-9

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1994; NCI: Carcinogenesis Studies (gavage); clear evidence: mouse; inadequate study: rat.

California Proposition 65 Chemical: Cancer 2/27/87; Developmental/Reproductive toxin (female) 8/7/09.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: 4-Vinyl-1-cyclohexene, a cyclic alkene, is a flammable liquid. Molecular weight = 108.20; Specific gravity (H_2O:1) = 0.83 at 25°C; Boiling point = 130.3°C; Freezing/Melting point = −109°C; Flash point = 16−21°C; Autoignition temperature = 269°C. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 3, Reactivity 2. Hydrolyzes in water.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector. 4-Vinyl-1-cyclohexene is used as an intermediate for the production of vinylcyclohexene dioxide, which is used as a reactive diluent in epoxy resins. Previous uses of 4-vinyl-1-cyclohexene include comonomer in the polymerization of other monomers and for halogenation to polyhalogenated derivatives which are used as flame retardants.

Incompatibilities: Hydrolyzes in water. Reacts with oxidizers, amines, alcohols.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: None.

ACGIH TLV®[1]: 0.1 ppm/0.44 mg/m^3 TWA; confirmed animal carcinogen with unknown relevance to humans.
AIHA WEEL: 1 ppm/4.4 mg/m^3 TWA.
Protective Action Criteria (PAC)
TEEL-0: 0.1 ppm
PAC-1: 0.3 ppm
PAC-2: 3500 ppm
PAC-3: 3500 ppm
DFG MAK: [skin] Carcinogen Category: 2.
Poland: MAC (TWA) 10 mg/m^3, 1999; the Netherlands: MAC-TGG 0.4 mg/m^3, 2003.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.93$.

Routes of Entry: Inhalation, skin, and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vapors cause irritation and smarting of the eyes and respiratory system if present in high concentrations. The effect is temporary.

Long Term Exposure: Workers exposed to 4-vinyl-1-cyclohexene experienced keratitis (inflammation of the cornea), rhinitis, headache, hypotonia, leucopenia (decrease in the number of white blood cells), neutrophilia, lymphocytosis, and impairment of pigment and carbohydrate metabolism. A confirmed carcinogen.

Points of Attack: Blood, eyes.

Medical Surveillance: Complete eye examination. Complete blood count and hematocrit.

First Aid: *Skin Contact*[52]*:* Flood all areas of body that have contacted the substance with water. Do not wait to remove contaminated clothing; do it under the water stream. Use soap to help assure removal. Isolate contaminated clothing when removed to prevent contact by others.

Eye Contact: Remove any contact lenses at once. Flush eyes well with copious quantities of water or normal saline for at least 20−30 min. Seek medical attention.

Inhalation: Leave contaminated area immediately; breathe fresh air. Proper respiratory protection must be supplied to any rescuers. If coughing, difficult breathing, or any other symptoms develop, seek medical attention at once, even if symptoms develop many hours after exposure.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton is among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Store in an explosion-proof refrigerator. Protect from exposure to oxidizers, alcohols, amines, air, and light. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Flammable liquids, n.o.s. require a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Water may be ineffective due to the low flash point. Water spray may be used however. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Carcinogenicity: IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1994; NCI: Carcinogenesis Studies (gavage); clear evidence: mouse, rat; NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

California Proposition 65 Chemical: Cancer 7/1/90; Developmental/Reproductive toxin 8/1/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: T; Risk phrases: R23/24/25; R40; Safety phrases: S1/2; S36/37; S45; S63 (see Appendix 4).

WGK (German Aquatic Hazard Class): No value assigned.

Description: Vinyl cyclohexene dioxide is a colorless liquid. Molecular weight = 140.20; Specific gravity (H_2O:1) = 1.10 at 25°C; Boiling point = 227.2°C; Freezing/Melting point = −109°C; Vapor pressure = 0.1 mmHg at 25°C; Flash point = 110°C; Autoignition temperature = 392°C. Hazard Identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 3, Flammability 1, Reactivity 0. Highly soluble in water; reacts slowly.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Primary Irritant. This material is used as a monomer in the production of epoxy resins for coatings and adhesives, as a chemical intermediate, and as a reactive diluent.

Incompatibilities: Reacts with alcohols, amines and other active hydrogen compounds, water. Slowly hydrolyzes in water.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH REL: 10 ppm/60 mg/m^3 TWA [skin]; Potential occupational carcinogen. Limit exposure to lowest feasible concentration; See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 10 ppm/57 mg/m^3 TWA [skin]; confirmed animal carcinogen with unknown relevance to humans.

Protective Action Criteria (PAC)

TEEL-0: 0.1 ppm

PAC-1: 0.35 ppm

PAC-2: 2.5 ppm

PAC-3: 75 ppm

DFG MAK: [skin], Carcinogen Category: 2.

Australia: TWA 10 ppm (60 mg/m^3), [skin], carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 10 ppm (57 mg/m^3), [skin], carcinogen, 1993; Denmark: TWA 10 ppm (60 mg/m^3), 1999; Finland: TWA 10 ppm (60 mg/m^3), STEL 20 ppm (120 mg/m^3), carcinogen, 1999; Norway: TWA 10 ppm (60 mg/m^3), 1999; the Netherlands: MAC-TGG 60 mg/m^3, 2003; United Kingdom: LTEL 10 ppm (60 mg/m^3), 1993; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. Several states have set guidelines or standards for vinyl cyclohexene dioxide in ambient air[60] ranging from zero (North Dakota) to 6.0 μg/m^3 (Virginia) to 150.0 μg/m^3 (Pennsylvania) to 600.0 μg/m^3 (Connecticut) to 1429 μg/m^3 (Nevada).

Determination in Air: No method available.

Determination in Water: Octanol−water coefficient: Log K_{ow} = 1.32.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vinyl cyclohexene dioxide can affect you when breathed in and by passing through your skin. Irritates the eyes, skin and severely irritates the nose, throat, and lungs, causing coughing and wheezing. Prolonged contact can cause severe burns and blisters.

Long Term Exposure: Vinyl cyclohexene dioxide may cause a skin allergy to develop. If this happens, very small future exposure can cause itching and a rash. It can cause lung irritation; bronchitis may develop. A potential occupational carcinogen and a mutagen; handle with extreme caution. It may also damage the testes (male reproductive system). In animals: irritation of the eyes, skin, respiratory system; testicular atrophy; leukopenia (reduced blood leukocytes), necrosis thymus; skin sensitization.

Points of Attack: Eyes, skin, respiratory system, blood, thymus, lungs, reproductive system. Cancer site in animals: skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or grater), the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: White blood cell count. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: *Eye Contact:* Immediately remove any contact lenses and flush with large amounts of water for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately.

Skin Contact: Quickly remove contaminated clothing. Immediately wash contaminated skin with large amounts of water. Seek medical attention.

Breathing: Remove the person from exposure. Begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility.

Ingestion: If convulsions are not present, give a glass or two of water or milk to dilute the substance. Assure that the person's airway is unobstructed and contact a hospital or poison center immediately for advice on whether or not to induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from heat or flames, water, alcohols, amines. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic, liquids, organic, n.o.s. require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming),

withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.
Disposal Method Suggested: Concentrated waste containing no peroxides: discharge liquid at a controlled rate near a pilot flame. Concentrated waste containing peroxides: perforation of a container of the waste from a safe distance followed by open burning.

Vinyl ether V:0200

Molecular Formula: C_4H_6O
Common Formula: $(CH_2{=}CH)_2O$
Synonyms: Divinyl ether; Divinyl oxide; Ethene, ethoxy-; Ethenyloxyethene; Ether, vinyl ethyl; Ethyl vinyl ether; Etoxyethene; EVE; 1,1-Oxybisethene; Vinamar; Vinesthene; Vinesthesin; Vinethen; Vinethene; Vinether; Vinidyl; Vinil etil eter (Spanish); Vinydan; Vinyl ethyl ether
CAS Registry Number: 109-93-3; 109-92-2
RTECS$^{®}$ Number: XZ6700000
UN/NA & ERG Number: UN1167(stabilized)/128
EC Number: 203-720-5
Regulatory Authority and Advisory Bodies
Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).
Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 1—Slightly water polluting (*CAS: 109-92-2*).
Description: Vinyl ether is a volatile liquid. Molecular weight = 70.10; Boiling point = 28°C; Freezing/Melting point = −101°C; Flash point ≤ −30°C; Autoignition temperature = 360°C. Explosive limits: LEL = 1.7%; UEL = 27%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. Insoluble in water.
Potential Exposure: It is used as an inhalation anesthetic; in formulation of copolymers with vinyl chloride.
Incompatibilities: Forms peroxides when exposed to air or oxygen; may polymerize explosively with evolution of acetylene gas. Store away from oxidizers, heat, and sunlight. Reacts with concentrated nitric acid. May accumulate static electricity.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
109-92-2
TEEL-0: 15 ppm
PAC-1: 50 ppm
PAC-2: 350 ppm
PAC-3: 1500 ppm
Permissible Concentration in Water: No criteria set.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: A moderate health hazard. Irritates the eyes, skin, and respiratory tract. Affects the central nervous system, causing anesthesia, narcosis, and loss of consciousness.
Long Term Exposure: Prolonged exposure may cause liver damage.
Points of Attack: Central nervous system, liver.
Medical Surveillance: Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear skin protection. Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Follow regulations in OSHA 29CFR1910.134 or European Standard EN149. Use a NIOSH/MSHA- or European Standard EN149-approved respirator; or use an approved supplied-air respirator with a full-face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a

full face-piece operated in pressure-demand or other positive-pressure mode.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in tightly closed containers in a cool, well-ventilated area away from heat and oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. Protect against physical damage. Outside or detached storage is preferred. Inside storage should be in a standard flammable liquids storage room or cabinet. Protect against static electricity and lightning. For large-quantity storage rooms, protect with automatic sprinklers, total flooding carbon dioxide, or dry chemical systems.

Shipping: Divinyl ether, inhibited, requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Allow to evaporate or incinerate. Beware of explosive peroxides in old containers.

Carcinogenicity: NTP: 11th Report on Carcinogens, 2004: Reasonably anticipated to be a human carcinogen; IARC: Animal, Sufficient Evidence; Human, Inadequate Evidence, Group 2A, 1995.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

California Proposition 65 Chemical: Cancer 5/1/97.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Vinyl fluoride is a colorless gas. Molecular weight = 46.05; Boiling point = −72.2°C; Freezing/Melting point = −160.6°C; Relative vapor density (air = 1) = 1.60; Vapor pressure = 25.2 atm; Flash point = flammable gas; Autoignition temperature = 385°C. Explosive limits: LEL = 2.6%; UEL = 21.7%. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 2. Insoluble in water.

Potential Exposure: Compound Description: Tumorigen; Mutagen. Vinyl fluoride's primary use is as a chemical and polymer intermediate; used to make polyvinyl fluoride (Tedlar®) film. Polyvinyl fluoride film is characterized by superior resistance to weather, high strength, and a high dielectric constant. It is used as a film laminate for building materials and in packaging electrical equipment. Polyvinyl fluoride film poses a hazard, so it is not recommended for food packaging. Polyvinyl fluoride evolves toxic fumes upon heating.

Incompatibilities: May polymerize. Inhibited with 0.2% terpenes to prevent polymerization. Violent reaction with oxidizers. May accumulate static electrical charges.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 1.82 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 1 ppm TWA; 5 ppm Ceiling Concentration/15 min, CFR 1910.1017.
ACGIH TLV®[1]: 1 ppm, Suspected Human Carcinogen.
NIOSH IDLH: Not determined. Suspected occupational carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 1 ppm
PAC-1: 7.5 ppm
PAC-2: 50 ppm
PAC-3: 75,000 ppm
The state of South Carolina has set a guideline of 19.0 μg/m^3 for vinyl fluoride in ambient air.[60]

Following are OELs for hydrogen fluoride which is produced as a decomposition product in the heat of fire.

OSHA PEL: 3 ppm/2.5 mg[F]/m^3 TWA.
NIOSH REL: 3 ppm/2.5 mg[F]/m^3 TWA; 6 ppm/5 mg[F]/m^3, 15 min Ceiling Concentration.
ACGIH TLV®[1]: 3 ppm/2.5 mg[F]/m^3 TWA; BEI: 3 mg [F]/g creatinine in urine *prior* to end-of-shift; 10 mg[F]/g creatinine in urine end-of-shift.
DFG MAK: 1 mg[F]/m^3, inhalable fraction [skin]; Peak Limitation Category II(4); Pregnancy Risk Group C; BAT: 7.0 mg[F]/g creatinine in urine at end-of-shift; 4.0 mg[F]/g creatinine in urine at the beginning of the next shift.
NIOSH IDLH: 30 ppm.

Determination in Air: There is no method listed by NIOSH. However, the following method is listed for gaseous fluorides: NIOSH Analytical Method 7902.[18]

Permissible Concentration in Water: The EPA has set a standard of 4 mg/L for fluoride[61] and the state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: A CNS depressant, causing headache, dizziness, confusion, a lack of coordination, nausea, vomiting, narcosis, unconsciousness. In industrial use, inhalation of dusts of decomposed fluorocarbon polymers may cause polymer fume fever characterized by headache, aching joints, general feeling of discomfort, cough, shivering, chills, fever, rapid heartbeat, and chest discomfort. Animal data indicate that concentrations at and above 30% (300,000 ppm) vinyl fluoride may cause symptoms of intoxication. Contact with the liquid may cause frostbite.

Long Term Exposure: May be a human carcinogen. Repeated high exposures may affect kidneys. Repeated high exposures can cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth. Repeated exposure can cause nausea, vomiting, loss of appetite, diarrhea, or constipation. Nosebleeds and sinus problems can also occur.

Points of Attack: Central nervous system, skeleton, kidneys.

Medical Surveillance: Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear appropriate personal protective clothing to prevent the skin from becoming frozen from contact with the evaporating liquid or from contact with vessels containing the liquid. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof or splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted acid gas canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentration or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store in a well-ventilated area away from sources of ignition. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Vinyl fluoride, inhibited, requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Vinylidene chloride is a volatile liquid or gas with a mild, sweet odor resembling that of chloroform. The odor threshold in air is 500 ppm. Molecular weight = 96.94; Specific gravity (H_2O:1) = 1.21 at 25°C; Boiling point = 31.7°C at 760 mm; Freezing/Melting point = −122.8°C; Vapor pressure = 500 mmHg at 25°C; Flash point = −18.9°C (cc); Autoignition temperature = 570°C. Explosive limits: LEL = 6.5%; UEL = 15.5%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 2. Practically insoluble in water; solubility = 0.04%.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Reproductive Effector; Human Data. Vinylidene chloride is used in the manufacture of 1,1,1-trichloroethane (methyl chloroform). However, the manufacture of polyvinylidene copolymers is the major use of VDC. The extruded films of the copolymers are used in packaging and have excellent resistance to water vapor and most gases. The chief copolymer is Saran® (polyvinylidene chloride/vinyl chloride), a transparent film used for food packaging. The films shrink when exposed to higher than normal temperatures. This characteristic is advantageous in the heat shrinking of overwraps on packaged goods and in the sealing of the wraps. Applications of VDC latexes include mixing in cement to produce high-strength mortars and concretes, and as binders for paints and nonwoven fabrics providing both water resistance and nonflammability. VDC polymer lacquers are also used in coating films and paper. VDC is also used to produce fibers. Monofilaments, made by extruding the copolymer, are used in the textile industry as furniture and automobile upholstery, drapery fabric, outdoor furniture, venetian-blind tape, and filter cloths.

Incompatibilities: Readily forms explosive peroxides; violent polymerization from heat or on contact with oxidizers, chlorosulfonic acid; nitric acid; or oleum; or under the influence of oxygen, sunlight, alkali metals; aluminum, copper. Explosive on heating or on contact with flames. Inhibitors, such as the monomethyl ether of hydroquinone, are added to prevent polymerization.

Permissible Exposure Limits in Air

OSHA PEL: None.

NIOSH PEL: None.

NIOSH REL: Potential occupational carcinogen. Limit exposure to lowest feasible concentration. See *NIOSH Pocket Guide*, Appendix A.

ACGIH TLV®[1]: 5 ppm/20 mg/m^3 TWA Not classifiable as a human carcinogen.

Protective Action Criteria (PAC)

TEEL-0: 5 ppm

PAC-1: 75 ppm

PAC-2: 500 ppm

PAC-3: 1000 ppm

DFG MAK: 2 ppm/8.0 mg/m^3; Peak Limitation Category II (2); Carcinogen Category 3B; Pregnancy Risk Group C.

Australia: TWA 5 ppm (20 mg/m^3), STEL 20 ppm, 1993; Austria: MAK 2 ppm (8 mg/m^3), Suspected: carcinogen, 1999; Belgium: TWA 5 ppm (20 mg/m^3), STEL 20 ppm (79 mg/m^3), 1993; Denmark: TWA 2 ppm (8 mg/m^3), 1999; Finland: TWA 10 ppm (40 mg/m^3), STEL 20 ppm (80 mg/m^3), carcinogen, 1999; France: VME 5 ppm (20 mg/m^3), 1999; the Netherlands: MAC-TGG 20 mg/m^3, 2003; Poland: MAC (TWA) 50 mg/m^3; MAC (STEL) 80 mg/m^3, 1999; Russia: STEL 50 mg/m^3, 1993; Sweden: NGV 5 ppm (20 mg/m^3), KTV 10 ppm (40 mg/m^3), 1999; Switzerland: MAK-W 2 ppm (8 mg/m^3), KZG-W 4 ppm (16 mg/m^3), 1999; United Kingdom: TWA 10 ppm (40 mg/m^3), 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: not classifiable as a human carcinogen. Several states have set guidelines or standards for Vinylidene chloride in ambient air[60] ranging from 0.2 μg/m^3 (Massachusetts) to 0.238 μg/m^3

(Kansas) to 3.5 μg/m^3 (Virginia) to 24.0 μg/m^3 (Pennsylvania) to 66.7 μg/m^3 (New York) to 120.0 μg/m^3 (North Carolina) to 200.0 μg/m^3 (Indiana) to 400.0 μg/m^3 (Connecticut) to 476.0 μg/m^3 (Nevada) to 200.0−10,000 μg/m^3 (North Dakota).

Determination in Air: NIOSH Analytical Method (IV) #1015, Vinylidene chloride, OSHA Analytical Method 19.

Permissible Concentration in Water: *To protect freshwater aquatic life:* 11,600 μg/L on an acute toxicity basis for dichloroethylenes as a class. *To protect saltwater aquatic life:* 224,000 μg/L on an acute basis for dichloroethylenes as a class; 1700 μg/L as a 24-h average, never to exceed 3900 μg/L. *To protect human health:* preferably zero. An additional lifetime cancer risk of 1 in 100,000 is posed by a concentration of 0.33 μg/L.[6] Russia set a MAC of 0.6 μg/L in water bodies used for domestic purposes and WHO has set a limit of 0.3 μg/L for drinking water.

Determination in Water: Inert gas purge followed by gas chromatography with halide-specific detection (EPA Method 601) or gas chromatography plus mass spectrometry (EPA Method 624). Octanol−water coefficient: Log $K_{ow} = 1.32$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Vinylidene chloride can affect you when breathed and by passing through skin. Exposure can irritate the eyes, nose, and throat. Contact can irritate and burn the eyes and skin. High levels may affect the CNS, causing dizziness, headache, nausea, dyspnea (breathing difficulty), a "drunken" feeling, unconsciousness. Swallowing the liquid may cause chemical pneumonitis.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis with drying and cracking. Repeated exposure may damage the liver, kidneys, and lungs. A potential occupational carcinogen. Handle with extreme caution. It may damage the developing fetus and cause reproductive damage in males.

Points of Attack: Eyes, skin, respiratory system, central nervous system, liver, kidneys. Cancer site in animals: liver and kidney; skin.

Medical Surveillance: For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following are recommended before beginning work and at regular times after that: lung function tests. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: Inhalation: bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *At concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv100 (APF = 50) [any air-purifying full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister having an N100, R100, or P100 filter] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. May form peroxides in storage. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045. Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration is not present. Vinylidene chloride must be stored to avoid contact with oxidizers, such as perchlorates, peroxides, permanganates, chlorates, and nitrates, and strong acids, such as hydrochloric, sulfuric, and nitric, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from sources of heat. Protect storage containers from physical damage. Sources of ignition, such as smoking and open flames, are prohibited where vinylidene chloride is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of vinylidene chloride should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of vinylidene chloride. Wherever vinylidene chloride is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association.

Shipping: Vinylidene chloride, inhibited, requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group I.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases, including phosgene, hydrogen chloride, and chlorine, are produced in fire. Do not extinguish fire unless flow can be stopped. Use dry chemical, carbon dioxide, or foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration, preferably after mixing with another combustible fuel. Care must be exercised to assure complete combustion to prevent the formation of phosgene. An acid scrubber is necessary to remove the halo acids produced.[22]

Vinylidene fluoride V:0230

Molecular Formula: $C_2H_2F_2$

Common Formula: $CH_2{=}CF_2$

Synonyms: 1,1-Difluoroethylene; Ethene, 1,1-difluoro-; Fluoruro de vinilideno (Spanish); Genetron®; Halocarbon 1132A; NCI-C60208; R1132A; Refrigerant gas, R 1132a; VDF; Vinylidene difluoride

CAS Registry Number: 75-38-7

RTECS® Number: KW0560000

UN/NA & ERG Number: UN1959/116

EC Number: 200-867-7

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity (pounds): *Release hazard* 10,000 (≥1.00% concentration).

Carcinogenicity: IARC: Animal, Inadequate Data; Human No Adequate Data, *not classifiable as carcinogenic to humans*, Group 3, 1999.

Clean Air Act: Accidental Release Prevention/Flammable Substances, (Section 112[r], Table 3), TQ = 10,000 lb (4540 kg).

European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Vinylidene fluoride is a colorless gas with a faint ethereal odor. Shipped as a liquefied compressed gas. Molecular weight = 64.04; Boiling point = −85.6°C; Freezing/Melting point = −143.9°C; Vapor pressure = 35.2 atm; Flash point (flammable gas) ≤ −65°C; Autoignition temperature = 640°C. Explosive limits: LEL = 5.5%; UEL = 21.3%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 4, Reactivity 0. Slightly soluble in water.

Potential Exposure: Compound Description: Tumorigen; Mutagen. Vinylidene fluoride is used in the formulation of many polymers and copolymers, such as chlorotrifluoroethylene-vinylidene fluoride (Kel F®), perfluoropropylene-vinylidene fluoride (Viton™, Fluorel®); polyvinylidene fluoride; and hexafluoropropylene-*tetra*-fluoroethylene-vinylidene fluoride; elastomeric copolymers. It is also used as a chemical intermediate in organic synthesis. NIOSH has estimated that 32,000 workers are exposed annually.

Incompatibilities: Contact with oxidizers can cause fire and explosions. Reacts with aluminum chloride. Capable of forming unstable peroxides, which can cause explosive polymerization. May accumulate static electricity, and cause ignition of its vapors.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 2.62 mg/m^3 at 25°C & 1 atm.
OSHA PEL: None.
NIOSH REL: 1 ppm TWA; 5 ppm Ceiling Concentration [15 min], use 29CFR1910.1017.
ACGIH TLV®[1]: 500 ppm/1310 mg/m^3 TWA, Not classifiable as a human carcinogen.
NIOSH IDLH: Not determined. Suspected occupational carcinogen.
Protective Action Criteria (PAC)
TEEL-0: 500 ppm
PAC-1: 500 ppm
PAC-2: 1250 ppm
PAC-3: 25,000 ppm
DFG MAK: Carcinogen Category 3B.
Austria: Suspected: carcinogen, 1999; Finland: carcinogen, 1993.

Determination in Air: NIOSH Analytical Method #3800.[18]

Permissible Concentration in Water: The EPA has set a standard of 4 mg/L for fluoride[61] and the state of Maine has set 2.4 mg/L as a guideline for drinking water. Arizona[61] has set 1.8 mg/L as a standard for drinking water.

Routes of Entry: Inhalation, skin and/or eye contact (liquid).

Harmful Effects and Symptoms

Short Term Exposure: Vinylidene fluoride is considered toxic by inhalation. The lowest lethal concentration is 128,000 ppm for a 4-h exposure. Vinylidene fluoride has been reported to be nontoxic to rats at 800,000 ppm. Irritating to skin and pulmonary tract. May affect the CNS, causing dizziness, disorientation, headache, a lack of coordination, narcosis, dizziness, nausea, vomiting. Contact with the liquid can cause frostbite.

Long Term Exposure: Repeated high exposures may affect kidneys. Repeated high exposures may cause deposits of fluorides in the bones (fluorosis), which may cause pain, disability, and mottling of the teeth.

Points of Attack: Eyes, respiratory system, central nervous system, skeleton, kidneys, skin.

Medical Surveillance: Lung function tests. Fluoride level in urine (use NIOSH #8308). Levels higher than 4 mg/L may indicate overexposure. If symptoms develop or overexposure is suspected, the following may be useful: consider chest X-ray after acute overexposure. Kidney function tests. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 20 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. If frostbite has occurred, seek medical attention immediately; do *NOT* rub the affected areas or flush them with water. In order to prevent further tissue damage, do *NOT* attempt to remove frozen clothing from frostbitten areas. If frostbite has *NOT* occurred, immediately and thoroughly wash contaminated skin with soap and water.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton™ and butyl rubber are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear gas-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *Up to 10 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator). *Up to 25 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)]. *Up to 50 ppm:* CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprTOv (APF = 50) [any powered, air-purifying respirator with a tight-fitting face-piece and organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece); *Up to 200 ppm:* SaF: Pd,Pp (APF = 2000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe: Flammability Hazard: Store separately from all other flammable materials. May form peroxides in storage. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Store gas cylinders in a cool, dry place and use the safety precautions necessary with all compressed gases. High concentrations cause a deficiency of oxygen with the risk of unconsciousness or death. Check that oxygen content is at least 19% before entering storage or spill area. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only non-sparking tools and equipment, especially when opening and closing containers of this chemical. Procedures for the handling, use, and storage of cylinders should be in compliance with OSHA 1910.101 and 1910.169, as with the recommendations of the Compressed Gas Association. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: 1,1-Difluoroethylene [or] Refrigerant gas, R 1132a requires a shipping label of "FLAMMABLE GAS." It falls in Hazard Class 2.1.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit and to disperse the gas. Stop the flow of gas if it can be done safely. If source of leak is a cylinder and the leak cannot be stopped in place, remove leaking cylinder to a safe place in the open air, and repair leak or allow cylinder to empty. Keep this chemical out of confined space, such as a sewer, because of the possibility of explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable gas. Poisonous gases are produced in fire, including hydrogen fluoride, fluorine, and fluorides. Extinguish with CO_2 or dry chemical to allow access to valves to shut off supply if necessary. Do not extinguish the fire unless the flow of gas can be stopped and any remaining gas is out of the line. Specially trained personnel may use fog lines to cool exposures and let the fire burn itself out. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If cylinders are exposed to excessive heat from fire or flame contact, withdraw immediately to a secure location. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Carcinogenicity: NCI: Carcinogenesis Studies (inhalation); no evidence: mouse, rat; IARC: Animal Lack Carcinogenicity; Human Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1994; NTP: Carcinogenesis studies (α-isomer); on test (prechronic studies), October 2000.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned.

Description: Vinyl toluene is a colorless liquid with a strong, disagreeable odor. It consists of mixed *meta*- and *para*-isomers. The odor threshold is 50 ppm. Molecular weight = 118.19; Specific gravity (H_2O:1) = 0.89 at 25°C; Boiling point = 170.6°C; Melting point = −76.7°C; Flash point = 53°C; Autoignition temperature = 538°C; also listed at 489−515°C. Explosive limits: LEL = 0.8%; UEL = 11.0%. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 2, Reactivity 2. Practically insoluble in water; solubility = 0.009%.

Potential Exposure: Compound Description (mixed isomers): Tumorigen, Mutagen; Reproductive Effector; Human Data; Primary Irritant; (*m*-isomer) Tumorigen, Mutagen. Vinyl toluene is used in copolymers and as specialty monomer for paint, varnish, and polyester preparations; as a solvent and an organic intermediate.

Incompatibilities: Violent reaction with oxidizers; catalysts for vinyl polymerization, such as peroxides, strong acids, iron or aluminum salts. Usually inhibited with *tert*-butylcatechol to prevent polymerization.

Permissible Exposure Limits in Air
Conversion factor: 1 ppm = 4.83 mg/m^3 at 25°C & 1 atm.
Methyl styrene, all isomers
OSHA PEL: 100 ppm/480 mg/m^3 TWA.
NIOSH REL: 100 ppm/480 mg/m^3 TWA.
ACGIH TLV®[1]: 50 ppm/242 mg/m^3 TWA; 100 ppm/483 mg/m^3 STEL, Not classifiable as a human carcinogen.

Determination in Air: Use NIOSH Analytical Method (IV) #1501, aromatic hydrocarbons, OSHA Analytical Method 7.

Determination in water: Octanol−water coefficient: Log K_{ow} = 3.58.

Routes of Entry: Inhalation, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms
Short Term Exposure: Vinyl toluene can affect you when breathed in. Exposure can irritate the eyes, nose, and upper respiratory system. A CNS depressant; very high levels can cause you to become dizzy, lightheaded, and drowsy. In animals: narcosis.

Long Term Exposure: Repeated exposure may affect the liver, kidneys, and nervous system. There is limited evidence that vinyl toluene may damage the developing fetus.

Points of Attack: Eyes, skin, respiratory system, central nervous system.

Medical Surveillance: Liver and kidney function tests. Evaluation of the nervous system.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Do not induce vomiting.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits,

gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *400 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge (s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Vinyl toluene must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates), strong acids, and aluminum chloride, since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls into Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, alcohol foam, or polymer foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

UN/NA & ERG Number: UN2810/123

EC Number: None assigned

Regulatory Authority and Advisory Bodies

Department of Homeland Security Screening Threshold Quantity: *Theft hazard* CUM 100 g.

Carcinogenicity: VX is not listed by the International Agency for Research on Cancer (IARC); American Conference of Governmental Industrial Hygienists (ACGIH); Occupational Safety and Health Administration (OSHA); or National Toxicology Program (NTP) as a carcinogen.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100 lb (45.4 kg).

Reportable Quantity (RQ): 100 lb (45.4 kg).

US DOT 49CFR172.101, Inhalation Hazardous Chemical.

Note: Army Regulation, AR 50-6, deals specifically with the shipment of chemical agents; must be escorted in accordance with Army Regulation, AR 740-32.

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: VX, a sulfinated organophosphorus compound, is a nerve agent, and the most toxic of all known chemical warfare agents. VX can cause death in minutes. As little as one drop of VX on the skin can be fatal. VX is a colorless, to straw to amber-colored, odorless liquid. Looks like motor oil. Molecular weight = 267.37; Boiling point = 298°C (decomposition); Freezing/Melting point = −51°C; Volatility = 8.9−10.5 mg/m^3 at 25°C Vapor density (air = 1): 9.2; Vapor pressure = 0.0007 mmHg at 25°C; Vapor density (air = 1) = 9.2; Flash point = 159°C. Hazard Identification (based on NFPA-704 M Rating System): Health 4, Flammability 1, Reactivity 0. Slightly to moderately soluble in water below 9.4°C; 30 g/L at 25°C. See "Medical Surveillance" below for odor detection.

Potential Exposure: VX is a quick-acting, military chemical nerve agent. VX is the most potent of all chemical warfare agents. It attacks the nervous system, causing the muscles to convulse uncontrollably. The nerve agent works similarly to pesticide and was originally developed in the early 1950s. Highly persistent, it can be dangerous for weeks and remains a liquid for more than 24 h. It poses little vapor hazard. The least volatile of the nerve agents, VX, is very slow to evaporate; about as slowly as motor oil. VX is highly efficient at skin penetration, more than any other of the "G" agents. It is used in the M-23 land mine. VX was never used in combat by the United States and all stockpiles of approximately 4400 tons of the Agent were destroyed in 2008 by the US Army Chemical Materials Agency (CMA).

Persistence of Chemical Agent: Agent VX: Summer: 2 days to a week; Winter: 2 days to weeks.

Incompatibilities: Contact with metals may evolve flammable hydrogen gas. Relatively stable at room temperature. Unstabilized VX of 95% purity decomposed at a rate of 5% a month at 71°C. At pH 12, the toxic by-product has a half-life of about 14 days and in 90 days there is about a 64-fold reduction.

Permissible Exposure Limits in Air

Conversion factor: 0.09145 ppm = 1 mg/m^3.

Protective Action Criteria (PAC) VX*

TEEL-0: 0.000005 ppm

PAC-1: 0.000016 ppm

PAC-2: **0.000016** ppm

PAC-3: **0.00027** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

STEL: 0.00001 mg/m^3.

WPL (worker population limit): 0.000001 mg/m^3.

The suggested permissible airborne exposure concentration of VX for an 8-h workday or a 40-h workweek is an 8-h time-weighted average (TWA) of 0.00001 mg/m^3 (9×10^{-7} ppm). This value is based on the TWA of VX as proposed in the USAEHA Technical Guide No. 169, *Occupational Health Guidelines for the Evaluation and Control of Occupational Exposure to Nerve Agents GA, GB, GD, and VX.*

GPL (general population limit): 0.0000006 mg/m^3.

Determination in Air: Available monitoring equipment for agent VX is the M8/M9 detector paper, (ACADA), detector ticket; M256/M256A1 kits; bubbler. Depot Area Air Monitoring System (DAMMS); automated Continuous Air Monitoring System (ACMS); Real-Time Monitor (RTM); Demilitarization Chemical Agent Concentrator (DCAC); M8/M43, M8A1/M43A1, CAM-M1, Hydrogen Flame Photometric Emission Detector (HYFED); and the Miniature Chemical Agent Monitor (MINICAM).

Determination in Water: Octanol−water coefficient: Log K_{ow} (estimated) = 2.06. VX is hydrolyzed only slowly, and the hydrolysis products include EA2192, which is nearly as toxic as VX and is hydrolyzed over 1000 times more slowly. Oxidation using common bleach Na(OCl) and superchlorinated bleach ($Ca(OCl)_2$)-calcium hypochlorite (HTH) will decontaminate.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Summary: Exposure can result in loss of consciousness, convulsions, paralysis, and respiratory failure resulting in death.

Short Term Exposure: VX. Acts as a cholinesterase inhibitor. Lowest toxic oral dose (TD_{LO}) to humans is 4 mg/kg; lowest lethal skin dose to humans (LD_{LO}) is 86 mg/kg. Death occurs within 15 min after fatal dose is absorbed. *Also reported:* VX is a lethal anticholinergic agent with the median dose in humans being: LC_{50} (skin) = 0.135 mg/kg; ID LC_{50} (Skin)—0.07−0.71 mg/kg; LCt_{50} (inhalation) = 30 mg-min/m^3; LCt_{50} (inhalation)—30 mg-min/m^3; LCt_{50} (inhalation)—24 mg-min/m^3.

One to several minutes after overexposure to airborne VX the following acute symptoms appear: *Local effects* (lasting 1−15 days, increases with dose). *Eyes:* Miosis (constriction of pupils); redness, pressure sensation on eyes. *Inhalation:* Rhinorrhea (runny nose), nasal congestion, tightness in chest, wheezing, salivation, nausea, vomiting. *Systemic effects* (increases with dose): *Inhalation*—excessive secretion causing coughing/breathing difficulty, salivation and sweating, vomiting, diarrhea, stomach cramps, involuntary urination/defecation, generalized muscle twitching/muscle cramps, CNS depression including anxiety, restlessness, giddiness, insomnia, excessive dreaming, and nightmares. With more severe exposure, headache, tremor, drowsiness, concentration difficulty, memory impairment, confusion, unsteadiness on standing or walking, and progression to death may also occur.

After exposure to liquid VX, the following acute symptoms appear: Local efffects: Eyes: Miosis, redness, pressure sensation on eyes. *Ingestion:* salivation, anorexia, nausea, vomiting, abdominal cramps, diarrhea, involuntary defecation, heartburn. *Skin:* Sweating, muscle twitching. *Systemic effects:* Similar to generalized effects from exposure to airborne material.

Long Term Exposure: Chronic overexposure to VX causes forgetfulness, thinking difficulty, vision disturbances, muscular aches/pains. Although *cer*-organophosphate pesticides have been shown to be teratogenic in animals, these effects have not been documented in carefully controlled toxicological evaluations for VX.[US Army]

Medical Surveillance: A chemical agent monitor (CAM) can detect VX at 0.1 mg/m^3. The US military also has the following detectors for VX and other chemical agents: *M256A1 Chemical Agent Detector Kit*; *M8A1 Automatic Chemical Agent Alarm.*

First Aid: Immediate decontamination of the smallest drop is essential. For decontamination, the *M291 Skin Decontamination Kit* should be used.

Inhalation: Hold breath until respiratory protective mask is donned. If severe signs of agent exposure appear (chest tightens, pupil constriction, lack of coordination, etc.), immediately administer, in rapid succession; all three Nerve Agent Antidote Kit(s), *Mark 1* injectors (or atropine if directed by the local physician). Injections using the Mark I kit injectors may be repeated at 5- to 20-min intervals if signs and symptoms are progressing until three series of injections have been administered. No more injections will be given unless directed by medical personnel. In addition, a record will be maintained of all injections given. If breathing has stopped, give artificial respiration. Mouth-to-mouth resuscitation should be used when approved mask-bag or oxygen delivery systems are not available. Do not use mouth-to-mouth resuscitation when facial contamination exists. If breathing is difficult, administer oxygen. Seek medical attention *immediately*.

Eye contact: Immediately flush eyes with water for 10−15 min, then don respiratory protective mask. Although miosis (pinpointing of the pupils) may be an early sign of agent exposure, an injection will not be administered when miosis is the only sign present. Instead, the individual will be taken immediately to the medical treatment facility for observation.

Skin contact: Don respirator with protective mask and remove contaminated clothing. Immediately wash contaminated skin with a solution of 5% household bleach. Rinse well with water to remove excess bleach followed by copious soap and water wash. Administer nerve agent antidote kit, Mark I, only if local sweating and muscular twitching symptoms are present. Seek medical attention *immediately.*

Ingestion: Do not induce vomiting. First symptoms are likely to be gastrointestinal. Immediately administer nerve agent antidote kit, Mark I. Seek medical attention *immediately*.

Medical observation recommended.

***Medical treatment*:** Electrocardiogram (ECG), and adequacy of respiration and ventilation, should be monitored. Supplemental oxygenation, frequent suctioning of secretions, insertion of a tube into the trachea (endotracheal intubation), and assisted ventilation may be required. Diazepam (5−10 mg in adults and 0.2−0.5 mg/kg in children) may be used to control convulsions. Lorazepam or other benzodiazepines may be used, but barbiturates, phenytoin, and other anticonvulsants are not effective. Administration of atropine (if not already given) should precede the administration of benzodiazepines in order to best control seizures. Patients/victims who have inhalation exposure and who complain of chest pain, chest tightness, or cough should be observed and examined periodically for 6−12 h to detect delayed-onset inflammation of the large airways (bronchitis), inflammatory lung disease (pneumonia), accumulation of fluid in the lungs (pulmonary edema), or respiratory failure.

Decontamination*:* This is very important. The rapid physical removal of a chemical agent is essential. If you do not have the equipment and training, do not enter the hot or the warm zone to rescue and/or decontaminate victims. Medical personnel should wear the proper PPE. If the victim cannot move, decontaminate without touching and without entering the hot or the warm zone. Nerve gases stay in clothing; *do not* touch with bare skin—if possible, seal contaminated clothes and personal belongings in a sealed double bag. Use clean water from any source; if possible, use a hose (spray or fog to prevent injury to the victim) or other system to avoid touching the victim. Do not wait for soap or for the victim to remove clothing, begin washing immediately. Do not delay decontamination to obtain warm water; time is of the essence; use cold water instead. Immediately flush the eyes with water for at least 15 min. Use caution to avoid hypothermia in children and the elderly. Wash−strip−wash−evacuate upwind and uphill: Patients exposed to nerve agent by vapor only should be decontaminated by removing all clothing in a clean-air environment and shampooing or rinsing the hair to prevent vapor-off gassing; Patients exposed to liquid nerve agent should be decontaminated by washing in available clean water at least three times. Use liquid soap (dispose of container after use and replace), large amounts of water, and mild to moderate friction with a single-use sponge or washcloth in the first and second washes. Scrubbing of exposed skin with a brush is discouraged; skin damage may occur and may increase absorption. The third wash should be to rinse with large amounts of warm or hot water. Shampoo can be used to wash the hair. Decontaminate with diluted household bleach* (0.5%, or one part bleach to 200 parts water), but do not let any get in the victim's eyes, open wounds, or mouth. Wash off the diluted bleach solution after 15 min. Remember that the water you use to decontaminate the victims is dangerous. Be sure you have decontaminated the victims as much as you can before they are released from the area, so they do not spread the nerve gas. Rinse the eyes, mucous membranes, or open wounds with sterile saline or water and then move away from the hot zone in an upwind and uphill direction.

*The following can be used in addition to household bleach: (1) solids, powders, and solutions containing various types of bleach (NaOCl or $Ca(OCl)_2$); (2) DS2 (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether); (3) towelettes moistened with sodium hydroxide (NaOH) dissolved in water, phenol, ethanol, and ammonia.

Note: Use 5% solution of common bleach (sodium hypochlorite) or calcium hypochlorite solution (48 oz per 5 gallons of water) to decontaminate scissors used in clothing removal, clothes and other items.

Personal Protective Methods: For emergency situations, wear a "moon suit" consisting of a positive pressure, pressure-demand, full-face-piece self-contained breathing apparatus (SCBA) or pressure-demand supplied-air respirator SCBA with escape cylinder in combination with a fully encapsulating, chemical-resistant suit capable of maintaining a positive air pressure within the suit. *Protective gloves*: butyl glove M3 and M4; Norton chemical protective glove set. *Eye protection*: Chemical goggles. For splash hazards use goggles and face shield.

Other protective equipment: Full protective clothing will consist of M9 mask and hood; M3 butyl rubber suit; M2A1 butyl boots; M3 and M4 gloves; unimpregnated underwear; or demilitarization protective ensemble (DPE). For laboratory operations, wear lab coats and have a protective mask readily available. In addition, daily clean smock, foot covers, and head covers will be required when handling contaminated lab animals.

Respirator Selection: *When used as a weapon, use SCBA Respirator Certified By NIOSH For CBRN Environments. Less than 0.00001 mg/m*^{3}*:* M9, M17, or M40 series mask shall be available for escape as necessary. 0.00001 *mg/m*^{3} to 0.02 *mg/m*^{3}*:* M9 or M40 series mask with Level A or Level B ensemble. *Greater than 0.02 mg/m*^{3}*:* or DPE or TAPES used with prior approval from AMC Field Safety Activity. *Note:* When DPE or TAPES is not available the M9 or M40 series mask with Level A protective ensemble can be used. However, use time shall be restricted to the extent operationally feasible, and may not exceed 1 h. As an additional precaution, the cuffs of the sleeves and the legs of the M3 suit shall be taped to the gloves and boots respectively to reduce aspiration.

Local Exhaust: Mandatory. Must be filtered or scrubbed to limit exit conc. to <0.00001 mg/m^3 (averaged over 8 h/day, indefinitely).

Special: Chemical laboratory hoods shall have an average inward face velocity of 100 linear feet per minute (lf/m) + 10% with the velocity at any point not deviating from the average face velocity by more than 20%. Laboratory hoods shall be located such that cross-drafts do not exceed 20% of the inward face velocity. A visual performance test utilizing smoke-producing devices shall be performed in assessing the ability of the hood to contain agent VX. Emergency back-up power necessary: Hoods should be tested semiannually or after modification or maintenance operations. Operations should be performed 20 cm inside hood face. *Other:* Recirculation of exhaust air from agent areas is prohibited. No connection between agent areas and other areas through ventilation system is permitted.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. *Precautions to be taken in handling and storing:* in handling, the buddy system will be incorporated. No smoking, eating, or drinking in areas containing agent is permitted. Containers should be periodically inspected for leaks (either visually or by a detector kit). Stringent control over all personnel practices must be exercised. Decontamination equipment shall be conveniently located. Exits must be designed to permit rapid evacuation. Chemical showers, eyewash stations, and personal cleanliness facilities shall be provided. Wash hands before meals and each worker will shower thoroughly with special attention given to hair, face, neck, and hands, using plenty of soap before leaving at the end of the workday. *Other precautions:* agent must be double-contained in liquid and vapor-tight containers when in storage or when outside of the ventilation hood.

Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Toxic, liquids, organic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group III. Driver shall be given full and complete information regarding shipment and conditions in case of emergency. AR 50-6 deals specifically with the shipment of chemical agents. Shipments of agent will be escorted in accordance with AR 740-32.

Spill Handling: See also above. Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. See Medical Surveillance section for decontamination kit. If kit is not available when needed, decontaminants include bleach slurry and hot soapy water.

Initial isolation and protective action distances

Distances shown are likely to be affected during the first 30 min after materials are spilled and could increase with time. If more than one tank car, cargo tank, portable tank, or large cylinder involved in the incident is leaking, the protective action distance may need to be increased. You may need to seek emergency information from CHEMTREC at (800) 424-9300 or seek professional environmental engineering assistance from the US EPA Environmental Response Team at (908) 548-8730 (24-h response line).

VX, when used as a weapon

Small spills (From a small package or a small leak from a large package)

First: Isolate in all directions (feet/meters) 100/30
Then: Protect persons downwind (miles/kilometers)
Day 0.1/0.2
Night 0.1/0.2

Large spills (From a large package or from many small packages)

First: Isolate in all directions (feet/meters) 200/60
Then: Protect persons downwind (miles/kilometers)
Day 0.2/0.3
Night 0.3/0.5

Fire Extinguishing: When heated, vapors may form explosive mixtures with air, presenting an explosion hazard indoors, outdoors, and in sewers. Containers may explode when heated. Use moon suit/respirator protection. Poisonous gases, including oxides of nitrogen and sulfur, are produced in fire. *Extinguishing media*: Water mist, fog, foam, CO_2—Avoid using extinguishing methods that will cause splashing or spreading of the VX. *Special firefighting procedures:* All persons not engaged in extinguishing the fire should be immediately evacuated from the area. Fires involving VX should be contained to prevent contamination to uncontrolled areas. When responding to a fire alarm in buildings or areas containing nerve agents, firefighting personnel should wear full firefighter protective clothing (without TAP clothing) during chemical agent firefighting and fire rescue operations. Respiratory protection is required. Positive pressure, full face-piece, NIOSH-approved self contained breathing apparatus (SCBA) will be worn where there is danger of oxygen deficiency and when directed by the fire chief of chemical accident/incident (CAI) operations officer. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode. The M9 or M17 series mask may be worn in lieu of SCBA when there is no danger of oxygen deficiency. In cases where firefighters are responding to a chemical accident/incident for rescue/reconnaissance purposes they will wear appropriate levels of protective clothing. Do not breathe fumes. Skin contact with V-agents must be avoided at all times. Although the fire may destroy most of the agent, care must still be taken to assure the agent or contaminated liquids do not further contaminate other areas or sewers. Contact with VX or VX vapors can be fatal. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156.

Disposal Method Suggested: Recommended field procedures (for quantities greater than 50 g): *NOTE:* These procedures can only be used with the approval of a qualified expert or safety officer. An alcoholic calcium hypochlorite (HTH) mixture is prepared by adding 100 mL of denatured ethanol to 900 mL slurry of 10% calcium hypochlorite (HTH) in water. This mixture should be made just prior to use since the HTH can react with the ethanol. Fourteen grams of alcoholic calcium hypochlorite (HTH) solution is used for each gram of VX. Agitate the contamination mixture as the VX is added. Continue the agitation for a minimum of 1 h. This reaction is reasonably exothermic and evolves substantial off gassing. The evolved reaction gases should be routed through a decontaminate-filled scrubber prior to release through filtration systems. After completion of 1 h minimum agitation, 10% sodium hydroxide is added in a quantity equal to that necessary to assure that a pH of 12.5 is maintained for a period not less than 24 h. Hold the material at a pH between 10 and 12 for a period not less than 90 days to ensure that a hazardous intermediate material is not formed. After sealing the head, the exterior of the drum shall be decontaminated and then labeled in accordance with IAW, EPA, and DOT regulations. All leaking containers shall be overpacked with vermiculite placed between the interior and exterior containers. Decontaminate and label per IAW, EPA, and DOT regulations. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the airborne exposure limit. If the alcoholic calcium hypochlorite (HTH) mixture is not available, then the following decontaminates may be used instead and are listed in the order of preference: Decontaminating Solution No. 2 [DS2: (2% NaOH, 70% diethylenetriamine, 28% ethylene glycol monomethyl ether)], Supertropical Bleach Slurry (STB), and sodium hypochlorite. Open pit burning or burying of VX or items containing or contaminated with VX in any quantity is prohibited. The detoxified VX (using procedures above) can be thermally destroyed by incineration in an EPA-approved incinerator in accordance with appropriate provisions of federal, state, and local RCRA regulations.

Note: Several states define decontaminated surety material as a RCRA Hazardous Waste.

Recommended laboratory procedures (for quantities less than 50 g): If the active chlorine of the calcium hypochlorite (HTH) is at least 55%, then 80 g of a 10% slurry is required for each gram of VX. Proportionally more HTH is required if the chlorine activity of the HTH is lower than 55%. The mixture is agitated as the VX is added and the agitation is maintained for a minimum of 1 h. If phasing of the VX/decon solution continues after 5 min, an amount of denatured ethanol equal to a 10 wt. % of the total agent/decon shall be added to assist miscibility.

Note: Ethanol should be minimized to prevent the formation of a hazardous waste. Upon completion of the 1-h agitation, the decon mixture shall be adjusted to a pH between 10 and 11. Conduct general area monitoring to confirm that the atmospheric concentrations do not exceed the airborne exposure limit.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 100/10,000 lb (45.4/4540 kg).
Reportable Quantity (RQ): 100 lb (45.4 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
European/International Regulations (*81-81-2*): Hazard Symbol: T; Risk phrases: R61; R48/25; Safety phrases: S3; S45 (see Appendix 4).
WGK (German Aquatic Hazard Class): No value assigned.
Description: Warfarin is a colorless, odorless crystalline solid. Molecular weight = 308.35. Combustible. Although warfarin is usually available commercially as the sodium salt, the following physical properties refer to the pure substance: Freezing/Melting point = 161°C (decomposes below BP); Vapor pressure = 0.09 mmHg at 25°C. Hazard Identification (based on NFPA-704 M Rating System) (*Fume and dust*): Health 4, Flammability 0, Reactivity 0. Practically insoluble in water; solubility = 0.002%.
Potential Exposure: Compound Description: Agricultural Chemical; Reproductive Effector; Human Data; Natural Product. Warfarin is used as an oral anticoagulant and as a rodenticide or rat poison.
Incompatibilities: Strong oxidizers, strong acids, strong bases. Dust mixtures with air may cause explosion.
Permissible Exposure Limits in Air
Warfarin 81-81-2
OSHA PEL: 0.1 mg/m^3 TWA.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00022-9

0.1 mg/m^3, 1993; Russia: STEL 0.001 mg/m^3, 1993; Switzerland: MAK-W 0.1 mg/m^3, KZG-W 0.5 mg/m^3, 1999; Thailand: TWA 0.1 mg/m^3, 1993; Turkey: TWA 0.1 mg/m^3, 1993; United Kingdom: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: TWA 0.1 mg/m^3.

Several states have set guidelines or standards for warfarin in ambient air[60] ranging from 0.016 μg/m^3 (Virginia) to 1.0−3.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Connecticut and Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #5002.

Determination in water: Octanol−water coefficient: Log $K_{ow} = 2.51$.

Routes of Entry: Skin absorption, ingestion, inhalation, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Warfarin is classified as very toxic, and may cause hemorrhage at even low levels. Probable oral lethal dose in humans is 50−500 mg/kg, between 1 teaspoon and 1 oz for a 150-lb person. Material is an anticoagulant. Toxic effects other than hemorrhage are rarely seen in humans. Other symptoms of warfarin exposure begin a few days or weeks after ingestion. They include epistaxis (nose bleed); bleeding gums; pallor, and sometimes hematomas around joints and on buttocks; blood in urine and feces; hematoma arms, legs; bleeding lips; mucous membrane hemorrhage; petechial rash; abnormal/abnormalities hematologic indices. Later, paralysis due to cerebral hemorrhage and finally, hemorrhagic shock and death may occur. Warfarin sodium is an anticoagulant. Hemorrhage is the most common sign and may be manifested by hemorrhagic skin rashes and lip, nose, and upper airway bleeding. Upper airway pain, difficulty in speaking and swallowing, and dyspnea (shortness of breath) may occur. Back pain may be noted.

Long Term Exposure: Anemia can result from severe or repeated bleeding. Repeated exposure may affect the liver and kidneys. Material is believed to be teratogenic in humans. There is limited evidence that warfarin may decrease fertility in females. Animal tests indicates that warfarin may cause malformations in human babies.

Points of Attack: Blood, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: blood plasma: prothrombin time; complete blood count; urine (chemical/metabolite): whole blood (chemical/metabolite); urinalysis (routine): red blood cells/count. Persons taking "blood thinning" medications are at increased risk.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated.

Respirator Selection: *Up to 0.5 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *Up to 1 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 2.5 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 5 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 100 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this

chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from other storage containers to process containers.

Shipping: Coumarin derivative pesticides, solid, toxic, require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. Do not touch spilled material. Eating and smoking should not be permitted in areas where it is handled, processed, or stored. *Small spills:* sweep onto paper or other suitable material. Place in an appropriate container and burn in a safe place. *Large quantities:* may be destroyed by dissolving in a flammable solvent (e.g., alcohol) and atomizing in a combustion chamber.

Fire Extinguishing: Warfarin is combustible; however, no flash point can be found. Extinguish fire using agent suitable for type of surrounding fire. Use alcohol foam, carbon dioxide, or dry chemical. Wear full protective clothing and self-contained breathing apparatus when engaged in firefighting. Poisonous gases are produced in fire, including oxides of sodium (warfarin sodium). If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant ($\geq$100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

Common Formula: $C_6H_4(CH_3)_2$
Synonyms: *m-isomer:* Benzene, *m*-dimethyl-; Benzene, 1,3-dimethyl-; *m*-Dimethylbenzene; 1,3-Dimethylbenzene; *m*-Methyltoluene; *m*-Xileno (Spanish); *m*-Xylene; 1,3-Xylene; Xylene, *m*-; *m*-Xylol
o-isomer: Benzene-*o*-dimethyl; Benzene-1,2-dimethyl-; *o*-Dimethylbenzene; 1,2-Dimethylbenzene; *o*-Methyltoluene; 1,2-Methyltoluene; *o*-Xileno (Spanish); *o*-Xylene; 1,2-Xylene; Xylene, *o*-; *o*-Xylol
p-isomer: Benzene-*p*-dimethyl; Benzene-1,4-dimethyl; Chromar; *p*-Dimethylbenzene; 1,4-Dimethylbenzene; *p*-Methyltoluene; 4-Methyltoluene; Scintillar; *p*-Xileno (Spanish); *p*-Xylene; 1,4-Xylene; Xylene, *p*-; *p*-Xylol
CAS Registry Number: 108-38-3 (*m*-isomer); 95-47-6 (*o*-isomer); 106-42-3 (*p*-isomer); 1330-20-7 (mixed isomers)
RTECS® Number: ZE2100000 (mixed isomers); ZE2275000 (*m*-isomer); ZE2450000 (*o*-isomer); ZE2625000 (*p*-isomer)
UN/NA & ERG Number: UN1307 (all isomers)/130
EC Number: 203-576-3 [*Annex I Index No.:* 601-022-00-9] (*m*-isomer); 202-422-2 [*Annex I Index No.:* 601-022-00-9] (*o*-isomer); 203-396-5 [*Annex I Index No.:* 601-022-00-9] (*p*-isomer); 215-535-7 [*Annex I Index No.:* 601-022-00-9] (mixed isomers)

Regulatory Authority and Advisory Bodies

Carcinogenicity (*m-, o-, and p-isomers*): IARC: Animal, Inadequate Evidence; Human, Inadequate Evidence, *not classifiable as carcinogenic to humans*, Group 3, 1999; EPA: Available data are inadequate for an assessment of human carcinogenic potential.
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
All isomers and mixtures:
Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).
Clean Water Act: Section 311 Hazardous Substances/RQ 100 lb (45.4 kg); Section 313 Water Priority Chemicals (57FR41331, 9/9/92).
US EPA Hazardous Waste Number (RCRA No.): U239.
RCRA, 40CFR261, Appendix 8 Hazardous Constituents.
RCRA 40CFR268.48; 61FR15654, Universal Treatment Standards: Wastewater (mg/L), 0.32; Nonwastewater (mg/kg), 30.
RCRA 40CFR264, Appendix 9; TSD Facilities Ground Water Monitoring List. Suggested methods (PQL μg/L): total dust 8020 (5); 8240 (5).
Safe Drinking Water Act: Xylenes, total dust, MCL, 10 mg/L; MCLG, 10 mg/L; Regulated chemical (47 FR 9352).
Reportable Quantity (RQ): 1000 lb (454.0 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0% (*o*- and *m*-isomers); 0.1% (*p*-isomer).
European/International Regulations (*all isomers*): Hazard Symbol: Xn; Risk phrases: R10; R20/21; R38; Safety phrases: S2; S25 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Water polluting (*all isomers*).

Description: Xylene exists in three isomeric forms, *ortho*-, *meta*-, and *para*-xylene. Commercial xylene is a mixture of these three isomers and may also contain ethylbenzene as well as small amounts of toluene, trimethylbenzene, phenol, thiophene, pyridine, and other nonaromatic hydrocarbons. *m*-Xylene is predominant in commercial xylene. The physical properties of the three isomers are as follows:

Isomer	Melting Point (°C)	Boiling Point (°C)	Flash Point (°C)	Lower Expl. (%)	Upper Expl. (%)	Auto-Temp. (°C)
ortho-	−25	144	32	0.9	6.7	463
meta-	−48	139	27	1.1	7.0	527
para-	13	138	27	1.1	7.0	528

Odor threshold = 0.081−40 ppm. The range of odor threshold values is quite broad and caution is advised in relying on odor alone as a warning of potentially hazardous exposures. NFPA 704 M Hazard Identification (all isomers): Health 2, Flammability 3, Reactivity 0. All isomers are practically insoluble in water.

Potential Exposure: Compound Description (*m*-isomer): Tumorigen; Reproductive Effector; Human Data; Primary Irritant; (*o*-isomer) Tumorigen; Reproductive Effector; Human Data; (*p*-isomer) Tumorigen; Reproductive Effector. Xylene is used as a solvent; as a constituent of paint, lacquers, varnishes, inks, dyes, adhesives, cements, cleaning fluids, and aviation fuels; and as a chemical feed-stock for xylidines, benzoic acid, phthalic anhydride, isophthalic, and terephthalic acids, as well as their esters (which are specifically used in the manufacture of plastic materials and synthetic textile fabrics). Xylene is also used in the manufacture of quartz crystal oscillators, hydrogen peroxide, perfumes, insect repellants, epoxy resins, pharmaceuticals, and in the leather industry. *m*-Xylene is used as an intermediate in the preparation of isophthalic acid; *o*-xylene is used in the manufacture of phthalic anhydride and in pharmaceutical and insecticide synthesis. *p*-Xylene is used in pharmaceutical and insecticide systhesis and in the production of polyester.

Incompatibilities: Strong oxidizers, strong acids. Electrostatic charges can be generated from agitation or flow.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.34 mg/m^3 *(all isomers)* at 25°C & 1 atm.
OSHA PEL: 100 ppm/435 mg/m^3 TWA.
NIOSH REL: 100 ppm/435 mg/m^3 TWA; 150 ppm/655 mg/m^3 STEL.

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00023-0

ACGIH TLV®[1]: 100 ppm/434 mg/m^3 TWA; 150 ppm/651 mg/m^3 STEL, not classifiable as a human carcinogen; BEI: (technical grade) 1.5 g[methylhippuric acids]/g creatinine in urine, end-of-shift.

NIOSH IDLH: 900 ppm.

Protective Action Criteria (PAC)*

All isomers and mixed isomers

TEEL-0: 100 ppm

PAC-1: **130** ppm

PAC-2: **920** ppm

PAC-3: **2500** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guideline) are in **bold face**.

DFG MAK: 100 ppm/440 mg/m^3 TWA; Peak Limitation Category II(2) [skin]; Pregnancy Risk Group D; BAT: 1.5 mg[xylene]/L in blood, end-of-shift; 2000 mg[methylhippuric (toluric)acid]/L in urine, end-of-shift.

European OEL: 50 ppm TWA; 100 ppm STEL [skin] (2000) Austria: MAK 100 ppm (440 mg/m^3), 1999; Denmark: TWA 35 ppm (150 mg/m^3), [skin], 1999; France: VME 100 ppm (435 mg/m^3), VLE 150 ppm (650 mg/m^3), 1999; Japan; 100 ppm (430 mg/m^3), 1999; Norway: TWA 25 ppm (108 mg/m^3), 1999; Switzerland: MAK-W 100 ppm (435 mg/m^3), KZG-W 200 ppm (870 mg/m^3), 1999; United Kingdom: TWA 100 ppm (441 mg/m^3), STEL 150 ppm, [skin], 2000. Russia[43] set a MAC value of 0.2 mg/m^3 (200 μg/m^3) for ambient air in residential areas both on a momentary and a daily average basis. Several states have set guidelines or standards for xylenes in ambient air[60] ranging from zero (Colorado) to 0.059 mg/m^3 (Massachusetts) to 0.073 mg/m^3 (Virginia) to 0.700 mg/m^3 (Rhode Island) to 1.45 mg/m^3 (New York) to 8.68 mg/m^3 (Connecticut) to 8.70 mg/m^3 (South Dakota) to 10.357 mg/m^3 (Nevada) to 2.6−65.5 mg/m^3 (North Carolina).

Determination in Air: Use NIOSH Analytical Method #1501, Hydrocarbons, aromatic, #3800, OSHA Analytical Method 1002.

Permissible Concentration in Water: Russia[43] set a MAC of 0.05 mg/L (50 μg/L) in water both for household and fishery purposes. The EPA has proposed a limit of 10 μg/L (10 ppm)[62] and has determined a lifetime health advisory of 400 μg/L.[48] Several states have set guidelines and standards for xylenes in drinking water[61] ranging from 44.0 μg/L (New Jersey) to 50.0 μg/L (New York) to 440.0 μg/L (Arizona, Kansas, Minnesota) to 620.0 μg/L (Massachusetts, Maine, New Mexico, Vermont, and Wisconsin).

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 3.20$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Exposure to vapor can be irritating to the nose and throat. Inhalation of vapor at concentrations *above 200 ppm* or 3−5 min can lead to xylene intoxication. Symptoms include headache, dizziness, nausea, and vomiting. If exposure continues, central nervous system depression characterized by shallow breathing and weak pulse can occur. Levels of 230 ppm for 15 min may cause lightheadedness without loss of equilibrium. Reversible liver and kidney damage in humans has followed exposure to sudden high concentrations of vapor. Such high levels may also give rise to lung congestion. Exposure to extremely high concentrations (10,000 ppm or more) of xylene vapors can lead to a strong narcotic effect with symptoms of slurred speech, stupor fatigue, confusion, unconsciousness, coma, and possible death. *Skin:* Contact with vapor or liquid can cause defatting which may lead to irritation, drying, and cracking. *Eyes:* Vapor and liquid may be irritating to the eye and eyelids at levels of 100 ppm for 15 min. *Ingestion:* Swallowing liquid xylene will bring about an immediate burning sensation in the mouth and throat. Irritation of the stomach and intestine can give rise to sharp stomach pains. Symptoms are the same as inhalation, except that lung congestion will not usually develop.

Long Term Exposure: Inhalation of xylene vapor and skin contact with liquid are the two most probable routes of long-term exposure. Symptoms of inhalation are dizziness, headache, and nausea. Long-term exposure has been associated with liver and kidney damage, intestinal tract disturbances, and central nervous system depression. Prolonged contact with skin can lead to irritation, dryness, and cracking. Repeated exposure can cause poor memory, difficulty in concentration, and other brain effects. It can also cause damage to the eye surface.

Points of Attack: Eyes, skin, respiratory system, central nervous system, gastrointestinal tract, blood, liver, kidneys.

Medical Surveillance: whole blood (chemical/metabolite); whole blood (chemical/metabolite), end-of-shift; Complete blood count; Complete blood count; hematopoietic depression, expired air, urine (chemical/metabolite); urine (chemical/metabolite): end-of-shift; urine (chemical/metabolite): end-of-work-week; urine (chemical/metabolite): Last 4 h of 8-h exposure; urinalysis (routine). For those with frequent or potentially high exposure (half the TLV or greater, or significant skin contact), the following is recommended before beginning work and at regular times after that: examination of the eyes by slit lamp. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Urine concentration of *m-methylhippuric acid* (at the end-of-shift) as an index of overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if

heart action has stopped. Transfer promptly to a medical facility. If victim is *conscious*, administer water or milk. Do not induce vomiting.

Note to physician: May require supportive measures for pulmonary edema.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. Viton™, polyvinyl alcohol, and Teflon™ are among the recommended protective materials. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *900 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)] or PaprOv (APF = 25) [any powered, air-purifying respirator with organic vapor cartridge(s)] or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Note: Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—Red: Flammability Hazard: Store in a flammable liquid storage area or approved cabinet away from ignition sources and corrosive and reactive materials. Prior to working with this chemical you should be trained on its proper handling and storage. Xylenes must be stored to avoid contact with strong oxidizers (such as chlorine, bromine, and fluorine) since violent reactions occur. Sources of ignition, such as smoking and open flames, are prohibited where xylenes are used, handled, or stored in a manner that could create a potential fire or explosion hazard. Use only nonsparking tools and equipment, especially when opening and closing containers of xylenes. Protect storage containers from physical damage.

Shipping: This compound requires a shipping label of "FLAMMABLE LIQUID." It falls in Hazard Class 3 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Oil-skimming equipment and sorbent foams can be applied to slick if done immediately. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a flammable liquid. Poisonous gases are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Vapors may travel long distances to ignition sources and flashback. Vapors in confined areas may explode when exposed to fire. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal. Incineration.

m-Xylene-α,α′-diamine X:0110

Molecular Formula: $C_8H_{12}N_2$
Common Formula: $H_2NCH_2C_6H_4CH_2NH_2$
Synonyms: 1,3-Benzenedimethanamine; 1,3-Bis(aminomethyl)benzene; Methylamine, *m*-phenylenebis-; MXDA; *m*-Phenylenebis(methylamine); *m*-Xylylenediamine
CAS Registry Number: 1477-55-0
RTECS® Number: PF8970000
UN/NA & ERG Number: Not regulated.
EC Number: 216-032-5
Regulatory Authority and Advisory Bodies
Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.
Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): 2—Hazard to waters.
Description: *m*-Xylene-α,α′-diamine is a colorless liquid. Molecular weight = 136.22; Specific gravity (H_2O:1) = 1.032 at 25°C; Boiling point = 247.2°C; Freezing/Melting point = 15°C; Vapor pressure = 0.03 mmHg at 25°C; Flash point = 117°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 0, Reactivity 0. Soluble in water.
Potential Exposure: Compound Description: Primary Irritant. *m*-Xylene-α,α′-diamine is a source of *m*-xylene diisocyanate and used as an intermediate in the manufacture of epoxy and polyamide resins.
Incompatibilities: Oxidizers, strong acids.
Permissible Exposure Limits in Air
OSHA PEL: None.
NIOSH REL: 0.1 mg/m^3 Ceiling Concentration [skin].
ACGIH TLV®[1]: 0.1 mg/m^3 Ceiling Concentration [skin].
No TEEL available.
DFG MAK: [skin] Danger of skin sensitization.
Australia: TWA 1 mg/m^3, 1993; Belgium: STEL 0.1 mg/m^3, 1993; Denmark: TWA 0.02 ppm (0.1 mg/m^3), [skin], 1999; Finland: TWA 0.1 mg/m^3, [skin], 1999; France: VLE 0.1 mg/m^3, 1999; Norway: TWA 0.1 mg/m^3, 1999; Switzerland: MAK-W 0.1 mg/m^3, [skin], 1999; the Netherlands: MAC-0.1 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Ceiling Concentration 0.1 mg/m^3 [skin].
Several states have set guidelines or standards for MXDA in ambient air[60] ranging from 0.008 μg/m^3 (Virginia) to 1.0 μg/m^3 (North Dakota) to 2.0 μg/m^3 (Nevada) to 33.0 μg/m^3 (New York).
Determination in Air: Use OSHA Analytical Method 105
Permissible Concentration in Water: No criteria set.
Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: *m*-Xylene-α,α′-diamine can affect you when breathed in and by passing through your skin. Contact can severely irritate and burn the skin and eyes. Exposure can irritate the nose and throat. High levels may cause respiratory depression, tiredness, and unconsciousness. The LC_{50} (rat) = 700 ppm/1 h.
Long Term Exposure: *m*-Xylene-α,α′-diamine may cause skin and lung allergies. Once this happens, even very small future exposures may cause a skin rash to develop and/or may cause an asthma-like reaction with wheezing, coughing, and shortness of breath. May cause liver and kidney damage. In animals: liver, kidney, lung damage.
Points of Attack: Eyes, skin, respiratory system, liver, kidneys.
Medical Surveillance: Before beginning employment and at regular times after that, the following are recommended: lung function tests. These may be normal if person is not having an attack at the time of test. If symptoms develop or overexposure is suspected, the following may be useful: liver and kidney function tests. Evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 30 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.
Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.
Respirator Selection: Where there is potential for exposures over *0.1 mg/m^3*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a

full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—White: Corrosive or Contact Hazard; Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) and strong acids (such as hydrochloride, sulfuric, and nitric). Store in tightly closed containers in a cool, well-ventilated area away from heat. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical.

Shipping: Not regulated.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: *m*-Xylene-α,α'-diamine may burn but does not readily ignite. Use dry chemical, CO_2, water spray, or foam extinguishers. Poisonous gases, including oxides of nitrogen, are produced in fire. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

3,5-Xylenol X:0120

Molecular Formula: $C_8H_{10}O$

Common Formula: $C_6H_3(CH_3)_2OH$

Synonyms: AI3-01553; 3,5-Dimethylphenol; 3,5-DMP; 1-Hydroxy-3,5-dimethylbenzene; Phenol, dimethyl-; *sym, m*-Xylenol; 1,3,5-Xylenol

CAS Registry Number: 108-68-9; 1300-71-6 (mixed isomers)

RTECS$^{®}$ Number: ZE6475000

UN/NA & ERG Number: UN2261/153

EC Number: 203-606-5 [*Annex I Index No.:* 604-037-00-9]; 215-089-3 [*Annex I Index No.:* 604-006-00-X] (mixed isomers)

Regulatory Authority and Advisory Bodies

Mixed isomers:

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below).

Reportable Quantity (RQ): 1000 lb (454 kg).

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B) as xylenols.

WHMIS Classifications, E, D2B.

European/International Regulations (*xylenols*): Hazard Symbol: T, N; Risk phrases: R24/25; R34; R51/53; Safety phrases: S1/2; S26; S36/3739; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Water polluting (*CAS: 108-68-9*).

Description: 3,5-Xylenol is a crystalline solid. Molecular weight = 122.17; Boiling point = 220°C (sublimes); Freezing/Melting point = 64°C; Flash point = 109°C. Soluble in water. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 2, Reactivity 0. Slightly soluble in water; solubility = 0.5%.

Potential Exposure: Compound Description: Tumorigen; Reproductive Effector; Primary Irritant. 3,5-Xylenol is used as an antioxidant, solvent, plasticizer, wetting agent; and in pharmaceuticals. Xylenols are also used in pesticides, fuel and lubricant additives; as a rubber chemical; in dyestuff manufacture. There are actually six xylenol isomers.

Incompatibilities: A weak organic acid. Keep away from oxidizers.

Permissible Exposure Limits in Air

No standards or TEEL available.

Permissible Concentration in Water: No criteria set.

Determination in Water: Octanol−water coefficient: Log $K_{ow} = 2.35$.

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Xylenol can affect you when breathed in and by passing through your skin. Can severely irritate the eyes, skin, and respiratory tract. Contact can severely burn the eyes and skin. LD_{50} = (oral-rat) 608 mg/kg.

Long Term Exposure: Repeated exposure may lead to vomiting, headaches, dizziness, and fainting. Chronic poisoning can cause digestive disturbances, nervous disorders, and skin eruptions. Closely related compounds can cause liver and kidney damage, and even collapse and death. Highly irritating substances can affect the lungs although it is not known if xylenols cause lung damage.

Points of Attack: Eyes, skin, respiratory system, liver, kidneys.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: Urinary phenol test. Liver and kidney function tests. Lung function tests.

First Aid: Get medical attention at once following exposure to this compound.

Inhalation: Remove patient immediately to fresh air; irritation of nose or throat may be somewhat relieved by spraying or gargling with water until all odor is gone; 100% oxygen inhalation is indicated for cyanosis or respiratory distress; keep patient warm but not hot.

Eyes: Flood with running water for 15 min; if physician is not immediately available, continue irrigation for another 15 min; 2−3 drops of 0.5% pontocaine or equivalent may be instilled after first 15 min; do not use oils or oily ointments unless ordered by physician.

Skin: Wash affected areas with large quantities of water or soapy water until all odor is gone; then wash with alcohol or 20% glycerin solution and more water; keep patient warm but not hot; cover chemical burns continuously with compresses wet with saturated solution of sodium thiosulfate; apply no salves or ointments for 24 h after injury.

Ingestion: Give large quantities of liquid (saltwater, weak sodium bicarbonate solution, milk, or gruel) followed by demulcent, such as raw egg white or corn starch paste; if profuse vomiting does not follow immediately, give a mild emetic (such as 1 tablespoon of mustard in glass of water) or tickle back of throat. Repeat procedure until vomitus is free of the odor. Some demulcent should be left in stomach after vomiting. Keep patient comfortably warm.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to xylenols, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from chemical oxidizers. Sources of ignition, such as smoking and open flames, are prohibited where xylenols is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Xylenols require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910. 120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible solid. Use dry chemical, carbon dioxide, water spray, or alcohol foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dissolve or mix the material with a combustible solvent and burn in a chemical incinerator equipped with an afterburner and scrubber. All federal, state, and local environmental regulations must be observed.

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

2,6-isomer:*

Carcinogenicity: NCI: Carcinogenesis Studies (feed); clear evidence: rat; IARC: Human Inadequate Evidence; Animal Sufficient Evidence, *possibly carcinogenic to humans*, Group 2B, 1993.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

California Proposition 65 Chemical: Cancer 1/1/91 (2,6-).

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, xylidine (mixed isomers).

*The 2,6-isomer is the only xylidine specifically regulated by the US EPA.

European/International Regulations (*87-62-7*): Hazard Symbol: T, N; Risk phrases: R23/24/25; R33; R51/53; Safety phrases: S1/2; S28; S36/37; S45; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Highly water polluting (*mixed isomers, dimethylaniline, and 3,5-isomer*). 2 for the (2,6-, 2,3-, 2,4-, 2,5-, and 3,4-isomers).

Description: There are six xylidine isomers. Xylidine, mixed isomers (principally made up of 2,4-, 2,5-, and 2,6-isomers), is a pale yellow to brown liquid with a weak, aromatic amine odor. The odor threshold is 0.056 ppm. Molecular weight = 121.20; Specific gravity (H_2O:1) = 0.98 at 25°C; Boiling point (mixed isomers) = 213−226°C; Freezing/Melting point = −36°C; Vapor pressure = <1 mmHg at 25°C; Flash point (2,6-isomer) = 91°C; (mixed isomers) 96.7°C. Explosive limits (2,6-isomer): LEL = 1.0%; UEL—unknown. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 1, Reactivity 0. Insoluble in water.

Potential Exposure: Compound Description (2,6-isomer): Tumorigen, Mutagen, Natural Product. Xylidines are used in dyestuff manufacture; as intermediates in the manufacture of pesticides, antioxidants, pharmaceuticals, and other organic compounds.

Incompatibilities: Strong oxidizers. Contact with hypochlorite salts and bleaches form explosive chloroamines.

Permissible Exposure Limits in Air

Conversion factor: 1 ppm = 4.96 mg/m^3 at 25°C & 1 atm.

OSHA PEL: 5 ppm/25 mg/m^3 TWA [skin].

NIOSH REL: 2 ppm/10 mg/m^3 TWA [skin].

ACGIH TLV®[1]: 0.5 ppm/2.5 mg/m^3, inhalable fraction and vapor [skin], confirmed animal carcinogen with unknown relevance to humans; BEI$_M$ issued for methemoglobin inducers.

NIOSH IDLH: 50 ppm.

DFG MAK: *(2,3-, 2,5-, 3,4-, 3,5-isomers):* [skin]; Carcinogen Category 3A; *(2,4- & 2,6-isomers):* [skin]; Carcinogen Category 2.

ACGIH TLV®[1]: 0.5 ppm, inhalable fraction and vapor [skin], confirmed animal carcinogen with unknown relevance to humans; BEI issued (1999).

Protective Action Criteria (PAC)
TEEL-0: 0.5 ppm
PAC-1: 10 ppm
PAC-2: 10 ppm
PAC-3: 50 ppm
DFG MAK: [skin] Carcinogen Category 3A.

Arab Republic of Egypt: TWA 5 ppm (25 mg/m^3), [skin], 1993; Australia: TWA 2 ppm (10 mg/m^3), [skin], 1993; Austria: MAK 5 ppm (25 mg/m^3), [skin], 1999; Belgium: TWA 2 ppm (9.9 mg/m^3), [skin], 1993; Denmark: TWA 0.5 ppm (2.5 mg/m^3), [skin], 1999; Finland: TWA 5 ppm (25 mg/m^3), STEL 10 ppm (50 mg/m^3), [skin], 1999; France: VME 2 ppm (10 mg/m^3), [skin], 1999; the Netherlands: MAC-TGG 2.5 mg/m^3, 2003; Norway: TWA 1 ppm (5 mg/m^3), 1999; the Philippines: TWA 100 ppm (435 mg/m^3), [skin], 1993; Poland: MAC (TWA) 10 mg/m^3, 1999; Russia: STEL 3 mg/m^3, [skin], 1993; Switzerland: MAK-W 2 ppm (10 mg/m^3), [skin], 1999; Turkey: TWA 5 ppm (25 mg/m^3), [skin], 1993; United Kingdom: TWA 2 ppm (10 mg/m^3), STEL 10 ppm, [skin], 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: confirmed animal carcinogen with unknown relevance to humans. The Czech Republic has set a TWA of 5.0 mg/m^3. Several states have set guidelines or standards for xylidine in ambient air[60] ranging from 1.6 μg/m^3 (Virginia) to 33.3 μg/m^3 (New York) to 50.0 μg/m^3 (South Carolina) to 100.0 μg/m^3 (Connecticut, Florida, and North Dakota) to 238.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method #2002, amines, aromatic.

Permissible Concentration in Water: No criteria set, but EPA[32] has suggested a permissible ambient concentration of 345 μg/L.

Determination in Water: Octanol−water coefficient: Log K_{ow} = (estimated) <2.0 (mixed isomers).

Routes of Entry: Inhalation, skin absorption, ingestion, skin and/or eye contact.

Harmful Effects and Symptoms

Short Term Exposure: Xylidine can affect you when breathed in and by passing through your skin. The effects of exposure may be delayed in case of skin absorption. Irritates the eyes, skin, and respiratory tract. Exposure can cause the formation of methemoglobin causing interference with the ability of the blood to carry oxygen, causing headaches, dizziness, nausea, vomiting, and cyanosis (a bluish color to the skin and lips). Higher levels can cause trouble breathing, collapse, and even death. High or repeated exposure may damage the liver.

Long Term Exposure: May cause anemia. Affects the kidneys, liver, and blood. 2,6-Xylidine has been shown to cause cancer in animals.

Points of Attack: Respiratory system, blood, liver, kidneys, cardiovascular system. Cancer site in animals: nose.

Medical Surveillance: US DHHS PHS CDC NIOSH, and US DOL OSHA list the following tests: whole blood (chemical/metabolite), methemoglobin; complete blood count. Liver and kidney function tests.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Treat for methemoglobinemia. Spectrophotometry may be required for precise determination of levels of methemoglobin in urine. If symptoms of serious cyanosis develop, *methylene blue* may be given as an antidote (by a trained medical person only), over 5 min. Repeat in 1 h if not improving. 100% oxygen can be given only by a trained person.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear splash-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: NIOSH: *20 ppm:* CcrOv (APF = 10) [any chemical cartridge respirator with organic vapor cartridge(s)]; Sa (APF = 10) (any supplied-air respirator). *50 ppm:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or CcrFOv (APF = 50) [any chemical cartridge respirator with a full face-piece and organic vapor cartridge(s)] or GmFOv (APF = 50) [any air-purifying, full face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or PaprOv (APF = 25) [any powered, air-purifying respirator with an organic vapor cartridge(s)] or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* GmFOv (APF = 50) [any air-purifying, full-face-piece respirator (gas mask) with a chin-style, front- or back-mounted organic vapor canister] or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Before entering confined space where this chemical may be present, check to make sure that an explosive concentration does not exist. Xylidine must be stored to avoid contact with strong oxidizers (such as bromine, chlorine, or fluorine) since violent reactions occur. Contact with hypochlorite bleaches may form explosive chloroamines. Store in tightly closed containers in a cool, dry, well-ventilated area away from heat sources. Sources of ignition, such as smoking and open flames, are prohibited where this chemical is used, handled, or stored in a manner that could create a potential fire or explosion hazard. Metal containers involving the transfer of 5 gallons or more of this chemical should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of this chemical. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Xylidines, solid require a shipping label of "POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 6.1 and Packing Group II.

Spill Handling: Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Establish forced ventilation to keep levels below explosive limit. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. Keep this chemical out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a combustible liquid. Poisonous gases, including nitrogen oxides, are produced in fire. Use dry chemical, carbon dioxide, or alcohol foam extinguishers. Vapors are heavier than air and will collect in low areas. Containers may explode in fire. Storage containers and parts of containers may rocket great distances, in many directions. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Incineration; oxides of nitrogen are removed from the effluent gas by scrubber, catalytic or thermal device.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%, elemental and compounds.
European/International Regulations: not listed in Annex 1.
WGK (German Aquatic Hazard Class): No value assigned (metal); 1 Slightly water polluting (oxide)
Description: Yttrium is a silvery-white to dark-gray, or black solid. Odorless. An element in Group III-B of the Periodic Table. It is very similar to the rare earth metals. Molecular weight = 88.91; Specific gravity (H_2O:1) = 4.47 @ 25°C; Boiling point = 2927°C; Freezing/Melting point = 1509°C. Soluble in hot water.
Potential Exposure: Yttrium is used in iron and other alloys, in incandescent gas mantles, and as a deoxidizer for metals. Yttrium metal has a low cross section for neutron capture and is very stable at high temperatures. Further, it is very inert toward liquid uranium and many liquid uranium alloys. Thus, it may well have applications in nuclear power generation. The metal is usually prepared by reduction of the halide with an active metal, such as calcium. To identify and analyze this element, x-ray fluorescence spectroscopy is commonly employed.
Incompatibilities: Flammable in the form of dust in air. Reacts with oxidizers, halogens. Yttrium nitrate: combustible materials.

Determination in Air: Use NIOSH Analytical Method (IV) #7300, #7301, #7303, #9102, OSHA Analytical Method ID-121.
Permissible Concentration in Water: No criteria set.
Routes of Entry: Inhalation of dusts, ingestion; skin and/or eye contact.
Harmful Effects and Symptoms
Short Term Exposure: Eye irritation in humans.
Long Term Exposure: In animals: pulmonary irritation; eye injury; possible liver damage.
Points of Attack: Eyes, respiratory system; liver
Medical Surveillance: Consider the points of attack in preplacement and periodic physical examinations. Liver function tests.
First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 minutes, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00024-2

medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full-face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 5 mg/m^3:* Qm (APF = 25) (any quarter-mask respirator). *Up to 10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100]; or Sa (APF = 10) (any supplied-air respirator). *Up to 25 mg/m^3:* Sa: Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode); or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *Up to 50 mg/m^3:* 100F (APF = 50) (any air purifying, full face-piece respirator with and N100, R100, or P100 filter); or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode); or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter); or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece); or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode); or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive pressure mode). *Escape:* 100F (APF = 50) (any air purifying, full-face-piece respirator with and N100, R100, or P100 filter); or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red (*powder*): Flammability Hazard: Store in a flammable materials storage area. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from oxidizers. Where possible, automatically transfer material from storage containers to process containers.

Shipping: Flammable powder requires a shipping label of "FLAMMABLE SOLID." It falls in Hazard Class 4.1 and Packing Group III.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until clean-up is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to cleanup spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is a noncombustible solid in bulk form. Use dry chemical, carbon dioxide; water spray; or foam extinguishers. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for fire fighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Recovery is indicated wherever possible. Specifically, processes are available for yttrium oxysulfide recovery from color television tube manufacture.

Fume or dust:
Clean Water Act: 40CFR401.15 Section 307 Toxic Pollutants; Section 313 Water Priority Chemicals (57FR 41331, 9/9/92).
Reportable Quantity (RQ): 1000 lb (454 kg).
EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.
Canada, WHMIS, Ingredients Disclosure List Concentration zinc metal not listed.
European/International Regulations (dust, pyrophoric): Hazard Symbol: F; Risk phrases: R15; R17; Safety phrases: S2; S7/8; S43 (see Appendix 4).
WGK (German Aquatic Hazard Class): 2—Water polluting (*zinc, grain size < = 1 mm*); Nonwater polluting agent (*metal*).
Description: Zinc is a soft silver-colored metal; the dust is odorless and gray. Molecular weight = 65.37; Boiling point = 908°C; Freezing/Melting point = 420°C; Autoignition temperature = 460°C. Ignition temperature of dust cloud = 600°C; Minimum explosive concentration = 0.48 oz/ft^3.[USBM] Relative explosion hazard of dust: Moderate. Hazard Identification (based on NFPA-704 M Rating System): Health 0, Flammability 2, Reactivity 0; (*powder*) Health 1, Flammability 3, Reactivity 2. The metal is insoluble in water. The dust reacts with water.
Potential Exposure: Compound Description: Tumorigen, Mutagen, Human Data; Primary Irritant. Zinc is used most commonly as a protective coating of other metals. In addition, it is used in alloys, such as bronze and brass, for electrical apparatus in many common goods; and in organic chemical extractions and reductions. Zinc chloride is a primary ingredient in smoke bombs used by military for screening purposes, crowd dispersal, and occasionally in firefighting exercises by both military and civilian communities. In pharmaceuticals, salts of zinc are used as solubilizing agents in many drugs, including insulin.
Incompatibilities: Dust may self-ignite in air. A strong reducing agent. Violent reaction with oxidizers, chromic anhydride, manganese chloride, chlorates, chlorine, and magnesium. Reacts with water and reacts violently with acids, alkali hydroxides, and bases forming highly flammable hydrogen gas. Reacts violently with sulfur, halogenated hydrocarbons, and many other substances, causing fire and explosion hazard.
Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 240 mg/m^3
PAC-3: 500 mg/m^3
Zinc nitrate (7779-88-6)
TEEL-0: 1 mg/m^3
PAC-1: 3 mg/m^3
PAC-2: 20 mg/m^3
PAC-3: 100 mg/m^3
DFG MAK (*zinc & zinc inorganic compounds*): 0.1 mg/m^3, respirable fraction; Peak Limitation Category I(4); 2 mg/m^3, inhalable fraction (excluding zinc chloride) TWA; Peak Limitation Category II(2).
Arab Republic of Egypt: 0.1 mg/m^3 TWA, 1993.
Several states have set a standard for zinc metal in ambient air[60] ranging from 0.03 μg/m^3 (New York) to 6.55−39.29 μg/m^3 (Montana).
Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements, #7030 Zinc and compounds (as Zn), #8005, Elements in blood or tissue, #8310 Metals in urine, OSHA Analytical Methods ID-121; ID-125G.
Permissible Concentration in Water: There are a number of standards for *zinc* in water set around the world[35]: EC: 100−500 μg/L, for drinking water; Germany: 2000 μg/L,

Sittig's Handbook of Toxic and Hazardous Chemicals and Carcinogens.
DOI: 10.1016/B978-1-4377-7869-4.00025-4

for drinking water; Mexico: 10,000 μg/L, for estuaries; Mexico: 10 μg/L, for coastal waters; Russia: 5000 μg/L, for drinking water; Russia: 1000 μg/L, for surface water; Russia: 10 μg/L, in water for fishery purposes; WHO: 5000 μg/L, in water for esthetic quality. The US EPA[6] has set 5 mg/L (5000 μg/L) for the prevention of adverse effects due to the organoleptic properties of zinc. The state of Kansas has also set a drinking water limit of 5 mg/L.[61]

Determination in Water: There are a number of standards for *zinc* in water set around the world[35]: EC: 100−500 μg/L, for drinking water; Germany: 2000 μg/L, for drinking water; Mexico: 10,000 μg/L, for estuaries; Mexico: 10 μg/L, for coastal waters; Russia: 5000 μg/L, for drinking water; Russia: 1000 μg/L, for surface water; Russia: 10 μg/L, in water for fishery purposes; WHO: 5000 μg/L, in water for esthetic quality. The US EPA recommends there be no more than 5 ppm of drinking water because of taste. The state of Kansas has set a drinking water limit of 5 mg/L.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Zinc can affect you when breathed in. Zinc dust particles can irritate the eyes. Exposure to solid zinc is not known to cause acute or chronic health effects, but heated zinc may give off zinc oxide fumes that can cause health effects. Metal fragments can scratch the eyes. When zinc is refined, cadmium is released. *Cadmium* is a cancer causing agent. Inhalation of the dust or fume may cause metal fume fever.

Long Term Exposure: Repeated contact with the dust or fume may cause dermatitis. Ingestion of high levels of zinc can cause anemia, pancreas damage, and lower levels of high-density lipoprotein cholesterol (HDL, the good form of cholesterol). It is not known if high levels of zinc affect human reproduction or cause birth defects. Rats that were fed large amounts of zinc became infertile or had small babies. Zinc is an essential element in our diet. Not enough zinc can cause a loss of appetite, a decrease in the sense of taste and smell, slow wound healing, and skin sores, or a damaged immune system. The recommended dietary allowance (RDA) for zinc is 15 mg/day for men; 12 mg/day for women; 10 mg/day for children; 5 mg/day for infants. Harmful health effects generally begin at levels from 10 to 15 times the RDA (in the 100−250 mg/day range).

Points of Attack: Skin, blood, pancreas.

Medical Surveillance: Zinc can be measured in the blood or feces.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning do not use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc or cadmium.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact with the dust. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to zinc dusts, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Yellow Stripe (*powder is a strong reducing agent*): Reactivity Hazard; Store separately in an area isolated from flammables, combustibles, or other yellow-coded materials. Prior to working with this chemical you should be trained on its proper handling and storage. Zinc must be stored to avoid contact with chromic anhydride, manganese chloride, chlorates, chlorine, and magnesium since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from water, acids, and alkali hydroxides because flammable hydrogen gas is produced. Sources of ignition, such as smoking and open flames, are prohibited where zinc is used, handled, or stored in a manner that could create a potential fire or explosion hazard.

Shipping: Zinc powder or zinc dust requires a shipping label of "DANGEROUS WHEN WET, SPONTANEOUSLY COMBUSTIBLE." They fall in DOT Hazard Class 4.3.

Pyrophoric metals, n.o.s., or Pyrophoric alloys, n.o.s. require a label of "SPONTANEOUSLY COMBUSTIBLE." They fall in DOT Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is

complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zinc is a combustible solid. Use dry chemical, sand, or foam extinguishers. Poisonous gases are produced in fire, including zinc oxides. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Zinc powder should be reclaimed. Unsalvageable waste may be buried in an approved landfill. Leachate should be monitored for zinc content.[22]

Zinc bromide Z:0110

Molecular Formula: Br_2Zn
Common Formula: $ZnBr_2$
Synonyms: Anhydrous zinc bromide; Bromuro de zinc (Spanish); Zinc bromide, anhydrous; Zinc dibromide
CAS Registry Number: 7699-45-8
RTECS® Number: ZH1150000
EC Number: 231-718-4

Regulatory Authority and Advisory Bodies

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR 401.15 Section 307 Toxic Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

Reportable Quantity (RQ): 1000 lb (454 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

US DOT Regulated Marine Pollutant (49CFR172.101, Appendix B).

European/International Regulations: not listed in Annex 1.

WGK (German Aquatic Hazard Class): No value assigned.

Description: Zinc bromide is an odorless white crystalline solid. Boiling point = 650°C; Freezing/Melting point = 394°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Zinc bromide is used in photography, rayon manufacturing, and medicine.

Incompatibilities: Alkali metals. Violent reaction with metallic sodium or potassium. Store above 32°F/0°C.

Permissible Exposure Limits in Air
Protective Action Criteria (PAC)
TEEL-0: 2 mg/m^3
PAC-1: 6 mg/m^3
PAC-2: 40 mg/m^3
PAC-3: 200 mg/m^3
Neither ACGIH nor OSHA have set standards but the state of New York has set a guideline for ambient air of 3.0 μg/m^3.[60]

DFG MAK (*zinc & zinc inorganic compounds*): 0.1 mg/m^3, respirable fraction; Peak Limitation Category I(4); 2 mg/m^3, inhalable fraction (excluding zinc chloride) TWA; Peak Limitation Category II(2).

Permissible Concentration in Water: There are a number of standards for *zinc* in water set around the world[35]: EC: 100−500 μg/L, for drinking water; Germany: 2000 μg/L, for drinking water; Mexico: 10,000 μg/L, for estuaries; Mexico: 10 μg/L, for coastal waters; Russia: 5000 μg/L, for drinking water; Russia: 1000 μg/L, for surface water; Russia: 10 μg/L, in water for fishery purposes; WHO: 5000 μg/L, in water for esthetic quality. The US EPA[6] has set 5 mg/L (5000 μg/L), for the prevention of adverse effects due to the organoleptic properties of zinc. The state of Kansas has also set a drinking water limit of 5 mg/L.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Dust levels of 80 mg/m^3 may cause irritation of the mouth, nose, and throat resulting in coughing, wheezing, and difficult breathing. *Skin:* Can cause irritation and burns. *Eyes:* Can cause irritation and burns. *Ingestion:* Dust or solution may cause irritation to the mouth, throat, and digestive tract. Large doses can cause violent vomiting, severe stomach pain, diarrhea, shock, and collapse. Scars may form in the throat and stomach. Long lasting kidney irritation may occur. Less than 1 oz may cause death. Repeated exposure can lead to bromine poisoning, with symptoms of personality changes (such as depression), poor appetite, and confusion.

Long Term Exposure: Can cause headache, personality changes, poor appetite, lethargy, and confusion. Skin rash can occur with repeated exposure. Can irritate the lungs; bronchitis may develop.

Points of Attack: Lungs.

Medical Surveillance: For those with frequent or potentially high exposure, the following are recommended before beginning work and at regular times after that: lung function tests. If symptoms develop or overexposure is suspected, the following may be useful: blood test for bromide.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: Administer prompt and complete gastric lavage and demulcents. Observe for gastric perforations and late complications, such as pyloric stenosis. For eye exposure, rinsing with 0.05 molar neutral sodium edetate may help prevent or reverse corneal opacification.

Note to physician: For severe poisoning, *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to zinc bromide, use a NIOSH/MSHA- or European Standard EN149-approved full-face-piece respirator with a high-efficiency particulate filter. Greater protection is provided by a powered air-purifying respirator. *Where there is potential for high exposures*, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Green: General storage may be used. Prior to working with this chemical you should be trained on its proper handling and storage. Zinc bromide must be stored to avoid contact with metallic sodium or potassium since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area. Where possible, automatically transfer material from drums or other storage containers to process containers.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Extinguish fire using an agent suitable for type of surrounding fire. Zinc bromide itself does not burn. Poisonous gases are produced in fire, including hydrogen bromide and zinc. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position.

Several states have set guidelines or standards for zinc chloride in ambient air[60] ranging from 0.16 μg/m^3 (Virginia) to 3.3 μg/m^3 (New York) to 10.0 μg/m^3 (Florida, North Dakota, South Dakota) to 20.0 μg/m^3 (Connecticut) to 24.0 μg/m^3 (Nevada).

Determination in Air: Use OSHA Analytical Method #ID-121, #ID-125G.

Permissible Concentration in Water: There are a number of standards for *zinc* in water set around the world[35]: EC: 100−500 μg/L, for drinking water; Germany: 2000 μg/L, for drinking water; Mexico: 10,000 μg/L, for estuaries; Mexico: 10 μg/L, for coastal waters; Russia: 5000 μg/L, for drinking water; Russia: 1000 μg/L, for surface water; Russia: 10 μg/L, in water for fishery purposes; WHO: 5000 μg/L, in water for esthetic quality. The US EPA[6] has set 5 mg/L (5000 μg/L) for the prevention of adverse effects due to the organoleptic properties of zinc. The state of Kansas has also set a drinking water limit of 5 mg/L.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: *Inhalation:* Corrosive to the respiratory tract. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Symptoms of exposure can include cough, copious sputum, dyspnea (breathing difficulty), chest pain, bronchopneumonia, pulmonary fibrosis, cor pulmonale, fever, cyanosis, tachypnea. No effects were reported from 30 min exposure to 0.07−0.04 mg/m^3. Exposure to dust or fumes above 80 mg/m^3 for 2 min may cause nose and throat irritation, cough, chest pain, cyanosis (bluish skin), fever, nausea and vomiting, shortness of breath, difficult breathing, and pneumonia. Breathing difficulties may not appear for several hours. Fume concentrations over 52 mg/m^3 may produce symptoms listed above. Fatal accidental exposures have occurred. *Skin:* Corrosive. Dust or solution can cause irritation and chemical burns particularly on areas where skin is broken. *Eyes:* Corrosive. Dust can cause burning irritation. Concentrated solutions are very dangerous to the eyes, causing extreme pain, redness, and swelling. Eye damage may result. *Ingestion:* Dust or solution may be irritating and corrosive to the mouth, throat, and digestive tract. Other symptoms may include stomach pain, nausea, vomiting, bloody diarrhea, swelling of the throat, blood in the urine, and shock. Less than 1 oz has killed an adult although recovery has been reported after ingestion of 4 oz.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. There is limited evidence that zinc chloride is a teratogen in animals. Repeated exposure can lead to delayed permanent lung damage. Prolonged contact can cause skin burns and ulcers.

Points of Attack: Eyes, skin, respiratory system, cardiovascular system.

Medical Surveillance: NIOSH lists the following tests: Blood gas analysis, whole blood (chemical/metabolite), biologic tissue/biopsy, chest X-ray, electrocardiogram, pulmonary function tests: forced vital capacity, forced expiratory volume (1 s), sputum cytology, urine (chemical/metabolite), white blood cell count/differential.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. If victim is *conscious*, administer water or milk. Do not induce vomiting. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed.

Note to physician: Inhalation: Bronchodilators, decongestants, and oxygen may be used if necessary. Corticosteroids are useful for treating pneumonitis. Ingestion—gastric lavage with 5% sodium bicarbonates; Dimercaprol has been suggested for treatment. *Eyes:* rinsing with 0.05 molar neutral sodium edetate may prevent or reverse corneal opacification.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof goggles and use a face shield when working with powders or dust unless full face-piece respiratory protection is worn. Wear splash-proof chemical goggles and use a face shield when working with liquid unless full-face-piece respiratory protection is worn. Where the fume is present, wear gas-proof goggles and use face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *10 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *25 mg/m^3:* Sa:Cf

(APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a high-efficiency particulate filter). *50 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or PaprTHie (APF = 50)* (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

*Substance reported to cause eye irritation or damage; may require eye protection.

Storage: Color Code—White: Corrosive or Contact Hazard; Store separately in a corrosion-resistant location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from potassium.

Shipping: Zinc chloride, anhydrous or solution, requires a shipping label of "CORROSIVE." It falls in Hazard Class 8 and Packing Group III.

Spill Handling: *Solid:* Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Wash spill area with soap and water. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. *Liquid:* Evacuate and restrict persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Ventilate area of spill or leak. Absorb liquids in vermiculite, dry sand, earth, peat, carbon, or a similar material and deposit in sealed containers. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: This chemical is noncombustible. Use agent suitable for surrounding fire. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Disposal Method Suggested: Dump in water; add soda ash and stir, then neutralize and flush to sewer with water. Alternatively, zinc chloride may be recovered from spent catalysts and used in acrylic fiber spinning solutions.

Carcinogenicity: IARC: Human Sufficient Evidence; Animal Sufficient Evidence, *carcinogenic to humans*, Group 1, 1997; NTP: 11th Report on Carcinogens, 2004: Known to be a human carcinogen; EPA *(inhalation)*: Known human carcinogen; EPA *(oral)*: Cannot be Determined; Not Classifiable as to human carcinogenicity; NTP: Known to be a human carcinogen.

US EPA Gene-Tox Program, Positive: Carcinogenicity—mouse/rat; Cell transform.—SA7/SHE; NIOSH: Potential occupational carcinogen.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

Chromium compounds:

Clean Air Act: Hazardous Air Pollutants (Title I, Part A, Section 112).

Clean Water Act: Toxic Pollutant (Section 401.15); 40CFR401.15 Section 307 Toxic Pollutants as chromium and compounds.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents, waste number not listed.

EPCRA (Section 313): Includes any unique chemical substance that contains chromium as part of that chemical's infrastructure. Form R *de minimis* concentration reporting level: Chromium(VI) compounds: 0.1%.

California Proposition 65 Chemical: (*hexavalent chromium*) Cancer 2/27/87; Developmental/Reproductive toxin (male, female) 12/19/08.

Canada, WHMIS, Ingredients Disclosure List Concentration 0.1%.

European/International Regulations: Hazard Symbol: E, T + , N; Risk phrases: R45; R46; R60; R61; R2; R8; R21; R25; R26; R34; R42/43; R48/23; R50/53; Safety phrases: S53; S45; S60; S61.

European/International Regulations (*zinc chromates including zinc potassium chromate*): Hazard Symbol: T, N; Risk phrases: R45; R22; R43; R50/53; Safety phrases: S53; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Zinc chromate is a yellow crystalline powder. Molecular weight = 181.37; Freezing/Melting point = 316°C. Hazard Identification (based on NFPA-704 M Rating System): Health 2, Flammability 0, Reactivity 0. Soluble in water.

Potential Exposure: Compound Description: Tumorigen, Mutagen; Human Data. Zinc chromate is used as an anticorrosion pigment in primers and as a coloring agent; as a pigment in surface coatings and linoleum; to impart corrosion-resistance to epoxy laminates.

Incompatibilities: An oxidizer; reacts with reducing agents, combustibles, organic materials.

Permissible Exposure Limits in Air

OSHA PEL: 0.005 mg[Cr(VI)]/m^3 (*13530-65-9 only*) TWA; 0.1 mg[CrO^3]/m^3 (*11103-86-9 and 37300-23-5*) Ceiling Concentration. See 29CFR1910.1026.

NIOSH REL: 0.001 mg[Cr]/m^3 TWA, potential carcinogen, limit exposure to lowest feasible level. NIOSH considers all Cr(VI) compounds (including chromic acid, *tert*-butyl chromate, zinc chromate, and chromyl chloride) to be potential occupational carcinogens. See *NIOSH Pocket Guide*, Appendix A & C.

ACGIH TLV®[1]: 0.015 mg[Cr]/m^3 TWA, Confirmed Human Carcinogen; BEI issued.

NIOSH IDLH: 15 mg[Cr(VI)]/m^3.

Protective Action Criteria (PAC)

TEEL-0: 0.0174 mg/m^3

PAC-1: 0.4 mg/m^3

PAC-2: 2.5 mg/m^3

PAC-3: 52.3 mg/m^3

DFG MAK: [skin] Danger of skin sensitization; Carcinogen Category 1; Pregnancy Risk Category 2; TRK: 0.05 mg[Cr]/m^3; 20 μg/L [Cr] in urine at end-of-shift.

Australia: TWA 0.01 mg/m^3, carcinogen, 1993; Austria: carcinogen, 1999; Belgium: TWA 0.01 mg/m^3, carcinogen, 1993; Denmark: TWA 0.02 mg[Cr]/m^3, 1999; France: VME 0.05 mg[Cr]/m^3, 1999; Japan; 0.05 mg[Cr]/m^3, 1999; Norway: TWA 0.02 mg[CrO$_3$]/m^3, 1999; Poland: TWA 0.1 mg/m^3, STEL 0.3 mg/m^3, 1999; Sweden: TWA 0.02 mg[Cr]/m^3, carcinogen, 1999; Switzerland: MAK-W 0.01 mg[Cr]/m^3, carcinogen, 1999; United Kingdom: TWA 0.5 mg[Cr]/m^3, carcinogen, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: Confirmed Human Carcinogen. Several states have set guidelines or standards for zinc chromate in ambient air[60] ranging from 0.008 μg/m^3 (Virginia) to 0.5 μg/m^3 (Connecticut) to 1.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Methods #7600,#7604, #7605, #7703, #9101; OSHA Analytical Methods ID-103, ID-215, W-4001.

Permissible Concentration in Water: Since zinc chromate may consist of compounds with various ZnO/Cr$_2$O$_3$ rations, it is best simply to refer to the EPA water quality criteria cited in the sections of the volume dealing with "Chromium" and with "Zinc Chloride." There are a number of standards for *zinc* in water set around the world[35]: The US EPA[6] has set 5 mg/L (5000 μg/L) for the prevention of adverse effects due to the organoleptic properties of zinc. The state of Kansas has also set a drinking water limit of 5 mg/L.[61] EC: 100−500 μg/L (drinking water); Germany: 2000 μg/L (drinking water); Mexico: 10,000 μg/L (estuaries); 10 μg/L (coastal waters); Russia: 5000 μg/L (drinking water); 1000 μg/L (surface water); 10 μg/L (for fishery purposes); WHO: 5000 μg/L (for esthetic quality). *As a hexavalent chromium compound:* For the protection of freshwater aquatic life: *Hexavalent chromium:* 0.29 μg/L as a 24-h average, never to exceed 21.0 μg/L. For the protection of saltwater aquatic life: *Hexavalent chromium:* 18 μg/L as a 24-h average, never to exceed 1260 μg/L. *To protect human health:* hexavalent chromium 50 μg/L according to EPA.[6] US EPA[49] has set a long-term health advisory for adults of 0.84 mg/L and a lifetime health advisory of 0.12 mg/L (120 μg/L) for chromium. EPA's maximum drinking water level (MCL) is 0.1 mg/L.[62] Germany, Canada, EEC, and WHO[35] have set a limit of 0.05 mg/L in drinking water. The states of Maine and Minnesota have set a guideline of 50 μg/L for chromium in drinking water[61] for Maine and 120 μg/L for Minnesota.

Determination in Water: Total chromium may be determined by digestion followed by atomic absorption, or by colorimetry (diphenylcarbazide), or by inductively coupled plasma (CP) optical emission spectrometry. Chromium(VI) may be determined by extraction and atomic absorption or colorimetry (using diphenylhydrazide). Dissolved total Cr or Cr(VI) may be determined by 0.45 μm filtration followed by the above-cited methods.[49]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Zinc chromate can affect you when breathed in and may enter the body through the skin. Zinc chromate is a carcinogen; handle with extreme caution. Zinc chromate can irritate the skin, causing a rash or skin ulcers. It can also trigger a skin allergy.

Long Term Exposure: Repeated exposure can cause a hole in the nasal septum (bone dividing the inner nose). Nose bleeds and sores are earlier signs. Zinc chromate is a human carcinogen. Repeated exposure may cause skin allergy with rash and itching.

Points of Attack: Skin. Cancer site in humans: Lung and throat.

Medical Surveillance: NIOSH lists the following tests for chromates: Blood gas analysis, complete blood count, chest X-ray, electrocardiogram, liver function tests; pulmonary function tests; sputum cytology, urine (chemical/metabolite), urinalysis (routine), white blood cell count/differential. Before beginning employment and at regular times after that, the following is recommended: Urine test for *chromates.* This test is most accurate shortly after exposure. If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Prevent skin contact. (As chromic acid and chromates) **8 h** (more than 8 h of resistance to breakthrough >0.1 μg/cm/min): polyethylene gloves, suits, boots; polyvinyl chloride gloves, suits, boots; Saranex™ coated suits; **4 h** (At least 4 but <8 h of resistance to breakthrough >0.1 μg/cm^2/min): butyl rubber gloves, suits, boots; Viton™ gloves, suits. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Eye protection is included in the recommended respiratory protection. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash. Specific engineering controls are recommended in NIOSH Criteria Document #76-129 [Chromium(VI)].

Respirator Selection: NIOSH, as chromates: *at any concentrations above the NIOSH REL, or where there is no REL, at any detectable concentration:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Store in tightly closed containers in a cool, well-ventilated area away from reducing agents. Where possible, automatically transfer material from other storage containers to process containers. A regulated, marked area should be established where this chemical is handled, used, or stored in compliance with OSHA Standard 1910.1045.

Shipping: Toxic solid, inorganic, n.o.s. requires a shipping label of "POISONOUS/TOXIC MATERIALS." They fall in Hazard Class 6.1.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Nonflammable. Use agent suitable for surrounding fire. Poisonous gases are produced in fire, including zinc and chromium. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Regulatory Authority and Advisory Bodies

Carcinogenicity: EPA: Not Classifiable as to human carcinogenicity; Inadequate Information to assess carcinogenic potential; Available data are inadequate for an assessment of human carcinogenic potential.

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

FDA—over-the-counter drug.

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol: N; Risk phrases: R50/53; Safety phrases: S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 2—Hazard to waters.

Description: Zinc oxide is an amorphous, white or yellowish-white powder. Odorless. Molecular weight = 81.37; Specific gravity (H_2O:1) = 5.61 at 25°C; Freezing/Melting point = 1975°C. Hazard Identification (based on NFPA-704 M Rating System) (*powder*): Health 2, Flammability 2, Reactivity 0. Practically insoluble in water; zinc oxide undergoes slow decomposition; solubility = 0.0004% at 18°C.

Potential Exposure: Compound Description: Mutagen; Reproductive Effector; Human Data; Primary Irritant. Zinc oxide is primarily used as a white pigment in rubber formulations and as a vulcanizing aid. It is also used as an anti-inflammatory agent; in photocopying; paints, chemicals, ceramics, lacquers, and varnishes; as a filler for plastic; in cosmetics, pharmaceuticals, and calamine lotion. Exposure may occur in the manufacture and use of zinc oxide and products, or through its formation as a fume when zinc or its alloys are heated. HC may have been used as a Choking/Pulmonary Agent.

Incompatibilities: Incompatible with linseed oil, magnesium. Contact with chlorinated rubber (at 215°C) may cause a violent reaction. Slowly decomposed by water.

Permissible Exposure Limits in Air

OSHA PEL: 15 mg/m^3 TWA (*total dust*); 5 mg/m^3 TWA (*respirable fraction and fume*).

NIOSH REL: (*dust only*): 5 mg/m^3 TWA; 15 mg/m^3 Ceiling Concentration; (*fume*) 5 mg/m^3 TWA; 10 mg/m^3 Ceiling Concentration.

ACGIH TLV®[1]: 2 mg/m^3, respirable fraction TWA; 10 mg/m^3, respirable fraction STEL.

NIOSH IDLH: 500 mg/m^3.

Protective Action Criteria (PAC)

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 15 mg/m^3

PAC-3: 500 mg/m^3

DFG *MAK* (*zinc oxide and fume*): 0.1 mg/m^3, respirable fraction TWA; Peak Limitation Category I(4); 2 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(2).

Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Australia: TWA 10 mg/m^3, 1993; Australia: TWA 5 mg/m^3, STEL 10 mg/m^3 (fume), 1993; Belgium: TWA 10 mg/m^3, 1993; TWA 5 mg/m^3, STEL 10 mg/m^3 (fume), 1993; Denmark: TWA 4 mg[Zn]/m^3, 1999; Finland: TWA 5 mg/m^3 (fume), 1999; the Netherlands: MAC-TGG 5 mg/m^3, 2003; France: VME (fume) 5 mg/m^3, 1999; Hungary: TWA 5 mg/m^3, 1993; Japan; 5 mg/m^3 (fume), 1999; Norway: TWA 5 mg/m^3, 1999; the Philippines: TWA 1 mg/m^3, 1993; Poland: MAC (TWA) fume 5 mg/m^3; MAC (STEL) fume 10 mg/m^3, 1999; Sweden: NGV 5 mg/m^3, 1999; Switzerland: MAK-W 5 mg/m^3, 1999; Thailand: TWA 5 mg/m^3 (fume), 1993; Turkey: TWA 5 mg/m^3, 1993; United Kingdom: TWA 5 mg/m^3, STEL 10 mg/m^3, fume, 2000; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 mg/m^3. Russia[43] set a MAC of 0.05 mg/m^3 in ambient air in residential areas on a daily average basis. Several states have set guidelines or standards for zinc oxide fume in ambient air[60] ranging from 0.8 μg/m^3 (Virginia) to 16.7 μg/m^3 (New York) to 50.0 μg/m^3 (Florida) to 50.0–100.0 μg/m^3 (North Dakota) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7303, Elements by ICP, #7502, Zinc and compounds, OSHA Analytical Method #ID-121, #ID1-43.

Permissible Concentration in Water: There are a number of standards for *zinc* in water set around the world.[35] The US EPA[6] has set 5 mg/L (5000 μg/L) for the prevention of adverse effects due to the organoleptic properties of zinc. EC: 100–500 μg/L (drinking water); Germany: 2000 μg/L (drinking water); Mexico: 10,000 μg/L (estuaries); 10 μg/L (coastal waters); Russia: 5000 μg/L (drinking water); 1000 μg/L (surface water); 10 μg/L (for fishery purposes); WHO: 5000 μg/L (for esthetic quality). The state of Kansas has also set a drinking water limit of 5 mg/L.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: *Note:* Symptoms of metallic or sweet taste and/or throat irritation or dryness may indicate overexposure. *Inhalation:* Irritates the respiratory tract. Exposure to fumes over 52 mg/m^3 can cause "metal fume fever." Onset of symptoms may be delayed 4–12 h. Symptoms include irritation of the nose, mouth, and throat; chills, muscle ache, nausea, fever, dry throat, cough, weakness, lassitude (weakness, exhaustion), metallic taste, headache, blurred vision, low back pain, vomiting, fatigue, malaise (vague feeling of discomfort), tightness in chest, dyspnea (breathing difficulty), rales, decreased pulmonary function, stomach pain, chills, fever, pains in the muscles and joints, thirst, bronchitis or pneumonia, and bluish tint to the skin. Higher exposures can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death.

Skin: Dust may cause irritation which can result in rash. *Eyes:* No information available. *Ingestion:* May cause abdominal discomfort, watery diarrhea, and cramps.

Long Term Exposure: Repeated or prolonged contact with skin may cause dermatitis. Repeated or prolonged inhalation exposure may cause asthma. There is limited evidence that zinc oxide may damage the developing fetus. Repeated overexposure may cause ulcer symptoms and affect the liver.

Points of Attack: Respiratory system, liver, skin.

Medical Surveillance: There are no special tests for this chemical. However, if overexposure is suspected or if illness occurs medical attention is recommended. Lung function tests. Liver function tests. GI series. Consider chest X-ray following acute overexposure.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit. Medical observation is recommended for 24–48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray. If metal fume fever develops, it may last less than 36 h.

Note to physician: In case of fume inhalation, treat pulmonary edema. Give prednisone or other corticosteroid orally to reduce tissue response to fume. Positive-pressure ventilation may be necessary. Treat metal fume fever with bed rest, analgesics, and antipyretics.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol ($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *Up to 50 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering facepieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or Sa (APF = 10) (any supplied-air respirator). *Up to 125 mg/m^3:* Sa:Cf (APF = 25) (any supplied-air respirator operated in a continuous-flow mode) or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust, mist, and fume filter). *Up to 250 mg/m^3:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SaT: Cf (APF = 50) (any supplied-air respirator that has a tight-fitting face-piece and is operated in a continuous-flow mode) or PaprTHie (APF = 50) (any powered, air-purifying respirator with a tight-fitting face-piece and a high-efficiency particulate filter) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece) or SaF (APF = 50) (any supplied-air respirator with a full face-piece). *Up to 500 mg/m^3:* Sa: Pd,Pp (APF = 1000) (any supplied-air respirator operated in a pressure-demand or other positive-pressure mode). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any NIOSH/MSHA- or European Standard EN 149-approved self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with a high-efficiency particulate filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Green: General storage may be used. Store in tightly closed containers in a cool, well-ventilated area away from chlorinated rubber, magnesium, and linseed oil.

Shipping: The name of this material is not on the DOT list of materials[19] for label and packaging standards. However, based on regulations, it may be classified[52] as an Environmentally hazardous substances, solid, n.o.s. This chemical requires a shipping label of "CLASS 9." It falls in Hazard Class 9 and Packing Group III.[20, 21]

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Does not burn. Extinguish fire using an agent suitable for type of surrounding fire. Poisonous gases are produced in fire, including oxides of zinc. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

Zinc phosphide Z:0150

Molecular Formula: P_2Zn_3

Common Formula: Zn_3P_2

Synonyms: Blue-ox; Fosfuro de zinc (Spanish); Kilrat; Mous-con; Phosphure de zinc (French); Phosvin; Ratol; Zinc (phosphure de) (French); Zinc-tox; Zinkphosphid (German); ZP

CAS Registry Number: 1314-84-7; (*alt.*) 39342-49-9

RTECS® Number: ZH4900000

UN/NA & ERG Number: UN1714/139

EC Number: 215-244-5 [*Annex I Index No.:* 015-006-00-9]

Regulatory Authority and Advisory Bodies

US EPA, FIFRA 1998 Status of Pesticides: RED completed.

Clean Water Act: Section 311 Hazardous Substances/RQ 40CFR117.3 (same as CERCLA, see below); 40CFR 401.15 Section 307 Toxic Pollutants; Section 313 Water Priority Chemicals (57FR41331, 9/9/92).

US EPA Hazardous Waste Number (RCRA No.): P122.

RCRA, 40CFR261, Appendix 8 Hazardous Constituents.

Superfund/EPCRA 40CFR355, Extremely Hazardous Substances: TPQ = 500 lb (227 kg). This material is a reactive solid. The TPQ does not default to 10,000 lb for nonpowder, nonmolten, nonsolution form.

Reportable Quantity (RQ): 100 lb (45.4 kg).

EPCRA Section 313 Form R *de minimis* concentration reporting level: 1.0%.

European/International Regulations: Hazard Symbol: T+, F, N; Risk phrases: R15/29; R28; R32; R50/53; Safety phrases: S1/2; S28; S30; S36/37; S43; S45; S60; S61 (see Appendix 4).

WGK (German Aquatic Hazard Class): 3—Severe hazard to waters.

Description: Zinc phosphide is a gray crystalline solid. Molecular weight = 258.05; Boiling point = 1100°C; Freezing/Melting point = 420°C. Hazard Identification (based on NFPA-704 M Rating System): Health 3, Flammability 3, Reactivity 2₩. Insoluble in water; slowly decomposes.

Potential Exposure: Compound Description: Agricultural Chemical; Mutagen; Reproductive Effector; Human Data. It is used as an acute single-feeding rodenticide.

Incompatibilities: Heat and contact with water causes decomposition, producing toxic and flammable fumes of phosphorus, zinc oxides, and toxic and flammable phosphine gas. Reacts violently with concentrated sulfuric acid, nitric acid, and other oxidizers. Reacts with hydrochloric acid or sulfuric acid with the evolution of spontaneously flammable phosphine gas. Incompatible with carbon dioxide, halogenated agents.

Permissible Exposure Limits in Air

Protective Action Criteria (PAC)*

TEEL-0: 0.05 ppm

PAC-1: 0.15 ppm

PAC-2: **1** ppm

PAC-3: **1.8** ppm

*AEGLs (Acute Emergency Guideline Levels) & ERPGs (Emergency Response Planning Guidelines) are in **bold face**.

Russia: TWA 0.1 mg/m^3, 1993.

Determination in Air: Use #7502, Zinc and compounds, OSHA Analytical Method #ID-121, #ID1-43.

Permissible Concentration in Water: There are a number of standards for zinc in water set around the world[35]: The EC: 100−500 μg/L (drinking water); Germany: 2000 μg/L (drinking water); Mexico: 10,000 μg/L (estuaries); 10 μg/L (coastal waters; Russia: 5000 μg/L (drinking water); 1000 μg/L (surface water); 10 μg/L (for fishery purposes); WHO: 5000 μg/L (for esthetic quality). US EPA[6] has set 5 mg/L (5000 μg/L) for the prevention of adverse effects due to the organoleptic properties of zinc. The state of Kansas has also set a drinking water limit of 5 mg/L.[61]

Routes of Entry: Inhalation, ingestion, eye and/or skin contact. Absorbed through the skin.

Harmful Effects and Symptoms

Short Term Exposure: Irritates the respiratory tract. Contact with the eyes can cause severe irritation, burns, and permanent damage. Skin contact causes irritation. This chemical is a CNS depressant. Inhalation of zinc phosphide dust is followed in several hours by vomiting, diarrhea, cyanosis (bluing of skin), rapid pulse, fever, and shock. The breath smells of phosphine. The compound is very caustic and may cause closing of the esophagus. Inhalation of phosphine (formed when zinc phosphide is exposed to flame, water, or acids) can cause pulmonary edema, a medical emergency that can be delayed for several hours. This can cause death. Zinc phosphide is very caustic when ingested and forms phosphine. The probable oral lethal dose is 5−50 mg/kg or between 7 drops and 1 teaspoonful for a 70-kg (150−lb) person. Most patients die after about 30 h from peripheral vascular collapse secondary to the compound's direct effects. Extensive liver damage and kidney damage can also occur. Ingestion of 4−5 g has produced death in human adults, but also doses of 25−50 g have been survived. The lowest oral lethal dose reported for women is 80 mg/kg. Symptoms of oral ingestion include nausea, abdominal pain, vomiting, tightness in chest, excitement, agitation and chills, faintness, weakness, dyspnea, fall in blood pressure, change in pulse rate, diarrhea, intense thirst, convulsions, paralysis, and coma. Early labored breathing, shock, halted urinary output, metabolic acidosis, muscle cramps, and convulsions are grave prognostic signs.

Long Term Exposure: The substance may cause effects on the liver, kidneys, heart, and nervous system. Repeated exposures to low exposures cause chronic poisoning, anemia, bronchitis, and gastrointestinal, visual, speech, and motor disturbances.

Points of Attack: Lungs, liver, kidneys, heart, blood, nervous system.

Medical Surveillance: Liver and kidney function tests. EKG. Lung function tests. Consider chest X-ray following acute overexposure. Complete blood count (CBC).

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled get medical attention for phosphine, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention for phosphine poisoning. Give one tablespoonful of mustard in a glass of warm water; repeat until vomit fluid is clear; avoid use of all oils. Do not make an unconscious person vomit. Medical observation is recommended for 24−48 h after breathing overexposure, as pulmonary edema may be delayed. As first aid for pulmonary edema, a doctor or authorized paramedic may consider administering a corticosteroid spray.

Note to physician: For severe poisoning *do not* use BAL [British Anti-Lewisite, dimercaprol, dithiopropanol

($C_3H_8OS_2$)] as it is contraindicated or ineffective in poisoning from zinc.

Personal Protective Methods: Wear protective gloves and clothing to prevent any reasonable probability of skin contact. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: Where there is potential for exposures to zinc dusts, use a NIOSH/MSHA- or European Standard EN149-approved respirator equipped with particulate (dust/fume/mist) filters. Particulate filters must be checked every day before work for physical damage, such as rips or tears, and replaced as needed. Where there is potential for high exposure, use a NIOSH/MSHA- or European Standard EN149-approved supplied-air respirator with a full face-piece operated in the positive-pressure mode, or with a full-face-piece, hood, or helmet in the continuous-flow mode; or use a NIOSH/MSHA- or European Standard EN149-approved self-contained breathing apparatus with a full face-piece operated in a pressure-demand or other positive-pressure mode.

Storage: Color Code—Blue: Health Hazard/Poison: Store in a secure poison location. Prior to working with this chemical you should be trained on its proper handling and storage. Store in tightly closed containers in a cool, well-ventilated area away from moisture and oxidizers.

Shipping: Zinc phosphide requires a shipping label of "DANGEROUS WHEN WET, POISONOUS/TOXIC MATERIALS." It falls in Hazard Class 4.3 and Packing Group I.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. *Do not use water*. Keep sparks, flames, and other sources of ignition away. Keep material out of water sources and sewers. Keep material dry. Avoid breathing dusts and fumes from burning material. Keep upwind. Avoid bodily contact with the material. Do not handle broken packages without protective equipment. Wash away any material which may have contacted the body with copious amounts of water or soap and water. For a land spill, dig a pit, pond, lagoon, or holding area to contain liquid or solid material. For water spill, neutralize with agricultural lime (slaked lime), crushed limestone, or sodium bicarbonate. Use mechanical dredges or lifts to remove immobilized wastes of pollutants and precipitates. *Small dry spills:* with clean shovel place material into clean, dry container and cover; move containers from spill area. *Large spills:* dike spill for later disposal. Cover powder spill with plastic sheet or tarp to minimize spreading. Clean up only under supervision of an expert. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable. UN1714, zinc phosphide is on the DOT's list of dangerous water-reactive materials which create large amounts of toxic vapor when *spilled in water*. Dangerous from 0.5 to 10 km (0.3−6.0 miles) downwind.

Fire Extinguishing: *Do not use water* or foam. For small fires, use dry chemical, soda ash, or lime. For large fires, withdraw from area and let burn. *Do not use water* or any agent with an acid reaction (i.e., carbon dioxide or halogenated agents) as phosphine will be liberated. Poisonous gases, including phosphine, zinc oxide, and phosphorus, are produced in fire. Wear boots, protective gloves, and goggles. Wear self-contained breathing apparatus when fighting fires involving this material. Keep unnecessary people away; isolate hazard area and deny entry. Stay upwind; keep out of low areas. Move container from fire area if you can do so without risk.

Disposal Method Suggested: Consult with environmental regulatory agencies for guidance on acceptable disposal practices. Generators of waste containing this contaminant (≥100 kg/mo) must conform with EPA regulations governing storage, transportation, treatment, and waste disposal.

EC Number: 231-176-9 [*Annex I Index No.:* 040-001-00-3]

Regulatory Authority and Advisory Bodies

Air Pollutant Standard Set. See below, "Permissible Exposure Limits in Air" section.

The FDA controls zirconium-containing drugs and/or cosmetic products.

Canada, WHMIS, Ingredients Disclosure List Concentration 1.0%.

European/International Regulations: Hazard Symbol (*powder, pyrophoric*): F; Risk phrases: R15; R17; Safety phrases: S2; S7/8; S43; (*powder stabilized*) Risk phrases: R17; Safety phrases: S2; S7/8; S43 (see Appendix 4).

WGK (German Aquatic Hazard Class): Nonwater polluting agent (*metal*); 1-Slightly water polluting (*acetate, dichloride, dioxide, propionate*).

Description: Zirconium is a grayish-white, lustrous metal in the form of platelets, flakes, or a bluish-black, amorphous powder. Molecular weight = 91.22 (elemental); Specific gravity (H_2O:1) = 6.51 at 25°C; Boiling point = 3577°C; Freezing/Melting point = 1857°C. Hazard Identification (based on NFPA-704 M Rating System): Health 1, Flammability 4, Reactivity 1. Insoluble in water. The powdered metal is a fire and explosive hazard: it may ignite *spontaneously* and can continue burning under water.

Zirconium is never found in the free state; the most common sources are the ores zircon and baddeleyite. It is generally produced by reduction of the chloride or iodide. The metal is very reactive, and the process is carried out under an atmosphere of inert gas.

Potential Exposure: Zirconium metal is used as a "getter" in vacuum tubes, a deoxidizer in metallurgy, a substitute for platinum; it is used in priming of explosive mixtures; flashlight powders; lamp filaments; flash bulbs; and construction of rayon spinnerets. Zirconium or its alloys (with nickel, cobalt, niobium, tantalum) are used as lining materials for pumps and pipes, for chemical processes, and for reaction vessels. Pure zirconium is a structural material for atomic reactor; and alloyed, particularly with aluminum, it is a cladding material for fuel rods in water-moderated nuclear reactors. A zirconium–columbium alloy is an excellent superconductor.

Zircon ($ZrSiO_4$) is utilized as a foundry sand, an abrasive, a refractory in combination with zirconia, a coating for casting molds, a catalyst in alkyl and alkenyl hydrocarbon manufacture, a stabilizer in silicone rubbers, and as a gem stone; in ceramics, it is used as an opacifier for glazes and enamels and in fritted glass filters. Both zircon and zirconia (zirconium oxide, ZrO_2) bricks are used as linings for glass furnaces. Zirconia itself is used in die extrusion of metals and in spout linings for pouring metals, as a substitute for lime in oxyhydrogen flam, as a pigment; and an abrasive; it is used, too, in incandescent lights, as well as in the manufacture of enamels, white glass, and refractory crucibles. Other zirconium compounds are used in metal cutting tools, thermocouple jackets, waterproofing textiles, ceramics, and in treating dermatitis and poison ivy.

Incompatibilities: Violent reactions with oxidizers, air, alkali hydroxides, alkali metal compounds (such as chromates, dichromates, molybdates, salts, sulfates, and tungstates), borax, carbon tetrachloride, lead, lead oxide, phosphorus, potassium compounds. Incompatible with boron, carbon, nitrogen, halogens, lead, platinum, potassium nitrate. Powder may ignite *spontaneously* and can continue burning under water. Explodes if mixed with hydrated borax when heated. Fine powder may be stored completely immersed in water.

Permissible Exposure Limits in Air

OSHA PEL (compounds): 5 mg[Zr]/m^3 TWA.

NIOSH REL: 5 mg[Zr]/m^3 TWA; 10 mg/m^3 STEL [The REL applies to all zirconium compounds (as Zr) except Zirconium tetrachloride].

ACGIH TLV®[1] (*elemental & zirconium compounds*): 5 mg[Zr]/m^3 TWA; 10 mg/m^3 STEL; not classifiable as a human carcinogen.

NIOSH IDLH: 50 mg[Zr]/m^3.

Protective Action Criteria (PAC)

Metal

TEEL-0: 5 mg/m^3

PAC-1: 10 mg/m^3

PAC-2: 10 mg/m^3

PAC-3: 25 mg/m^3

1314-23-4 (zirconium oxide)

TEEL-0: 6.75 mg/m^3

PAC-1: 13.5 mg/m^3

PAC-2: 13.5 mg/m^3

PAC-3: 33.8 mg/m^3

DFG MAK: (*elemental and insoluble compounds*): 1 mg/m^3, inhalable fraction TWA; Peak Limitation Category I(1) danger of sensitization of the airways and skin; Pregnancy Risk Group; (*soluble compounds*): danger of sensitization of the airways and skin.

Arab Republic of Egypt: TWA 5 mg/m^3, 1993; Austria: MAK 5 mg/m^3, 1999; Denmark: TWA 5 mg[Zr]/m^3, 1999; Finland: TWA 5 mg/m^3, 1999; Hungary: STEL 5 mg/m^3, 1993; Poland: MAC (TWA) 5 mg/m^3; MAC (STEL) 10 mg/m^3, 1999; Russia: STEL 6 mg/m^3, 1993; the Netherlands: MAC-TGG 5 mg/m^3, 2003; Argentina, Bulgaria, Columbia, Jordan, South Korea, New Zealand, Singapore, Vietnam: ACGIH TLV®: STEL 10 mg/m^3. Several states have set guidelines or standards for zirconium compounds in ambient air[60] ranging from 0.8 μg/m^3 (Virginia) to 50.0−100.0 μg/m^3 (North Dakota) to 100.0 μg/m^3 (Connecticut) to 119.0 μg/m^3 (Nevada).

Determination in Air: Use NIOSH Analytical Method (IV) #7300, Elements by ICP, #8005, Elements in blood or tissue. See also OSHA Analytical Method ID-121.

Permissible Concentration in Water: No criteria set.

Routes of Entry: Inhalation of dust or fume, eye and/or skin contact.

Harmful Effects and Symptoms

Short Term Exposure: Zirconium can affect you when breathed in. The dust can irritate the lungs, causing coughing and/or shortness of breath.

Long Term Exposure: Contact can cause an allergic skin reaction to develop with small nodules (granulomas). May cause change in chest X-ray; lung granulomas. In animals: irritation of skin, mucous membrane; X-ray evidence of retention in lungs.

Points of Attack: Skin, respiratory system.

Medical Surveillance: If symptoms develop or overexposure is suspected, the following may be useful: evaluation by a qualified allergist, including careful exposure history and special testing, may help diagnose skin allergy. If breathing problems occur, lung function tests and a chest X-ray should be considered.

First Aid: If this chemical gets into the eyes, remove any contact lenses at once and irrigate immediately for at least 15 min, occasionally lifting upper and lower lids. Seek medical attention immediately. If this chemical contacts the skin, remove contaminated clothing and wash immediately with soap and water. Seek medical attention immediately. If this chemical has been inhaled, remove from exposure, begin rescue breathing (using universal precautions, including resuscitation mask) if breathing has stopped and CPR if heart action has stopped. Transfer promptly to a medical facility. When this chemical has been swallowed, get medical attention. Give large quantities of water and induce vomiting. Do not make an unconscious person vomit.

Personal Protective Methods: Skin protection is not generally necessary, but it is probably advisable especially where there is a history of zircon granuloma from deodorants. Safety equipment suppliers/manufacturers can provide recommendations on the most protective glove/clothing material for your operation. All protective clothing (suits, gloves, footwear, headgear) should be clean, available each day, and put on before work. Contact lenses should not be worn when working with this chemical. Wear dust-proof chemical goggles and face shield unless full face-piece respiratory protection is worn. Employees should wash immediately with soap when skin is wet or contaminated. Provide emergency showers and eyewash.

Respirator Selection: *25 mg/m^3*: Qm (APF = 25) (any quarter-mask respirator). *50 mg/m^3:* 95XQ (APF = 10) [any particulate respirator equipped with an N95, R95, or P95 filter (including N95, R95, and P95 filtering face-pieces) except quarter-mask respirators. The following filters may also be used: N99, R99, P99, N100, R100, P100] or PaprHie (APF = 25) (any powered, air-purifying respirator with a dust, mist, and fume filter); 100F (APF = 50) (any air-purifying, full face-piece respirator with an N100, R100, or P100 filter) or Sa (APF = 10) (any supplied-air respirator) or SCBAF (APF = 50) (any self-contained breathing apparatus with a full face-piece). *Emergency or planned entry into unknown concentrations or IDLH conditions:* SCBAF: Pd,Pp (APF = 10,000) (any self-contained breathing apparatus that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode) or SaF: Pd,Pp: ASCBA (APF = 10,000) (any supplied-air respirator that has a full face-piece and is operated in a pressure-demand or other positive-pressure mode in combination with an auxiliary, self-contained breathing apparatus operated in a pressure-demand or other positive-pressure mode). *Escape:* 100F (APF = 50) (any air-purifying, full-face-piece respirator with an N100, R100, or P100 filter) or SCBAE (any appropriate escape-type, self-contained breathing apparatus).

Storage: Color Code—Red Stripe (*powder*): Flammability Hazard: Store separately from all other flammable materials. Zirconium must be stored to avoid contact with oxidizers (such as perchlorates, peroxides, permanganates, chlorates, and nitrates) since violent reactions occur. Store in tightly closed containers in a cool, well-ventilated area away from flammable materials. Sources of ignition, such as smoking and open flames, are prohibited where zirconium is handled, used, or stored. Metal containers involving the transfer of 5 gallons or more of zirconium should be grounded and bonded. Drums must be equipped with self-closing valves, pressure vacuum bungs, and flame arresters. Use only nonsparking tools and equipment, especially when opening and closing containers of zirconium. Wherever zirconium is used, handled, manufactured, or stored, use explosion-proof electrical equipment and fittings.

Shipping: Dry zirconium powder requires a shipping label of "SPONTANEOUSLY COMBUSTIBLE." It falls in Hazard Class 4.2 and Packing Group II.

Spill Handling: Evacuate persons not wearing protective equipment from area of spill or leak until cleanup is complete. Remove all ignition sources. Collect powdered material in the most convenient and safe manner and deposit in sealed containers. Ventilate area after cleanup is complete. Keep zirconium out of a confined space, such as a sewer, because of the possibility of an explosion, unless the sewer is designed to prevent the buildup of explosive concentrations. It may be necessary to contain and dispose of this chemical as a hazardous waste. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Contact your local or federal environmental protection agency for specific recommendations. If employees are required to clean up spills, they must be properly trained and equipped. OSHA 1910.120(q) may be applicable.

Fire Extinguishing: Zirconium is a flammable powder. Fire may restart after it has been extinguished. Containers may explode in fire. Use dry chemicals appropriate for extinguishing metal fires, salt, dry sand. *Do not use water*. Poisonous gases are produced in fire. If material or contaminated runoff enters waterways, notify downstream users of potentially contaminated waters. Notify local health and fire officials and pollution control agencies. From a secure, explosion-proof location, use water spray to cool exposed containers. If cooling streams are ineffective (venting sound increases in volume and pitch, tank discolors, or shows any signs of deforming), withdraw immediately to a secure position. If employees are expected to fight fires, they must be trained and equipped in OSHA 1910.156. The only respirators recommended for firefighting are self-contained breathing apparatuses that have full face-pieces and are operated in a pressure-demand or other positive-pressure mode.

General Guide to Chemical Resistant Gloves

Material	Generally suitable for
Butyl rubber	Aldehydes Carboxylic acids Glycols and ethers Hydroxyl compounds and alcohol peroxides
Latex	Limit use (see note below) Acetone Alcohols Alkalies and caustics Ammonium fluoride Dimethyl sulfoxide (DMSO) Phenol
Natural rubber	Plating solutions Alcohols Alkalies and caustics Cellosolve Degreasing solvents Mineral acids Oils
Neoprene	Plating solutions
Nitrile rubber	Alcohols Ammonium fluoride Freons Hexane Hydrofluoric and hydrochloric acid Perchloric acid Perchloroethylene Phosphoric acid Potassium and sodium hydroxide Water-soluble materials, dilute acids and bases
Vinyl	General prevention of contamination Medical examination Nuisance materials

Important Note: Latex gloves present a risk of irritation, allergic reaction, or sensitization which, for susceptible individuals, can be significant. The latex protein can leach out of the gloves into the user's skin, or into the glove powdering, if powdered gloves are used. This can lead to allergic skin reaction or a potentially more serious reaction if latex protein-contaminated powder is released into the environment and breathed in. The use of any sort of latex gloves should be considered carefully, and they should only be used when no other glove is appropriate. You are strongly advised not to use powdered latex gloves. *Users at University of Oxford should be aware that University Safety Policy statement S3/02 prohibits the use of powdered latex gloves for any purpose and advises that, if use of latex is essential, only latex gloves with low levels of extractable latex protein may be used.*

Appendix 1: Oxidizing Materials

Notes: Best efforts have been made to ensure the information below is as accurate as possible. This list is not (and cannot be) comprehensive. Therefore, the absence of an oxidizing material from this list *does not* mean that it is not an oxidizer. The Publisher or Author cannot accept any responsibility for the use or misuse of this information. Generally, solid oxidizers include the following materials: bromates, chlorates, chlorites, chromates, dichromates, hypochlorites, iodates, nitrates, nitrites, perchlorates, permanganates, peroxides, persulfates, picrates, and chemical oxygen generators (such as potassium superoxide). Also, many fertilizers are oxidizing materials.

Oxidizing Materials by Name and CAS

Aluminum nitrate	13473-90-0
Ammonium chloride	7446-70-0
Ammonium chromate	7788-98-9
Ammonium dichromate	7789-09-5
Ammonium nitrate	6484-52-2
Ammonium nitrate−phosphate mixture	57608-40-9
Ammonium nitrate−sulfate mixture	6484-52-2
Ammonium perchlorate	7790-98-9
Ammonium permanganate	13446-10-1
Ammonium persulfate	7727-54-0
Ammonium picrate (wet)	131-74-8
Amyl nitrate	463-04-7
Barium bromate	13967-90-3
Barium chlorate	13477-00-4
Barium hypochlorite	13477-10-6
Barium nitrate	10022-31-8
Barium perchlorate trihydrate	10294-39-0
Barium permanganate	7787-36-2
Barium peroxide	1304-29-6
Benzoyl peroxide	94-36-0
Beryllium nitrate	13597-99-4
Bromine	7726-95-6
Bromine chloride	13863-41-7
Bromine pentafluoride	7789-30-2
Bromine trifluoride	7787-71-5
t-Butyl peroxybenzoate	614-45-9
Cadmium nitrate	10325-94-7
Cadmium nitrate tetrahydrate	10022-68-1
Calcium chlorate	10137-74-3
Calcium chlorite	14674-72-7
Calcium hypochlorite*	7778-54-3
Calcium nitrate	10124-37-5
Calcium perchlorate	13477-36-6
Calcium permanganate	10118-76-0
Calcium peroxide	1305-79-9
Cesium nitrate	7789-18-6
Chloric acid solution	7790-93-4
Chlorine	7787-50-5
Chlorine oxide	10049-04-4
Chlorine trifluoride	7790-91-2
Chromic acid*	7738-94-5
Chromic anhydride	11115-74-5
Chromium nitrate	7789-02-8
Chromium oxychloride	14977-61-8
Chromium trioxide, anhydrous	1333-82-0
Cobalt nitrate	10141-05-6
Cobalt(II) perchlorate, hexahydrate	13478-33-6
Cumene hydroperoxide	80-15-9
Cupric nitrate (copper nitrate)	3251-23-8
Cyclohexanone peroxide	12262-58-7
Diacetone alcohol peroxide	N/A
Dimethylhexane dihydroperoxide	3025-88-5
Di-*t*-butyl peroxide	110-05-4
Dichloroisocyanuric acid	2782-57-2
Ferric nitrate	10421-48-4
Gallium(III) nitrate	13494-90-1
Guanidine nitrate	506-93-4
Hydrogen peroxide (27.5−52% by weight)*	7722-84-1
Indium nitrate	13770-61-1
Iodine pentafluoride	7783-66-6
Iron(II) nitrate hexahydrate (1:2:6)	13520-68-8
Isopropyl nitrate	1712-64-7
Isopropyl peroxydicarbonate	105-64-6
Lanthanum nitrate	10099-59-9
Lead dioxide	1309-60-0
Lead nitrate	10099-74-8
Lead perchlorate	13637-76-8
Lithium bichromate	N/A
Lithium chromate	14307-35-8
Lithium hypochlorite	13840-33-0
Lithium nitrate	7790-69-4
Lithium peroxide	12031-80-0
Magnesium bromate	7789-36-8
Magnesium chlorate	7791-19-7
Magnesium nitrate	10377-60-3
Magnesium perchlorate	10034-81-8
Magnesium peroxide	14452-57-4
Manganese dioxide	1313-13-9
Manganese nitrate	10377-66-9
Mercuric nitrate	10045-94-0
Mercurous nitrate	10415-75-5
Nickel nitrate	14216-75-2
Nickel nitrite	17861-62-0
Nickel perchlorate	13637-71-3
Nickel(II) nitrate	13138-45-9
Nitrogen dioxide	10102-44-0
Nitrogen trifluoride	7783-54-2
Nitrosylsulfuric acid	7782-78-7

Oxalic acid	6153-56-6
Ozone	10028-15-6
Palladium dinitrate	10102-05-3
Peracetic acid	79-21-0
Perchloric acid	7601-90-3
Perchloryl fluoride	7616-94-6
Potassium bromate*	7758-01-2
Potassium chlorate	1811-04-9
Potassium chromate(VI)	7789-00-6
Potassium dichloroisocyanurate	2244-21-5
Potassium dichromate	7778-50-9
Potassium nitrate	7757-79-1
Potassium nitrite	7758-09-0
Potassium perchlorate	7778-74-7
Potassium permanganate	7722-64-7
Potassium peroxide	17014-71-0
Potassium persulfate	7727-21-1
Potassium superoxide	12030-88-5
n-Propyl nitrate	627-13-4
Pyrosulfuryl chloride	7791-27-7
Silver nitrate	7761-88-8
Sodium dichloro-*s*-triazinetrione	2893-78-9
Sodium bromate	7789-38-0
Sodium chlorate	7775-09-9
Sodium chlorite (>40%)*	7758-19-2
Sodium chromate	7775-11-3
Sodium dichlorocyanurate*	2893-78-9
Sodium dichromate	7789-12-0
Sodium hypochlorite	7681-52-9
Sodium nitrate	7631-99-4
Sodium nitrite	7632-00-0
Sodium percarbonate	15630-89-4
Sodium perchlorate	7601-89-0
Sodium permanganate*	10101-50-5
Sodium peroxide*	1313-60-6
Sodium persulfate	7775-27-1
Sodium superoxide	12034-12-7
Strontium chlorate	7791-10-8
Strontium nitrate	10042-76-9
Strontium perchlorate	13450-97-0
Strontium peroxide	1314-18-7
Tetranitromethane	509-14-8
Thorium(IV) nitrate	13823-29-5
Trichloroisocyanuric acid*	87-90-1
Uranyl nitrate	10102-06-4
Urea peroxide	124-43-6
Vanadium pentoxide	1314-62-1
Ytterbium nitrate	13768-67-7
Yttrium(III) nitrate hexahydrate	13494-98-9
Zinc ammonium nitrite	63885-01-8
Zinc bichromate	N/A
Zinc bromate	13517-27-6
Zinc chromate	13530-65-9
Zinc chlorate	10361-95-2
Zinc nitrate	7779-88-6
Zinc permanganate	23414-72-4
Zinc peroxide	1314-22-3
Zirconium nitrate	13746-89-9

Oxidizing Materials by CAS and Name

N/A	Diacetone alcohol peroxide
N/A	Lithium bichromate
N/A	Zinc bichromate
79-21-0	Peracetic acid
80-15-9	Cumene hydroperoxide
87-90-1	*Trichloroisocyanuric acid
94-36-0	Benzoyl peroxide
105-64-6	Isopropyl peroxydicarbonate
110-05-4	Di-*t*-butyl peroxide
124-43-6	Urea peroxide
131-74-8	Ammonium picrate (wet)
463-04-7	Amyl nitrate
506-93-4	Guanidine nitrate
509-14-8	Tetranitromethane
614-45-9	*t*-Butyl peroxybenzoate
627-13-4	*n*-Propyl nitrate
1304-29-6	Barium peroxide
1305-79-9	Calcium peroxide
1309-60-0	Lead dioxide
1313-13-9	Manganese dioxide
1313-60-6	*Sodium peroxide
1314-18-7	Strontium peroxide
1314-22-3	Zinc peroxide
1314-62-1	Vanadium pentoxide
1333-82-0	Chromium trioxide, anhydrous
1712-64-7	Isopropyl nitrate
1811-04-9	Potassium chlorate
2244-21-5	Potassium dichloroisocyanurate
2244-21-5	*Potassium dichloroisocyanurate
2782-57-2	Dichloroisocyanuric acid
2893-78-9	Sodium dichlorocyanurate
2893-78-9	Sodium dichloro-*s*-triazinetrione
3025-88-5	Dimethylhexane dihydroperoxide
3251-23-8	Cupric nitrate (copper nitrate)
3597-99-4	Beryllium nitrate
6153-56-6	Oxalic acid
6484-52-2	Ammonium nitrate
6484-52-2	Ammonium nitrate−sulfate mixture
7446-70-0	Ammonium chloride
7601-89-0	Sodium perchlorate
7601-90-3	Perchloric acid
7616-94-6	Perchloryl fluoride
7631-99-4	Sodium nitrate
7632-00-0	Sodium nitrite
7681-52-9	Sodium hypochlorite
7722-64-7	Potassium permanganate
7722-84-1	*Hydrogen peroxide (27.5−52% by weight)
7726-95-6	Bromine
7727-21-1	Potassium persulfate
7727-54-0	Ammonium persulfate

7738-94-5	*Chromic acid
7757-79-1	Potassium nitrate
7758-01-2	*Potassium bromate
7758-09-0	Potassium nitrite
7758-19-2	*Sodium chlorite
7761-88-8	Silver nitrate
7775-11-3	Sodium chromate
7775-09-9	Sodium chlorate
7775-27-1	Sodium persulfate
7778-50-9	Potassium dichromate
7778-54-3	*Calcium hypochlorite
7778-74-7	Potassium perchlorate
7779-88-6	Zinc nitrate
7782-78-7	Nitrosyl sulfuric acid
7783-54-2	Nitrogen trifluoride
7783-66-6	Iodine pentafluoride
7787-36-2	Barium permanganate
7787-50-5	Chlorine
7787-71-5	Bromine trifluoride
7788-98-9	Ammonium chromate
7789-00-6	Potassium chromate(VI)
7789-02-8	Chromium nitrate
7789-09-5	Ammonium dichromate
7789-12-0	Sodium dichromate
7789-18-6	Cesium nitrate
7789-30-2	Bromine pentafluoride
7789-36-8	Magnesium bromate
7789-38-0	Sodium bromate
7790-69-4	Lithium nitrate
7790-91-2	Chlorine trifluoride
7790-93-4	Chloric acid solution
7790-98-9	Ammonium perchlorate
7791-10-8	Strontium chlorate
7791-19-7	Magnesium chlorate
7791-27-7	Pyrosulfuryl chloride
10022-31-8	Barium nitrate
10022-68-1	Cadmium nitrate tetrahydrate
10028-15-6	Ozone
10034-81-8	Magnesium perchlorate
10042-76-9	Strontium nitrate
10045-94-0	Mercuric nitrate
10049-04-4	Chlorine oxide
10099-59-9	Lanthanum nitrate
10099-74-8	Lead nitrate
10101-50-5	*Sodium permanganate
10102-05-3	Palladium dinitrate
10102-06-4	Uranyl nitrate
10102-44-0	Nitrogen dioxide
10118-76-0	Calcium permanganate
10124-37-5	Calcium nitrate
10137-74-3	Calcium chlorate
10141-05-6	Cobalt nitrate
10294-39-0	Barium perchlorate trihydrate
10325-94-7	Cadmium nitrate
10361-95-2	Zinc chlorate
10377-60-3	Magnesium nitrate
10377-66-9	Manganese nitrate
10415-75-5	Mercurous nitrate
10421-48-4	Ferric nitrate
11115-74-5	Chromic anhydride
12030-88-5	Potassium superoxide
12031-80-0	Lithium peroxide
12034-12-7	Sodium superoxide
12262-58-7	Cyclohexanone peroxide
13138-45-9	Nickel(II) nitrate
13446-10-1	Ammonium permanganate
13450-97-0	Strontium perchlorate
13473-90-0	Aluminum nitrate
13477-00-4	Barium chlorate
13477-10-6	Barium hypochlorite
13477-36-6	Calcium perchlorate
13478-33-6	Cobalt(II) perchlorate, hexahydrate
13494-90-1	Gallium(III) nitrate
13494-98-9	Yttrium(III) nitrate hexahydrate
13517-27-6	Zinc bromate
13520-68-8	Iron(II) nitrate hexahydrate (1:2:6)
13530-65-9	Zinc chromate
13637-71-3	Nickel perchlorate
13637-76-8	Lead perchlorate
13746-89-9	Zirconium nitrate
13768-67-7	Ytterbium nitrate
13770-61-1	Indium nitrate
13823-29-5	Thorium(IV) nitrate
13840-33-0	Lithium hypochlorite
13863-41-7	Bromine chloride
13967-90-3	Barium bromate
14216-75-2	Nickel nitrate
14307-35-8	Lithium chromate
14452-57-4	Magnesium peroxide
14674-72-7	Calcium chlorite
14977-61-8	Chromium oxychloride
15630-89-4	Sodium percarbonate
17014-71-0	Potassium peroxide
17861-62-0	Nickel nitrite
23414-72-4	Zinc permanganate
57608-40-9	Ammonium nitrate−phosphate mixture
63885-01-8	Zinc ammonium nitrite

Note: The asterisk (*) denotes some of those materials with potential for spontaneous ignition.

Appendix 2: Carcinogens

Carcinogen Index by Name and CAS

A-α-C (2-Amino-9H-pyrido [2,3-b]indole)	26148-68-5
Acetaldehyde	75-07-0
Acetamide	60-35-5
Acetochlor	34256-82-1
2-Acetylaminofluorene	53-96-3
Acifluorfen sodium	62476-59-9
Acrylamide	79-06-1
Acrylonitrile	107-13-1
Actinomycin D	50-76-0
AF-2 [2-(2-furyl)-3-(5-nitro-2-furyl)] acrylamide	3688-53-7
Aflatoxins	various CAS
Alachlor	15972-60-8
Alcoholic beverages, when associated with alcohol abuse	no CAS
Aldrin	309-00-2
Allyl chloride (*delisted 1999*)	107-05-1
2-Aminoanthraquinone	117-79-3
p-Aminoazobenzene	60-09-3
o-Aminoazotoluene	97-56-3
4-Aminobiphenyl (4-amin *o*-diphenyl)	92-67-1
1-Amino-2,4-dibromo-anthraquinone	81-49-2
3-Amino-9-ethylcarbazole hydrochloride	6109-97-3
2-Aminofluorene	153-78-6
1-Amino-2-methylanthraquinone	82-28-0
2-Amino-5-(5-nitro-2-furyl)-1,3,4-thiadiazole	712-68-5
4-Amino-2-nitrophenol	119-34-6
Amitrole	61-82-5
Amsacrine	51264-14-3
Analgesic mixtures containing phenacetin	various CAS
Aniline	62-53-3
Aniline hydrochloride	142-04-1
o-Anisidine	90-04-0
o-Anisidine hydrochloride	134-29-2
Antimony oxide (Antimony trioxide)	1309-64-4
Anthraquinone	84-65-1
Aramite	140-57-8
Areca nut	no CAS
Aristolochic acids	various CAS
Arsenic (inorganic arsenic compounds)	7440-38-2
*List of arsenic compounds, inorganic**	
Arsanilic acid [arsonic acid, (4-aminophenyl)-]	98-50-0
Arsenic pentoxide [arsenic oxide (As_2O_5)]	1303-28-2
Arsenic sulfide [arsenic sulfide (As_2S_3)]	1303-33-9
Arsenic trioxide [arsenic oxide (As_2O_3)]	1327-53-3
Arsine	7784-42-1
Calcium arsenate [arsenic acid (H_3AsO_4), calcium salt (2:3)]	7778-44-1
Dimethylarsinic acid (arsinic acid, dimethyl-)	75-60-5
Lead arsenate [arsenic acid (H_3AsO_4), lead(2+) salt (1:1)]	7784-40-9
Methanearsonic acid, disodium salt (arsonic acid, methyl-, disodium salt)	144-21-8
Methanearsonic acid, monosodium salt (arsonic acid, methyl-, monosodium salt)	2163-80-6
Potassium arsenate [arsenic acid (H_3AsO_4), monopotassium salt]	7784-41-0
Potassium arsenite (arsenenous acid, potassium salt)	13464-35-2
Sodium arsenate, sodium salt	7631-89-2
Sodium arsenite	7784-46-5
Sodium cacodylate (arsinic acid, dimethyl-, sodium salt)	124-65-2
Asbestos	1332-21-4
Asbestos, amosite	12172-73-5
Asbestos, actinolite	77536-66-4
Asbestos, anthophylite	77536-67-5
Asbestos, anthophyllite	17068-78-9
Asbestos, chrysotile	12001-29-5
Asbestos, crocidolite	12001-28-4
Asbestos, tremolite	77536-68-6
Auramine	492-80-8
Azacitidine	320-67-2
Azaserine	115-02-6
Azathioprine	446-86-6
Azobenzene	103-33-3
Benthiavalicarb-isopropyl	177406-68-7
Benz[a]anthracene	56-55-3
Benzene	71-43-2
Benzidine [and its salts]	92-87-5
Benzidine-based dyes	various CAS
Benzo[b]fluoranthene	205-99-2
Benzo[j]fluoranthene	205-82-3
Benzo[k]fluoranthene	207-08-9
Benzofuran	271-89-6
Benzo[a]pyrene	50-32-8
Benzotrichloride	98-07-7
Benzyl chloride	100-44-7
Benzyl violet 4B	1694-09-3
Beryllium (and beryllium compounds)	7440-41-7
*List of beryllium compounds**	
Beryllium chloride	7787-47-5
Beryllium fluoride	7787-49-7
Beryllium nitrate	13597-99-4
Beryllium sulfate	13510-49-1
Betel quid with tobacco	no CAS
Betel quid without tobacco	no CAS
2,2-Bis(bromomethyl)-1,3-propanediol	3296-90-0
Bis(2-chloroethyl)ether	111-44-4

N,*N*-Bis(2-chloroethyl)-2-naphthylamine (Chlornapazine)	494-03-1
Bischloroethyl nitrosourea (BCNU) (Carmustine)	154-93-8
Bis(chloromethyl)ether	542-88-1
Bis(2-chloro-1-methylethyl)ether, technical grade	no CAS
Bitumens, extracts of steam-refined and air refined	no CAS
Bracken fern	no CAS
Bromate	15541-45-4
Bromochloroacetic acid	5589-96-8
Bromodichloromethane	75-27-4
Bromoethane	74-96-4
Bromoform	75-25-2
1,3-Butadiene	106-99-0
1,4-Butanediol dimethanesulfonate (Busulfan)	55-98-1
Butylated hydroxyanisole	25013-16-5
β-Butyrolactone	3068-88-0
Cacodylic acid	75-60-5
Cadmium (and cadmium compounds)	7440-43-9
*List of cadmium compounds**	
Cadmium acetate	543-90-8
Cadmium bromide	7789-42-6
Cadmium chloride	10108-64-2
Cadmium cyanide	542-83-6
Cadmium fluoroborate	14486-19-2
Cadmium nitrate	10325-94-7
Cadmium nitrate tetrahydrate	10022-68-1
Cadmium oxide	1306-19-0
Cadmium oxide fume	1306-19-0
Cadmium stearate	2223-93-0
Cadmium succinate	141-00-4
Cadmium sulfate	10124-36-4
Caffeic acid	331-39-5
Captafol	2425-06-1
Captan	133-06-2
Carbaryl	63-25-2
Carbazole	86-74-8
Carbon black (airborne, unbound particles of respirable size)	1333-86-4
Carbon tetrachloride	56-23-5
Carbon-black extracts	no CAS
N-Carboxymethyl-*N*-nitrosourea	60391-92-6
Catechol	120-80-9
Ceramic fibers (airborne particles of respirable size)	no CAS
Certain combined chemotherapy for lymphomas	no CAS
Chlorambucil	305-03-3
Chloramphenicol	56-75-7
Chlordane	57-74-9
Chlordecone (Kepone)	143-50-0
Chlordimeform	6164-98-3
Chlorendic acid	115-28-6
Chlorinated paraffins (Average Chain length, C12; approximately 60% chlorine by weight)	108171-26-2
p-Chloroaniline	106-47-8
p-Chloroaniline hydrochloride	20265-96-7
Chlorodibromomethane (*delisted 1999*)	124-48-1
Chloroethane (Ethyl chloride)	75-00-3
1-(2-Chloroethyl)-3-cyclohexylnitrosourea (CCNU) (Lomustine)	13010-47-4
1-(2-Chloroethyl)-3-(4-methylcyclohexyl)-1-nitrosourea (Methyl-CCNU)	13909-09-6
Chloroform	67-66-3
Chloromethyl methyl ether (technical grade)	107-30-2
3-Chloro-2-methylpropene	563-47-3
1-Chloro-4-nitrobenzene	100-00-5
4-Chloro-*o*-phenylenediamine	95-83-0
Chloroprene	126-99-8
Chlorothalonil	1897-45-6
p-Chloro-*o*-toluidine	95-69-2
p-Chloro-*o*-toluidine, strong acid salts of	various CAS
5-Chloro-*o*-toluidine and its strong acid salts	various CAS
Chlorotrianisene	569-57-3
Chlorozotocin	54749-90-5
Chromium (hexavalent compounds)	various CAS
Chrysene	218-01-9
C.I. Acid Red 114	6459-94-5
C.I. Basic Red 9 monohydrochloride	569-61-9
C.I. Direct Blue 15	2429-74-5
C.I. Direct Blue 218	28407-37-6
C.I. Solvent Yellow 14	842-07-9
Ciclosporin (Cyclosporin A; Cyclosporine)	59865-13-3; 79217-60-0
Cidofovir	113852-37-2
Cinnamyl anthranilate	87-29-6
Cisplatin	15663-27-1
Citrus Red No. 2	6358-53-8
Clofibrate	637-07-0
Cobalt metal powder	7440-48-4
Cobalt[II] oxide	1307-96-6
Cobalt sulfate	10124-43-3
Cobalt sulfate heptahydrate	10026-24-1
Coke oven emissions	no CAS
Conjugated estrogens	no CAS
Creosotes	various CAS
p-Cresidine	120-71-8
Cumene	98-82-8
Cupferron	135-20-6
Cycasin	14901-08-7
Cyclophosphamide (anhydrous)	50-18-0
Cyclophosphamide (hydrated)	6055-19-2
Cytembena	21739-91-3
D&C Orange No. 17	3468-63-1
D&C Red No. 8	2092-56-0
D&C Red No. 9	5160-02-1
D&C Red No. 19	81-88-9
Dacarbazine	4342-03-4
Daminozide	1596-84-5

Dantron (Chrysazin; 1,8-Dihydroxyanthraquinone)	117-10-2
Daunomycin	20830-81-3
DDD (Dichlorodiphenyl-dichloroethane)	72-54-8
DDE (Dichlorodiphenyldichloroethylene)	72-55-9
DDT (Dichlorodiphenyltrichloroethane)	50-29-3
DDVP (Dichlorvos)	62-73-7
N,*N*′-Diacetylbenzidine	613-35-4
2,4-Diaminoanisole	615-05-4
2,4-Diaminoanisole sulfate	39156-41-7
4,4′-Diaminodiphenyl ether(4,4′-Oxydianiline)	101-80-4
2,4-Diaminotoluene	95-80-7
Diaminotoluene (mixed)	no CAS
Diazoaminobenzene	136-35-6
Dibenz[a,h]acridine	226-36-8
Dibenz[a,j]acridine	224-42-0
Dibenz[a,h]anthracene	53-70-3
7H-Dibenzo[c,g]carbazole	194-59-2
Dibenzo[a,e]pyrene	192-65-4
Dibenzo[a,h]pyrene	189-64-0
Dibenzo[a,i]pyrene	189-55-9
Dibenzo[a,l]pyrene	191-30-0
Dibromoacetic acid	631-64-1
1,2-Dibromo-3-chloropropane (DBCP) (male)	96-12-8
2,3-Dibromo-1-propanol	96-13-9
Dichloroacetic acid	79-43-6
p-Dichlorobenzene	106-46-7
3,3′-Dichlorobenzidine	91-94-1
3,3′-Dichlorobenzidine dihydrochloride	612-83-9
1,4-Dichloro-2-butene	764-41-0
3,3′-Dichloro-4,4′-diaminodiphenyl ether	28434-86-8
1,1-Dichloroethane	75-34-3
Dichloromethane (Methylene chloride)	75-09-2
1,2-Dichloropropane	78-87-5
1,3-Dichloropropene	542-75-6
1,3-Dichloro-2-propanol (1,3-DCP)	96-23-1
Diclofop-methyl	51338-27-3
Dieldrin	60-57-1
Dienestrol	84-17-3
Diepoxybutane	1464-53-5
Diesel engine exhaust	no CAS
Di(2-ethylhexyl)phthalate (DEHP)	117-81-7
1,2-Diethylhydrazine	1615-80-1
Diethylstilbestrol (DES)	56-53-1
Diethyl sulfate	64-67-5
Diglycidyl resorcinol ether (DGRE)	101-90-6
Dihydrosafrole	94-58-6
Diisopropyl sulfate	2973-10-6
3,3′-Dimethoxybenzidine (*o*-Dianisidine)	119-90-4
3,3′-Dimethoxybenzidine dihydrochloride (*o*-Dianisidine dihydrochloride)	20325-40-0
3,3′-Dimethoxybenzidine-based dyes metabolized to 3,3′-dimethoxybenzidine	various CAS
3,3′-Dimethylbenzidine-based dyes metabolized to 3,3′-dimethylbenzidine	various CAS
4-Dimethylaminoazobenzene	60-11-7
trans-2-[(Dimethylamino)methyl-imino]-5-[2-(5-nitr*o*-2-furyl)vinyl]-1,3,4-oxadiazole	55738-54-0
7,12-Dimethylbenz(a)anthracene	57-97-6

60568-05-0	Furmecyclox
62450-06-0	Trp-*p*-1 (Tryptophan-*p*-1)
62450-07-1	Trp-*p*-2 (Tryptophan-*p*-2)
62476-59-9	Acifluorfen sodium
64091-91-4	4-(*N*-Nitrosomethylamino)-1-(3-pyridyl)1-butanone
67730-10-3	Glu-*p*-2(2-Aminodipyrido[1,2-a:3′,2′-d] imidazole)
67730-11-4	Glu-*p*-1(2-Amino-6-methyldipyrido [1,2- a:3′,2′-d]imidazole)
68006-83-7	Me-A-α-C (2-Amino-3-methyl-9H-pyrido[2,3-b]indole)
68308-34-9	Shale-oils
72490-01-8	Fenoxycarb
76180-96-6	IQ (2-Amino-3-methylimidazo [4,5-f] quinoline)
77094-11-2	MeIQ(2-Amino-3,4-dimethyl-imidazo[4,5-f]quinoline)
77439-76-0	MX (3-chloro-4-(dichloromethyl) 5-hydroxy-2(5H)-furanone)
77500-04-0	MeIQx (2-Amino-3,8-dimethyl-imidazo[4,5-f]quinoxaline)
77501-63-4	Lactofen
79748-81-5	Fusarin C
82410-32-0	Ganciclovir
105650-23-5	PhiP(2-Amino-1-methyl-6-phenylimidazol[4,5-b]pyridine)
105735-71-5	3,7-Dinitrofluoranthene
108171-26-2	Chlorinated paraffins (Average Chain length, C12; approximately 60% chlorine by weight)
110235-47-7	Mepanipyrim
111406-87-2	Zileuton
113852-37-2	Cidofovir
116355-83-0	Fumonisin B1
140923-17-7/140923-25-7	Iprovalicarb
141112-29-0	Isoxaflutole
148477-71-8	Spirodiclofen
177406-68-7	Benthiavalicarb-isopropyl
no CAS	Silica, crystalline (airborne particles of respirable size)
no CAS	Soots, tars, and mineral oils (untreated and mildly treated oils and used engine oils)
no CAS	Strong inorganic acid mists containing sulfuric acid
no CAS	Phenylhydrazine and its salts
no CAS	Toxins derived from *Fusarium moniliforme* (*Fusarium verticillioides*)
no CAS	Nickel refinery dust from thepyrometallurgical process
no CAS	Oral contraceptives, combined
no CAS	Diesel engine exhaust

no CAS........Wood dust
no CAS........Ceramic fibers (airborne particles of respirable size)
no CAS........Oral contraceptives, sequential
no CAS........Residual (heavy) fuel oils
no CAS........Radionuclides
no CAS........Certain combined chemotherapy for lymphomas
no CAS........Talc containing asbestiform fibers
no CAS........Aflatoxins
no CAS........Diaminotoluene (mixed)
no CAS........Alcoholic beverages, when associated with alcohol abuse
no CAS........Bracken fern
no CAS........Bitumens, extracts of steam-refined and air refined
no CAS........Bis(2-chloro-1-methylethyl) ether, technical grade
no CAS........Tobacco smoke
no CAS........2,4-Hexadienal (89% *trans*, *trans* isomer; 11% *cis*, *trans* isomer)
no CAS........Tobacco, oral use of smokeless products
no CAS........Betel quid without tobacco
no CAS........5-Chloro-*o*-toluidine and its strong acid salts
no CAS........Herbal remedies containing plant species of the genus *Aristolochia*
no CAS........Creosotes
no CAS........Polychlorinated dibenzofurans
no CAS........Betel quid with tobacco
no CAS........Methylmercury compounds
no CAS........Conjugated estrogens
no CAS........Chromium (hexavalent compounds)
no CAS........Glasswool fibers (airborne particlesof respirable size)
no CAS........Gasoline engine exhaust (condensates/extracts)
no CAS........Coke oven emissions
no CAS........Quinoline and its strong acid salts
no CAS........Areca nut
no CAS........Aristolochic acids
no CAS........Carbon-black extracts
no CAS........Benzidine-based dyes
no CAS........3,3′-Dimethoxybenzidine-based dyesmetabolized to 3,3′-dimethylbenzidine
no CAS........3,3′;-Dimethoxybenzidine-based dyesmetabolized to 3,3′-dimethoxybenzidine
various CAS........Nickel compounds
various CAS........*p*-Chloro-*o*-toluidine, strong acid salts of
various CAS........Analgesic mixtures containing phenacetin
various CAS........Polybrominated biphenyls (PBBs)
various CAS........Polychlorinated dibenzo-*p*-dioxins
various CAS........Polychlorinated biphenyls (containing 60 or more percent Cl by molecular weight)
various CAS........Polychlorinated biphenyls
Various CAS........Estrogens, steroidal

Appendix 3: Glossary

A

absorbent material Commercially packaged clay, kitty litter, or other material used to soak up liquid hazardous materials.

absorption Penetration of a substance across a biologic barrier (such as the skin) and into either the lymphatic system or bloodstream.

acaricide A chemical substance used to kill ticks and mites.

accident An unplanned energy transfer causing property damage and/or human injury. See also “incident.”

accumulative effect The effect of a chemical substance on a biologic system when the substance is being absorbed at a rate that exceeds the body’s ability to eliminate it from the system. Excessive accumulation of the substance in the system can lead to toxicity.

acid Any compound containing hydrogen replaceable by metals, and having a pH of zero to 6. Strong acids in the pH range of zero to 2 are corrosive and will cause chemical burns to the skin, eyes, and mucous membranes. Acids turn litmus red. See also “pH” and “strong acids.”

acid gas A gas that forms an acid when dissolved in water.

acidosis A pathologic condition resulting from accumulation of acid in, or loss of base from, the body.

acrid Having a biting taste; sharp; pungent.

active ingredient The component that actually performs the primary function of a product. Products generally contain both active and inert ingredients, and both may be harmful. For example, insecticides in spray cans contain both chemicals having pesticidal action (active) and propellent gas (inert). Active ingredients are listed on product labels as percentage by weight or as pounds per gallon of concentrate.

acute The clinical term for a disease having a short and relatively severe course, measured in seconds, minutes, hours, or days, following exposure to a health hazard. Also, in animal testing, pertains to administration of an agent in a single dose.

acute effect Refers to an adverse health effect that usually occurs rapidly, sometimes immediately, as a result of a single, short significant exposure to a health hazard, without implying a degree of severity. Acute effects may include irritation, corrosivity, narcosis, and death. See also “chronic.”

acute exposure Refers to a single exposure to a toxic substance that results in death or severe biological harm. Acute exposures are characterized as lasting no longer than 1 day.

acidosis A pathologic condition resulting from accumulation of acid in, or loss of base from, the body.

adrenal gland A hormone-secreting organ located above each kidney.

AEGL Acronym for Acute Emergency Guideline Levels. AEGLs represent threshold airborne exposure limits for the general public and are applicable to emergency exposures ranging from 10 min to 8 h. Three levels—AEGL-1, AEGL-2, AEGL-3—are developed for each of five exposure periods (10 min, 30 min, 1 h, 4 h, and 8 h) and are distinguished by varying degrees of severity of toxic effects. DOE guidance is to use the 1-h AEGL values, which appear in this database.[DOE] AEGL values are developed and published by the US Environmental Protection Agency (EPA). See also “How to Use this Book” in the front matter of this book.

aerosol A dispersed suspension of fine particles suspended in air (dispersed in a gas), the particle size often being in the 0.01−100 μm range. Natural aerosols include smoke (solid particles) and fog (liquid particles). Man-made aerosols are manufactured by filling a valved container, usually a can, with a suspension (e.g., paint, insecticides, cosmetics) in a gas under pressure.

aliphatic Pertaining to an open-chain hydrocarbon compound. Substances such as methane and ethane are typical aliphatic hydrocarbons.

alkali Any ACID destroying compound having a pH of 8−14. Strong alkalis (or bases) in the pH range of 12−14 are considered corrosive and will cause chemical burns to the skin, eyes, and mucous membranes. Alkalis turn litmus blue. Widely used industrial alkali substances include sodium hydroxide, sodium carbonate, potassium hydroxide, and potassium carbonate. Common household products include DRANO™ and lye. See also “acid,” “base,” and “pH.”

alkaloid An organic nitrogen base, of vegetable origin, usually toxic.

allergen A substance that causes the body to produce an antibody and which results in an allergy in hypersensitive people.

allergy A hypersensitive reaction of body tissues to specific substances. In similar concentrations and circumstances these same substances do not affect other persons. Allergic reactions in the workplace tend to affect the skin (see dermatitis) and lungs (see asthma).

ambient air concentration The concentration of a material in environmental air outside of buildings, that is, air to which the general public is exposed.

amine An organic compound that may be derived from ammonia (NH_3) by the replacement of one or more hydrogen atoms (H) by hydrocarbon groups or other chemical moieties; replacing one, two, or three hydrogen atoms gives primary, secondary, or tertiary amines, respectively; if a fourth group is added to a tertiary amine (R_3N), the compound formed is called a quaternary amine (R_4N+) and the nitrogen carries a positive charge.

anaerobic conditions Refers to the absence of oxygen.

amnesia Total or partial memory loss.

analgesia A pain-relieving agent that causes insensibility to pain without loss of consciousness.

analogue A compound that resembles another in structure; may be an isomer, but not necessarily.

analytical grade The highest available purity of a chemical.

anemia A deficiency of the blood caused by reduced red blood cell count or a reduction in the amount of hemoglobin per unit volume of blood.

anesthesia Total or partial loss of sensation with or without loss of consciousness.

angina pectoris Pain in chest caused by inadequate supply of blood to the heart.

anhydrous Containing no water.

anorexia Loss or reduction of appetite for food.

anosmia Total or partial loss of the sense of smell.

anoxia A reduction in the quantity of oxygen supplied by blood to cells or tissues.

anticonvulsant A substance that lessens the severity of convulsions.

antidote A remedy to relieve, prevent, or counteract the effects of a poison; that which counteracts anything noxious.

antiepileptic A substance that lessens the severity of epileptic seizures.

anuria Absence of urine in the bladder caused by the failure of the kidneys to produce urine. This is a possible symptom of chlorate or inorganic mercury poisoning.

apathy Reduced emotions with lack of interest in outside stimuli.

apnea Temporary cessation of breathing. A possible symptom of poisoning.

aquatic toxicology A branch of toxicology that deals with water pollution and its ecological effects.

aqueous Watery or water like.

aromatic compound Pertaining to a molecular ring structure hydrocarbon compound, characterized by the presence of the benzene nucleus.

aromatic hydrocarbon An organic chemical compound formed primarily from carbon (C) and hydrogen (H) atoms with a structure based on benzene rings *and* resembling benzene in chemical behavior; substituents on the rings(s) may contain atoms other than C or H.

arrhythmia Disturbed heartbeat.

arsenical A compound containing arsenic.

arylamine An organic compound formed from an aromatic hydrocarbon that has at least one amine group joined to it.

ataxia Unsteady walk or shaky movements due to neurological problems. May be a symptom of poisoning.

asphyxia Difficulty in breathing or respiratory arrest; suffocation.

asphyxiant Refers to a substance, usually a vapor or gas, that can cause suffocation, unconsciousness, or death by preventing the blood from carrying oxygen. Most simple asphyxiants (which have no inherent toxicity) are harmful to the body only when they become so concentrated that oxygen in the air is reduced (normally about 21%) to dangerous levels (18% or lower).

asthenia Reduced physical and psychological strength.

asthma Respiratory problem characterized by attacks of wheezing, shortness of breath, and/or coughing and resulting in difficult breathing due to contraction of air passages.

ataxia Loss or failure of muscular coordination, voluntary movement, or muscle control.

atrophy A loss of weight, volume, and activity of an organ, tissue, or cell; shrinkage.

autoignition temperature The minimum temperature at which a substance will ignite spontaneously, or cause self-sustained combustion in the absence of any heated element, spark, or flame. The closer the autoignition temperature is to room temperature, the greater the risk of fire.

awareness level (trained) First responders at the awareness level are those persons who, in the course of their normal duties, may be the first on the scene of an emergency involving hazardous materials. First responders at the awareness level are expected to recognize hazardous materials presence, protect themselves, call for trained personnel, and secure the area (ANSI/NFPA 472).

azide A compound that contains the monovalent $-N_3$ group.

azo- A prefix denoting the presence in a molecule of the group $-N = N-$. See also “diazo-.”

B

bactericidal Destructive to bacteria. An agent (e.g., heat, light, or osmotic pressure) or a chemical, such as a pesticide, that kills bacteria or inhibits their growth is called a bactericide.

barbiturate A drug used as a sedative or hypnotic.

base A substance that reacts with acids to form salts and water. All bases create solutions having a pH of more than 7.0, the neutral point, and may be corrosive to skin and other human tissue. The terms alkali and caustic are closely related in meaning. See also “acid,” “alkali,” and “pH.”

BEI Biological Exposure Index. The maximum recommended value of a substance in blood, urine, or exhaled air, recommended by the ACGIH. See “Threshold Limit Values and Biological Exposure Indices,” published by the ACGIH, for an explanation.

benign Not harmful.

bile A yellow-green, bitter fluid secreted by the liver. Also called gall.

bioaccumulation The process by which a material in an organism’s environment progressively concentrates within the organism.

bioassay The determination of the potency or concentration of a compound by its effect upon animals, isolated tissues, or microorganisms, as compared with a chemical or physical assay.

biodegradation Biotransformation; the conversion within an organism of molecules from one form to another, a change often associated with change in pharmacologic activity.

bld Blood effects. A toxicology term describing the effect on all blood elements including oxygen carrying or releasing capacity, pH, protein, and electrolytes.

blepharospasm Abnormal contraction of eyelid muscles.

BOD Biological oxygen demand. A test that measures the dissolved oxygen consumed by microbial life while assimilating and oxidizing the organic matter present in organic waste discharges. This test permits calculation of the effect of the discharges on the oxygen resources of the receiving water.

boiling point The temperature at which a product changes from a liquid to a vapor at normal atmospheric pressure (760 mmHg). Mixtures may not have a specific boiling point. As a general rule, material safety data sheets (MSDS) carry the initial boiling point or a boiling range for a mixture.

bowel The intestine, or the part of the digestive tract extending from the stomach to the anus.

bradycardia A decrease in the heartbeat rate to less than 60 beats per minute.

breakthrough time The time from initial chemical contact to detection.

breathing zone sample An air sample collected from the area around the nose of a worker to assess exposure to airborne contaminants.

bronchoconstriction Contraction with narrowing of bronchia.

bronchospasm Spasmodic contraction of the muscles surrounding the bronchia.

bulk density Mass of powdered or granulated solid material per unit of volume.

by-product Any material, other than the principal product, generated as a consequence of an industrial process.

C

C Symbol for Celsius or Centigrade, a unit of temperature in which the interval between the freezing point of water and the boiling point is divided into 100 units, or degrees, with 0°C representing the freezing point and 100°C the boiling point.

cancer A general term used to indicate any of various types of malignant neoplasms.

canister A personal air cleaning device usually worn by the user. The canister contains sorbents, catalysts, or other filter materials designed to remove gases, vapors, and liquid and solid particles from air drawn through it.

carcinogen Any substance causing the promotion or initiation of malignant or benign neoplasia (cancer) in humans or animals. A material is considered carcinogenic if (a) it is found to be a carcinogen or potential carcinogen by the International Agency for Research on Cancer (IARC); or, (b) if it is listed in the latest edition of the "Annual Report on Carcinogens," published by the National Toxicology Program (NTP); or, (c) it is regulated by OSHA as a carcinogen.

carcinogenesis The process by which normal tissue becomes cancerous.

carcinogenicity The power, ability, or tendency to produce cancerous tissue from normal tissue.

carcinoma A malignant neoplasm of the epithelium.

carcinoma in situ Noninvasive cancer.

carcinoma A malignant tumor; a type of cancer.

cardio A medical prefix that refers to the heart.

cardiovascular A medical term that refers to the heart and blood vessel system.

catalyst A substance that affects the rate of a chemical reaction, but that is neither changed nor consumed by the reaction.

cataract A disease of the eye in which the lens becomes gray-white and loses its clearness.

cathartic Substance that aids bowel movement and stimulates evacuation of the intestine.

cation An ion that carries a positive charge, e.g., sodium (N^{+}), (calcium Ca^{2+}), and ammonium ($NH_4{}^{+}$); the corresponding hydroxide is formed when combined with hydroxyl (OH^{-}) ions.

caustic Any strongly alkaline substance that has a corrosive effect on living tissue. See also "alkali."

ceiling limit The concentration of a substance that should not be exceeded, even for an instant. Also called ceiling concentration.

central nervous system (CNS) Refers to the brain and spinal cord, the main network of coordination and control for the entire body. Chemicals acting on the brain may cause CNS depression with symptoms of dizziness, headache, and drowsiness; higher exposure may cause unconsciousness, coma, and death.

characteristic hazardous waste An RCRA regulated waste classified as "hazardous" because of its ignitability, corrosivity, reactivity, or toxicity as determined by the Toxicity Characteristic Leachate Procedure (TCLP). It has an EPA Waste Code ranging from "D001" to "D043."

chelation A complex formation involving a metal ion and two or more polar groupings of a single molecule; chelation can be used to remove an ion from participation in biological reactions, as in the chelation of Ca^{2+} in blood by EDTA.

chemical Any element, chemical compound, or mixture of elements and/or compounds.

chemical burn Similar to a thermal burn from heat or fire, but caused by contact with a chemical substance.

chemical family A group of single elements or groups of compounds having a common chemical structure and name. Also known as chemical class. As used on a Material Safety Data Sheet (MSDS), more than one chemical family may be used if applicable.

chemical formula The chemical makeup of a substance using accepted written symbols. Although several kinds of formulas are used to indicate chemical constitution and physical structure, the *molecular formula* showing the actual kinds and numbers of atoms that comprise a molecule of a chemical substance is most commonly used in Material Safety Data Sheet (MSDS).

chemical hygiene plan A written action plan required by OSHA's regulation 29CFR1910, Occupational Exposures to Hazardous Chemicals in Laboratories.

chemical intermediate A chemical formed or used during the process of producing another chemical.

chemically active metals Usually refers (but not restricted) to chemicals such as sodium, potassium, beryllium, calcium, powdered aluminum, zinc, and magnesium. These metals can cause violent reactions with certain other substances and materials.

chemical name The scientific designation of a chemical as outlined by the Chemical Abstract Service (CAS) rules of nomenclature and the nomenclature system developed by the International Union of Pure and Applied Chemistry. Also defined by the OSHA Hazard Communication Standard (HCS) as a name which will clearly identify the chemical for the purpose of conducting a hazard evaluation. By this definition, more than one valid name for many chemicals is permitted. However, when chemicals with more than one valid name appears on the OSHA (29CFR1910 Table Z-1) or CERCLA (40CFR302.4) lists, this name is generally used as the chemical name on material safety data sheets (MSDS). If a chemical does not appear on these lists, then the most common chemical name should be used. Trade names that adequately identify a chemical may be used.

chemical manufacturer Defined in the OSHA Hazard Communication Standard (HCS) as an employer with a workplace where chemical(s) are produced for use or distribution.

chemical reaction Any chemical change, regardless of rate, or whether it occurs naturally or induced by human. There are many types of chemical reactions including decomposition, explosion, combustion, condensation, polymerization, neutralization.

chemical resistance The ability of a material to resist chemical reaction.

chemosterilant A chemical compound that causes an organism to become sterile after exposure to it.

chlorofluorocarbons (CFCs) A group of chemicals that depletes the earth's protective ozone layer. Chemical substance often used as refrigerants, solvents, and propellants as propellants in spray cans. CFCs are not destroyed in the lower atmosphere; they drift into the upper atmosphere where their chlorine components are released and destroy the ozone layer.

chloracne A severe acne-like affliction of the skin resulting from excessive exposure to certain chlorinated or halogenated chemical compounds, such as carbon tetrachloride, chloroform, trichloroethylene, biphenyls, dioxins, naphthalenes, and DDT.

chronic Refers to a change to an organism over a long period of time, measured in weeks, months, or years following repeated exposure to a health hazard.

chronic effect of overexposure Refers to an adverse health effect that develops slowly over a long period of time or from prolonged exposure to a health hazard without implying a degree of severity.

chronic toxicity Refers to permanent and irreversible health effects resulting from prolonged exposure to a toxic substance.

circulatory system The system consisting of the blood, blood vessels, lymph vessels, and heart; involved in circulating blood and lymph throughout the body.

cirrhosis Chronic progressive illness affecting the structure and function of the liver. Replacement of normal liver tissue with bands of fibrous tissue surrounding nodules of regenerating liver tissue.

closed cup Test for the flash point of a substance.

coagulant An agent that causes, stimulates, or accelerates coagulation, especially with reference to blood.

co-carcinogen Any substance, not itself carcinogenic, capable of enhancing the carcinogenic effect of another substance.

Code of Federal Regulations (CFR) A publication of the regulations promulgated under United States federal law. Changes to CFR are published in the "Federal Register" (FR). The CFR is divided into titles as follows:

Title 29: OSHA regulations, including the Hazard Communication Standard (HCS).

Title 40: EPA regulations, including TSCA.

Title 49: DOT regulations.

colic A sharp, crampy, and possibly painful disorder of the abdomen resulting from blockage, twisting, or muscle spasm.

collapsus Rapid decrease in strength or collapse of an organ.

coma A state of deep unconsciousness from which a victim cannot be wakened by external stimulants.

combustible liquid A material having a flash point at or above 37.8°C/100°F, but below 93.3°C/200°F, except that this term does not include any liquid mixture that has one or more components with a flash point above 93.3°C/200°F, which make up 99% or more of the total volume of the mixture as determined by tests listed in 49CFR173.115(d). Exceptions to this are found in 49CFR173.115(b).

commercial grade Less than the purest available form of a chemical; the purity normally produced for and adequate for commercial uses.

common name Any designation or identification such as a code name, code number, trade name, or generic name used to identify a chemical other than by its chemical name (OSHA).

component An ingredient or constituent part.

compound A substance consisting of two or more elements that have united chemically.

compressed gas Any material or mixture having in the container a pressure exceeding 40 psi at 70°F/21.1°C, or a pressure exceeding 104 psi at 130°F/54.4°C, regardless of the pressure at 70°F/21.1°C; or any liquid flammable material having a vapor pressure exceeding 40 psi absolute pressure at 100°F/37.8°C as determined by the American National Standard Method of Tests for Vapor Pressure of Petroleum Products (Reid Method) Z11.44-1973 (ASTM—American Society for Testing Materials D 323-72).

congenital A condition that begins to develop in the uterus and is existing at birth.

congestion Abnormal accumulation of blood in the vessels of tissue, an organ or other part of the body.

conjugated Bound together; in organic chemistry, conjugated refers to a molecular structure or substructure containing alternating double and single bonds between pairs of adjacent atoms.

conjunctivitis Irritation and inflammation of the conjunctiva, a part of the inner lining of the eyelids.

container Defined by OSHA as any bag, barrel, bottle, box, can, cylinder, drum, reaction vessel, storage tank, or the like that contains a hazardous chemical. Pipes and piping systems and engines, fuel tanks or other operating systems in a vehicle, are not considered containers (29CFR).

contaminant An impurity; in the environment, a chemical that is not ordinarily present and that may have deleterious effects.

contraindication Any condition that renders some particular treatment of disease improper or undesirable.

convulsions Violent, involuntary spasms or muscle contractions.

copolymer A chemical (polymer) made up of repetitive subunits (monomers) that are not all alike.

corrosive material Any liquid or solid with pH ranges of 2−6 or 12−14, and that cause visible destruction or irreversible alteration of living tissue, or a liquid that has a severe corrosion rate on steel. To determine whether a material is destructive or to cause irreversible alteration of human skin, refer to the method described in Appendix A of 49CFR173. A liquid is considered to have a severe corrosion rate if its corrosion rate exceeds 0.250 inch per year (IPY) on steel [Society of Automotive Engineers (SAE) 1020] at a test temperature of 130°F/54.4°C. Also see test described in NACE Standard TM-01-69.

cryogenic liquid Defined by DOT as a refrigerated liquefied gas having a boiling point colder than −130°F/−90°C at one atmosphere, absolute.

cutaneous Pertaining to the skin. See also "dermal."

cyanosis A bluish discoloration of the skin, lips, and mucous membrane, resulting from lack of oxygen in the blood hemoglobin, or excessive concentration of reduced hemoglobin in the blood.

cytotoxic Having a poisonous effect on cells.

D

decomposition Breakdown of a material or substance into parts, elements, or simpler compounds that may be caused by heat, chemical reaction, electrolysis, decay, biodegradation, or other process.

decontamination The removal of hazardous substances from employees and their equipment to the extent necessary to preclude the occurrence of foreseeable adverse health effects.

degradation The destructive effect a chemical may have on chemical-protective clothing, reducing its strength and flexibility, and permitting a direct route to skin contact.

defoliant A chemical spray or dust that causes leaves to drop off plants prematurely.

dermal penetration The act of entering the body by penetrating the layers of the skin.

dermatitis An inflammation of the skin.

delayed hazard The potential to cause an adverse effect which may not appear until after a long period of time. Carcinogenicity, teratogenicity, and certain target organ/system effects are examples of delayed hazards (ANSI).

deliquescent Substance which absorbs moisture from the air to the point of becoming liquid.

delirium A mental state of great excitement or confusion marked by speech disorders, anxiety, and often hallucinations.

density The mass (weight) per unit volume of a substance. For example, lead has much greater density than aluminum.

dermal Pertaining to the skin. See also "cutaneous."

dermatitis Inflammation of the skin from any cause.

dermatosis Generic name for all skin disorders.

desquamation Abnormal elimination of surficial layers of skin in small flakes.

diabetes A disease in which the body's ability to use sugar is impaired and which usually involves the abnormal appearance of sugar in the urine; characterized by excessive urination.

diamine An organic compound containing two amine groups, e.g., ethylenediamine, $H_2NCH_2CH_2NH_2$.

diarrhea Abnormally frequent discharge of loose, watery feces from the large intestine (colon). May be a symptom of poisoning.

diazo- A prefix denoting a compound containing the $-N'N-$ or $-N,N^+$ group. See also "azo-."

dimer A compound or unit produced by the combination of two like molecules.

diuretic That which increases volume of urine.

DL- Used separately, prefixes of D- for dextrorotary (rotated to the right) and L- for levorotary (rotated to the left) before the same chemical name refer to designations for optically active isomers that are chemically identical but that rotate plane polarized light in opposite directions; the isomers are mirror images of each other; when used together, DL designates a racemic mixture of the two isomers, whose optical activities cancel each other.

dose The amount of a chemical substance or drug to which a person has been exposed or absorbed into the body.

dysplasia Malformation; abnormal development.

dyspnea Difficulty or labored breathing. Shortness of breath. A possible symptom of poisoning.

dysuria Painful or difficulty in urinating.

E

easily oxidized materials A broad range of materials that includes combustible materials, organic materials, paper, wood, sulfur, aluminum, acetic acid, alcohols, fuels, oils, plastics, hydrazine, acetic anhydride, sulfuric acid, and many other chemicals. Easily oxidized materials can cause violent reactions with other substances and materials. See also "oxidizer," "strong oxidizers."

eczema Not a distinct disease but a general medical description for swelling of the skin, or rash of unknown cause. An inflammation of the outer layer of skin, characterized by redness, itching, crusting, and scaling.

edema Swelling caused by infiltration of fluid into the tissues or intercellular spaces.

effluent Wastewater discharged from a treatment plant, sewer, or industrial outfall into the environment, usually to surface waters.

effluent guidelines (listed as a toxic pollutant) Under the Clean Water Act, pollutants that are subject to technology-based standards (application of best available technology) developed for selected groups of industries.

electrolyte a substance, such as sodium chloride (NaCl), that dissociates into ions when fused (melted) or in solution, thereby becoming capable of conducting an electric current.

EIS Environmental Impact Statement. The results of a study to determine the probable effects of a proposed activity on the surrounding environment.

element The simplest form of a pure substance that cannot be broken down into simpler substances by chemical means.

embryotoxic Toxic effect on the embryo.

emphysema A condition of the lungs characterized by dilation or destruction of the pulmonary areola. An illness characterized by plugged passageways and a difficulty in exhaling.

employer Defined by OSHA as a person (including contractor or subcontractor) engaged in business, where chemicals are either used, distributed, or produced for use or distribution.

encephalopathy Generic name given to illnesses affecting the brain in general.

environment Includes water, air, and land and their interrelationship which exists among and between water, air, and land and all living things (EPA).

EP Extraction Procedure toxicity characteristics. Toxicity test performed on RCRA wastes.

environmental fate The distribution and transformation of a chemical from its first release until its ultimate removal from or recycling through the environment.

enzyme A protein produced in organisms capable of accelerating a particular biochemical reaction; a biological catalyst.

epidemiology Science concerned with the study of disease in a general population. Determination of the incidence (rate of occurrence) and distribution of a particular disease (as by age, sex, or occupation), which may provide information about the cause of the disease.

ergonomics The activity dealing with interactions between workers and their total working environment and their stresses relating to the elements of the environment, their tools and equipment.

ERPG Acronym for Emergency Response Planning Guidelines. Exposure limit values produced by the American Industrial Hygiene Association (AIHA). See also "How to Use this Book" in the front matter of this book.

erythema Abnormal flushing or redness of the skin due to increase in blood flow.

etiologic agents Airborne microorganisms capable of causing disease. These agents are the only nonchemical materials regulated by the US Department of Transportation (DOT).

etiology The science and study of all the factors that contribute to the development of a disease.

euphoria Intense feeling of well-being or elation.

evaporation rate A measure of the time required for a given amount of a substance to evaporate, compared with the time required for an equal amount of butyl acetate or ether to evaporate.

exothermic Heat producing.

expectoration Expulsion from the mouth of secretions from the respiratory tract.

explosive Any chemical compound, mixture, or device that produces a sudden, almost instantaneous release of pressure, gas, and heat when subjected to sudden shock, ignition source, pressure, or high temperature.

explosive limits Defined by the NFPA as the boundary-line mixture of vapor or gas with air, which, if ignited will just propagate the flame. They are known as the "lower and upper explosive limits," and are usually expressed in terms of percentage by volume of gas or vapor in air. Same as flammable limits. See also "LEL" and "UEL."

exposure People, property, or the environment that are subjected to the harmful effects of a hazardous material. Defined by OSHA as meaning an employee subjected to a hazardous chemical in the course of employment through a ROUTE OF ENTRY (e.g., ingestion, inhalation, skin contact, or absorption) and includes potential (e.g., accidental or possible) exposure.

exposure limits Concentrations of substances and conditions under which it is believed that nearly all workers may be repeatedly exposed, day after day, without adverse effects. Standard limits are established by ACGIH and OSHA.

F

F Degree Fahrenheit, a unit for measuring temperature. On the Fahrenheit scale, water boils at 100°C or greater.

Federal Register (FR) A daily publication of all US government documents required by law. It is the daily supplement to the Code of Federal Regulations (CFR).

fibrillation Rapid and chaotic contractions of many individual muscle fibers of the heart in the area of the ventricles, capable of causing cardiac arrest.

fibrosis Chronic lung affliction or scarring of the lung caused by an unusual increase of fibrous tissue, causing progressive respiratory problems, and often occurring after exposure to certain chemical substances.

fire diamond A visual hazard rating system of the National Fire Protection Association (NFPA). Provides general information about inherent hazards of materials: Health, Flammability, Reactivity and Special.

flammable Catches on fire and burns rapidly. The National Fire Protection Association and the US Department of Transportation define a flammable liquid as having a flash point below 100°F/37.8°C.

flammable aerosol An aerosol that, when tested by the method described in 16CFR1500.45, yields a flame projection exceeding 18 in at full valve opening, or a flashback (a flame extending back to the valve) at any degree of valve opening (29CFR).

flammable limits Range of gas or vapor concentrations (percent by volume) in air which will burn or explode if an ignition source is present. See also “LEL” and “UEL.”

flash back A phenomenon characterized by vapor ignition and flame traveling back to the source of the vapor.

flash point The minimum temperature at which a substance gives off flammable vapors that are in contact with spark or flame will easily ignite and burn rapidly. The flash point is established by one of the two following methods: in a closed cup (see also “Pensky-Martens”), or inside its container; or in an open cup, or near the surface of the liquid. The lower the flash point of a liquid, the higher the risk of fire.

flatulence Accumulation of gas in the digestive tract.

fluorosis Characteristic chronic intoxication caused by fluorine and its derivatives.

foreseeable emergency Any potential occurrence such as, but not limited to, equipment failure, rupture of containers, or failure of control equipment, that could result in an uncontrolled release of a hazardous chemical into the workplace (OSHA).

Form R Forms that must be completed annually for the EPA by reporting industrial facilities for chemicals used above the threshold amount.

fume A suspension of very fine solid particles in air, or vapors from a volatile liquid.

fumigant A pesticide in vapor or gaseous form used to kill pests or disinfect materials.

fungicide A pesticide used to control, prevent, or kill fungi.

fungus A lower plant that feeds on other organic matter and lacks the chlorophyll and tissue differentiation of higher plants.

G

gas An air-like, formless fluid having the property of uniformly distributing itself throughout a space in air. A state of matter.

gastric lavage Washing out the stomach.

gastrointestinal (GI) Refers to the organs of stomach, intestines, and/or other organs from mouth to anus.

gene Heredity-carrying material that is part of the chromosome.

genotoxic Causing genetic damage.

gestation The development of the fetus in the uterus from conception to birth; during pregnancy.

glycosuria Abnormal presence of glucose in the urine.

granulomatosis Pulmonary lesion characterized by the formation of small nodules.

granulometry Indicates the size of powder, and usually expressed in microns (1 micron is 0.000001 meters, or about 1,000 times smaller than a grain of sand). Particles of less than 10 microns are capable of deep penetration and becoming deposited in the respiratory tract. Larger particles can deposit in the upper respiratory area such as the bronchia, and although they may be expulsed, they can be dissolved by the organism. Particle size makes it possible to deduce the method to be adopted for corrective action (e.g., ventilation, respirator).

H

halogens Refers to inorganic compounds containing astatine, bromine, chlorine, fluorine, and iodine.

hazardous classes A collection of terms established the United Nations Committee of Experts to categorize hazardous materials. The specific categories are: flammable liquids, explosives, gases, oxidizers, radioactive materials, corrosives, flammable solids, poisonous and infectious substances, and dangerous substances.

hazardous constituent of waste A list of chemicals which is referenced under certain Conservation and Recovery Act (RCRA) provisions to determine if a solid waste is a hazardous waste.

hazardous materials Refers generally to hazardous substances, petroleum, natural gas, synthetic gas, acutely toxic chemicals, and other toxic chemicals. Substances or materials which have been determined to be capable of posing an unreasonable risk to health, safety, and property.

hazardous waste Defined by RCRA as any solid or combination of solid wastes, which because of its physical, chemical, or infectious properties, may pose a health hazard when improperly managed. It must possess at least one of four characteristics—ignitability, corrosivity, reactivity, toxicity—or appears on special EPA lists.

hazardous waste code The number assigned to every hazardous waste listed under the Resource Conservation and

Recovery Act (RCRA); the code is used for notification, recordkeeping, and reporting requirements.

hazard warning The OSHA definition means any words, pictures, symbols, or combination thereof appearing on a label or other appropriate form of warning that conveys the hazards of the chemical(s) in the container(s).

health hazard Evidence based on scientific data (human or animal) that acute or chronic effects may occur (29CGR1910.1200).

hematoma Localized bleeding into tissue.

hematuria Presence of blood in the urine.

heme The prosthetic, oxygen-carrying, color-furnishing constituent of hemoglobin.

hemoglobin The red, respiratory protein of erythrocytes; transports oxygen from the lungs to the tissues.

hemolysis Destruction of red blood cells, releasing hemoglobin.

hematopoietic system System responsible for formation of blood cells (includes bone marrow and lymphatic organs).

hemorrhage Loss of a significant amount blood. Can be external or internal bleeding.

hepatic Referring to the liver.

hepatitis An inflammation of the liver.

hepatoma Tumor of the liver.

hepatomegalia Increase in liver volume.

hepatotoxic Refers to a substance that is toxic to the liver.

hormone Any of various chemical substances that are produced by the endocrine glands and that have specific regulatory effects on the activity of certain organs.

hydrolysis A chemical process whereby a compound is cleaved into two or more simpler compounds with the uptake of the H and OH parts of a water molecule on either side of the chemical bond cleaved.

hydrolyze To subject to hydrolysis.

hydroxyl The atom group or radical, OH.

hypnotic Sleep inducing. Also, a drug that induces sleep.

hot zone The area immediately surrounding the incident site. Appropriate protective clothing and equipment must be worn by all personnel in the hot zone. AWARENESS LEVEL and OPERATIONAL LEVEL trained personel are not permitted in the hot zone.

hydrate Chemical substance combined with water in a specific proportion.

hydrocarbons Chemical compounds that consist entirely of carbon and hydrogen.

hydrochlorofluorocarbons (HCFCs) A group of chemicals having a weaker negative impact on the ozone layer and developed as temporary substitutes for ozone-depleting chemicals, such as CFCs.

hydrolysis Chemical change to a substance in an aqueous environment leading to the formation of new products.

hygroscopic Substances with a tendency to absorb moisture from the air.

hyperkeratosis Increased thickness of the cornified layer of the epidermis such as a corn.

hyperpigmentation Excessive pigmentation of the skin.

hyperplasia Abnormal growth of normal tissue.

hyperreflexia Excessive reflexes.

hypertension Increased blood pressure.

hypotension Decreased blood pressure.

hypothermia Lowering of body temperature to below normal.

I

icterus Yellow coloration of the skin and mucosa.

ignition temperature The minimum temperature required to initiate or cause self-sustained combustion independent of a heat source.

incident An unplanned event that could have resulted in an accident or which diminishes efficiency or production. See "accident."

inhibitor A chemical that is added to another substance to prevent unwanted chemical change from occurring.

immediate hazard A hazard with immediate effects. See "acute effect."

immediate use The hazardous chemical that will only be used by the individual who transfers it from a labeled container (29CFR1910.1200).

immunosuppression Decrease in the immune response. Artificial prevention or diminution of the (natural) immune response, e.g., by irradiation or by administration of substances such as pharmaceutical antimetabolites or specific antibodies to prevent sensitization; immunosuppression, or immunodeficiency may also be used to describe the condition of acquired or congenital lowered immune response.

incompatibility Indicates whether a material can be placed in contact with certain other products or materials. The direct contact of incompatible materials can cause dangerous reactions and give off heat and toxic vapors.

inflammation The response of the tissues of the body to injury, infection, or irritation. Its chief symptoms are redness, heat, swelling, and pain.

ingestion Taking in by the mouth; swallowing.

inhalation Breathing into the lungs of a (contaminated) substance in the form of a gas, vapor, fume, mist, or dust.

initiator A chemical that permanently alters a cell or group of cells and, in the case of carcinogens, is tumor producing.

inorganic chemical Those chemical substances not containing carbon.

insoluble Products that cannot be dissolved in each other.

interaction Modification of the toxic effects of one substance by another. Depending on the substances involved, the effects of interaction can be amplified or mitigated.

irritant A substance or material capable of causing irritation to organs and body parts.

irritating material Any substance that upon contact with fire or air produces irritating fumes.

invasive Spreading beyond specific body tissues.

isomer One of two or more variations of a chemical, each of which has the same chemical formula but a different structural arrangement.

J

jaundice Yellowing of the skin or eyes caused by too much bilirubin in the blood, and indication of liver diseases, biliary obstructions, and hemolysis.

K

keratitis Inflammation of the cornea of the eye.
keratoconjunctivitis Inflammation of the cornea and the conjunctiva of the eye.
K_{ow} See "partition coefficient."

L

lacrimation Production or discharge of excess tears from the eyes.
lacrimator A chemical substance that causes the secretion of excess tears from the eyes.
laryngitis Inflammation of the larynx.
latency period A seemingly inactive period, as that between the exposure of tissue to an injurious agent and a manifest response; often used to identify the period between exposure to a carcinogen and development of a tumor.
LEL Lower Explosive Limit of a vapor or gas; the lowest concentration (lowest percentage of the substance in air) that will produce a flash of fire when an ignition source (heat, arc, or flame) is present. At lower concentrations, the mixture is too "lean" to burn. See "UEL."
lethargy Deep and prolonged sleep, or extreme indifference.
leukemia A cancer of the blood-forming tissues that is characterized by a marked increase in the number of abnormal white blood cells (leukocytes).
listed hazardous waste under the Resource Conservation and Recovery Act (RCRA), wastes from generic industrial processes, wastes from certain sectors of industry, and unused pure chemical products that have been shown to generally contain toxic chemicals that could pose a threat to human health and the environment, or that generally exhibit one of the characteristics of ignitability, corrosivity, reactivity, or toxicity are considered hazardous and must adhere to RCRA provisions.
lymph A clear liquid that is collected from the tissues throughout the body and that flows in lymphatic vessels.
lymphatic A medical term describing a small sac or node in which lymph is stored; pertaining to the lymph, lymph nodes, or vascular channels that transport lymph to the lymph nodes.

M

malaise A feeling of general discomfort, distress, or uneasiness; an out-of-sorts feeling.
malignant Tending to become progressively worse; life-threatening.
manganism Chronic intoxication caused by manganese and its derivatives.
maximum contaminant levels (MCLs) The maximum level of a contaminant permissible in a public water system.
MCL The Maximum Contaminant Level; the maximum allowable of a contaminant in public drinking water supplies under the Safe Drinking Water Act.
melanoma A neoplasm derived from cells that are capable of forming the pigment melanin.
meta- In chemistry, a prefix denoting that a compound is formed by two substitutions in the benzene ring separated by one carbon atom, i.e., linked to the first and third, second and fourth, etc., carbon atoms of the ring; usually abbreviated *m*-.
metastasis The appearance of a neoplasm in a part of the body remote from the site of its origin.
methemoglobinemia Presence of an abnormal concentration and form of hemoglobin which will not carry oxygen to the blood, resulting in anemia or cyanosis.
miscible Products capable of being completely mixed and staying mixed with each other (without separation into distinct components) under normal conditions.
mist Liquid droplets suspended in air.
molecular weight Weight (mass) of a molecule based on the sum of the atomic weights of the atoms that make up the molecule.
mucous membranes Membranes lining body cavities and covered by a viscous substance called mucus.
myosis Reduction in diameter of pupils of the eye.
melting point The temperature at which a product changes from the solid to liquid state at normal atmospheric pressure (760 mmHg).
Montreal Protocol A 1987 agreement made by 25 countries to reduce the production and consumption of ozone depleting chemicals. Since 1987, additional countries have joined this agreement.
mutagen A chemical substance or physical effect capable of inducing transmissible changes in the genetic material of a living cell that results in physical and functional changes in the descendants. Depending on the type of cells affected, ova or spermazoids, both male and female can be affected. Mutations can lead to birth defects, miscarriage, or cancer.
mutagenic Capable of causing mutations.
mutagenicity The capability to induce mutation, or permanent change, in genetic material.

N

narcosis A stupor, drowsiness, arrested activity or unconsciousness produced by the influence of narcotics or other chemical substances. Artificially induced sleep.
narcotic Any substance that induces narcosis.
National Fire Protection Association (NFPA) This international membership organization promotes/improves fire protection and prevention and establishes safeguards against loss of life and property by fire. Best known in industry for

the National Fire Codes. Among these codes is the NFPA 704M, the code for classifying substances according to their fire and explosion hazard (as they might be encountered under fire or related emergency conditions) using the familiar diamond-shaped label or placard with appropriate color, numbers, or symbols.

nausea The urge to vomit; a feeling of sickness in the stomach.

necrosis Cellular or tissue death.

neonatal Relating to or affecting the first 4 weeks after birth.

neoplasm Presence of a new growth of abnormal cells. A tumor.

nephritis Inflammation of the kidney.

nephropathy Any affliction of the kidneys.

nephrotoxic Toxic to the kidneys.

NESHAP (National Emission Standards for Hazardous Air Pollutants) Under the Clean Air Act, regulations set for industries that emit one of more of the listed hazardous air pollutants in significant quantities.

neuropathy Any affliction of the nervous system.

neurotoxic Toxic to nerve cells and the nervous system. The effect may produce emotional or behavioral abnormalities.

neuritis Inflammation of a nerve.

neural Refers to a nerve or the nervous system.

neutralize To eliminate potential hazards by inactivating strong acids, caustics, and oxidizers. For example, acid spills can be neutralized by adding an appropriate amount of caustic or alkali substances.

NIOSH National Institute for Occupational Safety and Health. Tests equipment, evaluates and approves respirators, conducts studies of workplace hazards, and proposes standards to OSHA.

nitrogen mustard A substituted mustard gas in which sulfur is replaced by an amino nitrogen.

nitrogen oxides (NO_x) Gases associated with the breakdown of the earth's protective ozone layer that are released primarily from the burning of fossil fuels.

nitroparaffin An organic compound in which one or more hydrogen molecules of an alkane are replaced by a nitro group.

nitrosamine A class of organic compounds that contain a $-NH_2$ and a $-NO$ radical.

non-liquefied compressed gas DOT describes as a gas, other than gas in solution, which under the charged pressure is entirely gaseous at a temperature of 21°C. (Code of Federal Regulations, Title 49, Department of Transportation).

O

oncogenicity The capacity to induce tumors.

operations level (trained) First responders at the operational level are those persons who respond to releases or potential releases of hazardous materials as part of the initial response to the incident for the purpose of protecting nearby persons, the environment, or property from the effects of the release. They shall be trained to respond in a defensive fashion to control the release from a safe distance and keep it from spreading (ANSI/NFPA 472).

optic nerve Nerve running from the eye to the centers of vision in the brain.

oral Used or taken into the body through the mouth.

organic compound A class of chemical compounds containing mainly carbon atoms.

organic peroxide An organic compound containing the bivalent $-O-O-$ structure and which may be considered a structural derivative of hydrogen peroxide where one or more of the hydrogen atoms have been replaced by organic radicals (49CFR173.151).

ortho- In chemistry, denoting that a compound has two substitutions on adjacent carbon atoms in a benzene ring; usually abbreviated *o*-.

oxidant The substance that is reduced and that, therefore, oxidizes the other component of an oxidation–reduction system.

oxidase One of a group of enzymes now termed oxidoreductases that bring about oxidation by the addition of oxygen to a metabolite or by the removal of hydrogen or of one or more electrons.

oxidation The act of combining or causing to combine with oxygen or to lose electrons.

oxidize Oxygenize; to combine or cause an element or radical to combine with oxygen or to lose electrons.

oxidizing agent or oxidizer A substance other than a blasting agent or explosive such as chlorate, permanganate, inorganic peroxide, or a nitrate, that yields oxygen or other gases readily, thereby causing fire of other, usually organic, materials. Perchlorates, peroxides, permanganates, chlorates, and nitrates are examples of oxidizers.

ozone layer The protective layer of molecules surrounding the earth. The ozone layer reduces the amount of high-energy ultraviolet radiation that reaches the earth's surface.

P

PAC Acronym for Protective Action Criteria exposure limits developed by the US Department of Energy (DOE) for hazardous chemicals. These exposure limits include TEELs, AEGLs, and ERPGs and are used to estimate the consequence of uncontrolled releases of hazardous materials and to plan for emergency response. See also definitions in the glossary.

para- In chemistry, a prefix designating two substitutions in the benzene ring arranged symmetrically, i.e., linked to opposite carbon atoms in the ring; usually abbreviated *p*-.

particulate Fine liquid or solid particles such as dust, smoke, mist, fumes, or smog suspended in air or atmospheric emissions.

partition coefficient The ratio of a substance's distribution between oil and water when they are in contact. A value of less than 1 indicates better solubility of the substance in oils and greases. Such a product is therefore likely to be absorbed by the skin. A value greater than 1 indicates a better solubility in water, and, therefore, can be absorbed by the mucosa. This information can be useful in assessing first aid requirements, and can help in the selection of proper protective equipment. Also known as the coefficient of water/oil distribution. Usually abbreviated K_{ow}.

palpitation Perception of one's own heartbeat. A racing, irregular beat, or pounding of the heart.

paralysis The loss of function and/or feeling.

pathology The study of the nature of diseases, especially of the structural and functional changes in body tissues, organs, or fluids caused by disease, physical and biological agents, and toxic substances.

Pensky-Martens A closed cup method for determining flash point.

percutaneous absorption Absorption through the skin.

peritonitis Inflammation of the peritoneum or the membrane lining the abdominal cavity and the organs contained within it.

permissible exposure limit (PEL) A legal occupational limit of exposure established and defined by OSHA. The limit of allowable exposure to a chemical contaminant expressed as a Time-Weighted Average (TWA) concentration during a work-day of 8 h within, or as a maximum concentration never to be exceeded either instantaneously (ceiling) or a Short Term Exposure Limit (STEL) during any maximum period of 15 min. The exposure, inhalation, or dermal permissible exposure limit specified in 29CFR1910, Subparts G and Z. These concentrations are expressed in parts per million (ppm) and or milligrams of the product per cubic meter of air (mg/m^3) at 25°C. Exposure limits published in 29CFR1910.1000.

peroxide Compounds containing two oxygen atoms bound together. The oxide of any series that contains the greatest number of oxygen atoms; applied most correctly to compounds containing an −O−O-link, as in hydrogen peroxide (H−O−O−H).

peroxy- Prefix denoting the presence of an extra O atom, as in peroxides, peroxy acids (e.g., hydrogen peroxide, peroxyformic acid).

pesticide As defined by the Federal Insecticide, Fungicide and Rodenticide Act (FIFRA), a pesticide includes "any substance or mixture of substances intended for preventing, killing, repelling, or mitigating any pest, and any substance or mixture of substances intended for use as a plant regulator, defoliant, or desiccant."

petroleum distillate A material produced by a combination of vaporization and condensation of petroleum.

personal protection equipment (PPE) Safety equipment designed to protect parts or all of the body from workplace hazards. Such protective equipment includes chemical resistant clothing, gloves, respirators, and eye protection.

pH A symbol representing the concentration in hydrogen ions (H^+) in aqueous solution. This logarithmic scale is expressed as a numerical value usually between 0 and 14. A pH of 7 indicates a neutral or noncorrosive substance. A pH between 0 and 7 indicates greater acidity. A pH between 7 and 14 indicates greater alkalinity. A pH of 0 (very acid) or 14 (very basic) are highly corrosive. The symbol is useful in the identification of the appropriate type of protective equipment necessary for handling a chemical material.

pharyngitis Inflammation of the throat or pharynx.

phlegm Thick mucus produced in the breathing passages.

photophobia Unpleasant to painful feeling in the eyes, caused by light.

photosensitive Substances that change in the presence of light.

photosensitization Abnormal reaction of the skin to sunlight.

physical hazard A chemical for which there is scientifically valid evidence that it is a combustible liquid, a compressed gas, explosive, flammable, an organic peroxide, an oxidizer, pyrophoric, unstable (reactive) or water reactive.

pituitary gland A small gland at the base of the brain that secretes several important hormones.

plasma The fluid part of blood or lymph, as distinguished from suspended material.

platelet An irregularly shaped disk found in blood, containing granules in the central part and, peripherally, clear protoplasm, but no definite nucleus; it is about one-third to one-half the size of an erythrocyte, and contains no hemoglobin.

pneumoconiosis Chronic affliction of the lungs due to the inhaling of certain types of dust.

pneumonia Acute infection of the lung, characterized by inflammation.

pneumonitis (chemical) Inflammation of the lungs, resulting from chemical irritation.

pneumopathy Any pulmonary affliction.

point source contamination Contamination to the environment from a specific source such as a smokestack or sewer pipe.

polychlorinated biphenyl (PCBs) A pathogenic and teratogenic industrial compound used as a heat-transfer agent, primarily in transformers. PCBs may accumulate in human or animal tissue. PCBs are banned from production in the United States.

polymer A chemical formed by the joining together of similar chemical subunits.

polymerization A chemical reaction in which one or more small molecules combine to form larger molecules. A hazardous polymerization is a reaction that takes place at a rate that releases large amounts of energy. If hazardous polymerization can occur with a given material, the MSDS usually will list conditions that could start the reaction and—since the material usually will list conditions that could start the reaction, and since the material usually contains a polymerization inhibitor—the length of time during which the inhibitor will be effective. The heat given off or the expansion in volume, or both, caused by the polymerization reaction could cause the container holding the product to break and the unpolymerized residual product to be spilled.

polyneuritis Inflammation of several nerves.

polyuria Elimination of an abnormally large amount of urine over a given period.

pro-carcinogen Product that must be changed by the organism in order to become a carcinogen.

promoter (of carcinogenesis) Substance capable of enhancing the carcinogenic effect of another substance.

prostration Extreme exhaustion, physical or mental.

pulmonary Pertaining to the lungs.

pulmonary edema A buildup of fluid in the lungs caused by congestive heart failure, lung damage, side effects of drugs, infections, or kidney failure.

pyrophoric Any chemical substance or mixture that ignites spontaneously in dry or moist air at or below 130°F/54.4°C.

pyrolysis Decomposition of a substance by heat in the absence of air.

psychosis A group of mental illnesses characterized by a change in personality and loss of contact with reality.

Q

quaternary In chemistry, the term used to describe a substance with four chemical groups attached to a central atom; when the central atom is a trivalent nitrogen atom (N), adding the fourth group places a positive charge on N; compounds thus formed are called quaternary ammonium compounds.

R

racemate A mixture of equal parts of isomers of opposite rotation.

racemic Denoting a mixture that is optically inactive, being composed of an equal number of dextro- and levorotary substances (see DL-), which are separable.

radioactive Having the property of emitting radiation (such as alpha, beta, or gamma rays) from an atomic nucleus.

radioactive material Any material, or combination of materials, that spontaneously emits ionizing radiation, and having a specific activity greater than 0.002 microcuries per gram.

radionuclides Radioactive-decay particles emitted from natural and manufactured sources, including cosmic rays, X-rays, radon, and coal-fired utilities.

radon A colorless, naturally occurring, radioactive, inert gaseous element formed by radioactive decay of radium atoms in soil or rocks.

reactive Unstable.

reactivity Chemical reaction with the release of energy. Undesirable effects such as pressure buildup, temperature increase, formation of noxious, toxic, or corrosive by-product, may occur because of the reactivity of a substance to heating, burning, direct contact with other materials, or other conditions in use or in storage.

Recommended Exposure Limit (REL) A 10-h average exposure limit during a 40-h work-week recommended by the National Institute for Occupational Safety and Health (NIOSH) for occupational exposures.

reducing agent In a reducing reaction (which occurs simultaneously with an oxidation reaction) the reducing agent is the chemical or substance which (1) combines with oxygen or (2) loses electrons to the reaction. Reducing agents react violently with oxidizing agents or oxidizers.

Registry of Toxic Effects of Chemical Substances (RTECS) Published by NIOSH, RTECS is a compendium of the known toxic and biological effects of many chemical substances.

regulated material A substance or material that is subject to regulations promulgated by any government agency.

relative density The ratio of the density of a material to the density of a standard material, such as water at a specified temperature.

remedial action The actual construction or implementation phase of a Superfund site cleanup that follows remedial design.

renal Pertaining to the kidney.

reportable quantity (RQ) An amount of a hazardous substance or "extremely hazardous substance" that, if released, requires notification to the National Response Center (800/424-8802) under the emergency release reporting requirements of the Emergency Planning and Community Right-to-Know Act (EPCRA) or under those of CERCLA (Superfund). For the purposes of the Department of Transportation, RQ means the quantity specified for the substance in the Appendix to the Hazardous Materials Table. For the purposes of SARA Title III, RQ means, for any CERCLA hazardous substance the reportable quantity established therein for such a substance, for any other substance the RQ is one pound.

respirator A devise worn by a person to filter dust particles or gas out of surrounding air before inhalation of air.

respiratory tract The structures and organs involved in breathing; includes the nose, larynx, trachea, bronchi, bronchioli, and lungs.

respiratory tract filters Those anatomical structures that remove particles from inhaled air.

responsible party Someone who can provide additional information on the substance if needed (29CFR1910.1200).

rhinitis Inflammation of mucosa of the nasal passages.

rheumatoid arthritis A chronic disease of the joints, marked by inflammatory changes of joint structures.

rodenticide Chemical substances used to kill mice, rats, and other rodents.

route of entry The means or natural route by which hazardous chemicals or other contaminants can penetrate the body. For example, the skin (by cutaneous absorption), the digestive system (by ingestion), or the respiratory system (by inhalation).

routes of exposure Also known as routes of entry, any one of the ways by which substances enter the body, such as through the skin, ingestion, eye contact, or by breathing.

S

sensitization Defense reaction by the organism following exposure to a contaminant, resulting in an allergy.
senstitizer A chemical that causes a substantial proportion of exposed people or animals to develop an allergic reaction in normal tissue after repeated exposure to the chemical.
shock An abnormal condition resulting from not enough blood flowing through the body causing reduced blood pressure and interference with bodily functions.
Short Term Exposure Limit (STEL) A 15-min time-weighted-average exposure limit that should not be exceeded at any time during a work-day, recommended by the National Institute for Occupational Safety and Health (NIOSH) or a concentration that it is believed a worker can be exposed to continuously for a short period of time without suffering from irritation, chronic or irreversible tissue damage, or narcosis of sufficient degree to increase the likelihood of accidental injury, impair self-rescue, or materially reduce work efficiency, recommended by the American Conference of Governmental Industrial Hygienists (ACGIH).
silicosis Chronic disease of the lungs (fibrosis) provoked by inhaling dust of crystalline silica. See “pneumoconiosis.”
solid waste Any garbage, refuse or sludge, including solid, liquid, semisolid, or contained gaseous material resulting from industrial, commercial, agricultural, and mining operations, and community activities (excluding material in domestic sewage); discharges subject to regulation as point sources under the Federal Water Pollution Control Act, or any nuclear material or byproduct regulated under the Atomic Energy Act of 1954.
solubility The property of a substance describing the degree to which one material may be completely mixed or dissolved in another material. The degree of solubility of most substances increases with the rise in temperature; however, in the case of organic salts of calcium the substance may be more soluble in cold than in hot solvents.
solution Any homogeneous liquid mixture of two or more chemical compounds or elements that will not undergo any segregation normal to transportation (CFR, Title 49, DOT).
solvent A chemical liquid, capable of dissolving another substance. A term generally used to describe organic solvents.
spasm Involuntary muscle contraction.
specific gravity The weight of a material compared to the weight of an equal volume of water is an expression of the density (or heaviness) of a material. Insoluble materials with specific gravity of less than 1.0 will float in (or on water). Insoluble materials with specific gravity greater than 1.0 will sink in water. Most (but not all) flammable liquids have specific gravity less than 1.0 and, if not soluble, will float on water—an important consideration for fire suppression.
spill Another name for a leak. The methods, equipment, and precautions that should be used to control or clean up a leak or spill.
stability Relates to a material’s ability to resist change in form or chemical nature (e.g., xylene decomposes when strongly heated, and gives off toxic fumes). For MSDS purposes, a material is stable if it remains in the same form under expected and reasonable conditions of storage or use. Conditions that may cause instability (dangerous change) are stated; for example, temperature above 150°F/66°C; shock from dropping.
stabilized Containing a small amount of another substance included to keep the first material from changing form.
stool Discharge from the bowels.
stratosphere That part of the earth’s atmosphere, located above the troposphere, containing the ozone layer.
strong acids Refers, but not restricted, to chemicals such as hydrochloric, sulfuric, and nitric acids. Strong acids can cause violent reactions with certain other substances and materials.
strong bases Refers, but not restricted, to chemicals such as sodium hydroxide and potassium hydroxide. Strong bases can cause violent reactions with certain other substances and materials.
strong oxidizers Refers, but not restricted, to chemicals such as chlorine, bromine, and fluorine and many of their compounds Strong oxidizers can cause violent reactions with certain other substances and materials. See also “oxidizers,” “oxidizing agent,” “easily oxidized materials.”
sublimate To go directly from the solid to the gaseous state without passing through the liquid state.
Superfund Amendments and Reauthorization Act (SARA) Title III of SARA establishes the first national program of emergency planning for dealing with hazardous chemicals. Includes detailed provisions for community planning and annual submission of information about hazardous chemicals to the EPA, states and local communities.
suspected carcinogen A substance which is known to cause cancer in test animals, but is only suspected of causing cancer in humans. Also referred to as an experimental or potential carcinogen.
systemic toxicity Adverse effects caused by a substance that affects the body as a whole rather than local or individual parts or organs.

T

tachycardia Increased speed of heart beat.
tachypnea Abnormally rapid breathing.
target organ The body affected by a specific chemical in a specific species.
TCLP (toxicity characteristics leaching procedure) Under the Resource Conservation and Recovery Act (RCRA), wastes are subject to this laboratory procedure to determine if they can be disposed of in Subtitle D landfills or if they require Subtitle C disposal (i.e., considered a hazardous waste).

technical grade A purity standard applied to a chemical that may contain multiple impurities.

TEEL Acronym for Temporary Emergency Exposure Limit. Airborne exposure limits, TEELs are intended for use until AEGLs or ERPGs are adopted for chemicals. Temporary emergency exposure limit (TEEL) values developed by the Subcommittee on Consequence Assessment and Protective Actions (SCAPA) which provides the US Department of Energy (DOE)/National Nuclear Security Administration (NNSA) and its contractors with technical information and recommendations for emergency preparedness to assist in safeguarding the health and safety of workers and the public. See also "How to Use this Book" in the front matter of this book.

teratogen A substance that has been demonstrated to cause birth defects by causing malformations in the fetus. Teratogenic contaminants can be qualified as being "proven" when an effect has been shown in humans, "possible" when an effect has been shown in animals, or suspected in humans, and "suspected" when an effect is suspected in animals.

tetanic Refers to persistence in a muscle contraction.

***Threshold Limit Value®—Time-Weighted Average limit* (TLV®—TWA)** An 8-h average exposure limit during a 40-h work-week recommended by the American Conference of Governmental Industrial Hygienists (ACGIH) for occupational exposures.

Threshold Planning Quantity (TPQ) Under the Emergency Planning and Community Right-to-Know-Act, the presence of a chemical at or above this level requires certain emergency planning activities to be conducted. The quantity of a SARA extremely hazardous substance present at a facility above which the facility's owner/operator must give emergency planning notification to the SERC and LEPC.

Tier I or Tier II Describes hazardous substances inventory forms required under SARA Title III. These forms report quantities and locations of hazardous substances to various state agencies and planning committees.

Time-Weighted Average (TWA) The average concentration of a substance in air over the total time of exposure, usually expressed as an 8-h day.

tinnitus Ringing in one or both ears. May be a sign of hearing injury.

Title III The third part of SARA, also known as EPCRA, the Emergency Planning and Community Right-to-Know Act of 1986. Specifies requirements for organizing the planning process at the state and local levels for extremely hazardous substances; minimum plan content; requirements for fixed facility owners and operators to inform officials about extremely hazardous substances present at the facilities; and mechanisms for making information about extremely hazardous substances available to citizens.

tolerance Under the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA), the amount of pesticide residues allowed to remain in or on each treated food commodity.

topical Designed for direct application to a specific part of the body.

toxic Any substance capable of causing human injury or damage to living body tissue, impairment to the central nervous system, severe illness, and, in severe cases, death. A poison.

toxicology The branch of chemistry that deals with poisons.

toxicologist One who studies the nature, effects, and detection of poisons and the treatment of poisoning.

toxic pollutant Pollutants, which after discharge and upon exposure, cause adverse health effects.

Toxic Release Inventory (TRI) (Listed substance subject to reporting requirements.) An EPA database of release quantities by facilities of a growing list of chemicals and chemical categories into the nation's air, water, and land, and transfers to off-site locations for treatment or disposal, or for recycling and energy recovery. Under the Emergency Planning and Community Right-to-Know Act, certain industries are required on an annual basis to complete a Toxic Chemical Release Inventory Form for these chemicals.

trade name The manufacturer's commercial name for a chemical substance or product. A registered trade name contains the symbol "®".

trade secret Any confidential formula or information used to give the manufacturer, etc. an (economic) advantage over others who do not have the information (29CFR 1910.1200).

tumor A neoplasm; a mass of new tissue that persists and grows independently of its surrounding structures and that has no physiological use; it may be benign or malignant.

tumorigenic That which causes or produces tumors.

U

UEL Upper Explosive Limit of a vapor or gas; the highest concentration (highest percentage of the substance in air) that will produce a flash of fire when an ignition source (heat, arc, or flame) is present. At higher concentrations, the mixture is too "rich" to burn. See also "LEL."

UN identification number An international four digit number assigned to all hazardous materials regulated by the United Nations.

unstable A chemical in the pure state which will become self-reactive under conditions of shocks, pressure, or temperature (29CFR1910.1200).

UST Underground Storage Tank regulated under RCRA. A tank used to store CERCLA-regulated chemicals or petroleum products, with 10% or more of its volume underground, having connected piping.

ulceration Creation of an ulcer.

urban air toxics Under the Clean Air Act, the 33 air toxics that have been identified as posing the greatest potential health threat in urban areas.

V

vapor density Indicator of the number of times that the vapors of a substance are heavier or lighter than air. Vapor density measurement is taken at the boiling point. If the vapor density is greater than 1, the vapor will tend to collect at floor level. If the vapor density is less than 1, the vapor will rise in air.

vapor pressure When a substance evaporates, its vapors create a pressure in the surrounding atmosphere; therefore, vapor pressure is a measurement of how readily a liquid or a solid mixes with air at its surface. This measurement is expressed in millimeters of mercury (mmHg), at 68°F/20°C and normal atmospheric pressure (760 mmHg). A vapor pressure above 760 mm indicates a substance in the gaseous state. The higher a product's vapor pressure, the more it tends to evaporate, resulting in a higher concentration of the substance in air and therefore increases the likelihood of breathing it in.

vascular Pertaining to vessels or ducts that convey fluids such as blood, lymph, or sap; in human or veterinary medicine, vascular pertains to blood vessels.

vascular constriction Constriction with narrowing of blood vessels.

vascular dilation Dilation of the blood vessels.

vertigo Dizziness; giddiness.

volatiles A substance, usually a liquid, that easily vaporizes or evaporates to form a gas or vapor.

W

waste code Identifier assigned by the EPA consisting of a single letter (D, F, P, U, K) and three numbers in the format "Dxxx." This code identifies the type of hazardous waste stream being reported.

waste management Describes activities undertaken by facilities to treat, recycle or otherwise manage generated waste, including disposal and energy recovery.

waste stream Under RCRA, solid or liquid materials containing hazardous materials and generated as waste.

water reactive A chemical which reacts with water to release flammable or hazardous gas (29CFR1910.1200).

work area A defined space where hazardous substances are produced or used when employees are present (29CFR 1910.1200).

Appendix 4: European/International Hazard Codes, Risk Phrases, and Safety Phrases

Note: Followed by the GLOBALLY HARMONIZED SYSTEM OF CLASSIFICATION AND LABELING OF CHEMICALS (GHS)

Hazard Codes

Explosive (E)
Oxidizing (O)
Highly flammable (F)
Extremely flammable (F+)
Toxic (T)
Very toxic (T+)
Harmful (Xn)
Irritant (Xi)
Corrosive (C)
Dangerous to the environment (N)

(List of R-phrases) Risk Precaution Codes and Statements

R1—Explosive when dry.
R2—Risk of explosion by shock, friction, fire, or other sources of ignition.
R3—Extreme risk of explosion by shock, friction, fire, or other sources of ignition.
R4—Forms very sensitive metallic compounds.
R5—Heating may cause an explosion.
R6—Explosive when mixed with combustible materials.
R7—May cause fire.
R8—Contact with combustible material may cause fire.
R9—Explosive when mixed with combustible material.
R10—Flammable.
R11—Highly flammable.
R12—Extremely flammable.
R13—Extremely flammable liquefied gas.
R14—Reacts violently with water.
R14/15—Reacts violently with water, liberating extremely flammable gases.
R14/15—Reacts violently with water, liberating highly flammable gases.
R14/15—Reacts violently with water, liberating extremely flammable gases.
R15—Contact with water liberates highly flammable gases.
R15/29—Contact with water liberates toxic, highly flammable gas.
R16—Explosive when mixed with oxidizing substances.
R17—Spontaneously flammable in air.
R18—In use, may form flammable/explosive vapor−air mixture.
R19—May form explosive peroxides.
R20—Harmful by inhalation.
R20/21—Harmful by inhalation and in contact with the skin.
R20/21/22—Harmful by inhalation, in contact with skin and if swallowed.
R20/22—Harmful by inhalation and if swallowed.
R21—Harmful in contact with skin.
R21/22—Harmful in contact with the skin and if swallowed.
R22—Harmful if swallowed.
R23—Toxic by inhalation.
R23/24—Toxic by inhalation and in contact with skin.
R23/24/25—Toxic by inhalation, in contact with skin and if swallowed.
R23/25—Toxic by inhalation and if swallowed.
R24—Toxic in contact with skin.
R24/25—Toxic in contact with skin and if swallowed.
R25—Toxic if swallowed.
R26—Very toxic by inhalation.
R26/27—Very toxic by inhalation and in contact with the skin.
R26/27/28—Very toxic by inhalation, in contact with the skin and if swallowed.
R26/28—Very toxic by inhalation and if swallowed.
R27—Very toxic in contact with skin.
R27/28—Very toxic in contact with skin and if swallowed.
R28—Very toxic if swallowed.
R29—Contact with water liberates toxic gas.
R30—Can become highly flammable in use.
R31—Contact with acids liberates toxic gas.
R32—Contact with acids liberates very toxic gas.
R33—Danger of cumulative effects.
R34—Causes burns.
R35—Causes severe burns.
R36—Irritating to eyes.
R36/37—Irritating to eyes and respiratory system.
R36/37/38—Irritating to eyes, respiratory system and skin.
R36/38—Irritating to eyes and skin.
R37—Irritating to respiratory system.
R37/38—Irritating to respiratory system and skin.
R38—Irritating to skin.
R39—Danger of very serious irreversible effects.
R39/23—Toxic: danger of very serious irreversible effects through inhalation.
R39/23/24—Toxic: danger of very serious irreversible effects through inhalation and in contact with skin.
R39/23/24/25—Toxic: danger of very serious irreversible effects through inhalation, in contact with skin and if swallowed.

R39/23/25—Toxic: danger of very serious irreversible effects through inhalation and if swallowed.
R39/24—Toxic: danger of very serious irreversible effects in contact with skin.
R39/24/25—Toxic: danger of very serious irreversible effects in contact with skin and if swallowed.
R39/25—Toxic: danger of very serious irreversible effects if swallowed.
R39/26—Very toxic: danger of very serious irreversible effects through inhalation.
R39/26/27—Very toxic: danger of very serious irreversible effects through inhalation and in contact with skin.
R39/26/27/28—Very toxic: danger of very serious irreversible effects through inhalation, in contact with skin and if swallowed.
R39/26/28—Very toxic: danger of very serious irreversible effects through inhalation and if swallowed.
R39/27—Very toxic: danger of very serious irreversible effects in contact with skin.
R39/27/28—Very toxic: danger of very serious irreversible effects in contact with skin and if swallowed.
R39/28—Very toxic danger of very serious irreversible effects if swallowed.
R40—Possible risks of irreversible effects.
R40/20—Harmful: possible risk of irreversible effects through inhalation.
R40/20/21—Harmful: possible risk of irreversible effects through inhalation and in contact with skin.
R40/20/21/22—Harmful: possible risk of irreversible effects through inhalation, in contact with skin and if swallowed.
R40/20/22—Harmful: possible risk of irreversible effects through inhalation and if swallowed.
R40/21—Harmful: possible risk of irreversible effects in contact with the skin.
R40/21/22—Harmful: possible risk of irreversible effects in contact with skin and if swallowed.
R40/22—Harmful: possible risk of irreversible effects if swallowed.
R41—Risk of serious danger to eyes.
R42—May cause sensitization by inhalation.
R42/43—May cause sensitization by inhalation and skin contact.
R43—May cause sensitization by skin contact.
R44—Risk of explosion if heated under confinement.
R45—May cause cancer.
R46—May cause heritable genetic damage.
R47—May cause birth defects.
R48—Danger of serious damage to health by prolonged exposure.
R48/20—Harmful: danger of serious damage to health by prolonged exposure through inhalation.
R48/20/21—Harmful: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/20/21/22—Harmful: danger of serious damage to health by prolonged through inhalation, in contact with skin and if swallowed.
R48/20/22—Harmful: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/21—Harmful: danger of serious damage to health by prolonged exposure in contact with skin.
R48/21/22—Harmful: danger of serious damage to health by prolonged exposure in contact with skin and if swallowed.
R48/22—Harmful: danger of serious damage to health by prolonged exposure if swallowed.
R48/23—Toxic: danger of serious damage to health by prolonged exposure through inhalation.
R48/23/24—Toxic: danger of serious damage to health by prolonged exposure through inhalation and in contact with skin.
R48/23/24/25—Toxic: danger of serious damage to health by prolonged exposure through inhalation, in contact with skin and if swallowed.
R48/23/25—Toxic: danger of serious damage to health by prolonged exposure through inhalation and if swallowed.
R48/24—Toxic: danger of serious damage to health by prolonged exposure in contact with skin.
R48/24/25—Toxic: danger of serious damage to health by prolonged exposure in contact with skin and if swallowed.
R48/25—Toxic: danger of serious damage to health by prolonged exposure if swallowed.
R49—May cause cancer by inhalation.
R50—Very toxic to aquatic organisms.
R50/53—Very toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R51—Toxic to aquatic organisms.
R51/53—Toxic to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R52—Harmful to aquatic organisms.
R52/53—Harmful to aquatic organisms, may cause long-term adverse effects in the aquatic environment.
R53—May cause long-term adverse effects in the aquatic environment.
R54—Toxic to flora.
R55—Toxic to fauna.
R56—Toxic to soil organisms.
R57—Toxic to bees.
R58—May cause long-term adverse effects in the environment.
R59—Dangerous to the ozone layer.
R60—May impair fertility.
R61—May cause harm to the unborn child.
R62—Possible risk of impaired fertility.
R63—Possible risk of harm to the unborn child.
R64—May cause harm to breast-fed babies.
R65—Harmful: may cause lung damage if swallowed.
R66—Repeated exposure may cause skin dryness or cracking.

R67—Vapors may cause drowsiness and dizziness.
R68—Possible risk of irreversible effects.
R68/20/21—Harmful: possible risk of irreversible effects through inhalation and in contact with skin.
R68/20/22—Harmful: possible risk of irreversible effects through inhalation and if swallowed.
R68/20/21/22—Harmful: possible risk of irreversible effects through inhalation, in contact with skin and if swallowed.
R68/21/22—Harmful: possible risk of irreversible effects in contact with skin and if swallowed.

(List of S-phrases) Safety Precautions

S1—Keep locked up.
S1/2—Keep locked up and out of the reach of children.
S2—Keep out of the reach of children.
S3—Keep in a cool place.
S3/7—Keep container tightly closed in a cool place
S3/7/9—Keep container tightly closed in a cool, well-ventilated place.
S3/9—Keep in a cool, well-ventilated place.
S3/9/14—Keep in a cool well-ventilated place away from __?__(incompatible materials to be indicated by the manufacturer).
S3/9/14/49—Keep only in the original container in a cool, well-ventilated place away from __?__(incompatible materials to be indicated by the manufacturer).
S3/9/49—Keep only the original container in a cool, well-ventilated place.
S3/14—Keep in a cool place away from __?__ (incompatible materials to be indicated by the manufacturer).
S4—Keep away from living quarters.
S5—Keep contents under __?__(appropriate liquid to be specified by the manufacturer).
S6—Keep under __?__(inert gas to be specified by the manufacturer).
S7—Keep containers tightly closed.
S7/8—Keep container tightly closed and dry.
S7/9—Keep in a container tightly closed and in a well-ventilated place.
S7/47—Keep container tightly closed and at temperature not exceeding __?__°C (*to be specified by the manufacturer*).
S8—Keep containers dry.
S8/10—Keep container wet, but keep the contents dry.
S9—Keep containers in a well-ventilated place.
S12—Do not keep container sealed.
S13—Keep away from food, drink, and animal foodstuffs.
S14—Keep away from __?__(incompatible materials to be indicated by the manufacturer).
S15—Keep away from heat.
S16—Keep away from sources of ignition—No smoking.
S17—Keep away from combustible material.
S18—Handle and open containers with care.
S20—When using do not eat or drink.
S20/21—When using do not eat, drink, or smoke.
S21—When using do not smoke.
S22—Do not breathe dust.
S23—Do not breathe gas/fumes/vapor/spray (appropriate wording to be specified by the manufacturer).
S24—Avoid contact with skin.
S24/25—Avoid contact with the skin or eyes.
S25—Avoid contact with eyes.
S26—In case of contact with the eyes, rinse immediately with plenty of water and seek medical advice.
S27—Take off immediately all contaminated clothing.
S27/28—After contact with skin, take off immediately all contaminated clothing, and wash immediately with plenty of __?__ (*to be specified by the manufacturer*).
S28—After contact with skin, wash immediately with plenty of __?__(to be specified by the manufacturer).
S29—Do not empty into drains.
S29/35—Do not empty into drains; dispose of this material and its container in a safe way.
S29/56—Do not empty into drains, dispose of this material and its container at hazardous or special waste collection point.
S30—Never add water to this product.
S33—Take precautionary measures against static discharge.
S34—Avoid shock and friction.
S35—This material and its container must be disposed of in a safe way.
S36—Wear suitable protective clothing.
S36/37—Wear suitable protective clothing and gloves.
S36/37/39—Wear suitable protective clothing, gloves and eye/face protection.
S36/39—Wear suitable protective clothing and eye/face protection.
S37—Wear suitable gloves.
S37/39—Wear suitable gloves and eye/face protection.
S38—In case of insufficient ventilation, wear suitable respiratory equipment.
S39—Wear eye/face protection.
S40—To clean the floor and all objects contaminated by this material, use __?__(appropriate wording to be specified by the manufacturer).
S41—In case of fire and/or explosion, do not breathe fumes.
S42—During fumigation/spraying wear suitable respiratory equipment (appropriate wording to be specified by the manufacturer).
S43—In case of fire, use __?__(indicate in the space the precise type of fire-fighting equipment. If water increases the risk, add “Never use water”).
S44—If you feel unwell, seek medical advice (show the label where possible).
S45—In case of accident or if you feel unwell, seek medical advice immediately (show the label where possible).

S46—If swallowed, seek medical advice immediately and show this container or label.
S47—Keep at temperature not exceeding __?__ °C (to be specified by the manufacturer).
S47/49—Keep only in the original container at temperatures not exceeding __?__ °C (to be specified by the manufacturer).
S48—Keep wetted with __?__(appropriate material to be specified by the manufacturer).
S49—Keep only in the original container.
S50—Do not mix with __?__(to be specified by the manufacturer).
S51—Use only in well-ventilated areas.
S52—Not recommended for interior use on large surface areas.
S53—Avoid exposure—obtain special instructions before use.
S54—Obtain the consent of pollution control authorities before discharging to wastewater treatment plants.
S55—Treat using the best available techniques before discharge into drains or the aquatic environment.
S56—Do not discharge into drains or the environment, dispose to an authorized waste collection point.
S57—Use the appropriate containment to avoid environmental contamination.
S58—To be disposed of as a hazardous waste.
S59—Refer to manufacturer/supplier for information on recovery/recycling.
S60—This material and/or its container must be disposed of as hazardous waste.
S61—Avoid release to the environment. Refer to special instructions/safety data sheet.
S62—If swallowed, do not induce vomiting; seek medical advice immediately and show this container or label.
S63—In case of accident by inhalation; remove casualty to fresh air and keep at rest.
S64 −If swallowed, rinse mouth with water (only if the person is conscious).

Globally Harmonized System of Classification and Labeling of Chemicals (GHS)

Hazard statements are an essential element under the GHS, and will eventually replace the currently used R-phrases. In addition to hazard statements, containers and Material Safety Data Sheets (MSDS) will include, where necessary, the following: one or multiple pictograms, a signal word such as “Warning” or “Danger,” and precautionary statements. The precautionary statements will indicate proper handling procedures aimed at protecting the user and other people who might come in contact with the substance during an accident or in the environment. The container and MSDS will also contain the name of the supplier, manufacturer, or importer.

Each hazard statement contains a four digit code, starting with the letter H (Hxxx). Statements appear under various headings grouped together by code number. The purpose of the four digit code is for reference only; however, following the code is the exact *phrase* as it should appear on labels and MSDS.

Hazard Statements

Physical Hazards Codes and Statements

H200—Unstable explosive.
H201—Explosive; mass explosion hazard.
H202—Explosive; severe projection hazard.
H203—Explosive; fire, blast, or projection hazard.
H204—Fire or projection hazard.
H205—May mass explode in fire.
H220—Extremely flammable gas.
H221—Flammable gas.
H222—Extremely flammable material.
H223—Flammable material.
H224—Extremely flammable liquid and vapor.
H225—Highly flammable liquid and vapor.
H226—Flammable liquid and vapor.
H227—Combustible liquid.
H228—Flammable solid.
H240—Heating may cause an explosion.
H241—Heating may cause a fire or explosion.
H242—Heating may cause a fire.
H250—Catches fire spontaneously if exposed to air.
H251—Self-heating; may catch fire.
H252—Self-heating in large quantities; may catch fire.
H260—In contact with water releases flammable gases which may ignite spontaneously.
H261—In contact with water releases flammable gas.
H270—May cause or intensify fire; oxidizer.
H271—May cause fire or explosion; strong oxidizer.
H272—May intensify fire; oxidizer.
H280—Contains gas under pressure; may explode if heated.
H281—Contains refrigerated gas; may cause cryogenic burns or injury.
H290—May be corrosive to metals.

Health Hazards

H300—Fatal if swallowed.
H301—Toxic if swallowed.
H302—Harmful if swallowed.
H303—May be harmful if swallowed.
H304—May be fatal if swallowed and enters airways.
H305—May be harmful if swallowed and enters airways.
H310—Fatal in contact with skin.
H311—Toxic in contact with skin.
H312—Harmful in contact with skin.
H313—May be harmful in contact with skin.
H314—Causes severe skin burns and eye damage.
H315—Causes skin irritation.
H316—Causes mild skin irritation.
H317—May cause an allergic skin reaction.
H318—Causes serious eye damage.

H319—Causes serious eye irritation.
H320—Causes eye irritation.
H330—Fatal if inhaled.
H331—Toxic if inhaled.
H332—Harmful if inhaled.
H333—May be harmful if inhaled.
H334—May cause allergy or asthma symptoms or breathing difficulties if inhaled.
H335—May cause respiratory irritation.
H336—May cause drowsiness or dizziness.
H340—May cause genetic defects.
H341—Suspected of causing genetic defects.
H350—May cause cancer.
H351—Suspected of causing cancer.
H360—May damage fertility or the unborn child.
H361—Suspected of damaging fertility or the unborn child.
H362—May cause harm to breast-fed children.
H370—Causes damage to organs.
H371—May cause damage to organs.
H372—Causes damage to organs through prolonged or repeated exposure.
H373—May cause damage to organs through prolonged or repeated exposure.

Environmental Hazards

H400—Very toxic to aquatic life.
H401—Toxic to aquatic life.
H402—Harmful to aquatic life.
H410—Very toxic to aquatic life with long lasting effects.
H411—Toxic to aquatic life with long lasting effects.
H412—Harmful to aquatic life with long lasting effects.
H413—May cause long lasting harmful effects to aquatic life.

Prevention Precautionary Codes and Statements

P201—Obtain special instructions before use.
P202—Do not handle until all safety precautions have been read and understood.
P210—Keep away from heat/sparks/open flames/hot surfaces—NO SMOKING.
P211—Do not spray on an open flame or other ignition source.
P220—Keep/Store away from clothing/. . ./combustible materials.
P221—Take any precautions to avoid mixing with combustibles.
P222—Do not allow contact with air.
P223—Keep away from any possible contact with water, because of violent reaction and possible flash fire.
P230—Keep wetted with __?__.
P231—Handle under inert gas.
P232—Protect from moisture.
P233—Keep container tightly closed.
P234—Keep only in original container.
P235—Keep cool.
P240—Ground/bond container and receiving equipment.
P241—Use explosion-proof electrical/ventilating/light/. . ./equipment.
P242—Use only non-sparking tools.
P243—Take precautionary measures against static discharge.
P244—Keep reduction valves free from grease and oil.
P250—Do not subject to grinding/shock/. . ./friction.
P251—Pressurized container—Do not pierce or burn, even after use.
P260—Do not breathe dust/fume/gas/mist/vapors/spray.
P261—Avoid breathing dust/fume/gas/mist/vapors/spray.
P262—Do not get in eyes, on skin, or on clothing.
P263—Avoid contact during pregnancy/while nursing.
P264—Wash __?__ thoroughly after handling.
P270—Do not eat, drink, or smoke when using this product.
P271—Use only outdoors or in a well-ventilated area.
P272—Contaminated work clothing should not be allowed out of the workplace.
P273—Avoid release to the environment.
P280—Wear protective gloves/protective clothing/eye protection/face protection.
P281—Use personal protective equipment as required.
P282—Wear cold insulating gloves/face shield/eye protection.
P283—Wear fire/flame resistant/retardant clothing.
P284—Wear respiratory protection.
P285—In case of inadequate ventilation wear respiratory protection.
P231 + 232—Handle under inert gas. Protect from moisture.
P235 + 410—Keep cool. Protect from sunlight.

Response Precautionary Codes and Statements

P301—IF SWALLOWED −.
P302—IF ON SKIN −.
P303—IF ON SKIN (or hair) −.
P304—IF INHALED −.
P305—IF IN EYES −.
P306—IF ON CLOTHING −.
P307—IF exposed −.
P308—IF exposed or concerned −.
P309—IF exposed or you feel unwell −.
P310—Immediately call a POISON CENTER or doctor/physician.
P311—Call a POISON CENTER or doctor/physician.
P312—Call a POISON CENTER or doctor/physician if you feel unwell.
P313—Get medical advice/attention.
P314—Get medical advice/attention if you feel unwell.
P315—Get immediate medical advice/attention.
P320—Specific treatment is urgent (see __?__ on this label).

P321—Specific treatment (see __?__ on this label).
P322—Specific measures (see __?__ on this label).
P330—Rinse mouth.
P331—Do NOT induce vomiting.
P332—If skin irritation occurs −.
P333—If skin irritation or a rash occurs −.
P334—Immerse in cool water/wrap in wet bandages.
P335—Brush off loose particles from skin.
P336—Thaw frosted parts with lukewarm water. Do not rub affected areas.
P337—If eye irritation persists −.
P338—Remove contact lenses if present and easy to do. Continue rinsing.
P340—Remove victim to fresh air and keep at rest in a position comfortable for breathing.
P341—If breathing is difficult, remove victim to fresh air and keep at rest in a position comfortable for breathing.
P342—If experiencing respiratory symptoms −.
P350—Gently wash with soap and water.
P351—Rinse continuously with water for several minutes.
P352—Wash with soap and water.
P353—Rinse skin with water/shower.
P360—Rinse immediately contaminated clothing and skin with plenty of water before removing clothes.
P361—Remove/Take off immediately all contaminated clothing.
P362—Take off contaminated clothing and wash before reuse.
P363—Wash contaminated clothing before reuse.
P370—In case of fire −.
P371—In case of major fire and large quantities −.
P372—Explosion risk in case of fire.
P373—DO NOT fight fire when fire reaches explosives.
P374—Fight fire with normal precautions from a reasonable distance.
P375—Fight fire remotely due to the risk of explosion.
P376—Stop leak if safe to do so.
P377—Leaking gas fire—do not extinguish unless leak can be stopped safely.
P378—Use __?__ for extinction.
P380—Evacuate area.
P381—Eliminate all ignition sources if safe to do so.
P301 + 310—IF SWALLOWED—Immediately call a POISON CENTER or doctor/physician.
P301 + 312—IF SWALLOWED—Call a POISON CENTER or doctor/physician if you feel unwell.
P301 + 330 + 331—IF SWALLOWED—Rinse mouth. DO NOT induce vomiting.
P302 + 334—IF ON SKIN—Immerse in cool water/wrap in wet bandages.
P302 + 350—IF ON SKIN—Gently wash with soap and water.
P302 + 352—IF ON SKIN—Wash with soap and water.
P303 + 361 + 353—IF ON SKIN (or hair)—Remove/Take off immediately all contaminated clothing. Rinse skin with water/shower.
P304 + 312—IF INHALED—Call a POISON CENTER or doctor/physician if you feel unwell.
